Christ has gone up, He is throned in the glory of heaven, never to be seen of man until His second coming; but Christian art could not rest satisfied with the representation of His Ascension. Inspired by the mysterious passages in St. John's vision, it early sought to depict "Christ in glory," and "the Majesty" of His return to judge the world. Of the modes adopted by Christian artists to depict the Glory of Christ, we shall have to speak in a future article—here we must confine our remarks to the strictly iconographic Glory, as rendered by the two attributes already treated of. Christ is no longer in the flesh, although retaining to the eyes of faith His earthly body and the marks of the nails and spear. He is God the Son, seated in the glory of the Father, one with Him and the Holy Spirit for ever. Now comes the Aureole into full significance as the attribute of the Deity; as the visible exponent of that radiance, to which sunshine is as darkness, and of which even the words of revelation, in borrowing earthly similes, convey but an imperfect idea to the mind. The Aureole, in its simple expressiveness, tells us, in the language of symbolic art, of the radiance never fading, issuing from the throne of God; and seeks, by a literal translation of the Vision of St. John, to concentrate the mysteries of heaven around the person of the throned One.

The iconographic Glory presents Christ, robed in white garments, wrought with golden embroidery, studded with jewels, and clasped with a precious morse; His head invested with a Nimbus of gold, on which are the three rays indicative of the Triune; seated on a throne or on a rainbow, "in sight like unto an emerald," bearing in His hand the sceptre or orb of sovereignty, and inclosed in an Aureole, filled with vivid rays or powdered with stars of gold, and surrounded with a cordon of Seraphim and Cherubim.

The Lamb, as the chief symbol of our Lord, is frequently found in Mediæval works invested with the Aureole, generally of a circular form, as in the miniature of the Triumph of the Lamb in the Evangeliarium illuminated for Charles the Bald, and in the case of the symbol held in the hands of the statue of St. John the Baptist in the north porch of Chartres Cathedral (see Fig. 2, Article IV.)

Portraitures, or representations of God the Father in the human form, are rare in comparison with those of God the Son; although artists after the 12th century threw aside the considerations which induced those of earlier centuries to refrain from attempting portraitures of the Invisible God. When we find representations of God the Father invested with the Aureole, the attribute differs in no way from that applied to the portraitures of our Lord; indeed, the resemblance in the treatment of their respective portraitures and the exact similarity of both their Aureoles and Nimbi, render it sometimes a difficult matter to decide which of the two Personages is intended. In early work the student need, however, have no hesitation in accepting every such portraiture as that of God the Son. If the reader will now refer to Fig. 5 (Article V.), he will find a curious illustration of what we have just stated. If the figure seated in the Aureole and holding a book were shown alone, that is, without the accompanying figure, to any student of Christian Iconography, he

would most assuredly pronounce it to be a portraiture of God the Son, notwithstanding the absence of the nail-marks in the hands, which he well knows are by no means invariably present in representations of our Saviour after His Passion. The figure here alluded to is unquestionably intended for God the Father, as will be seen by the remarks we have passed on the subject in Article V.

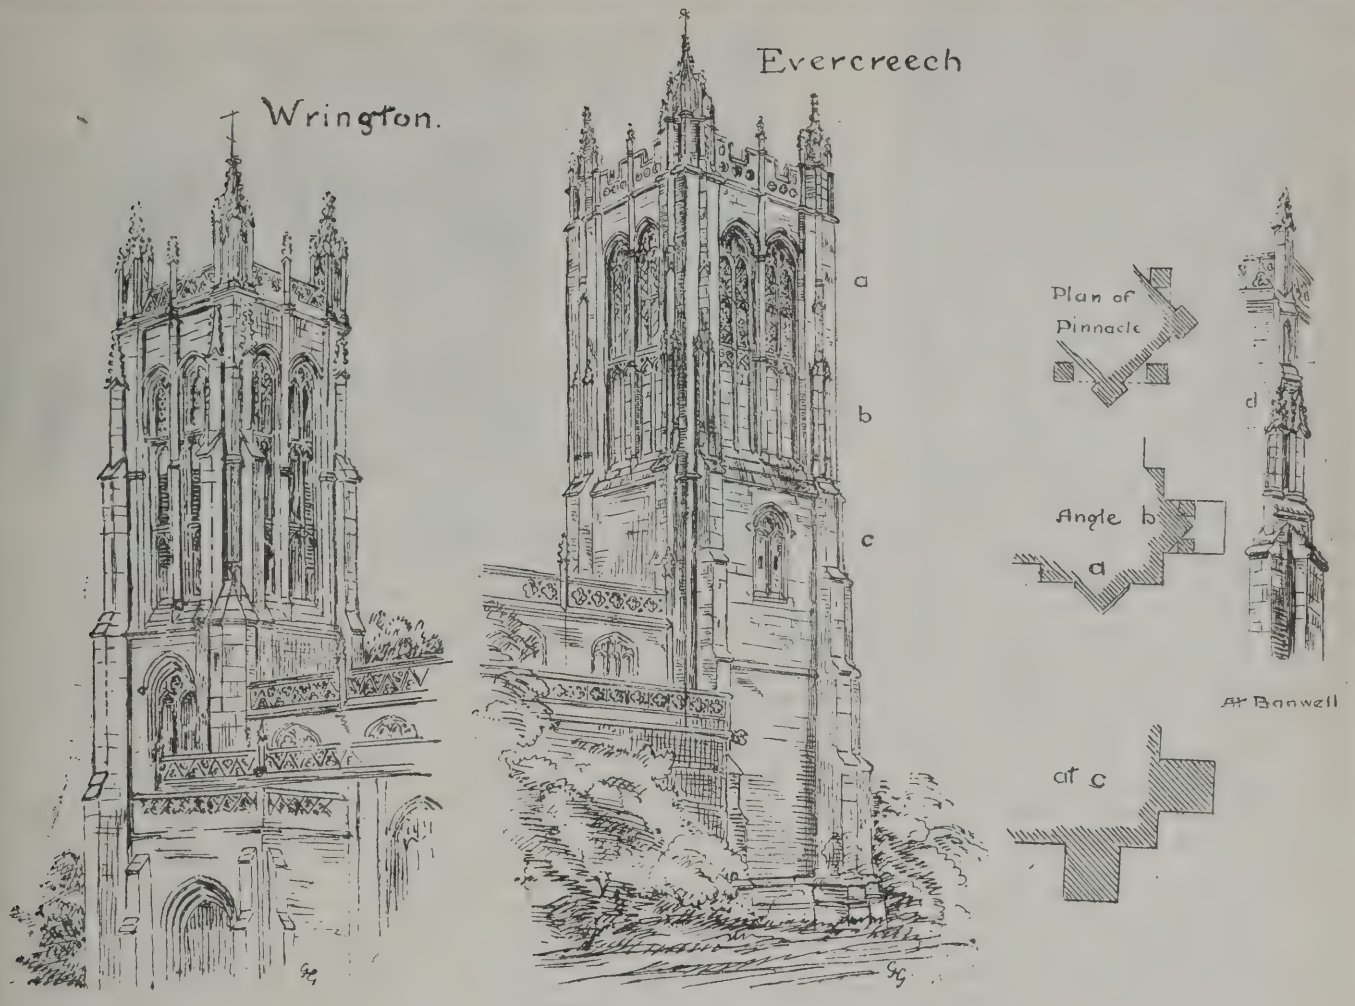
We have not been able to find any work of art in which a portraiture of God the Holy Ghost is represented, invested with a special Aureole; indeed, separate portraitures are not known to have ever obtained. The symbol of the Holy Spirit—the Dove—is, on the contrary, of constant occurrence in all departments of Christian art. It is introduced without either a Nimbus or Aureole; with the tri-radiated Nimbus only; with an Aureole only; and sometimes in Glory—with both Nimbus and Aureole. In Fig. 42, the Dove is without a Nimbus, but the great Aureole incloses it as well as the figures of God the Father and God the Son. In the miniature of the Baptism of Christ, in the Benedictional of St. Æthelwold, the Dove is neither invested with a Nimbus, nor an Aureole, whilst in that of the Descent of the Holy Ghost, it has a lenticular Aureole only. The Dove invested with a circular Aureole is of frequent occurrence in Christian art. In representations of the Trinity, the Dove is sometimes invested with the Aureole, whilst the accompanying portraitures of God the Father and God the Son have the Nimbus only. An example of this is furnished by the fresco, in one of the churches of Mount Athos, illustrated in Fig. 17. (Article VI.) In this painting the Dove is placed in a circular Aureole, from which rays issue in all directions, whilst the portraitures have Nimbi only. It is just possible that the artist here intended to extend the signification of the attribute to the figures by giving them the background of rays diverging from the bright disc behind the symbol of the Holy Ghost.

In Fig. 21 (Article VII.) is given a curious and unique rendering of the Trinity, showing the combination of three Aureoles of circular form. In the greater Aureole, a youthful figure of God the Son is seated on the wings of Seraphim, holding in the right hand the combined symbols of the Four Evangelists, nimbed. His head is invested with the Greek tri-radiated Nimbus. The field of the Aureole is divided into zones, rayed, and powdered with monograms and stars. Above the head of Christ appears the symbol of the Holy Ghost invested with a circular Aureole and Nimbus. Higher still is a half-length portraiture of God the Father, a venerable figure, invested with a circular Aureole, smaller, but treated very similar to that of God the Son. The Nimbus of God the Father has already been described.

The only other personage on whom Mediæval artists have considered it correct to bestow the Aureole, is the Virgin Mary, as "Queen of Heaven." According to strict rule, such an application is incorrect, but it is quite easy to realise the arguments which obtained, in the Latin Church, in favour of the adoption of the recognised insignia of deification, power, and glory in connection with her portraitures. In subjects where the Saviour is also depicted, the Virgin is seldom invested with an Aureole: a notable exception to this general rule is furnished by the "Last Judgment," by Orcagna, in the Campo Santo, at Pisa. In this fresco both Christ and the Virgin are depicted, side by side, in large lenticular Aureoles, exactly similar in dimensions, form, and artistic treatment. An outline drawing of the portraiture of the Virgin is given in Fig. 43. Neither of the figures is invested with the Nimbus proper, its place being taken by a diffused radiation formed of divergent lines of light, which extend beyond the confines of the Aureole. The figures are seated on bows which span the fields of their Aureoles, whilst their feet rest on clouds. In the fresco of the Assumption of the Virgin, by Giunta di Pisa (A.D. 1230), in the church of St. Francesco, at Assisi, one broad lenticular Aureole invests both the figures of our Lord and the Virgin. They are seated together, with their feet resting on a bow, which spans the lower part of the Aureole. The attribute is borne aloft by four angels, in a manner similar to that shown in Fig. 31 (Article XI.) In certain pictures of the Assumption, as in those of Perugino and Pinturicchio, the Aureoles which invest the figures of the Virgin are surrounded with cordons of angels.

Of the application of the Aureole to the representations of the higher angels we have already spoken, and it only remains for us, in closing this section of our subject, to say a few words upon the application of the attribute to representations of the human soul on its way to heaven. The instances of the latter are rare, as might be expected, for in them artists strained the rules of iconography much beyond their proper bounds. When they are met with, we may justly accept their signification as different from the Aureoles of divine personages and their symbols. Such an Aureole as that surrounding the soul of St. Martin (Fig. 29, Article XI.); and the one which surrounds the soul of St. Margaret, in the window which contains her legendary history, in the Cathedral of Auxerre, may properly be understood to represent the way of light, the radiant clouds amidst which the souls of the saints ascend to heaven. The Aureole of St. Margaret has, like that of St. Martin, a margin of conventional clouds, and is borne aloft by angels.

(To be continued.)



TYPICAL CHURCH TOWERS.—II.

SKETCHING as we have done the characteristic features of a few Somersetshire towers, we may now in more detail endeavour to show the points which differentiate them from other types. The first distinguishing feature we meet with which separates one class from the other is the treatment of belfry, the second the angle or buttress arrangement. Let us compare, for instance, the tower of Cromer Church, Norfolk, or of Framlingham, Suffolk, and those of Huish Episcopi, Cheddar, or Banwell. The former have breadth of wall surface, and double or single windows simply pierced through the walls; the Somersetshire examples have couplets or triplets of partially pierced and panelled windows filling up the belfry space, or arranged to agree with the horizontal lines of cornice by means of engaged pinnacles of equal height. Thus the belfry windows of Banwell, Cheddar, Chewton Mendip, and other towers were designed with reference to the rectangular wall space composing the upper story: they appear to fit the space, but we fail to observe the same attempt in the East Anglian structures, where the massive wall and pier were more in request. Secondly, as to the angle treatment. The East Anglian tower has the usual single angular or double buttress, at right angles, finished by splayed weatherings. At Framlingham the fine panelled flint angle buttress of six stages is terminated by a small angle-set pinnacle, which just breaks the corners of the battlement; at Cromer splayed weatherings terminate the buttresses, the angle of tower being carried up square to form the pinnacles. At Southwold, the panelled angle-buttresses, like those at Framlingham, are stopped level with the parapet, and are without pinnacles, though these terminals were probably intended, as on many other East Anglian towers, which we shall show later when we come to speak of them. The angle of the Somersetshire tower is, as we have hinted, more elaborated. Taking the simpler kind, such as that of Cheddar and Banwell (see sketch) the coupled rectangular buttress changes to a diagonal arrangement in the upper story, as we have sketched at A and B, p. 278, which describes the former of these examples. At Banwell the arrangement is very similar: a pair of engaged pinnacles stand on the first weathering of the diagonal buttress, which springs out of the lower ones (see sketch). At Langport the tower of the church is quite of this character, and is of very elegant design. The belfry has a triple arrangement of windows on each face, with pinnacles between them, which spring out of a weathered set-off, and the angles have buttresses set anglewise upon the right angle coupled buttresses below; and these terminate in pinnacles above a plain battlemented parapet. Farther south the towers show a more usual design. Both at Yeovil and Trent the belfry stage is marked by a single window, and the buttresses are double ones with plain weathered heads.

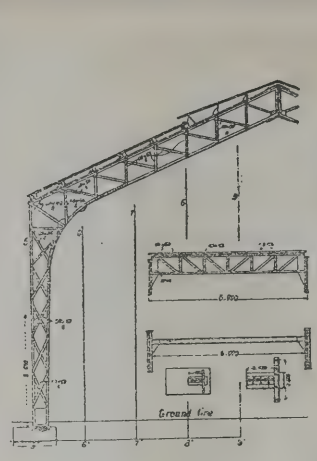
While speaking of the design of the belfry stories, we may notice the very common employment of the Early Perpendicular window, which is found, with few exceptions, in nearly every instance. Thus, the windows at Cheddar, Banwell, Huish, Yeovil, and Langport are of similar tracery—two-light cusped windows with muntins from the points of the sub-arches, the upper piercings being also cusped. Another peculiarity is the triangular-shaped buttresset or pinnacle engaged to the wall between the windows, or on the face of buttress, as in the examples of Wrington and Evercreech, both of which we show. The windows of the last two towers have transoms dividing their height into three. The very common use of perforated parapets, composed of triangles with trefoils pierced in them alternately, as at Wrington and Banwell, deserves notice. In other instances, like that of Huish and Cheddar, the parapet is pierced by quatrefoils, bands of the latter ornament also occurring between the stories of the first-named tower, producing a very rich effect. Another variety consists of upright openings or arcading, pierced or blank, as seen at Yeovil, Chewton Mendip, St. Cuthert's, Wells, in which latter the openings follow the battlemented outline. These varieties of treatment are deserving the attention of the architect.

The stone towers of Somerset afford, in fact, a very interesting study, more particularly in the arrangement and cutting of the angles, parapets, and pinnacles. The sub-division and elevation of the buttresses at the upper angles of towers lead the eye from the lower and plainer portions by an imperceptible gradation to the summit, and impart a graceful outline to the whole. Fineness in stone-cutting has scarcely been carried to the same extent elsewhere.

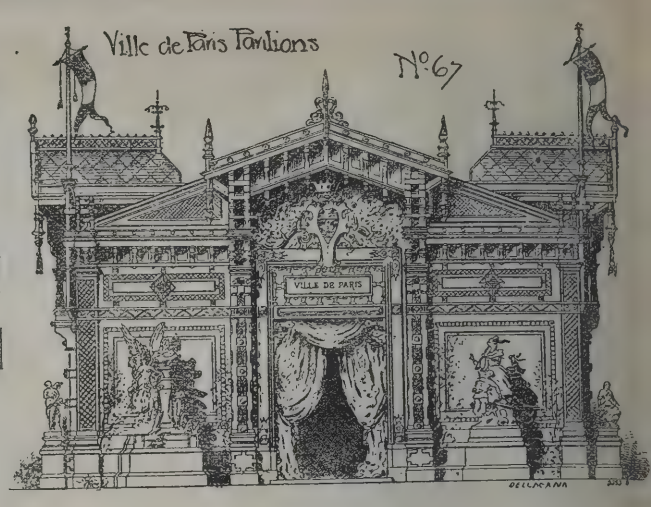
Comparing the towers of Wrington and Evercreech, which our present sketches enable the reader to do in their full proportion, it will be noticed that there is very much in common between them. There is the lofty belfry story with its two enormously high windows, partially pierced and divided into three stages by transoms, the entire height of which occupies about one-half of the total height of tower, the deep weathered set-off reducing the thickness of the tower walls in the upper part, the square angle piers to belfry, the same arrangement of buttresses below, and a like number of stories, and within 10ft. of the same height, Wrington Tower being 140ft. and that of Evercreech about 130ft. high. Probably the last named is a little later in date, if we go by the details. We place them side by side with the object of comparing the points of difference in the details. These chiefly reside in the design of the angle buttresses of the belfry stage. It will be noticed that both have the same square projecting pier at each corner, but that the external buttresses or engaged

pinnacles are not treated alike. At Wrington the main buttress on each face continues to half-way up the belfry, is there weathered, and carries an engaged triangular pinnacle, which finishes below the cornice. The corner turrets are square, and have four engaged pinnacles at the angles of each, which rise from the cornice member. Turning to the tower of Evercreech, the plain, square buttresses stop at the belfry level, and from each of them starts a triangular-shaped buttresset, flanked by two pinnacles for a short distance bonded into the work *b*, beyond which the buttresset is carried right up the centre of each angle-pier through the cornice, and terminates as a small pinnacle, one of eight, which surround each turret (see plan). These form a richly-clustered group at each corner of the tower. We cannot but admire the arrangement. More elegant and graceful than the former, the triangular buttresset starts less abruptly from the buttress head, and is diminished by two ornamental set-offs, the lower third being further accentuated by the small square pinnacles joined to the shaft just described. These are managed with much artistic skill, and are separated by deep vertical quirks and sinkings, which throw them out by lines of shadow. Plans *a*, *b*, and *c* show the manner these are worked at those levels. Each corner pinnacle is engaged to the centre shaft by its inner angle *b*, and worked from the same stone, but projecting on each of its outside faces sufficient to throw the return sides into shadow. The plan of corner-clustered pinnacles is no less artistic and charming in its outline. The sunlight glinting on the faces of the semi-engaged pinnacles and thrown up from the shaded mass of the centre turret produces a pleasing variety to the mass. Each turret is connected by the vertical shaft or buttresset to the angle, instead of being an independent design springing from the weather cornice. Both towers also have the intermediate pinnacle between the belfry windows breaking the parapet. On the whole, we may suppose, from the more graceful arrangement of the angles and pinnacles seen at Evercreech, that the work was at least an improvement upon, if not later in date than, those of Wrington. Certainly, taking them both as examples of tower design, and tracing so many close resemblances in the structures, we are tempted to conclude that the architects and masons engaged on these churches belonged to one school, if they were not indeed the same individuals. Interiorly the church of Evercreech has four bays to nave and aisles, and a low chancel of three bays. The tower, as usual, opens into the church by a lofty archway, with rich moulded jambs, as there is a carved gallery front in the arch like the one at St. Cuthbert's. The nave roof is flat and coloured, of the tie-beam type.

A rather more complex but, perhaps, less elegant arrangement of angle pinnacles occurs in the towers of Chewton Mendip and Huish. They are more isolated from the angle, and are set diagonally on the buttresses. They terminate below the cornice, and the parapet and upper pinnacles have no connection with them, as we shall show later on.



THE MARBLES AND ORNAMENTAL ROCKS OF THE MEDITERRANEAN.*



By W. Brindley, F.G.S., F.R.M.S.

WHILE the waters of the Mediterranean Sea are opalescent, abounding with fish of the most exquisite colours and hues, and with seaweeds equally beautiful, the rocks which surround this basin sea, along with those of its islands, are equally beautiful in colour, and have from the earliest times supplied nearly the whole of the valuable marbles used for the architectural adornment of the cities of Greece and Rome. And if we include a moderate inland belt of the coast line, within the watershed to this sea, we can then call almost every fragment of ancient marble found in Greece, Rome, and their colonial cities Mediterranean marbles. The Classic Greeks may be considered the pioneers in the working of marbles, the origin of which is easy to understand, as white marble was the stone most easily obtainable in large sizes for architectural purposes, and no doubt this choice material, which was capable of taking and retaining the most delicate chiselling, with its ivory-like tinting and semi-transparency, played its part in the refinement of both architecture and sculpture in the ancient world. It is possible that the outcome of their refined colour decoration may have been requisite to subdue its dazzling brightness under an Eastern sun. The Romans in their turn endeavoured to obtain lasting colour in their buildings by the introduction of coloured marbles, which the Greeks had all but neglected. The result of this introduction was the magnificent colour decoration of Rome and Byzantium, the influence of which has continued through all architectural changes and styles down to the present time. The demand is now so great for varieties of choice coloured marble, not only for architectural decoration but for articles of *virtu* and furniture, that not only has search been made for the various quarries of the ancients (all of which except one have now been rediscovered), but hundreds of new ones have been opened and worked in every part of the explored globe. In the midst of all this modern adventure, the ancient quarries of the Greeks and Romans on the shores of the Mediterranean Sea still retain their pre-eminence. Greece has her white marble quarries at Mount Pentelicus; these quarries supplied the material for the Acropolis of Athens and the Great Temple of Jupiter Olympus and the Pantheon of Rome; those of Paros produced the finest material for sculpture, and in my opinion the marble for Herod's Temple at Jerusalem. Several of the Greek islands produce good white marble and every

* Read before the British Association, Leeds, 1890. This paper is intended as a short sequel to the opening address of the President of the Geographical Section, Sir Lambert Playfair.

variety of grey is found in these white formations. The Cippollinos were quarried chiefly at Carystus, from whence the monoliths for the Temples of Antonius and Faustina in Rome were taken; these are the largest marble columns known. The beautiful Verde Antica green porphyry comes from near Sparta, and the green marbles from the shores of Magnesia, Thessaly, and Sinos. The various Rosso Anticos have all been rediscovered in Laconia, on the coast between Cape Matapan, and Gythium. The grand quarries of Porta Santa are still workable, on the Island of Chios block marbles are found in several places, and varieties of Pavonazzetto at Skyros. The famous quarries of Synada in Asia Minor, which supplied Rome with her monoliths of Pavonazzetto marble, were found last year by Dr. Leoni, of Smyrna. There are 16 quarries of immense size, side by side, which are about to be reworked. Between Smyrna and Ephesus there are white marble quarries; but the most important blocks used for the "Temple of Diana" came from Pentelicus or Paros, although some may have been taken from Samos. At Tarsus there are quarries of ivory - white marble, from which the Temple was built. All the white marbles used in Egypt came from the Mediterranean. History tells us little about the old quarries of Greece; but the architectural remains of Greek and Roman cities show plainly that their produce was enormous. Eight-tenths of the white marble found in Rome is Greek, and the quantity of worked material recklessly burnt as lime for centuries must have been enormous. Byzantium was chiefly built with the marbles of the Sea of Marmora, and these quarries are still worked for Constantinople. No doubt this sea takes its name from being really a marble basin. The produce of the quarries of Egypt brought down the Nile for Roman use may be called Mediterranean, the most valuable of which were those of Imperial Red Porphyry. These are now being reworked, the first important consignment of 270 small blocks having within the last month arrived in London, where they may be seen. The remains of ancient working on some of these blocks is most interesting, showing that the workman not only wedged, scabbled, and chiselled as is now done, but even sawed blocks of this hard material asunder. The Breche Verde of Egypt, the granites and Oriental alabasters were all extensively worked and floated down the Nile for shipment to Rome and other cities. Ancient Numidia (now the eastern portion of Algeria and west of Tunis) produced Giallo Antica. These quarries are very extensive, the Romans having quarried right through the mountain. From hence came the yellow monolith columns of the Pantheon in Rome, and those of the arch of Trajan (these are now reused in that of Constantine). At a number of places along the Algerian coast there are ancient quarries of rich-coloured marbles, chiefly reds and yellows. From those of Cape Chenona, near the ancient Julia Cæsarea, the capital of Mauritania, was brought the rich red marble (rouge Etruscan) used for the decoration of the new rooms and staircases at the National Gallery, London. Further W. of Kleber, near Oran, there are the famous quarries of Sig del Monte—these marbles are unquestionably the richest (as regards reds, and breccias of reds, yellows, and browns) that have ever been discovered in any part of the world. These are now largely used in America. The Algerian onyx marbles are found near Oran, and red ones have recently been discovered at Guelma, in the W. of Algiers. The Mediterranean coast of Spain for 30 miles inland abounds with marbles of every colour. There is first the sparkling crystaline statuary of Macael, with which the Alhambra was built, the rosy-veined of Tarragona, the rich brocatellos and jaspers of Tortosa, the red and orange-blended brocatellos and onyxes of Malaga, the griotte deep reds; blue turquin and fossil of Gevona, also the precious green serpentine of Granada, which has scarcely a rival in richness of colour and firmness of texture. Many of these were worked by the early Romans and Moors. On the French coast are quarried a number of deep and light reds, brecciated yellow, and rich conglomerates. The ancient quarries of Luni, now Carrara, are, at the present day, the most renowned in the world, and, considered with the adjoining ones of Massa and Saravezza, cover an area of 27 square miles. The marble rocks commence a little above sea-level, and extend up the mountain to an altitude of 7,000ft., the whole of the sides and valleys of these mountains being studded with innumerable quarries, giving employment to 15,000 people, the results of whose labour probably supply 90 per cent. of the white marbles used in the world. These quarries were known and worked by the Romans, and have been worked continuously since before Christ; but the immense development has taken place within the last fifty years, or we might even say the last thirty years. Probably no single individual has visited the whole of these quarries, not even interested residents. To see and examine them all would take an entire season. The most valuable marbles of the Apennine range are those of Mont Altissimo at Saravezza, situated at an altitude of 7,000ft. Here the most beautiful and durable statuary is found in immense beds, masses being extracted of the purest quality, containing thousands of feet cube, the value per foot being £2 or even more; single blocks worth £500 each are often obtained, and occasionally up to £1,000. This marvellous mountain of Altissimo produces also a statuary grained marble of bluish tint, nearly the whole of which is sent to France for statuary purposes, as it is extremely durable for exterior work. The famous coloured breccias of grey, red, and purple, the Rhondona, Fior de Perchia, and others are found here in large masses, also the blue-veined Bardillio and a Cippollino. The promontory of the Gulf of Spezzia (Porto Venere) is one massive rock of black and gold marble. Near Genoa are the quarries of green serpentinous limestone; the one containing red spots is called in commerce Egyptian. Similar marbles are found in Corsica, also the purple-veined (Fior de Persico), and a rich mixed green, and amethyst-coloured granite used largely in the Medici Chapel at Florence; the orbicular granite (Napoleonite) is also obtained from this island. Between Sienna and the coast there are the rich quarries of Sienna, yellow (this beautiful marble is not found in Ancient Rome). At Voltera, near this coast, is obtained the pure white Italian Alabaster; and at Prato the deep olive-green serpentine, used so extensively at Pisa and Florence. At Mount Rommola, near the coast, are ancient quarries of statuary white. Sicily contains several good marbles; near Trappini, on the W., the choice jasper marble is obtained, also the rich-coloured silicious jaspers. At Sanromena are quarries of reds and browns. The rocks of Brindisi, and those of the opposite Adriatic coast up to Istria, are a fine-grained white limestone; this is the stone with which the Venice Palaces are built, the white sort being the palambino found in mosaic pavements. E. of Trieste a useful red marble, like the brocatello of Verona, is worked very extensively. I hope, in conclusion, this short but very imperfect summary may give some idea of the money wealth in the Mediterranean rocks.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XIV.

THE MISCELLANEOUS PAVILIONS AND BUILDINGS ON THE CHAMP DE MARS.

HAVING considered in some detail the buildings which may appear to some of us the most important constructions in the Exhibition, we have next to examine shortly the various other buildings which have been erected at the Exhibition; and it has appeared to us that the best way, at all events for the present, of classifying these buildings is by locality in preference to classifying them in regard to their construction, although in many cases we are sure that the latter would have been preferable; but as chance would have it, these buildings are to a great extent placed near one another as regards their construction. For instance, at the N.W. angle of the Champs de Mars are the buildings erected by the South American Republic, which are mostly constructed in iron, terracotta, and glass, and without much heed to any particular style of architecture, which was natural, considering the materials employed. In the N.W. angle of the Champ de Mars are several entirely wooden constructions belonging to Norway, Sweden, &c., bnt there are not many of this type.

Across the river on the Trocadéro Gardens are two buildings, one entirely in wood, the Forestry Pavilion, and the other in brick and iron framing —the "Ministry of Public Works" Pavilion. On the Quai d'Orsay, besides the "History of Human Habitation," which will be treated under a separate heading, there are several iron-framed buildings, and in making our way to the "Esplanade des Invalides," the only buildings which are not in iron are the Spanish Pavilion and the Portuguese Pavilion.

On the Invalides we come to what may be called the archæological part of the Exhibition, consisting of Algerian Palace, the Tunis Palace, Annam and Tonkin Palace, Cochin-China Pavilion, &c, all of which are exceedingly interesting as regards their architecture, but not worthy of study as regards their construction, being mostly in wood, with plaster facing.

Returning to the Champs de Mars, the pavilions of the Municipality of Paris stand by themselves, and I propose commencing with these.

THE PARIS MUNICIPAL PAVILIONS.

The two pavilions erected by the Municipality of Paris, and which are like one another as regards design and construction, stand in the open space in front of the great dome, and inclosed on three sides by the restaurant courts. They are longitudinal in plan, and consist of the iron trusses, &c., of the Jubilee Railway Exhibition held at Vincennes in 1887. M. Bouvard, the architect of the great dome, was called in to clothe these trusses, &c., with a suitable interior (No. 67, from *Engineering*), and considering that the buildings have only cost £6,000, one can say that he has done this with considerable success.

The buildings have been erected by various trade guilds of Paris. The interior is in wood, and parts are moulded. Each of the sides of the buildings have an entrance doorway surmounted with a low-pitched gable formed with wooden uprights and framing and bargeboards. The roofs are covered with tiles, and the whole is painted in a gay and effective manner; the gutter is supported by a wooden cornice with consoles.

The Exhibition itself consists of one building, which is devoted to the executive departments of the Ville de Paris, which is especially interesting to architects. The drainage system of Paris is explained by the aid of models and full-size sections of pipes, gullies, and ventilators, &c., and also by the drainage to a "Healthy House"

No 69 Pendantif du dôme central du pavillon de la République Argentine.

and an "Unhealthy House," which will be explained further on.

The other pavilion consists of objects and exhibits from primary schools, &c.

THE ARGENTINE REPUBLIC.

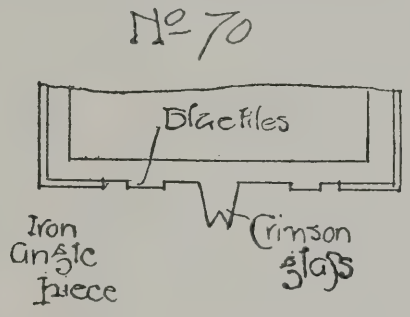
This pavilion is of the foreign countries distinctly the most original. The architect is M. A. Ballu, the son of that Ballu who, with Duperthes, erected the modern Hôtel de Ville at Paris.

The plan consists of a central dome, round which are grouped four smaller domes, all with a glass covering.

At the side opposite the entrance is the staircase, which leads to the first floor; this staircase is in wood, with iron treads and risers (see No. 68 from *Le Génie Civil*). There is a lantern light to the first floor on each side of the central dome. The dome is carried on iron lattice-work standards painted white, with a filling-in of blue plaster. The spandrels below the dome are filled in with "motifs" in bronze (No. 69 from *Le Génie Civil*).

The dome covering is in yellow glass supported iron purlins. The walls of the pavilion are 25 centimètres (10ft.) thick between the iron standards, which project into the building. The outer face of the first floor is recessed, and forms an interior balcony, which projects at different points by means of iron cantilevers.

Coming to the interior, we find that the central motif is composed of a large semicircular arch and two smaller openings on each side, over which are placed the smaller glass domes. On each side of these central features the façade is divided into three divisions by iron pilasters painted gold. Each of these divisions is again subdivided into three by light circular columns and caps in the Renaissance style and semi-circular arches; this is all painted gold, and the effect is very rich. These divisions are surrounded by two deep rows of blue tiles.



The three main arches are separated by piers formed of an iron framework and filled in with blue tiles and glass bull's-eyes in different colours; these are hollow, and are lit up at night with the electric light. Behind these hollow bull's-eyes is placed a thin layer of glass mosaic. This, M. Ballu explained, was to prevent the bull's-eyes working hollow.

In the central division of each of the wings there is a projecting balcony, elliptical on plan, supported by light iron cantilevers painted gold. There is also a square balcony to the angle towers on each elevation.

The cornice is supported by iron consoles running through the frieze, and between these consoles is a prism or "cabuchon" in green-coloured glass. Above this is a parapet, behind which is gutter (No. 68) painted a terracotta colour, and having electric lights along the top.

The ironwork generally is painted gold and green. The reveals to the arches to the main entrance are filled in with real mosaic, the dominant colours being blue, red, gold, and white.

M. Ballu, who explained the building in detail, told me that his idea in designing the building was to make use of all modern materials which could in any way be brought in. The pavilion has been built up in a framework of iron, and the materials used for filling in are terracotta, faience, glazed tiles, and coloured glass in bull's-eyes, which at night is lit up with the electric lights (No. 70). The building itself is put together in its larger parts by the aid of

bolts and screws, as it is the intention of the Argentine Government to have it re-erected at Buenos-Ayres.

The jury have awarded the architect, M. Ballu, the first prize for the foreign pavilions, and we think that for originality of treatment it well deserves the prize. There is no doubt, also, that this building, one of the first to be erected on the Champs de Mars, influenced to a somewhat large extent some others in close proximity, and M. Ballu, considering this to be the case, caused the president of the "Comité de la Protection Artistique des Œuvres d'Art" to take action in the matter.

The building itself cost £48,000, and, as an example of building in modern materials to the special needs for which it was designed, it is one of the most striking and original buildings in the Exhibition. I have to thank M. Ballu also for a complete collection of drawings of this building and for the great trouble and kindness he took in explaining the construction.

ARCHITECTURAL ADVERTISING IN ENGLAND.

As might be expected, the publication of the crude poetical effusion from the hands of an American advertising architect in last week's Building News has caused no little amusement to our readers, and some have forwarded us specimens of a similar style of thing, only of a more prosaic type, current in England among a certain class of practitioners working in the bypaths of the architectural profession throughout the country. The conspicuous absence of good taste in most of these productions of course goes without saying, and all the time we lack a proper system of architectural registration no limit can be insured to the extent in which touting may be carried on. Indeed, for the matter of that, everybody knows it is not altogether an unheard-of thing to meet with instances of rapacious overreaching in the practice of those even who reckon themselves among the *élite* of the profession, which would in no sense bear the light of day. What is more patent still, some who are most loud in their condemnation of advertising are themselves known to have been associated with very questionable pieces of sharp practice—on the quiet, perhaps—quite unworthy of gentlemen. Snobs of this kind abound in every calling, and the "Apostles of Art" are no exception to the rule. While all advertise more or less in one way or another, who shall cast the first stone? Anything calculated to discredit the repute of the profession should unhesitatingly be exposed, and those who are guilty of unworthy conduct must expect to be told of it, no matter in what grade of society they flourish. At present the professional press is the only available method in a general way of reaching men of this class; but when registration becomes law, a much more effective treatment will be secured for the malefactors. In the meantime, we scarcely consider it our function to single out the little vulgar puffers for execration, simply because their unblushing circulars are in bad taste and out of accord with generally-accepted rules of professional etiquette. The following is a specimen of the class of thing we have before us. It comes from Newport, Mon.; but we omit, for obvious reasons, the name of the author, who, on the fly-sheet, informs his readers that he can design any class of building, enumerating for their guidance the various classes—domestic, ecclesiastical, and commercial in all their detailed comprehensiveness. For these, he draws in "Deplicate." He is competent to take out quantities, estimate cost, measure up artificers' work, "plant" plans on parchment, undertake mathematical calculations, and arrange temporary or permanent loans. The circular is in the form of a letter, of which the following is an exact copy:—

To——,

Sir,—Doubtless you often require the services of an experienced Architect, Land and Building Surveyor. I have had a large experience in my business, and shall be pleased to prepare Designs, Working Drawings, Detail Drawings, Specifications, Bill of Quantities, &c., for any Architectural and Surveying Work you may have in hand or interested in, either in Public, Ecclesiastical, Private, Domestic, Villa, or any other Buildings, with or without the Superintendence of the Erection and Completion of the same at Moderate Charges. As Competition is very great in our day, I submit for my Clients' approval Sketch Designs (Free of Charge) of any class of Buildings they may intend to erect, or are interested in, upon receivin (*sic*) particulars of their requirements. I shall be pleased to Survey, Level, and Lay Out any Land for Building Estates or other Purposes. I have had a large experience in Designing, Planning, and carrying out Buildings in London, Cardiff, and other towns, and shall be pleased to submit to you Specimen Work and Testimonials from Clients for whom I have carried out Buildings, &c. of ability in my Business. Any work entrusted to me will be thoroughly and carefully executed in all details, and carried out in a proper manner. My Experience is large and varied, and I am well versed in all matters and requirements of Local Boards, Rural and other Sanitary Authorities, and in regard to the most improved systems of Drainage and Ventilation and all necessary requirements in the erection of Buildings.

I beg to call your attention to the fact that I take great care in preparing Bills of Quantities for Works that they contain every item to complete the Buildings for which they are prepared fit for habitation, and with the Measurement of the Materials I fully specify and describe where and for what part of the Buildings they are required, so that a Novice to the Building Trade could easily follow each item out. If I am favoured with your patronage I shall be able to prove practically what I now state in this Letter. Trusting to receive your patronage, I remain, Yours respectfully, ******, Architect and Surveyor.

If you have anything in my way to be done and you will please drop me a Post Card, I will attend to it and see you without delay.

Designs for any buildings sent free of charge.

The work of preserving the Abbey Church of Crowland, Lincolnshire, has been in progress for some time, and six of the ten sections requiring attention have now been restored. The rector of the parish has raised £1,400 out of the £3,000 required to preserve what remains of this venerable relic of antiquity.

The bell striking figures of Gog and Magog in Cheapside are to come down, as the front, so long associated with that modest horologist Sir John Bennett, is about to be rebuilt by the Limited Company who took over the business. These clockwork giants are, however, to be reinstated, as their advertising worth has been proved by experience and has frequently caused great inconvenience to pedestrians in that crowded thoroughfare. When first put up, some years ago, the proprietor was summoned for causing thereby an obstruction to the traffic. He suggested, if we remember rightly, that being the best-looking man in the street the public naturally stopped to obtain a glimpse of him. Mr. Burnel Burnel is the architect of the new façade.

CONTEMPORARY BRITISH ARCHITECTS.—THE WHITWORTH MEMORIAL HOSPITAL.—BAKEWELL TOWN HALL.—ALL SOULS' CHURCH, HARLESDEN, N.W.—CRANBORNE MANOR HOUSE, DORSET.

Our Illustrations.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 416.)

WHITWORTH HOSPITAL, DARLEY DALE.

This hospital has been erected by the trustees of the late Sir Joseph Whitworth, Bart., of Stancliffe, on a piece of ground on the high road between Darley Dale and Matlock. In the main building provision is made for eight beds (four for men, and four for women), medical officer's, matron's, and nurses' rooms, parlour for convalescents, &c. In the detached building provision is made for two men patients and two women patients, nurses' room, and patients' sittting-room. A mortuary is built at the back of the detached building, screened from all the windows of the buildings. The materials used are local stone of rich varied tints for the lower portions, with red tile hangings for the upper stories, and red tiles for the roof. The buildings are fitted up with all modern conveniences, and great attention has been paid to the sanitary arrangements. The whole of the work has been carried out by Messrs. Southern and Sons, contractors, of Manchester, from the designs and under the superintendence of Messrs. J. W. and R. F. Beaumont, of 10, St. James's-square, Manchester, and 73, Queen Victoria-street, London. Mr. Patterson has acted as clerk of works.

NEW TOWN HALL AT BAKEWELL.

This building, of which Mr. George E. Statham, Nottingham and Matlock, is the architect, was opened yesterday by the Duke of Rutland. It has been designed to harmonise with the quaint Gothic work, of which so many good specimens may be found in Derbyshire, and of which Haddon Hall is so fine an example. The structure is of local freestone. The plan of the buildings is somewhat peculiar, and has been made to suit the special requirements of the town. A public hall, having stage fitted for theatrical performances, and a justice room fitted for Petty Sessions and County Court, each with necessary retiring rooms and offices, form the chief accommodation. The staircases are of York stone; landings and approaches to public hall are all of fireproof concrete vaulting. The entrance halls, landings, lavatories, &c., have marble mosaic pavements by De Grelle, Houdret and Co., of London; floors of large rooms are of pitch-pine. The ornamental iron balustrade, gas-fittings, &c., have been executed by Mr. G. Wragge, of Salford, and the stained glass by Messrs. Shrigley and Hunt, of Lancaster and London. A good effect is obtained in the public rooms by the deeply-recessed and arched windows, each having a seat fitted in. The building is heated throughout by hot-water apparatus. A block of offices is being built at the corner of the site by Messrs. F. and H. Taylor, solicitors, to complete the town hall buildings. The contractors for the stonemasons', &c., branch of the town hall are Messrs. J. Walker and Son, of Wirksworth, and of the offices, Mr. T. Allsop, of Bakewell, and Messrs. Norman and Groom, of Bakewell, are contractors for joiners' work and plumbing throughout. The total cost is about £6,000. The whole works have been carried out to the designs and under the supervision of the architect.

CHURCH OF ALL SOULS, HARLESDEN, MIDDLESEX.

This church, of which we give this week an interior view looking west, was partly built and consecrated some twelve years ago, and has now been completed, with the exception of the tower and certain internal fittings and decorations. The nave and aisles form an approach to a more extensive portion of the interior, as they would do in a cruciform church; but this portion, which has been called the "dome," is entirely unobstructed by such piers as are usually found in a transeptal building. It somewhat resembles the dome of the Church of S. Gereon at Cologne. The Cologne churches have also suggested the grouping of the turrets flanking the apse, with its arcade just under the eaves. This arcade is glazed at the back, and gives light to the upper surface of the brick and stone vaulting. An organ-chamber has been added, with a lofty roof rising above the window which occupied this gable of the octagon. The removal of this window, and of those at the clerestory level, has produced an organ-chamber which Mr. Willis declares to be the finest in London, and it is to be hoped that funds may be forthcoming to provide a permanent organ to be built in it. Since the preparation of the original plan in 1877, it has been found expedient to increase the number of bays in the nave from three to five, in order to provide for the great increase in the local population. Beyond this is a western porch, abutting close on to the road, and the lintel and imposts are left in block for sculpture. This sculpture should represent "All Souls," a somewhat difficult subject, the treatment of which is still under consideration. Internally there is a large panel at the west end of the nave intended for permanent colour decoration. Around the dome, except where pierced by the arches into the nave and apse, there is a continuous band of plain walling, about 6ft. high, which is intended to contain a representation of the Te Deum. The windows are being filled with stained glass as opportunity arises. The architect is Mr. Edward J. Tarver, F.S.A.

CRANBORNE MANOR HOUSE, DORSET: R.I.B.A EXTRA MEDAL DRAWINGS.

This double-page plate of details is from the same prize set of drawings of this celebrated historic house, by Mr. J. E. Mowlem, as the sheets which we printed in our issue for May 23rd last, when we gave the general plans and elevations of the building, with an account of its history. We likewise at the same time published some elevations and plans of the entrances, lodges, and a page of details of the wooden staircase in the manor-house. To-day the enlarged parts represented readily explain themselves when studied in connection with the general drawings just referred to. The property belongs to Lord Salisbury, and the estates give the title of Viscount Cranborne to the Prime Minister's eldest son. Canon Cazenove is the present occupier. Inigo Jones added a wing to the house.

Mr. William Stevenson, who has been residing in Scarborough for the past seven years, has returned to Hull and is opening offices on the Queen's Dock side. We understand he has retained the services of Mr. George Bousfield, salesman during the past five years with Messrs. Joseph Chapman and Co., timber merchants, Grimsby, and Mr. George Bell, clerk during the last eight years with Messrs. Stratford and Mullett, wholesale cabinet-makers and sawmill proprietors, Hull. Mr. Stevenson's speciality is the hardwood branch of the trade.

The architects of the proposed schools at Watford are Messrs. Ayres and Ardron jointly, and not C. P. Ayres only, as published last week in the list of tenders.

A new town hall has been erected at Northampton, and special attention has been paid to the ventilation; the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved self-acting air-pump ventilator.

During the year ended on June 1st, 2,049 houses have been built within the city boundaries of Glasgow, making a total number of 118,272.

Engineering Notes.

Highland Railway Extension.—The directors of the Highland Railway have decided to proceed forthwith with the construction of over 40 miles of new railways. These will include (1) the construction of the second portion of the new Aviemore line, extending from Carrbridge to the River Findhorn, a distance of about eight miles, thus carrying the line over the first half of the route to Inverness; and (2) to proceed with the construction of the Black Isle Railway from Muir of Ord to Fortrose, a distance of 30½ miles; and (3) to proceed with the extension of the Burghead branch to Hopeman, a distance of 2¼ miles. The directors have resolved to invite tenders for the works without delay, and on their acceptance the construction of the various lines will at once be proceeded with. The first section of the Aviemore line, that from Aviemore to Carrbridge, is making good progress, and will be opened in May of next year. This line, when completed, will reduce the distance by rail between Inverness and the south by 24 miles, saving the long detour eastwards to Forres.

CHIPS.

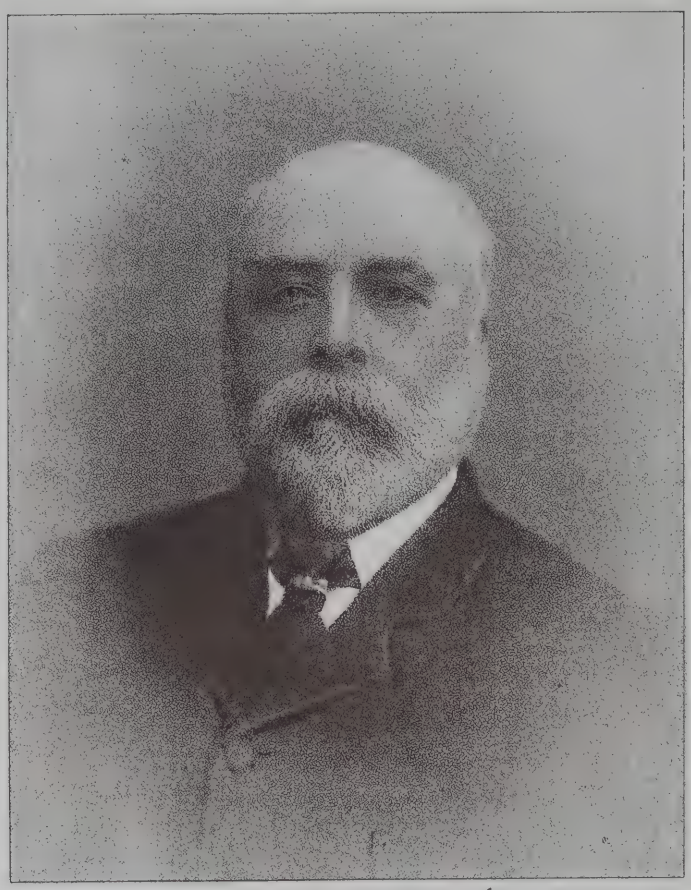
The town council of Stockton-on-Tees resolved on Tuesday afternoon to purchase, at £300 per acre, some gardens containing between three and four acres, to be added to the 36 acres which Major Ropner has, at a cost to himself of £9,000, presented to the town for the purposes of a park.

A commencement will be at once made in carrying out the improved approach to the cathedral of Gloucester, at a cost of about £9,000, by widening College-street to the extent of 32ft., directors having been elected by the company which has been formed, and all the old houses to be removed having been purchased.

The memorial to Mr. John Pearson, who died in 1887, and who held the offices of chairman of the Lancashire and Yorkshire Railway, mayor of Liverpool (1871-2), and high sheriff of Lancashire (1875-6), was unveiled on Wednesday in front of Exchange Station, Liverpool. The memorial, which is by Mr. F. J. Williamson, of Esher, takes the form of a square bronze panel, 4ft. 9in. by 3ft. 9in., inclosing a concave oval, in which is placed an heroic-sized full-face portrait bust of the deceased in alto-relief. At the four corners of the panel are the arms, in bas-relief, of Yorkshire, Lancashire, Manchester, and Liverpool, entwined with the rose of Lancashire.

Three handsome bronze panels, bearing the name and date of foundation, have lately been placed in the Clare-street front of the new building in Bristol for the Provident Life Office. The addition of these panels has a striking effect, and are the completing touch to the handsome pile of offices erected for the company from the designs of their architect, Mr. E. Henry Edwards, of 5, Clare-street, Bristol.

In the list of receiving orders in Friday's *Gazette*, the name appears of George Wall (trading as Wall Brothers), of Carlton-road, Kentish Town, builder and contractor; and among the adjudications in bankruptcy is that of Edwin Finch Spragg, Saltoun-road, Brixton, surveyor.



On Thursday week a new dry dock constructed at Newport, Mon., was opened by the mayoress. The dock has been constructed by Mr. Mackay, contractor, Newport, from the plans of Messrs. Jacob and Pickwell, Cardiff, its length being 350ft., width 60ft., and draught 32ft.

The restoration of the south and west façades of the Ducal Palace at Venice, which has been for many years in progress, has now been completed, and the scaffolding has been removed during this week.

An altar tomb of alabaster, executed by Mr. A. Bruce Joy, in memory of Dr. Berkeley, Bishop of Cloyne, was unveiled in Cloyne Cathedral on Tuesday, when an address was delivered by Dr. Gregg, Bishop of Cork, Cloyne, and Ross.

Mr. Codrington, C.E., held an inquiry at Bangor, on Friday, on behalf of the Local Government Board, touching an application by the town council for a loan of £650 towards carrying out public improvements in the borough. Evidence was given by Mr. Gill, the city surveyor.

The Coventry School Board decided on Friday to accept the tender of Mr. T. Wingrove, of Northampton, for the erection of the new set of schools in Wheatley-street, according to plans prepared by Messrs. G. and J. Steane, for the sum of £15,596, the cost of site and other charges being estimated to bring up the total cost to £20,000. Mr. A. Davis, late of Cheltenham, was appointed clerk of the works, at a salary of £4 a week.

WAYSIDE NOTES.

THE whole architectural world may con- gratulate itself that the Alhambra has not en burned to the ground. Much as we may ve to regret, the damage done is small when mpared with what might very easily have curred had the fire been less under control. A flection of this kind is perhaps no great con- lation in view of the fact that what has been stroyed is neither to be replaced for love or oney; but it is something to compensate for e loss sustained. Had the whole building been stroyed, and it had suddenly been found that l that posterity would have to remind it of the ory of the Saracenic masterpiece would be the odel at the Crystal Palace, and "Jones," and Murray," the art world might have reasonably it on some show of mourning. Every artist d architect cherishes some hope of some day ssibly setting foot among the ruined wonders the Eternal City and on the Athenian Acro- lis; no less have they a longing to look upon e "Red Palace" on the heights of Granada, d linger in its cool courts and many-coloured lls. Compared with the numbers journeying the East, and bent on exploring sites llowed by classical memories, few penetrate to the heart of Spain and stand before the faded ories of the old Moorish potentates. Travelling the Peninsula is not attractive, and of bad pute; in consequence the Alhambra is visited ly by persons passing through Granada on siness, or such as from a desire to see the orld-famed building—now despoiled of one nole court and a portion of another—are to be terred by no lack of personal ease and com- rt. As a result, I should imagine, the real auty of the Moorish Palace is as incom- ehensible to those of us who have never trodden panish soil, as is the white marble loveliness of e Taj Mahal to those who have never stood in e blaze of an Indian sun. Fortunate, then, r the present and future generations is it that e hope of seeing the Alhambra may remain. ne Court of the Myrtles may have disappeared r ever, and with it some portion of the rrayanes Court; but the Alhambra, as a world's onder, remains, in spite of the recklessness of harles V., the ill-advised restorations and vulgar terations of Isabella II. and King Philip V., e wanton desecration of General Sebastiani, and e recent disastrous conflagration.

The "Iron Gates" have been attacked at st, and, with perseverance, the works in- gurated by M. Baross, the Hungarian Minister Commerce, will be the means of facilitating eatly the navigation of the Danube. Long ve these masses of rock been an obstruction to e river, and not only to the waters themselves, using dangerous rapids, but to commerce on eir surface. Vessels of no great tonnage will able at some future date to pass up and down e river; but it is expected that in years to me the new canals will be made wider and eper, after the system followed in the con- ruction of the Suez waterway. It is curious to flect that 17 centuries ago Trajan seems to ve had an almost identical plan for the removal the Iron Gates to that to be followed now, and r which the Hungarian Parliament passed a ll two years ago. The old Roman Emperor, leed, is stated to have commenced actual work, ices of which, it is said, are still to be seen, r the construction of a large navigable canal the right bank of the Danube, so as to oid the Iron Gates. The end in view seems to ve been the removal of rocks, the cutting canals, and the formation of dams where the cks were too numerous. The present scheme actically embraces the proposals of Trajan, and ll be worked out from details of operation anned by Willandt, the Hungarian engineer. the several canals required to be formed, one the Servian bank of the river will have a ngth of over two kilomètres. The works are ubtless to be very heavy at times, and it would interesting to know the *modus operandi* pro- sed by Trajan and his engineers, without un- nited kilogrammes of dynamite or, so far as know, any other blasting agent. Possibly ey would, by slow and laborious degress, have verted the waters, now here, now there, and mmenced a process of rock-removing akin to grubbing of tree stumps. Vastly more to the dit of the old Romans would have been the rk if carried out than to the engineers of to- y with their dynamite and other scientific aids known to the ancients; and I suppose it is these scientific short cuts to great ends that deprive modern engineering of poetry and wonder, and their absence that induces us to look at works of antiquity with a feeling akin to awe.

"Active measures" are a good deal talked about, but less frequently taken. When they are, it is always pleasing and grateful, by contrast with the British stick-in-the-mudism. The people interested in the condition of the Wandle, in Surrey, are not going to stick in the mud and refuse that is choking their pretty river, but are setting themselves in earnest to restore to its pristine liquid condition the gravel-bedded, chalk-bottomed, crystal stream of which Mr. Ruskin wrote fondly in "A Crown of Wild Olives," wherein, too, that great writer has pointed out the quiet beauty of the country through which the Wandle passes, and the charm of Carshalton, with its quaint old church and village street, and of Beddington and Mitcham lower down its course. One wishes the energetic movers in this matter every success in forming and maintaining the association proposed for the preservation and conservation of the river, and for maintaining its old reputation for the abundance and excellence of its trout. That there will be no difficulty in this is apparent from the list of names of persons interesting themselves in the proposed company or association; and at the meeting at Carshalton Park on Tuesday afternoon, it was stated that a good sum of money had been promised in shares. This effort to restore a beautiful river to its former good condition is worth the notice of riparian owners and others interested in many small English streams and rivers, which, through various causes, have become polluted, choked, or altered in character. As a rule, such degenerations and gradual alterations for the worse are greatly neglected, it being no one's business in particular to move in the matter. Mills and drains pollute, and accumulations of mud, or worse, take place, and the character of the stream is entirely altered. Many a beautiful river and stream in a beautiful countryside that once was, and should always be, an attraction of the place, becomes foul, and often pestilential, the last surviving fish having long floated belly-uppermost. Matters like these should be taken in time; the "active measures" should be inaugurated and followed up at an early stage. The Wandle, I believe, has not got into such a very deplorable condition, but it would doubtless sooon do so, had not many gentlemen banded themselves together thus promptly.

The London County Council don't intend that their assistant engineer, when appointed, shall have more money than they can possibly avoid giving to a person qualified to fulfil the duties of the post. The advertisement of the vacancy does not give one any clue as to the position of the assistant in the engineering staff; but from the display and show in it one would conclude that he is to be well up, if not at the head of the assistant staff. In which case £200 per annum is very small for an engineer having the knowledge required by the Council, and doesn't look any larger for the munificent rise of "£15 a year to £245, with prospective further increase (dependent on merit) to a maximum of £300 a year." It is candid to state that the further rise is "prospective"; and the young engineer between the ages of 27 and 35 years, with thorough experience, great accomplishment as a draughtsman, knowledge of sewage and other pumping machinery, not to mention marine engineering, who obtains this lucrative appointment with a "prospective" rise of £45, will know he need not be over-sanguine as to getting it. Men with wives and families will note the special stipulations in the advertisement that the engineering assistant "will not on retirement be entitled to any superannuation or pension," and therefore arrange for their own superannuation fund, should one with a quiver full get the important municipal appointment.

Mr. Gladstone gave a very interesting address to the asembled members of Saltney Literary Institute, subsequent to his visit to Messrs. Henry Wood and Co.'s chain and anchor works at Saltney, touching the dignity of labour, and with especial reference to manual labour. Any protest against the deplorable delusion of the lower classes in making their sons "labourers with the pen," as Mr. Gladstone happily put it, is welcome, and especially one from so powerful a thinker. Where men would be leading happy, manly lives on works as skilled artisans, thousands, we know, and tens of thousands draw out a miserable existence as "labourers with the pen" in unhealthy offices, and for less remuneration than they could obtain as ordinary skilled artisans and mechanics. Whatever the blessings of compulsory municipal education, it has certainly created an evil in this way, though one that may some day right itself. Without of necessity being a disciple of Count Tolstoi, one may aver that the ordinary lower-class father will be best insuring the happiness of his sons and the good of the nation by bringing them up as artisans or mechanics, or to some honest manufacture or handicraft. Much as has been written as to the dignity of labour by great writers, the popular delusion as to the desirability of a life in a City office as against one at the lathe or bench, &c., still holds sway. But in days when everyone can read, write, and "'rithmetic,' it is not venturing too much to predict that at no distant date a considerable change will be evidenced, and the mere, mechanical "labourer with the pen" be regarded as the lowest possible class of workmen in the body social.

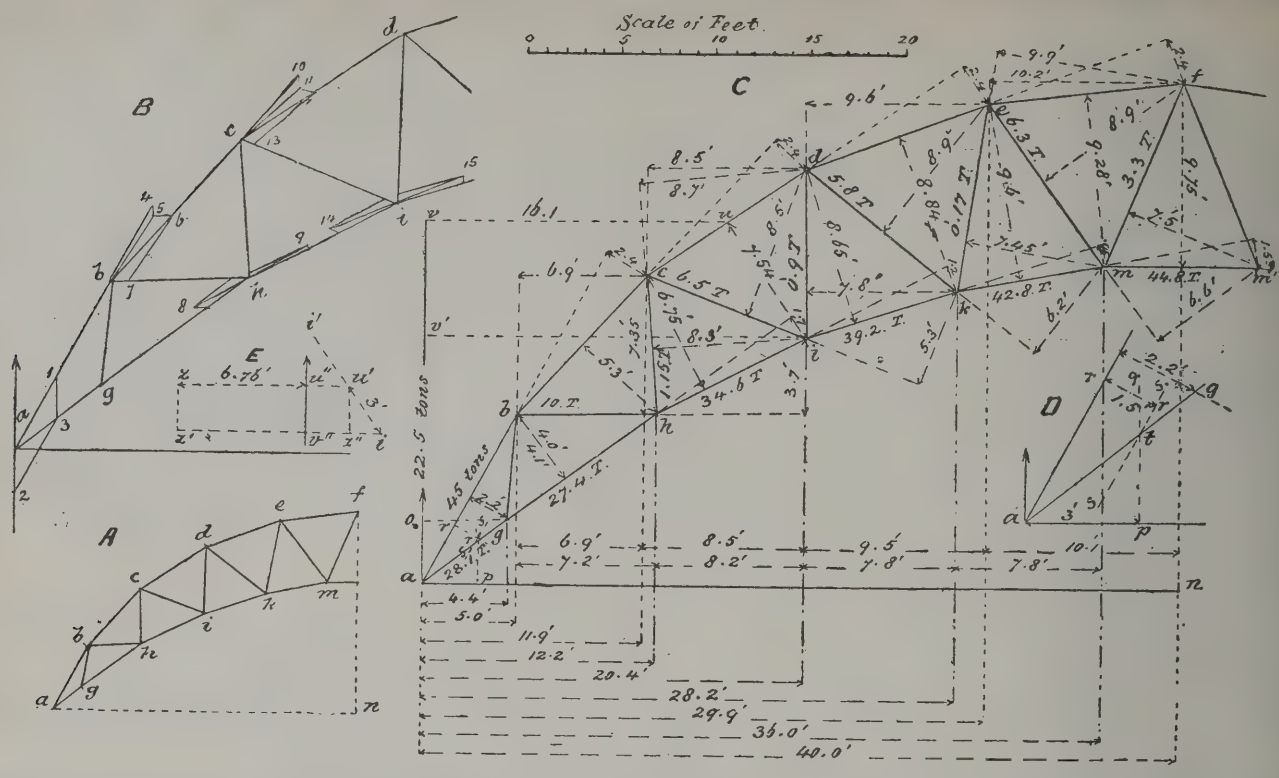
GOTH.

CHIPS.

The wife of Mr. Roumieu Gough, F.R.I.B.A., died on Friday at her residence, Shaftesbury-road, Ravenscourt-park, aged 46 years.

The foundation stone of the "Eiffel" Tower and bridge at Douglas, Isle of Man, will be laid by the Earl of Lathom to-morrow (Saturday). The works are being carried out from plans by Mr. Floyd, C.E.

The School Board for Seacombe have adopted plans by Mr. T. Mellard Reade, of Liverpool, for new schools, to which baths and offices for the board are to be attached.



The erection of new stalls in Peterborough Cathedral has been commenced. The foundations have been put in, and part of the oak work has been placed. The cathedral is to be re-opened on the 14th of October. The restoration, which has been in progress for five years, has been carried out under the direction of Mr. J. L. Pearson, R.A., the contractor being Mr. John Thompson, of Peterborough.

A memorial cross has been placed over the grave of Dean Bramston at Winchester. It is hexagonal on plan, and consists of two steps, also hexagonal, from which rises the base, carved on its sides with six shields, above which is the clustered shaft of the cross, 12ft. high, and finished with an open tabernacle in which are six statuettes. The cross was designed by Mr. Kitchin, son of the present dean, and executed by Mr. Whitley, the cathedral carver.

A new Liberal club is about to be built at Lincoln, at a cost of about £2,200. Messrs. Sington and Brameld, of Manchester, are the architects, and Messrs. Lansdown and Son are the contractors.

On Saturday the foundation-stone of the new Albion Congregational Church at Ashton-under-Lyne was laid by Mr. Abel Buckley. Contracts have been entered into for the completion of the structure at a cost of £20,000, and the building is being erected by Mr. Allen Holmes, of Ashton, from designs by Mr. John Brooke, A.R.I.B.A., of Manchester. The church, which will have the highest spire in the town, is to be built in the Stamford-terrace, Lees-square, and will accommodate 1,000 persons. Mr. Buckley has promised to make a gift of the tower and spire to the church, which will cost £4,000.

A special meeting of the Queenbury Local Board was held on Tuesday week to consider a claim by Messrs. E. and E. Balmforth, contractors for the reservoir, for extras, the Waterworks Committee being unanimous in their opinion that the balance certified by the engineer was in favour of the contractors. Mr. J. Flew, F.I.A., of Bradford, on behalf of Messrs. Balmforth, explained the items in the claim, the chief of these being for cement concrete used in lieu of clay puddle. The contractors, it was admitted, did not obtain a written order from the engineer, Mr. Drake, before making this substitution, considering that a signed drawing prepared by the engineer would be sufficient evidence for recovering payment. Replying to a question, Messrs. Balmforth said that the amount of commission they were allowing Mr. Drake (the Board's engineer) was 2 per cent., not 5 per cent. as had been stated. A letter was read from Mr. Drake, the Board's engineer, stating that he refused to attend the meeting as requested, after having examined the account with the schedule of prices. It was resolved that the Board could not see their way clear to deviate from the engineer's certificate, the Chairman suggesting that it would be best to let the matter go to litigation.

THE CRESCENT FORM OF TIED ARCH.

THIS structural combination is generally termed a "crescent-girder," but is more properly a tied arch. With the exception of the top member, all the bars are ties, and there is no web in the sense of a weight-carrying element, whereas a girder is usually taken to be a combination of a web carrying the load, with flanges which keep it extended, and for that reason have, by some authors, been called booms.

It has been customary to analyse the strains on this class of rib by the principle of the parallelogram of forces; but there are some reasons of a practical character which show that that method is not so convenient in the present case as treatment by the principle of equal moments of force, and these reasons we shall now proceed to set forth.

In the accompanying illustration, at A is shown a key diagram of half a crescent-rib, exhibiting the arrangement of the bars. It will be observed that the top member is not uniformly curved, but made up of straight lengths, *ab*, *bc*, *cd*, *de*, and *ef*, and this is so made because the load is not evenly distributed along the length, but aggregated at the points *b*, *c*, *d*, *e*, *f*, and the directions of the strains are therefore determinate, and do not change under variations of load. As we intend to show a method of designing these structures by means of an example, definite sizes have been taken. The span is assumed as 80ft. (*a n* = 40ft.), and the total rise *n f* is 27ft., the depth at the centre is for the present taken as about 10ft.; but this will be more precisely defined as we proceed. The points *a* and *f* being thus fixed, a circular arc—of which the radius is 43·13ft.—is described between them, its centre, of course, being in the straight line *f n* produced. The intermediate points between *a* and *f* are found by dividing the arc into equal parts—in this case, five—and from point to point thus determined are drawn the centre lines of the bars forming the arch. The assumed maximum load is 5 tons at each point *b*, *c*, *d*, *e*, *f*, thus making the total load on the entire rib 45 tons, which will give a load on each point of support equal to 22·5 tons, and that amount will, therefore, be the reaction at each support. Although this work is an arch, it puts no thrust upon its supports, the thrust being taken up by the ties, and therefore its ends must be carried in shoes, of which one is free to move on its supports in order to allow for the expansion and contraction arising from changes of temperature. This is a very important point to watch during the erection of a rib of this class, for we have known of several cases in which the erectors have fastened the ends firmly, under the impression that the work was a free arch. This, in one case, caused twisting of the ribs, which, however, disappeared when the ends were released; in the other cases this blunder was watched for by the engineer, and corrected as soon as it occurred. This is one instance out of many how obstinate workmen can be in respect to matters of which they have no correct knowledge.

If the strains are to be determined by the parallelogram of forces, the disposal of all the bars must be made, and it is assumed that the form shown at A is adopted—at all events for a first trial. To show the application of this method and illustrate the disadvantages attending it, a part of the rib is drawn to a larger scale at B. Upon the vertical line touching the extremity *a* of the rib, mark off from the point *a* to any convenient scale the distance *a* 2 equal to the reaction, 22·5 tons, and complete the parallelogram *a*, 1, 3, 2, then *a* 1 and *a* 3 respectively represent (to the same scale as *a* 2) the stresses on *a b* and *a g*, the former being compression and the latter tension. *a g* is so nearly in the same straight line with *g h* that no resolution of strains can be made at *g*—but the bar *b g* must be retained to prevent the long bar *a h* from "sagging" with its own weight—we therefore pass on to the point *b*, and there resolve the strains on bars *b c* and *b h*. Produce *a b* to 4, making *b* 4 equal to *a* 1. At *b* there is a vertical load of five tons, therefore draw vertically the line 4, 5, equal to five tons on the scale, and join *b* 5; *b* 5 will be the resultant of the vertical load and the thrust on *a b*; complete the parallelogram *b*, 5, 6, 7, then *b* 6 and *b* 7 will respectively represent the strains upon the bars *b c* and *b h*. At the point *h* is formed another parallelogram from the strains on *b h* and *a h*, of which the resultant is 8, *h*; this being produced through the point *h*, and *h g* being made equal to *h* 8, the strains are found upon *h c* and *h i*. At *c* the direction of the bar *h c* happens to be vertical, so the strain upon it is added to the load of five tons at *c*. *b c* is produced to 10, making *c* 10 equal to *b* 6; 10, 11, is drawn vertically equal to five tons plus the strain on *h c*, and the resultant *c*, 11, is resolved upon the bars *c d* and *c i*; *c* 12 and *c* 13 representing the strains upon them respectively. At the point *i* the strains are dealt with in the same manner as at *h*, by means of the parallelograms *i* 14 and *i* 15, and so on until the centre of the rib is reached. For our present purpose, however, we have gone far enough, that being to point out the disadvantages of the method.

It will be seen that the angles, 4, *b*, 5; 10, *c*, 11; and those also at *h* and *i* are very small, and no matter how large the scale to which the diagram is drawn, the angles remain the same; this is a great obstacle to obtaining accurate results, as a very slight *actual* error in drawing the angle makes a very considerable *proportional* error in the result, and the error made in one parallelogram is passed on through the following ones to the end. Another inconvenience is that the whole arrangement of the bars must be made to begin with, we cannot build up, as it were, as we proceed, which it will be shown we can very conveniently do if the method of moments is adopted for the analysis of the strains.

At C is shown enlarged the half rib lettered the same as the key diagram at A, and with all the results as determined by the principle of moments marked on; the measurements have been made, where they required scaling, from a much larger diagram from which that shown has been reduced.

Now firstly, in regard to size of angles of lines in the diagram; in the top member there is none upon which a measurement depends smaller than that contained by *b c* produced, and *c d* (which gives the measurement 2·4), and this is equal to 4 *b* 6 in diagram B, and therefore more than double the angle 4 *b* 5. In the bottom member, diagram C, the angle contained between *g h* produced and *h i* is obviously very much greater than the angle 9 *h i* in diagram B; so it is evident that the risk of error from this source is very materially reduced, if not altogether removed. Secondly, it will be seen as we progress that the strain on each bar of the top and bottom members is calculated quite independently of the strain on any other bar, so that an error in the strain upon one cannot affect the calculation of that upon another, and it is only in the diagonal ties, in which the strains are light, that they follow consecutively.

It should not be difficult to perceive that considerable practical convenience and expedition in making a final design must accrue from the adoption of a mode of calculation which permits of the arrangement of the bars being made *pari passu* with the computations, so that the strains, so far as intensity is concerned, may be adjusted to give the most satisfactory disposition of material.

As has been remarked in an earlier part of this article, the top member of the rib is the only part that is in compression, and therefore the only part that requires to be of a built up section suitable to withstand that class of strain. Such a section is very inconvenient to vary, in order to adapt it to varying strains, hence it will often happen, as a matter of practical necessity, that where there is a varying thrust, the section will be made throughout strong enough to resist the strain at the point of maximum thrust, thus causing a waste of material; the same inconvenience does not arise in the treatment of flat or round tie bars, hence it is obviously desirable to keep the strain upon the top member the same throughout its length.

We now start, then, having only the points *a*, *b*, *c*, *d*, *e*, *f*, fixed; and assuming the depth at

the centre to be about 10ft., we roughly find the strain at the centre from the expression $S = \frac{W\,l}{8\,D}$ where W = total load; l = span; and D = depth, both in feet. This we may take as a sufficient guide, as the load is tolerably uniformly spread over the span. In the present case W = 45 tons; l = 80ft., and D = 10ft.; therefore $S = \frac{W\,l}{8\,D} = \frac{45 \times 80}{8 \times 10} = 45$ tons. We will, therefore, decide to make the total strain on the top member 45 tons throughout its length. Let it be decided that the diagonal tie bars shall form the sides of isosceles triangles, having *a b*, *b c*, &c., for their bases; bisect therefore these bases, and at the points of bisection draw perpendiculars downwards from them; then the vertices of these triangles must lie somewhere in such perpendiculars because they are to be isosceles triangles. Now, in order to determine the strain upon a given bar, a point must be found about which the force or forces act to produce such a strain, and the strain upon the bar multiplied by its distance from the given point must be equal to the sum (or difference, as the case may be) of the forces multiplied by the distance of its direction from the same point. The points about which the moments are to be taken are the angles opposite the bars under consideration; therefore, for the top member strains the centres of moments will be *g*, *h*, *i*, *k*, *m*; and for the strains on the bars of the bottom member, the points *b*, *c*, *d*, *e*, *f*.

First is to be determined the height of the triangle *a b g*. There is only one force acting upon the bar *a b*; it is the reaction 22·5 tons acting at the distance *o g* about the centre *g*. At D is an enlargement of the toe of the rib to twice the scale of diagram C; on this enlargement from *a* mark off on the horizontal line *a p* equal any convenient distance—say 3ft., and set up the vertical line, *p q*, parallel to the reaction at *a*. The distance of the bar *a b* from any centre of moments in the line *p* must be to the distance of the reaction (3ft.) from the same point inversely as the thrust on the bar *a b* is to the reaction; let the distance be *r r*, and at that distance and parallel to *a b* draw the straight line *s s*, intersecting *q p* in *t*, then as the centre of moments must lie in the bar forming a side of the triangle *a b g*, *t* will be a point in *a g*; join *a t*, and produce the line to intersect the perpendicular set up at the bisection of *a b*, this intersection being at *g*, then *g* will be the vertex of the triangle *a b g*. The value of *r r* will be: $r\,r = a\,p \times \frac{22{\cdot}5}{45} = 3 \times \frac{1}{2} = 1{\cdot}5$, and the height of the triangle *a b g* scales 2·2ft. and *o g* scales 4·4ft. which is the correct proportion to give a strain of 45 tons on *a b*.

We will now proceed to show how the heights of the remaining triangles are to be determined so as to keep the strain on the top member at 45 tons throughout; as these are calculated quite independently of each other, any one may be taken; as an example, the height *u i* for the triangle of which the bar *c d* is the base, will be taken. Draw the horizontal lines *u v* and *i v'* to meet the direction of the reaction (22·5) at *v* and *v'* respectively. The moment of resistance of the bar *c d* about the point *i* will be equal to the direct resistance of bar *c d* multiplied by the height *u i* of the triangle *c i d*; the moment of strain about *i* will be the reaction multiplied by the horizontal distance *v' i*, less the loads at *b* and *c* multiplied by their respective horizontal distances from *i*, because the reaction acts vertically upwards and these loads act vertically downwards.

Let the horizontal distance *v i'* be represented by x, and let w and w' equal the loads at *b* and *c* respectively; let also y and y' be the horizontal distances of the loads w and w' from *a v*, R = the reaction; S = the strain on bar *c d*; and H = *u i*, the height of the triangle *i d*. Then as the moments of strain and resistance must be equal:—

$R.\ x - w\,[x - y] - w'\,[x - y'] = S.\ H.$

$x\,[R - w - w'] = S.\ H. - w\,y - w'\,y'$; therefore $x = \frac{S.\ H - w\,y - w'\,y'.}{R - w - w'}$. Had a triangle further along the rib been taken there would have been more minus quantities $w''\,y''$, $w'''\,y'''$, etc., but the principle is the same throughout.

All the terms in the equation except x and H are known for each case, hence the ratio of these quantities can be found, and subsequently by a geometrical construction their actual values. For the bar under consideration $w = w' = 5$ tons; y = 5ft. (scaled from diagram) y' = 11·9ft; R = 22·5 tons, and S = 45 tons; therefore, $x = \frac{45.\,H - (5 \times 5) - (5 \times 11{\cdot}9)}{22{\cdot}5 - 5 - 5} = 3{\cdot}6\ H - 6{\cdot}76$.

The geometrical construction by which the actual values of x and H are found is shown at E. Draw the angle *i' i z'* equal to the angle *u i v'* (diagram C), and from *i* upon the line *i i'* mark off any convenient distance *i u'*, say 3ft.; now if 3ft. was the height of the triangle, then $x = 3{\cdot}6 \times 3 - 6{\cdot}76 = 10{\cdot}8 - 6{\cdot}76$, or, $x \times 6{\cdot}76 = 10{\cdot}8$. Make *i z'* = 10·8, and from *z* on the line *z u'* mark off *z u''* = 6·76, and through the point *u''* and at right angles to *z u'* and *z' i* draw a line indicating the direction of the reaction 22·5, and from *u'* let fall the perpendicular *u' z''* upon the straight *z' i*. Then it will be found that the distance *z'' i* scales 1·71ft. *z z''* = 10·8 − 1·71 = 9·09. We can now compare the figure *u'' v'' i u'* in E with *v v' i u* in C, observing that *v u* scales 16·1ft., and that 6·76′ is the fixed value of *z u''* and *z' v''*. On the diagram *z u'* = 9·09ft., but let the value of *u'' u'* become equal to that of *v u* (diagram C) then *z u'* = 16·1 + 6·76 = 22·86, by proportion, 9·09 : 22·86 :: 3 : H; or $H = \frac{28{\cdot}6 \times 3}{9{\cdot}09} = 7{\cdot}54$ft. In like manner the heights of the other triangles are found, and all marked off as shown on diagram C, and thus the positions of the points *h i k* and *m* are determined and the diagram completed. We can now ascertain by a check calculation whether these heights give a constant strain on the top member. The general formula for the strain on any bar is $S = \frac{R\,x - w\,(x - y) - w'\,(x - y') - \&c.}{H}$

The values of x are found from those of H; thus in the above instance it is $x = 3{\cdot}6\ H - 6{\cdot}76 = 3{\cdot}6 \times 7{\cdot}54 - 6{\cdot}76 = 20{\cdot}384$, say, 20·4ft. The values of x being all worked out and marked on the diagram, the results may easily be tabulated as under:—

Point about which Moments act.	Bar	$\frac{R\,x - w\,x - \&c.}{H}$	Total strain tons.
g	*a b*	$\frac{22{\cdot}5 \times 4{\cdot}4}{2{\cdot}2} =$	45
h	*b c*	$\frac{22{\cdot}5 \times 12{\cdot}2 - 5 \times 7{\cdot}2}{5{\cdot}3} =$	45
i	*c d*	$\frac{22{\cdot}5 \times 20{\cdot}4 - 5\,(15{\cdot}4 + 8{\cdot}5)}{7{\cdot}54} =$	45
k	*d e*	$\frac{22{\cdot}5 \times 28{\cdot}2 - 5\,(23{\cdot}2 + 16{\cdot}3 + 7{\cdot}8)}{8{\cdot}84} =$ ...	45
m	*e f*	$\frac{22{\cdot}5 \times 36 - 5\,(31{\cdot}0 + 24{\cdot}1 + 15{\cdot}6 + 7{\cdot}8}{9{\cdot}28} =$	45

As w has the same value for each point at which it occurs the expressions are simplified thus: instead in the expression for bar *d e* of putting the negative quantities $-5 \times 23{\cdot}2 - 5 \times 16{\cdot}3 - 5 \times 7{\cdot}8$, they are bracketed as shown. To find the strains upon the bottom member the heights are scaled on the diagram and marked on as shown.

The strain on *a g*, as well as that upon *g h*, is determined by moments about the point *b*; *a g* produced so nearly coincides with *g h* that it cannot be shown apart from it in the illustration; but the heights of the triangles *a b g* and *g b h*, as scaled from a larger diagram, are given, being respectively 4ft. and 4·1ft. The strains on the bars of the bottom members are as follows:—

Point about which Moments act.	Bar	$\frac{R\,x - w\,x - \&c.}{H}$	Total strain tons.
b	*a g*	$\frac{25{\cdot}5 \times 5}{4} =$	28·12
b	*g h*	$\frac{25{\cdot}5 \times 5}{4{\cdot}1} =$	27·4
c	*h i*	$\frac{22{\cdot}5 \times 11{\cdot}9 - 5 \times 6{\cdot}9}{6{\cdot}75} =$	34·6
d	*i k*	$\frac{22{\cdot}5 \times 20{\cdot}4 - 5\,(15{\cdot}4 + 8{\cdot}5)}{8{\cdot}65} =$	39·2
e	*k m*	$\frac{22{\cdot}5 \times 29{\cdot}9 - 5\,(24{\cdot}9 + 18 + 9{\cdot}5)}{9{\cdot}6} =$...	48·2
f	*m m'*	$\frac{22{\cdot}5 \times 40 - 5\,(35 + 28{\cdot}1 + 19{\cdot}6 + 10{\cdot}1)}{9{\cdot}75} =$	44·8

It will be seen from this that the strain at the centre approximates very closely to the 45 tons with which we started.

The values of x are all marked on the diagram below the line *a n* for the sake of clearness, being terminated by vertical lines let fall from the points to which they refer. The lines from the points in the top member are plain dotted, those from the bottom member a short line and two dots alternately; where the points (*d* and *i*) fall in one straight line, a short line and one dot alternately are used. The values of $(x - y)$, $(x - y')$, $(x - y'')$, &c., are found from the numbers immediately above the line *a n*, which are added together as required. By thus marking the results of all calculations as they proceed upon a diagram, the operations are much facilitated, confusion is avoided, and a permanent record is prepared in the most convenient form, giving any information required at a glance.

There now remain to be determined the tensions upon the diagonal ties, and in computing these it is necessary to commence at the foot *a*, and take them *seriatim* until the centre is reached. The strain on *g b* would be determined by moments about *h*: but the bars *a g*, *g h* are so nearly in line that the strain is quite insignificant, and may be neglected, as there is sure to be ample material to cover it; we shall, therefore, pass it by, and commence with the bar *b h*, the moments in this case being taken about *c*. The perpendicular distances of the directions of the forces from the centres about which they act are found by measurement—that of the resistance of *b h* is 7·35ft.; the sum or difference, as the case may be, of the movements of force acting about *c*, divided by this distance, will give the strain on the bar. In this case there are two forces—one acting in the direction of *a b*, and tending to put the bar in tension; its amount is found thus:—Produce *a b*, as shown by the dotted line, until it meets a perpendicular drawn to it from *c*; the length of this perpendicular measures 2·4ft., and the strain on *a b* is 45 tons; hence the moment is 45 × 2·4. The other force is the load at *b*, 5 tons acting vertically at a horizontal distance of 6·9ft. from *c*; this tends to put the bar *b h* in compression, and its moment is 5 × 6·9; the resultant force on the bar will be in tension, and equal to $[45 \times 2{\cdot}4 - 5 \times 6{\cdot}9] \div 7{\cdot}35 = 10$ tons. *h c* is the next bar in order; its distance from the point *i*, about which the moments are to be taken, is 8·3ft. Here there are two forces in action: one from the bar *g h*, which, being produced, meets a perpendicular 1·7ft. long; this moment produces tension. The direction of the bar *b h* being produced, meets a perpendicular 3·7ft. long, and the force tends to put compression on *h c*; the resultant tension will be $(27{\cdot}4 \times 1{\cdot}7 - 10 \times 3{\cdot}7) \div 8{\cdot}3 = 1{\cdot}15$ tons. The strain upon *c i* is caused by three forces acting about *d*; that due to the bar stress on *b c* acting at 2·4ft. from *d*, causing tension, and the load at *c* and stress on *h c* both tending to produce compression. It may here be observed that the moment of the first of these forces will be the same for every top joint, because the points *a*, *b*, *c*, *d*, *e*, *f*, are equally spaced on a circular arc, and the strain on the bars between them is constant throughout. The strain on *c i* = $[45 \times 2{\cdot}4 - (5 \times 8{\cdot}5 + 1{\cdot}15 \times 8{\cdot}7)] \div 8{\cdot}5 = 6{\cdot}5$ tons. The numbers can be followed on the diagram. The moments taken about *k* give the tension on *i d* = $(34{\cdot}6 \times 1{\cdot}2 - 6{\cdot}5 \times 5{\cdot}3) \div 7{\cdot}8 = 0\,9$ ton. As the bar *i d* happens to be vertical, its stress will act in the same direction as the load at *d*, the two added together making 5·9 tons; the tension on *d k* will therefore be = $(45 \times 2{\cdot}4 - 5{\cdot}9 \times 9{\cdot}6) \div 8{\cdot}9 = 5{\cdot}8$. By the same method the strains on the remaining bars will be:—On *k e* = $(39{\cdot}2 \times 0{\cdot}95 - 5{\cdot}8 \times 6{\cdot}2) \div 7{\cdot}45 = 0{\cdot}17$ ton; on *e m* = $[45 \times 2{\cdot}4 - (5 \times 10{\cdot}2 + 0{\cdot}17 \times 9{\cdot}9)] \div 8{\cdot}9 = 6{\cdot}3$ tons; the strain on *m f*, found by taking the moments about *m'*, is = $(42{\cdot}8 \times 1{\cdot}55 - 6{\cdot}3 \times 6{\cdot}6) \div 75 = 3{\cdot}3$ tons.

We have now completed the calculations necessary to enable the rib to be designed in accordance with the conditions pre-supposed, and all that remains is to adapt the sections of the bars to the strains to which they will be subjected and design suitable joints for their interconnection. Interesting as it would be to pursue this subject, want of space precludes our doing so here. The point upon which we started was to show how to design the rib to suit fixed conditions, and to do so without having recourse to a series of approximations or the guess-work of the method of trial and error, a system, in our opinion, as clumsy and unsatisfactory as it is illogical. Other conditions than those here chosen for illustration may be laid down; for instance, the apex points in the lower member

may be fixed, and those in the upper require to be determined, but the mode of reasoning would be analogous to that pursued above, and whatever the nature of the restrictions imposed, provided only that they are not contradictory, there need be no trouble in complying with them.

CONTEMPORARY BRITISH ARCHITECTS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

HAVING reached over twenty plates of portraits of living architects in England, it becomes necessary to specify at the commencement of the letterpress descriptions the number of the selection herewith given. It is the twenty-first double-page sheet. In the centre of the group thus brought together is, however, a portrait of the late Sir Edwin Chadwick, K.C.B., who, although in no sense an architect, was intimately connected with the science of building—as the father, so to speak, of improved sanitation, and we therefore make no apology for introducing his portrait on this occasion. His death, which occurred a few weeks ago, was announced with regret, though Sir Edwin passed away from the scene of his usefulness full of years and honours at the advanced age of 91. Educated as a barrister, Edwin Chadwick early devoted himself to the study of the causes of zymotic diseases, and the means by which the losses of health and life resulting therefrom could be diminished. Chadwick then preached to a generation with ears that were deaf and eyes that were blind to the startling facts he brought before them; but though his views on cleanliness were rudely ridiculed, Jeremy Bentham left him a small legacy and part of his library. Earl Grey nominated Chadwick, in 1833, as assistant-commissioner to inquire into the operation of the Poor Laws of England and Wales, and the outcome of his searching investigations and elaborate report was the passing of the Poor Law Act. Mr. Chadwick was appointed secretary to the Poor Law Board, and during more than twenty years his labours in connection with it and the General Board of Health were untiring. Factory labour, half-time, and instruction occupied some of his attention. In 1838 he obtained a special commission of inquiry into the prevention of disease and the improvement of dwellings in England and Wales, and in 1843 one on interments in towns, which laid the foundation for subsequent legislation. In 1848, Mr. Chadwick was appointed a Commissioner of the General Board of Health, from which he retired nearly six years later on a well deserved pension of £1,000. His services to the country were only tardily and grudgingly acknowledged. Created a C.B. in 1848, he was only fifteen months ago advanced to the rank of knight in the same order. His labours have been indefatigable in all matters relating to the health and welfare of the people, and were continued to the last. His volume on "The Health of Nations," of which an abridged edition, revised by Dr. W. B. Richardson, has just been published, is a standard work on the subjects of the benefits conferred on the people by attention to hygienic rules. Chadwick was an earnest worker in the Sanitary Institute from its formation, and was half-a-dozen years president of the newly-organised Association of Public Sanitary Inspectors, and his address to that body, read in his absence through enfeebled health, at the Annual Congress at Leamington in October last, was as fresh and vigorous in style as any of his earlier writings. His funeral took place at Mortlake Cemetery. His portrait is an admirable one, taken this year by Messrs. Done and Ball, of Baker Street, W.

The first architect represented on our plate is Mr. Julius Alfred Chatwin, F.S.A. (Scot.), F.R.I.B.A., of Birmingham. He was born in 1830, and was a pupil at King Edward's School when the present Archbishop of Canterbury and the late Bishop of Durham (Dr. Lightfoot) were scholars there with him. Afterwards Mr. Chatwin matriculated in London, and adopted architecture as his profession. He was first placed in the office of Messrs. Branson and Gwyther, the largest local building firm of that day, and was, in 1851, articled to Sir Charles Barry, and during his term with that distinguished architect the new palace at Westminster was in course of erection, as well as many other important buildings. During this period Mr. Chatwin regularly attended the evening classes of the first Schools of Design, originated by Prince Albert, and which were held at the old Royal Academy Rooms, at Somerset House, under the direction of such men as R. Redgrave, R.A., J. R. Herbert, R.A., and other artists of distinction. On leaving Sir Charles Barry, Mr. Chatwin commenced practice in Birmingham, and he has restored and erected thirty-five churches. Amongst his principal works must be mentioned the artistic transformation of the ugly but ancient Puritanised brick church of St. Martin's into one of Birmingham's handsomest ecclesiastical structures. The restorations and additions to Aston Church is Mr. Chatwin's *magnum opus*. The same architect's work may be seen in the Catholic Apostolic Church, Summer-hill; the parish churches of Handsworth, Edgbaston, and St. Philip's, to the latter of which he added a chancel; the church of Penkridge, and others—too many in fact to catalogue at length. Lloyds' Bank in Lombard-street, London, as well as their buildings in Birmingham, are by his hand, as are the Birmingham Joint Stock Bank, Compton and Evans' Bank at Derby, Great Western Hotel, Birmingham, King Edward's Schools, Aston, Wolverhampton Art Gallery and Art Schools, Lench's Trust Almshouses, Conybere-street, the Evans Cottage Homes, and many other works. In most of the church restorations we have mentioned the architect has had one idea, and that has been to produce, by simple breadth of treatment, "a feeling of repose." Mr. Chatwin is vice-president of the Royal Birmingham Society of Artists. This position Mr. Chatwin has held since the death of Mr. J. H. Chamberlain. Mr. Chatwin is also a Fellow of the Antiquarian Society of Scotland, and a member of most of the local archæological societies. Mr. J. A. Chatwin married in 1869 the second daughter of Mr. Edmund Boughton, J.P. His portrait is by Mr. Harold Baker, of Birmingham.

Mr. Samuel Joseph Nicholl, A.R.I.B.A., comes next on our plate. He was apprenticed in 1840 to his relative, Mr. Joseph John Scoles for seven years as a member of the Coach-makers' Company of the City of London, serving his time as Mr. Scoles had served his apprenticeship to his kinsman, Joseph Ireland, Bishop Milner's architect, a friend of John Carter the antiquarian, and one of the earliest of the Gothic revivalists. Mr. Nicholl therefore claims a sort of hereditary connection with the revival of Mediæval art, and was one of the early workers, for in his days of pupilage every bit of ornament had to be drawn to the full size and occasionally modelled for the carver or mason. He was a student of the R.I.B.A., gaining the students' prizes and silver medals in 1845-6 and 7, and was elected an Associate in 1847. Working much for his old master and others, one of the earliest works to which his name was attached was the Chapel of the Sacred Heart, St. Francis Xavier's Church, Liverpool, a drawing which was exhibited at the R.A. in 1852, and subsequently engraved for the BUILDING NEWS. He was a member of the committee of the Architectural Association in 1851, and one of the promoters of the Architectural Exhibition, which did not prove more interesting to the general public than the architectural room at the R.A. now is. Since the days of his pupilage he has been actively employed in the design of every class of building and furniture, his ecclesiastical buildings having been exclusively for the Roman Catholic Church, the latest of this class being the restoration, after a fire which occurred last Christmas, of the church of Our Lady, St. John's Wood, originally designed by his old master, Mr. J. J. Scoles, in 1832, but with high altar, lady altar, and reredoses, a pulpit, and Communion railing, with other furniture from Mr. Nicholl's designs. Mr. Nicholl writes: "As I do not consider my career as an architect yet closed, I leave for the future the compilation of the complete list of my works." The photograph is by Mr. Vernon Kaye, of Kensington.

Mr. John Littlewood, F.R.I.B.A., served his articles with Messrs. Travis and Mangnall, architects, Manchester, and was engaged with that firm during the erection of many important buildings, including Watts's Warehouse in that city. Afterwards Travis and Mangnall dissolved partnership, when Mr. John Littlewood entered into partnership with the late Mr. Wm. Mangnall, and soon after Mr. Mangnall's death joined his brother, Mr. W. H. Littlewood, in 1874, the two having since carried on the practice under the name of Mangnall and Littlewoods. Mr. John Littlewood is a member of the Manchester Society of Architects, was elected an Associa of the R.I.B.A. in 1882, becoming a Fellow 1887. Mr. W. H. Littlewood, F.R.I.B.A., al served his articles with Messrs. Travis a Mangnall, of Manchester, and was engaged wi that firm until they dissolved partnership. H remained with Mr. Mangnall and his broth until Mr. Mangnall's death, and in 1874 join his brother, Mr. John Littlewood, under t name of Mangnall and Littlewoods. Mr. W. H Littlewood is a member of the Manchest Society of Architects, was elected an Associa of the R.I.B.A. in 1882, and became a Fello in 1887. He is also an Associate of the Mar chester Academy of Artists, and frequentl exhibits at the Picture Galleries. Messr Littlewoods have been successful in numero competitions. They have carried out the ex tensive improvements and addition to the marke at Smithfield for the Corporation of Manchest and have erected a large Market Building Campfield for the same Corporation, for whor they have also carried out considerable ne works in their extensive Gas Works. They hav also been largely engaged in the construction o hotels, intances of which are the Victoria Hote at Southport, Palace Hotel at Birkdale, nea Southport, and Imperial Hotel and Hydro Blackpool. They have been largely employe by the guardians of the Chorlton Unio in the erection of schools and homes, thei new offices, and also extensive addition to their union hospitals, a recent alteratio being additions for 160 beds, and a detached ne residence for 40 nurses. At Peel, Isle of Mar they erected an hotel and other residential build ings for the Peel Parade Co. The Exchang Arcade Buildings, and numerous other busines premises in Manchester were also erected unde their superintendence. They have also super vised several ecclesiastical buildings, instance being the Presbyterian Church, Whalley Rang restoration of the Parish Church of Holmfirth and additions to the Church of St. John in th same district. They are now engaged upon tw sets of baths for the Borough of Salford, on being for Broughton, and the other for th Regent-road district, both of which wer obtained by separate competitions. The first named has been illustrated in the BUILDIN NEWS, and the latter will shortly appear. The are likewise engaged upon extensive additions t the business premises of Mr. William Paulden Stretford-road; upon additions to Lewis's Market-street; upon extensions to stables for th Manchester Carriage and Tramway Co.; an upon other minor works. Both portraits ar by Messrs. A. Brothers and Co., of Manchester

The last portrait to notice on the page is tha of Mr. G. Washington Browne, architect of th Edinburgh Public Library, the largest and mos important building of this kind in Scotland, fo the erection of which Mr. Andrew Carnegie, o Pittsburg, presented £50,000 to the Scottish capital. Mr. Browne received his early training i Glasgow, his native city. In 1875 he went t London, and passed through the offices of Messrs J. J. Stevenson and H. R. Robson, Mr. Blomfield (now Sir Arthur), and Mr. Wm. Eden Nesfield. In 1878 he gained the Pugin Travelling Studentship, and published a folio volume of his sketches and measured drawings made in connection therewith. After studying for a short time in Paris he returned to Scotland, and in 1881 became partner with Dr. Rowand Anderson, under the style of Anderson and Browne, and subsequently Wardrop, Anderson, and Browne. At the close of 1885 Mr. Browne severed his connection with the firm, and has since practised most successfully by himself. His design for the Edinburgh Public Library was placed first by Mr. Waterhouse from among upwards of 30 designs submitted by his contemporaries in Edinburgh, and the building was recently opened by Lord Rosebery. In addition to the library, the following are among the works carried out or in progress from Mr. Browne's designs:—U. P. Church, Braid; U. P. Church, Brechin; Halls for Davidson U. P. Church, Edinburgh; Organ-chamber and Case for Broughton-place U.P. Church, Edinburgh; remodelling Rooms of the Philosophical Institution, Edinburgh; additions and alterations to Craiglockhart Poor-house, Edinburgh; Sanatorium, Museum, and Class-rooms, Merchiston Castle School; Swan Memorial, Kirkcaldy; "Royston," Glasgow; "Westdel," Glasgow; "Langlees," Lanarkshire; 33, Cluny-gardens, Edinburgh; Residence for Mr. J. White, Edinburgh; Studio for Mr. D. W. Stevenson,

F.S.A., Edinburgh; House and Studio for Mr. C. Martin Hardie, A.R.S.A., Edinburgh. Mr. Washington Browne has taken an active part in the work of the Edinburgh Architectural Association, of which he was President for the two years 1884-5 and 1885-6, and is an honorary member of the Glasgow Architectural Association. The photo. is from the studio of Mr. Wm. Crooke, Edinburgh.

NOTES ON BUILDING PRICES.—IX.

By John Leaning.

RAILWAY WAGGONS.—The question of the carrying capacity of railway waggons will sometimes arise during the preparation of an estimate. About 10 tons is the limit of load, as this is the most that a horse can draw on rails in addition to the weight of the truck; and it is hardly necessary to remark that in the course of making up a goods train the loaded waggons are drawn to their position by horses. Waggons are rarely fully loaded. Often a 10-ton waggon will only be loaded with 7 or 8 tons. Very many of the London and North-Western waggons are 15ft. 6in. long, 7ft. 8in. wide, and the sides 20in. high. The general type of the waggons on the South-Eastern railway is 16ft. long, 7ft. 6in. wide, and the sides 3ft. high. Many of the waggons used for minerals are 15ft. 6in. long, 7ft. 6in. wide, with sides only 9in. high.

From the foregoing particulars and the tables of weights of materials, a complete list of which may be found in "Hurst's Handbook," it will be easy to compute the labour that will be involved in unloading, and the consequent necessities of cartage.

EXCAVATOR.

Sand and Ballast.—The prices of the materials used in this trade are a necessary preliminary to the consideration of the cost of the finished work. The rate of wages in the following calculations is to be found in Article III. Pit sand in London (generally from Fulham), delivered, 6s. per yard. In the country pit sand at the pit usually costs 2s. per yard, and to this must be added cost of cartage. Thames sand delivered within two miles of a river wharf, 5s. 6d. per yard; Thames ballast delivered within two miles of a river wharf, 4s. 6d. per yard; for each additional mile beyond two the cost would be 1s. per yard. Good Thames sand by the barge-load can be brought up to a river wharf at 2s. 9d. per yard cube; pit sand at 3s. Pit sand from the Drayton district brought to a canal wharf, Paddington Basin, 3s. 4d. per ton = $\frac{2}{3}$ of a yard = 5s. per yard. To this must be added in either case unload cart not exceeding two mile and shoot, 1s. 9d. per yard; and to the whole freight probably 100 tons = 67 yards, must be added for permission to unload; 10s. for the freight, or 1$\frac{3}{4}$d. per yard, in case of canal, and 25s. the freight, or nearly 2d. per yard, for river wharf, in such a locality as Thames-street. The charges are highest at the City wharves. But on some parts of the foreshore of the Thames, as at north end of Lambeth Bridge, and the southern shore between Lambeth and Vauxhall, the permission costs only 12s. 6d. per cargo. Carts can be taken to the water's edge, close to the barge, and sand, ballast, or broken stone can be thrown into the cart by a single throw. The time available for work in such a position is limited by the state of the tide, and is not generally more than seven hours in the day; but this inconvenience is met by the use of more men and more carts than ordinary. The man who contracts to unload and deliver will supply baskets, barrows, and planks. When a crane and buckets are available the unloading is quicker, but if the builder has to pay for their use not much cheaper. Two buckets of the capacity of a yard each are most convenient, three men filling one bucket during the transit of the other. The average time to fill a yard bucket is eight minutes, but unavoidable delays would increase it to an average of nine minutes; equivalent to 22$\frac{1}{2}$ yards per day for each man. Sand brought by the truck-load to a railway station will require one man in the truck to unload, and the driver to assist him. A sufficient number of carts should be used to keep the man in the truck occupied. What this number shall be will depend upon the length of the journey. A truck will contain about 14 yards, but the weight they will carry is limited to about ten tons —about seven yards—and will take about two hours to unload, including inevitable delays. When sand is known to exist in the part of the site which will be excavated, it will be (if of sufficiently good quality for use in the work) not only a saving of the purchase-money of sand, but also of carting the earth; the digging being alike in either case. The advantages would be as follows: Sand 5s. 6d. per yard cube, carting 2s. 6d. = 8s. per yard; but frequently the architect who knows his business stipulates that for every yard of sand procured on the site and used in the building, a certain agreed sum shall be allowed. The consequences of failure to settle the question of the disposal of sand is known to professional men by unpleasant experience. A contractor will sometimes come upon an unexpected bed of sand, and will not only obtain enough for his building, but, there being no restraining condition, will dig much more than he requires and sell it. An instructive instance of this kind occurred in a London suburb a few years ago. As a preliminary to the development of a building estate, the freeholder contracted with a roadmaker to construct the roads. The whole course of these roads lay over beds of sand near the surface, and well adapted for building purposes. There being no adverse conditions in his contract, the contractor proceeded to dig it out to a considerable depth and sell it, the excavation being filled with rubbish of all kinds, the permission to shoot being in all cases paid for at per load. A load of sand is a cubic yard, and should slightly exceed 21 striked bushels, but it never does. The War Office schedules insist on 22 bushels to the yard.

Clay for Puddling.—The cost of clay will vary according to the position of the works, the quantity, and the purposes for which the clay is required. In many parts of London, enough for the purpose (it may only be required for puddling around the joints of drain pipes) may be found on the site. In other cases it may be obtained from works in progress near at hand, as in the case of the construction of a section of the Northern Thames Embankment (Mr. Ridley's contract). A very large proportion of the clay required for puddling the coffer dams was brought from the excavations for the Metropolitan Railway by the contractor for that work, he not only charging nothing for the clay, but paying a sum per load for permission to deposit it. When required in considerable quantity it may be drawn from the nearest brickfield. Clay delivered in the City of London costs 5s. 6d. per yard; in the suburbs, 3s. 6d. per cubic yard. In the country it may commonly be bought for 1s. per yard at the field, to which must be added cartage according to distance. The labour of tempering varies considerably; but a labourer should do not less than 4 yards in a day. Rankine says: Tempering, ·3; spreading, ·3 per yard cube. Cost at 6$\frac{1}{2}$d. per hour, 1s. 3$\frac{1}{2}$d. per cubic yard. Constant, ·25.

Portland Cement—Is sometimes sold by the cental, or trade bushel, of 100lb. weight, but generally by the ton; will weigh from 90lb. to 130lb. per bushel, and costs about 35s. per ton, including the use of sacks, delivered in London within five miles of the work, or at any London railway terminus. The average weight per bushel may be reckoned at 112lb. There are commonly 10 sacks of two striked bushels each to the ton. The weight last mentioned is most frequently specified; but it is rarely the case that anyone takes the trouble to weigh it. In arranging with contractor for its supply the merchant usually agrees to deliver cement of the specified weight, and will take the responsibility.

Stone Limes.—The lime merchants supply their own railway trucks, whose capacity varies, carrying 10 yards under 5 tons; 12 yards under 6 tons, 14 yards under 7 tons. For country work it is nearly always necessary to buy lime by the truck-load, and the same arrangement as suggested for sand will be necessary. The driver and a labourer should (including delays) deliver into carts about 4 yards in an hour. The usual form in which stone lime is used by the excavator is ground to powder. A yard of ground lime is the result of grinding a cubic yard of stone lime in lumps, and will measure about 16 striked bushels. Is delivered in London at 11s. per yard, use of two-bushel sacks 1d. each by some merchants, by others nothing.

Lias Lime.—Good ground lias lime costs 25s. per ton delivered in London. The number of bushels in a ton varies (dependent upon the degree of freshness) from 27 to 33 bushels; a common average is 30 bushels. Add for use of bags as before. The uniform charge (included in the foregoing prices) for grinding a yard of lump lime is 1s.

Burnt Ballast.—Sometimes burnt ballast is specified as one of the ingredients of concrete. As such cases occur where the digging is in clay, the requisite quantity is often obtained from the excavation, or is procurable on the site. The digging and depositing of the clay is of equal value whether to be burned or not. A ton of common coal (a mixture of small coal and slack) will burn 12 yards of clay. As the burning has to be done further away from the proposed building than ballast would be shot, filling barrows and wheeling must be reckoned for, and the disposition of the coals and clay will take a labourer about one hour per yard. In the country the wheeling into heap and burning is done as low as 2s. per yard. The whole process is described in Seddon's "Builders' Work." Slack is delivered at country stations in loads of eight or nine tons; the cost of unloading and delivering into carts and cartage to the site must be reckoned for. The cost of slack at country stations is about 14s. per ton. In the neighbourhood of London the small coal and dust which accumulates in the coal depôts of railway stations is used—the price is about 15s. per ton delivered.

Rubbish.—Hard, dry rubbish for filling in often arises in sufficient quantity on the building. If the works are pulling down and alteration, its deposit beneath pavings would be a saving compared with carting away. In town it may often be obtained for nothing at an adjacent building which is being pulled down, in which case so many loads carted would represent the cost; in many cases, however, it would have to be paid for besides. And similarly, the carman who knows where to dispose of hard rubbish will reduce his price for cartage. In the country it will sometimes be necessary to break up bricks or buy gravel to make up the requisite quantity. A common contract price in London for "hard, dry brick or stone rubbish, and filling in and ramming," is 4s. per cubic yard. When it is known that the works will produce enough for the purpose, the cost of basketing or wheeling, and a little breaking and levelling is generally about 1s. 6d. per yard.

Pumping.—The removal of water from the trenches and basement does not often entail much expense, but sometimes it does. The judicious contractor lays his drains as early as he can in the progress of the works, which enables him to dispose of the water as it is baled or pumped. In London, land water seldom troubles the contractor; the ground being thoroughly drained by the deep sewers. In the suburbs of London or in the country the shallower sewers, or their entire absence, give reasonable cause of apprehension. Inquiry in the neighbourhood as to the depth at which water is reached is always necessary so as to know what may be expected; as the architect has generally done this, he has probably taken constructive precautions for the exclusion of water, and these would be adopted by the builder as soon as possible. Except in very wet seasons the rain water causes but little inconvenience if the contractor takes the precaution of cutting shallow channels to prevent the surface water from running into the trenches. It is impossible to give any rule for estimating the cost. Small quantities would be baled, for larger quantities a chain pump would be necessary, and for very large quantities a pulsometer. In most cases the digging a sumpt towards which the water may drain and be pumped from is a convenient expedient. In any case the trench stage of the work does not last long, and when water is troublesome is shortened to the best of the contractor's ability. Comparison of similar cases and a record of observations will be useful to the estimator, but the cost is generally small.

SOCIETY OF ENGINEERS.

A VERY interesting visit was made on the 16th September by the Society of Engineers to the L. and N.W. Railway works at Crewe.

Upon the arrival of the visitors at the works (which cover an area of over 85 acres of ground), they were conveyed to the Bessemer steel converting house, where the process of steel-making was shown, after which they proceeded past the Siemens-Martin furnaces to the 14in. merchant mill, where the spring plates and fish plates are rolled. Here the latter, after being passed

through the rolls, are sawn to the required lengths, punched, straightened, and finished ready for sending away. Thence to the rail mill, which was occupied in rolling 30ft. lengths of rails, 90lb. per yard; thence to the points and crossings shop, where the different kinds of switches and crossings were in process of manufacture. The next shop which was visited was the boiler shop. Here locomotive and stationary boilers, as well as bridge work, were seen in different stages of manufacture, the hydraulic riveting machinery being especially worthy of notice. Thence they passed on to the flanging shop where the various plates used in the boilers are stamped and flanged under powerful hydraulic presses. After viewing the boiler mounting shop, where the boilers are tubed, mounted with their various fittings, and tested, they visited the iron foundry, where the different machines for plate moulding may be seen in operation. From here they passed on to the tender shop, where, in addition to the tenders and tanks for the locomotives and steel frames for the 42ft. carriages with the radial axle were inspected. The next place of interest is the forge, where was seen the large plate mills, used for rolling boiler and frame plates. Other objects of interest in this department were a large circular saw for cutting up bars and slabs cold, a Ramsbottom 30 tons duplex steam-hammer, and the tire rolling and finishing mill. They next visited the iron forge where the merchant bars are rolled, and through the steel foundry to the paint shop, where the various processes in connection with painting the engines were seen. Here the party re-entered their special saloon carriages, and were conveyed to the "deviation" shops, and were shown through the testing department, where the chain and other testing machines were seen at work. Thence they passed through the millwright's shop to the joiner's shop, where a number of wood-working machines were seen in operation. They next visited the iron and stamping forge, where the various articles manufactured there were exhibited. The next shops visited were the erecting shops, where the building of new locomotives was in progress, as well as repairs to engines which have been running. Thence to the wheel shop, where a number of cast steel wheels and compound engine cranks and straight axles were seen in various stages of completion; also the machine for cutting out the throws of the crank. They next came to the fitting shop, where the various parts of the engines are fitted together and finished before being sent to the different erecting shops. In this shop also were seen a number of tools which have been especially designed for turning out the work quickly and economically. This being the last shop to be inspected, the visitors rejoined their saloon carriages, and were conveyed back to London by express train.

CHIPS.

A meeting of the Archæological and Architectural Society of Durham and Northumberland will be held to-day (Friday), when Whicham Church, Hollinside House, the old seat of the Hardinge family, the Hermit's Chapel at Friarside, and the churches of Ebchester and Medomley will be visited.

The restoration of the central tower of the Priory Church of Leominster has been commenced this week. Mr. Edwards, of Leominster, is the builder.

A new wharf, to be known as East St. Paul's, is being built between Upper Thames-street and the river. Messrs. Chambers and Son, of College-hill, are the architects, and Messrs. Holland and Hannen the builders.

As a memorial of the late Archdeacon Sanctuary, it is proposed to place a stained-glass window in his church at Powerstock, and to complete the spire of West Milton Church.

The foundation-stone of a new church at the Meir, near Longton, Staffs, was laid on Friday in last week by the Suffragan Bishop of Shrewsbury. The church is to be erected for the accommodation of an outlying portion of the parish of Caverswall. At present only the nave will be erected, leaving the chancel, transepts, organ-chamber, and vestry to be added by future effort. The total outlay for the present building will be £1,820. Messrs. Scriviner, of Hanley, are the architects of the new church, and the contract has been let to Messrs. H. and R. Inskip, of Longton.

Mr. William Holloway, for many years the proprietor of a large builder's firm in Maidstone, died suddenly on Wednesday at his residence at Aylestone, to which village he moved on retirement some three years since. He was 74 years of age.

Building Intelligence.

Bromsgrove.—The site for the new Cottage Hospital, between the New-road and Ednal-lane, is being cleared preparatory to building operations. The hospital is arranged as a central block and two side wings, comprising wards for males and females respectively, connected by corridors. Each of these main wards, which will be 35ft. by 18ft. 6in. by 12ft. 6in. in height, will afford accommodation for six beds, and at the rear of the wards are bath-room, lavatory (with nurse's sink), and water-closets, shut off by cross draughts. On either side of the main entrance are the day-room for convalescent patients, and the matron's room, the dimensions of each of which are about 16ft. by 14ft. Below are the surgical ward, operating room, dispensary, three stores, and kitchen about sixteen feet square, heating chamber, and scullery. In the yard are a mortuary, disinfecting chamber, and stores. The whole of the buildings will be one story in height, except the front portion of the centre block, which will have on first floor a large bed-room, three smaller ones, and a store room. It is proposed to carry out the work in red bricks, with pressed bricks and stone for dressings. The gables will be finished in the half-timbered style, with solid oak timbers cemented between, and with barge-boards, and the whole of the roofs will be covered with purple Staffordshire tiles. The inside walls will be finished with Portland cement, and the dado of the operating room with glazed bricks. The whole of the internal woodwork will be stained and varnished. The wards and day-rooms will have wood floors, laid double, with upper boards of narrow pitch-pine. The corridors and passages will be paved with blue and red quarries. All the soil drains will be separately arranged from the rain-water and sink drains. Mr. John Cotton, of the firm of Messrs. Cotton and Bidlake, of Birmingham, is the architect; and Mr. J. Brazier, of Bromsgrove, has taken the contract at £2,673.

Swansea.—Messrs. Evans and Co. have just had completed in Frog-street a large range of stables. The main front is of Ebbw Vale bricks, with Bridgend stone dressings, and contains house for the stable manager. Inside the entrance is an open paved yard, and opposite is a van-shed, with workshop above. A lofty arch on the left side admits to a covered yard. The stable itself is on two sides of this covered yard, the third side being occupied with the harness-rooms and washing place. The floor is paved throughout with buff adamantine clinkers, laid to falls, and draining into a covered gutter at the back of the stalls. The stable is divided into twelve stalls and two loose boxes. The whole of the stall divisions and mangers were supplied by Messrs. Musgrave and Co., of London and Belfast. The lower part of the stall doors and the doors of the loose boxes, together with passages, are filled in with pitch-pine match boarding. Over the mangers are glazed tiles of an olive green tinge. Shoots conduct down chaff, hay, and straw from the floor above. An office, weigh-bridge, washing-room, a range of lofts, corn rooms, &c., are provided in the building. The contractors were Messrs. Jenkins Bros., of Swansea, and the architect was Mr. H. C. Portsmouth, of Castle-buildings, Swansea.

On Tuesday week an inquiry was held in the Town-hall, Brynmawr, by Colonel J. Ord Hasted, on behalf of the Local Government Board, touching the application of the Brynmawr Local Board for powers to borrow £3,000 for street improvements. There was no opposition. Mr. G. A. Lundie, of Cardiff, explained his plans and estimates.

The new storm-water overflow for Preston has been completed, and on Monday sewage was run for the first time into it, so that no more foul matter will be sent into the old river bed, which is being rapidly filled up with soil taken from the dock. The sewage is carried down the new culvert to Chain Caul, where it is poured into the Ribble. The culvert has been built by Mr. John Christian.

The chairman of the City of Glasgow District Lunacy Board cut last week the first sod for the asylum about to be erected by the board at Gartloch, near Glasgow. The estate at Gartloch, comprising 347 acres, was purchased for £8,500. An asylum is to built overlooking the loch, and is to accommodate 500 insane patients. The cost of the building is estimated at about £70,000. The architects are Messrs. John Thomson and R. D. Sandilands, of Glasgow.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi) £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—S. and S.—C. S. and S.—R. U.—R. M. B.—C. H. W.—B. of W.—J. W. R.

Correspondence.

THERE'S WORK FOR ALL TO DO.

To the Editor of the Building News.

Sir,—Architects do not seem to be aware of the great amount of their work which is carried out by builders, especially in alterations; there would be no objection to that, only unfortunately it is invariably badly done. The employer often thinks, before he sees the result, that the builder is quite capable of "carrying out his wishes"; in fact, I am afraid he sometimes thinks he is more likely to get his own way without the assistance of an architect, and then there are many conceited and foolish employers who think they know a thing or two themselves about building. I have no hope of builders employing architects—they like to be cock of their own walk, and then they do not know that they are such duffers as they are; but considering there are so many architects with little or nothing to do, I am somewhat surprised that no effort is made by them to utilise their knowledge.

There is room for a revolution in the building trade; in fact, considering the amount of bad work, from an architectural point of view, there is an absolute necessity for one, and I would suggest that work carried out on the lines of the Brixton Co-operative Builders, where there is an architect at the head of the concern, is very much better for everybody all round.—I am, &c.,

C. F. M.

The committee recently appointed to arrange the preliminaries for establishing a Science and Art School in Gravesend have worked out the principal details of the scheme. From a large number of candidates they have selected Mr. W. A. Craister, who has been for 17 years head-master of the Chester Science and Art School, for the post of art master.

Intercommunication.

QUESTIONS.

[10384.]—**Wood Block Floor.**—Which is best,—pitch or cement,—in which to lay down the blocks? Is there any fear of smell from the pitch, with a room so laid to wn, at a moderately high temperature? Or any danger of dry rot to the wood from the absorption of water contained in the cement?—TRENWITH, CARLETON.

[10385.]—**A.R.I.B.A. Exam.**—Would some Associate of the Royal Institute, or other gentleman, inform me—(1) Whether the application form must be obtained, and the entrance fee and probationary work deposited, personally by the candidate at the offices of the Institute? (2) When will the passing of the preliminary and intermediate stages before attempting the final A.R.I.B.A. become compulsory? (3) Do many candidates enter before the age of 23?—PROVINCIAL.

[10386.]—**Charges for Laying Out Building Land.**—Being asked to state charge for laying out several hundred acres of land on the sea coast for building purposes, I shall be glad of any information to assist me, or to know where same can be obtained. Will "G. H. G." kindly give me a few hints?—G. A. H.

REPLIES.

[10359.]—**Intercepting Chamber.**—"A Young Architect" insists upon a definite reply to an indefinite question. He does not state either the width of his area or whether his drain passes right across below it in a straight line. Supposing the drain does so pass, then keep the chamber one or more feet or yards back from the house, as there is room. Also, if there is room, have the fresh air inlet to one side a couple of yards or so, and either on the ground level or in face of wall. 3ft. 6in. by 2ft. 6in. is a better size than only 3ft. long. Seeing "A Young Architect" asks if it is "absolutely necessary that the back manhole should be in a line with the intercepting chamber," one is tempted to inquire why does he ask this question? It is better to have the manhole at back of the house, so that one may see right through from back to front or *vice versâ* if the drain can be laid in a straight line right through, but it is not absolutely necessary to lay a drain in a straight line right through a house if there is something important in the way. There may be several access-pipes or access-chambers in a line of drain. "A Young Architect" appears to expect your readers to know intuitively all the particulars of his job without him taking the trouble to explain them.—W. P. BUCHAN.

[10362.]—**Fire-Proof Floor.**—With reference to fire-proof buildings, in your issue of 5th, I should like to submit that from the experiments made by me, the most effective plan to adopt in preventing transmission of heat is to use a non-conducting material, such as asbestos or slag-wool. These materials are much better non-conductors of heat than air-spaces, and, unlike concrete or brick, yield to expansion of iron, in event of iron becoming affected by heat. Wooden joists, if preferred to iron girders, might be rendered perfectly fireproof if protected in such a manner as to prevent flames coming into immediate contact with them. I have note of an experiment where wooden joists, when properly protected, have withstood the influence of heat to which iron and concrete and iron and brick have succumbed. Apart from the fact that it is cheaper, it is certainly much more efficient, and the wooden joists in question were simply protected with a 1in. thickness of slag-wood, backed with ordinary plaster.—J. CHRISTIE.

[10372.]—**Farm Buildings.**—Bailey Denton's "Farm Buildings," and "Farm Buildings" by John Scott, one of Weale's Rudimentary Series, are useful books on the subject. The *Journal* of the Society of Estate Clerks of Works, published monthly, contains illustrations and articles on "Farm Buildings," by Mr. A. D. Clarke, F.S.I., and others.—THOMAS POTTER, Alresford.

[10373.]—**Noiseless Pavements.**—In reply to Edward Vergette, Town Councillor, Peterborough, wooden paving would be the most noiseless for the surrounding area of a public building. The same kind of wood paving as that used in London roadways would answer. Next in noiselessness would come asphalte.—G. H. G.

[10374.]—**Stoppage of Work Let.**—The contractors would only be able to claim for labour and material actually supplied, unless there are special terms, if the contracts are rescinded. The architect's charge would also be based on a measure and value estimate.—G. H. G.

[10377.]—**Flushing Tank.**—Try Field's or one of Doulton's flushing tanks, both of which are on the principle of the siphon.—G. H. G.

[10377.]—**Flushing Tank.**—I would advise "Country Builder" to use Adams and Co.'s Patent Automatic Flushing Tanks, which I know, from experience, to be reliable and certain in action. They have these in cast iron for building into ground to take rain water or bath waste, &c.—T. G. EASDALE.

[10377.]—**Flushing Tank.**—Try Kimpton's tip-up flush tank, sold by Braby and Co.—G. A. T. MIDDLETON.

[10377.]—**Flushing Tanks.**—"Country Builder" will undoubtedly find that a siphon will prove the best flusher. Engineers generally do condemn siphons, on account of defective working; however, the cause of such complaints is unoubtedly removed, and a siphon is now on the market (in earthenware only, as yet), for which a patent was granted in May or June last, which gives an instantaneous discharge, and at once to the full bore of the siphon pipe, of whatever diameter it may be, and with an absolutely drop, drop, drop supply. There is, I think, but one maker of the same at present; to publish the address would be a gratuitous advertisement; but I hear an advertisement is being prepared for BUILDING NEWS.—SURVEYOR.

[10379.]—**R.I.B.A. Exams.**—As a rule, I should advise a student, when selecting a subject for his "drawing from the round," to adopt one of an architectural character, such as a capital or a bench-end from some neighbouring church. Failing this, a good cast should be procured of a piece of carved ornament, by preference of the style which he intends to select for special study. A really good work on Renaissance architecture has yet to be written.—G. A. T. MIDDLETON.

[10380.]—**Building of Basements.**—If the building is to be situated, as described, on a hill-side, the basement wall should be built with a cavity, say, of two 9in. walls, with a 3in. cavity, or a 21in. wall; if the wall is 2ft. 6in. thick at ground-floor level (a very thick wall), there may be two brick-and-a-half walls, and a cavity of 3in. The damp course would be inserted above the footings, a few inches below the floor of the basement in the *inner* thickness; and also just above level of soil in the outer thickness. A dry area or rubble drain should be formed on the outside against outer wall, with a drain pipe just below the footings to carry off the water that would otherwise percolate through outer wall on the hill-side. The two thicknesses of wall should be tied by galvanised iron cramps every five or six courses in height, and about 2ft. 6in. apart. With such a construction of basement walls no damp could penetrate the outer thickness, and the little dampness that may come through could not affect the inside wall which would be cut off by the damp-course.—G. H. G.

[10381.]—**Roof—Graphic Solution.**—The proportions of W on rafter is at foot $\frac{3}{4}$ W, at middle purlin $\frac{1}{2}$ W, and at ridge $\frac{1}{4}$ W.—G. H. G.

10381.—**Roof—Graphic Solution.**—However a roof may be loaded, the solution of its stresses by graphics should be both possible and easy. If it be uniformly loaded, the weights acting upon the various points depend upon the positions of the members.—G. A. T. MIDDLETON.

[10382.]—**Altar Rail.**—It is the candid opinion of "H. W." that the words "provided expense is no object" should have been added by "A. H." to his question. Has he access to some working example? London affords several. St. Mary's Church, Charing Cross-road, in its present unfinished state, is extremely suggestive. The nave is in a pit at present, the aisle being higher. The retable is attached to the wall, and the altar stands clear, with room for passing behind, but not much. Less than 3ft. is not worth having for a passage, and 2ft. is not too much for retable, etc.; 3ft. for width of end of altar, and 3ft. to 3ft. 6in. for footpace—thus top step is 11 or 12ft. from wall. Altar rail 11 or 12ft. more is not excessive, as people overhang the rails a foot or so, and it does not tend to reverence to reduce the room allowed for administration to a minimum. Better omit a step or two than run any such risk. The general adoption of side altars, whereat steps are not wanted, leaves the architect free to introduce several more under the principal altar within the railed space, or even to omit the rails entirely. If "A. H." will write to "H. W." stating fixed conditions, he will endeavour to help by reference to examples—some more melancholy than admirable perhaps. Is the altar to be a low altar high up (that at the Cathedral, Canterbury, exemplifies), or a high altar low down (St. Alban's, Holborn, comes to mind)? Country or town also regulates much, and the taste of the parson is uncommonly self-assertive.—H. W.

[10383.]—**North Devon.**—Braunton, Georgeham, and Heanton churches can be seen from Braunton Station as a centre. Mitchell, of Vellator, or some boatman should be arranged with for next day, perhaps. Then, by dropping down the Braunton Pill and sailing across the estuary of the Taw at Appledore, a walk to Northam and Bideford, either taking in the Pebble Ridge or not, might be sufficient. If the latter is decided on, boatman should be retained for return journey. Otherwise a trip to Barnstaple and so home by train might be managed, the boatman being dismissed on landing. Georgeham Church might be visited, after seeing that at Morte Hoe, per Lee, and the Bull Point Lighthouse, returning by Braunton Station—Berrynarbor, Coomb Martin, and Lynton are in the opposite direction. The woodwork in Braunton Church seats is as thick as a brick.—H.

A new wing, which has been added to the Convalescent Home at Felixstowe, was opened on Wednesday week. Mr. E. F. Bisshopp, of Ipswich, was the architect.

The latest reports fram Salonica state that the famous Mosque of St. Sophia was burnt down, the minaret falling with a terrible crash. The palace of the Greek Archbishop, the Greek church and hospital, the Greek and British consulates, 15 Jewish synagogues, and a large Greek school were also destroyed, in addition to some 2,000 houses, the latter valued at not less than half a million sterling.

An installation of the electric light is at present being carried out at the church and parochial hall of St. John's the Divine, Vassall-road, Brixton. About 300 incandescent lamps will be used, and a motor is also being put down for blowing the organ of the church electrically. The church is one of the finest works of the late Mr. G. E. Street, R.A., and has recently been completed by the addition of a tower and spire, one of the loftiest in South London, designed by Sir Arthur Blomfield.

The Glasgow Town Council accepted on Monday tenders amounting to £8,249 for the building of four tenement shops and dwelling-houses in Stobcross- and Lancefield-streets. A report was received, but referred back for future consideration, from the committee having in hand the disposal of sewage from the eastern portion of the city. The committee recommended that the sewage be dealt with by precipitation on the plan adopted at Sheffield, and advised that the works be established on the site of the disused waterworks at Cranston Hill, Dalmarnock; the estimated outlay would be £38,000, including the transfer of £4,000 to the water committee for the Cranston Hill site.

WATER SUPPLY AND SANITARY MATTERS.

UCKFIELD WATERWORKS.—The town of Uckfield has just been supplied with water in accordance with the scheme prepared by Mr. H. Bertram Nichols, C.E., of Grosvenor Chambers, Birmingham, the engineer retained by the water company, and the works have been carried out under Mr. Nichols's supervision. A well has been sunk, and a bore-hole carried down to a depth of 278ft., at which depth a copious supply of pure water was reached. The water rises in the well, which is of an artesian character, to within 7ft. of the surface, and is pumped into a covered service reservoir having a capacity of 250,000 gallons, sufficient for seven days' supply at the rate of 15 gallons per head. A petroleum engine (Spiel's patent) supplemented by wind power, raises the water. The wind-motor is of the "Halliday" pattern, and is carried up to a height of 90ft., the sails being 30ft. in diameter. These motors answer their purpose admirably, and under Mr. Nichols's advice great economy will be experienced in the annual working expenses, both gas and coal being expensive items in the district. The service reservoir is constructed of concrete, 6 to 1, the cement used in the work bearing an average tensile strain of 590lb. to the square inch. There is a good pressure throughout the town. The mains vary from 5in. to 3in. in diameter, supplied with all requisite sluice valves, hydrants, &c., in suitable positions, and in the aggregate measure about 2½ miles. The cost has been about £3,250, which is irrespective of land, Parliamentary and other charges. Mr. N. Monzier, of Birmingham, was the contractor for the well and bore-hole, and Messrs. W. Jenkins and Sons, of Leamington, were the contractors for the remainder of the works forming the main contract.

LEGAL INTELLIGENCE.

RE W. L. KELLAWAY.—The debtor, trading as a builder and contractor at Pentonville, has filed his petition, and a receiving order has been made. The liabilities, secured and unsecured, are estimated at about £50,000, the value of the assets not being ascertained.

CHIPS.

A marble tablet has been erected in Canterbury Cathedral to commemorate the bequest of the library of Archbishop Howley to the Dean and Chapter by the late Archdeacon Harrison.

A new Congregational Church was opened in Audley Range, Blackburn, on Friday. The church has been erected at a cost of £6,000, and will provide accommodation for 700 worshippers. It is Decorated Gothic in style.

The Ton schools for the Ystradyfodwg School Board are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

Walworth-road Baptist Chapel was reopened for divine service on Sunday morning last, after extensive alterations and repairs. These works have been executed by Messrs. Pitman and Son, of Newgate-street, E.C., under the direction of Mr. J. E. Sears, F.R.I.B.A.

A *Salon* at Brussels, opened by the King and Queen of the Belgians on Tuesday, is more remarkable for the immense number of works hung than for any special merit in the exhibits. Among the portraits is one of a lady by Sir J. E. Millais.

The Paddington vestry voted, on Tuesday, £10 towards a fund for meeting the necessary expenses of promoting a Bill in Parliament for purchasing the water companies' undertakings in the Metropolis, or for power to set up a competing supply. The London County Council have no power to introduce such a Bill.

A new theatre is about to be provided for Dublin at a cost of about £60,000. It will be exactly opposite the Queen's Theatre in Great Brunswick-street. Mr. Dudgeon is the architect, and Messrs. Meade and Sons, of Dublin, are the contractors.

The foundation-stone of a new church at Penarth, to be called All Saints, was laid on Monday by Lady Windsor. The new church will be erected from designs by Mr. J. Coates Carter, of the firm of Seddon and Carter, diocesan architects, Cardiff. The cost is estimated at £6,000. The church will be Early English in style, and will consist of a chancel, nave with north and south aisles, organ-chamber, and vestry. Mr. Purnell, of Penarth, is the contractor.

For the construction of a dock on the banks of the Grand Junction Canal at Kensal-road, the Vestry of Kensington have accepted the tender of Messrs. Nowell and Robson at £8,250.

Mr. Geo. S. Horton, surveyor to the Market Bosworth rural sanitary authority, has been appointed surveyor to the Felixstowe and Walton local board.

Our Office Table.

THE injury occasioned by the disastrous fire which occurred on Monday night in the Palace of the Alhambra, at Granada, the most magnificent relic of Saracenic architecture in Spain, was less extensive than was at first feared; but the magnificent Court of the Myrtles and the right wing of the Arrayanes Court are totally destroyed. The fire, which is suspected to have been caused by an incendiary, broke out in the Court of Alberça, which is situated close to the famous Court of the Lions and the Queen's Dressing-room. One side of the Court of the Myrtles is overlooked by the Tower of Comares, which contains the Hall of the Ambassadors, the finest and largest apartment in the Alhambra; but it is hoped that this has escaped serious damage. We gave views of the interior of the Lions' Court and an entrance to one of the pavilions in our issue of Dec. 14, 1888, together with a general description of the palace, which is not only the most magnificent relic of Saracenic architecture in the Peninsula, but the summit of perfection of all Moorish art.

IT is frequently assumed that Mediæval builders were the first to display indifference to the charms of older work by constructing their additions in marked contrast to the style observed in the existing masonry, and in utilising as common building material carved stones of previous generations. The Rev. Robert S. Baker, F.S.A., the rector of Hargrave, reminds us that the Romans were equally careless as to the preservation of ancient buildings and the maintenance of historical records in stone. In excavating the purely Roman site of Irchester, a walled camp and Roman town near Wellingborough, in 1878, Mr. Baker found foundations of later Roman houses overlying earlier ones, and crossing them at all angles—sometimes three deep. In one later foundation a mutilated stone deity lay prostrate, as a mere building stone, clearly pointing to the last hundred years of Roman rule, when the gods had to make way for Jesus of Nazareth. Similarly, he remembers the veteran town clerk of Newcastle, the late John Clayton, pointing out an altar of Jupiter, built in to form a corner-stone in one of the camps of the Roman Wall.

THE site for the Royal Naval Exhibition, to be held next summer, has been very prudently changed from the grounds of Greenwich Hospital to those of Chelsea Hospital, now occupied by the Military Exhibition. Already the guarantee fund exceeds £30,000, and there is every probability that an interesting and successful Exhibition will be organised. The committee are making an appeal to all who may possess any works of art, relics, momentoes, or trophies connected with naval history or illustrative of naval warfare which may be in the possession of private persons or in public collections, and they desire all who may possess such articles to communicate with the honorary secretary, Captain Jephson, R.N., at the offices of the Exhibition, 6, Craig's-court, S.W.

THE Vestry of Paddington have discussed at great length the question of the erection of sky signs in the district, the matter coming before them in consequence of the addition of a "huge advertising structure" to the roof of the Lord Elgin Hotel, in Elgin Avenue, Edgware-road. A resolution was moved by Mr. Mark H. Judge, stating that in the opinion of the vestry the roof and walls of the hotel named were not a suitable foundation for such a framework, and informing the district surveyor that the vestry consider the structure a dangerous one within the meaning of the Metropolitan Building Act of 1855. The resolution was, however, rejected, and a modified one, simply declaring that "the structure was most objectionable," was carried. A copy was ordered to be forwarded to the London County Council, with a request that that body would at once frame by-laws for the purpose of controlling the erection of such structures on the roofs of houses, "seeing that the rules of the Metropolitan Building Act, 1855, do not apply, and that the Council are empowered by that Act to make by-laws to meet the cases of 'any iron building or other building to which the rules of this Act are inapplicable.'"

THE directors of the Bath Stone Firms (Limited) announce in their fifth half-yearly report that they have become the sole agents in Great Britain and Ireland for the sale and use of the process introduced by Messrs. Faure, Kessler, and Co., of Clermont-Ferrand, for hardening and preserving stone. The process, which is known as "Fluate," consists of applying to the surface of the stone a solution made by dissolving in ordinary water certain chemical crystals. The cost of the solution is, the directors state, but trifling, and the labour in applying it to the stone is as simple and cheap as whitewashing. The process does not affect the colour or alter the granular appearance of the stone. It sets up a chemical action, which transmutes the stone into a substance practically imperishable. As the adoption of this invention in this country will in many cases lead to the use of Bath stone in lieu of hard and expensive stones and other costly materials, the directors have evidently secured what will prove a not unimportant auxiliary to the company's business.

A REVOLVING door, rolling up upon a spindle when not in use, has just been patented in the United States by an architect living at Worcester, Mass. The door is an adaptation of the principle of the roller-top desk and cover, and consists of a series of slats, each about 1½in. wide and ¾in. thick, joined together by wooden spindles, one revolving within another. In the roller-top desk the slats are joined by ribbons of steel or canvas. When the door is opened it is wound up on a spiral drum at top and bottom, and all is inclosed within the door casing. An ordinary 3ft. door winds up in a roll. 7in. in diameter. A wire or cord or steel ribbon (as the case may be) runs from the outer edge of the door at top and bottom, and is wound upon a spiral drum in the casing opposite the side in which the door itself is wound up.

THE mining department of the United States Geological Survey has issued a special report on the production of slate last year. It is the first of this kind published, and shows the value of the slate produced, the number of men employed, the wages, the capital in the industry, and other details. The total value of the slate produced in 1889 was 3,444,863dol., of which 2,775,271dol. represented the value of the roofing slate to the amount of 828,990 squares. This is nearly twice the amount produced in 1880. At present twelve States produce slate; but a line drawn from Maine to Georgia, and approximately following the coast outline, would pass through all the important slate-producing localities. Pennsylvania, Vermont, Maine, New York, Maryland, and Virginia are, in order, the most productive. In Georgia, Michigan, and New Jersey the amount and value are small; and quite recently quarrying has been commenced in Arkansas, California, and Utah. Discoveries of slate under promising conditions have been made in other States, chiefly in Tennessee. The quarrymen all over the country, as well as the owners of the quarries, are either Welsh or of Welsh descent, and many of them have been trained in the Welsh quarries.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY.—Glasgow Architectural Association. "Ravenna, and other Italian Towns," by William Leiper. 8 p.m.

CHIPS.

A new Primitive Methodist chapel is being built at Doncaster, from plans by Mr. J. Simmons, of that town, at a cost of £1,200. Messrs. C. Sparkes and Son are the contractors.

The name of Charles Glass, of Cardiff, builder, appears in Tuesday's list of adjudications in bankruptcy.

The Local Board of Moss Side, near Manchester, has raised the salary of Mr. Acton, the surveyor, to £335 per annum.

The will of Mr. Henry Boyes (formerly of the firm of Boyes Brothers, merchants), late of 95, Ebury-street, and of Arundel House, Arundel-street, Strand, was proved on the 5th inst. by Mr. Henry Cowell Boyes, F.R.I.B.A., the nephew, the sole executor, the value of the personal estate exceeding £29,000. Besides a legacy of a third share of £10,000, the residuary real and personal estate is left to the said nephew, Henry Cowell Boyes.

New head premises for the Shipbuilders' and Boilermakers' Union have just been completed in Eslington-road, Jesmond, Newcastle-on-Tyne. The building is entirely of stone, and is surrounded by a stone wall and ornamental railing on all four sides. Besides a hall, committee-room, and clerks' rooms, a residence is provided for the secretary to the Union.

Trade News.

WAGES MOVEMENTS.

NORTHAMPTON.—The working plumbers, wh have been on strike for about two months, hav received a final reply from their employers refusin arbitration.

SHEFFIELD.—There is a strike of cabinet-make in Sheffield. The men ask 2s. a week advance, an increased rates of pay for overtime and Sunda work. The present rate of wages in Sheffield 35s. a week.

METROPOLITAN SLATERS AND TILERS.—A well attended public meeting of London journeyme slaters and tilers was held on Tuesday evening a the Three Kings, Clerkenwell, for the purpose o organising the trade. Mr. Daniel Shaw presided Mr. J. Davey and others addressed the meeting and a resolution was passed pledging those presen to join the Union.

Holloway's Pills improve the appetite, strengthe the digestion, regulate the liver, and act as gentle aperients. The pills are suited to all ages, and their inventor's fame has resounde through all the quarters of the globe. Wherever sickness exists, th medicine has made its way to be everywhere and justly appreciated.

ELECTRIC LIGHTING.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1864.
FRIDAY, SEPTEMBER 26, 1890.

THE GROUNDWORK OF BUILDINGS.

IF architects looked a little beyond their drawing-paper to the actual surroundings of the site and the locality, they might do a great deal to make their art more attractive to the bulk of most people who care to look at buildings either from the outside or within. A popular preacher once argued in the same way about preaching: he thought it would be better to look beyond the sermon to try and "win souls," and it is quite evident that the same advice would be more usefully followed if every design for a building could be made to win the eye of the spectator by a study of the surrounding site, and the adaptation of the building to it. Isolation and the want of sympathy with site are obvious defects in many of the buildings erected nowadays. The design has been studied on paper: it may possess good outline and details, but appears out of place with the site or scenery when built—either too town-like and formal, or too rural and irregular. A spick and span new red-brick villa looks as if it had been transplanted to its site from the builder's yard, for it neither harmonises with the scenery nor fits the ground upon which it stands. It looks out of joint with everything near it. Hampstead, Wimbledon, and many of the newly-formed western suburbs near London, afford us examples of the architect's fancy design conceived and completed on the drawing-board. No affinity is to be found between the design and the situation. In one place a ridge or hill-side is occupied by a row of level-ridged houses suitable for a street, or a few isolated villas that look as if they had been plucked from a terrace at Kilburn or Kensington. A declivitous hill, instead of having a few detached houses well broken in outline and surrounded by foliage, may be seen rigidly marked by lines of step-like buildings. The hills of Hampstead and Croydon are spoilt by designs of this description; and we meet with this unsightly mode of building more conspicuously on the undulating hills and downs round Preston and the north of Brighton. On flat ground the value of a good sky-line is quite as evident, but the straight, level-roofed terrace, or street, ostentatiously offensive. No doubt we shall be told these are faults which the architect cannot avert; he has seldom any choice in the planning of estates, and is obliged to follow suit; the speculative builder and the landowner together arrange the class of house required for a particular locality. Not always. Detached residences are to be found on all good estates, and the architect is generally his own master in determining the style of building, and it is in respect of these larger structures that we now write. They dot about nearly all our well-wooded localities, and spring up on cliff and chine in our fashionable watering places, such as Bournemouth, Southsea, Eastbourne, and Westgate. The designs of these buildings have all the appearance of having been selected at random from a stock collection: Gothic from 13th Century to Tudor, Stuart, and Queen Anne, half-timber, brick and parget, Italian Renaissance, Flemish, *et hoc genus omne*, are tried by the complacent designer to gratify a whim of his employer or his own. Each arrests the eye by its self-assertion of independence; each is strongly dissonant with everything around it. The design is made on paper, perhaps in London, Paris or a hundred miles away from the locality. The educated taste at once perceives a want of sympathy between the building and its surroundings; the house impresses only by its singularity and its want of harmony with the situation.

And the first thing which makes itself felt in modern architecture is a certain kind of abruptness. The ordinary observer likes to find some sort of agreement between his own sense of what is right and the executed building, but he sees very little that he can understand or appreciate. He cannot, for instance, perceive why an elaborated Italian or florid Gothic building should be placed on a rugged cliff when all beside it is barren and wild, and he can only compare such a building to a dressed-up dandy of the West End on a lonesome moor or in a country lane. One of the most neglected studies of the architect is the groundwork or base of his buildings. Very seldom do we find him attempt anything more than to make a plan of the approaches or to take a few levels for foundations. The consequence is that the building appears to start abruptly from the ground without any sort of preparation; if flat, nothing is done to raise the ground on which the structure stands, and therefore, if the addition is made afterwards, the building is sunk in a depression or it appears half-buried from the roadway. A perfectly flat or level plot unrelieved by foliage is what is often seen in the outskirts of our towns, and from this dreary flat springs a very ornate structure. The building looks as if it were there by accident; no effort of art has been expended to form a platform or base for it. The unbroken flatness of the ground and the ornamental or irregular features of the building produce a most abrupt effect on the eye of the spectator. Turn from this sort of situation to the slope of a hill or declivitous land descending to the sea. We find the same want of study to make the structure suit the ground. In the first place, the plan of the building has not been disposed in reference to the fall of ground; a long front is placed lengthwise with the declivity, creating unnecessary foundations and earthwork; it has a level roof which causes one end to be considerably higher than the other. A study of the whole site and building in pencil would have suggested, instead of a long parallelogram, a block plan broken into wings or return ends, to prevent unnecessary excavations and to reduce the length on the declivity; or the long front, if necessary, could be stepped down by adopting an irregular sky-line. In either of the cases we have imagined the platform or the terrace is a very essential preparation, as it forms a kind of substructure, leading the eye from the natural level to the building itself. We have a few good instances of this sort of design at Chatsworth, Hatfield, Wollaton, Blenheim, Castle Howard, in which the groundwork has been studied in connection with the building. The forms of terrace walls ought to be made a special part of the architectural design. The architect should first select his site and aspect, then take the necessary levels for the ground formation. He may have a walled terrace parallel with the building front, constituting a base, either surmounted by a balustrade or left plain. From this level flights of steps may conduct to a lower plane or second terrace, with its formal laying out of beds and plantation, thence to a third or natural level of the grounds. Each terrace is an architectural boundary, bringing down and extending the lines of the structure giving the building a foundation and a base In flat situations a single terrace may suffice; but for steep declivities three or more are required, and these should be varied in form to suit the contour of the ground.

At the seaside, the terrace is absolutely essential to give a base to the buildings which occupy the rising ground towards the sea. At Eastbourne, for example, much has been done to give breadth of base and form the parades, by cutting the natural escarpment into two or three level shelves or promenades, and constructing concrete retaining walls between the roadways. The marine promenades from the pier to beyond the Wish Tower form a succession of terraces which might have been rendered still more attractive at a little cost. Yet as they are, they become handsome additions to the attractions of this fashionable Sussex watering place. The escarpment has been successfully relieved by evergreen shrubs, and by steps and inclines to give access to the higher levels. The houses are still further embanked and planted on the summit. The chalk hill facing the sea front, which gradually slopes away towards the abrupt hill on the west, is thus converted into two artificial escarpments and roads partaking of the curvature of the hill. At Scarborough, the South Cliff presents an even grander example of a natural escarpment. The Grand Hotel, the Spa, and the Promenade extending southward have been constructed upon and out of this great frontage of rocks. Plantations and terraces cut out of the rock give Scarborough a charm of its own. The Spa Saloon, with its front terrace, is unique as an example of marine architecture at the base of a great hill. Again, the Valley Bridge (uniting the old and new towns) and the Spa Bridge (connecting St. Nicholas Cliff and the Grand Hotel with the Spa) are valuable adjuncts. Hastings and Brighton both present examples of the terrace—the latter town has indeed, at the Kemp Town end, a noble terrace or marine parade with its esplanade below, while on the new western side, terraces and lawns have been formed which surpass in their breadth and spaciousness those of other sea-fronts. It is to the architectural advantages offered by these artificial works we now allude. On the cliff or hillside the terrace is absolutely necessary to give base and to form a kind of transitional step between the ground and the building; on the flatter situation the terraced platform helps to break the angle between the horizontal and vertical lines. In both the steep declivity and the plateau, the level platform, with its balustrades and artificial embankments, lead the eye from the natural surroundings to the architect's work. Why should he not make this artificial outwork a feature in his design, and consider it as necessary a portion of it as the foundations themselves? Till the architect can divest his mind of the notion that his design merely pertains to the structure *per se*, and conceives it to be his duty to extend his study to the groundwork and surroundings of his buildings, we shall continue to see the abrupt and unsympathetic vagaries which mar our best situations. Contented to work *in nubibus*, many imagine they can "drop down" a design anywhere.

THE EMPLOYMENT OF BUILDERS.

THAT the builder encroaches largely on the domain of the architect is too obvious to admit of any doubt, and is now and again an unpleasant reflection among many in the profession. A very considerable number of the buildings erected are planned and carried out by builders, and, as a correspondent reminded us in a letter last week, they do a great amount of work in alterations. We cannot disguise the thought that this state of things is not what it should be, nor that a great deal of this preference is owing partly to the architects themselves. But whatever may be the cause of this seeming declension of the public for professional advice and design, it is very unfortunate in result. Hundreds of acres of park-land are covered by buildings every year, the larger portion of them by builders single-handed, and the consequence is a very inferior class of buildings is erected, that

cannot but have an injurious effect on the taste of the public. We do not affirm that builders' architecture must be inferior—far from it, for we have seen some notable exceptions; but we do say that the indiscriminate employment of builders without professional advice is detrimental to the interests of both classes, and cannot fail to be disappointing to the employers.

There are two reasons why the labours of the architect are dispensed with which may be worth the consideration of the profession. The first is the desire not to add to the expenditure; the second the employer's wish to carry out his own views. Unfortunately, some employers' experience of architects is not very favourable, and the public entertain a strong idea that an architect's services are expensive and unnecessary. Until the profession does its best to remove this apprehension we are afraid that the builder's services will be deemed above their real value, and their own will be underrated. When an employer finds that a considerable percentage above the contract sum has to be paid in the shape of "extras," and that his architect has exceeded his instructions, he has a fair ground for assuming that professional aid is expensive; but this conclusion may be considerably aggravated should he discover serious defects in the building, scamped workmanship, and inferior materials. There have been, unfortunately for the profession, too many instances of such experience with which people are familiar. To these the builder can point. Irreparable injury has been done to the profession by these cases; the injury has not fallen on those who were really the defaulters, but has been shared by the whole body of which they are members. Have we not, on this ground, a strong argument for the *statutory* registration of architects?

Of course, in extenuation of these capital charges against the architect it may be argued that when he is employed he is to a certain extent a free agent, and ought to be fully intrusted with the work; that if the building is more costly it is because more thought and artistic design have been expended on the work than would have been the case if only a builder had been employed. The employer is satisfied if he obtains a house or business premises that just suit him, though the building represents barely the expenditure on materials and labour, and does not profess to be more than a commonplace structure. He does not regard an extra expenditure of a hundred pounds or two as contributing anything to the efficiency or convenience of the building; he does not set any value on architectural design or skilful adaptation, and is therefore not disposed to pay for professional knowledge and taste. Such a view of professional services is both near-sighted and unfortunate; but is one that, in the eyes of commercial men, is justifiable. It is the penny-wise-and-pound-foolish policy. Builders prefer the readiest and most easy methods of building: they do not trouble to solve the problem of plan, or to find out the most scientific construction of a floor or a roof; still, their buildings may be practically sound and substantial. The desire to carry out one's own ideas is a strong one. As our correspondent says, the employer often thinks "he is more likely to get his own way without the assistance of an architect," and is conceited enough to think he knows a thing or two about building. To a person of this kind, the builder who is willing to execute the work at the least cost is the only desideratum. He is not required to trouble himself about the plan which has already been laid down, but simply to find materials and labour, and no doubt a man imbued with the superiority of his own ability and his own whims cannot do better than engage someone to carry them out. The employment of an architect implies the submission of the whole design to him, and no independent professional man would care to act under dictation. Therefore we see the reason why so many employers who wish to be their own architects prefer to employ builders. Let us look at the other side of the picture. The old adage that the man who is his own lawyer has a fool for his client applies with almost equal force to the employer who imagines he can do without an architect. Whatever supposed advantages he gains by carrying out his own plans are dearly purchased by inferior workmanship. How does he proceed? A rough and imperfect plan is drawn, probably by the builder's clerk or by a friend, the employer trusting to his own verbal instructions. The contractor gives a price which does not include certain things, and is a mere guess, and after the building is commenced a variety of requirements have to be met. The employer gives a fresh order and is mulcted by an extra; in this manner the work is proceeded with, till he finds to his cost and chagrin that five per cent. expended on a properly drawn set of plans and specification would have saved him more than the cost in expenditure and peace of mind. We have imagined no chimerical picture. The employer with "fads" of his own, who laughs at the notion of employing an architect, is generally mulcted in extras, if not in a law suit. Still there are hundreds of persons who, heedless of the dearly-bought experience of others, are willing to commence building in the same way. We can point to numberless instances of failure. The amateur architect is the most unteachable of all bigots, for he carries his commonsense notions to the length of denying even the existence of the art of building. We cannot repress the "faddist." The misfortune is that he represents a blind class, and one exceedingly large, and the small contracting builder makes a good thing out of him. We cannot wonder at the amount of bad building, or the summonses against builders for using inferior bricks and mortar, as long as the trade has nothing to unite it. Could the builders unite to frame a set of rules for their guidance in the acceptance of contract work, could they be induced not to undertake any work that was not clearly described in drawings and specifications prepared by an architect, or, at least, endorsed or signed by one, a better order of things would prevail. The builder should be brought to see that it is for his own interest that he has the necessary conditions for carrying out his own work; and the public to understand that they have no assurance of efficient building except it be performed under the supervision of a third and independent party.

THE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—XI.

By R. Owen Allsop, Architect.

(Author of "The Turkish Bath: its Design and Construction.")

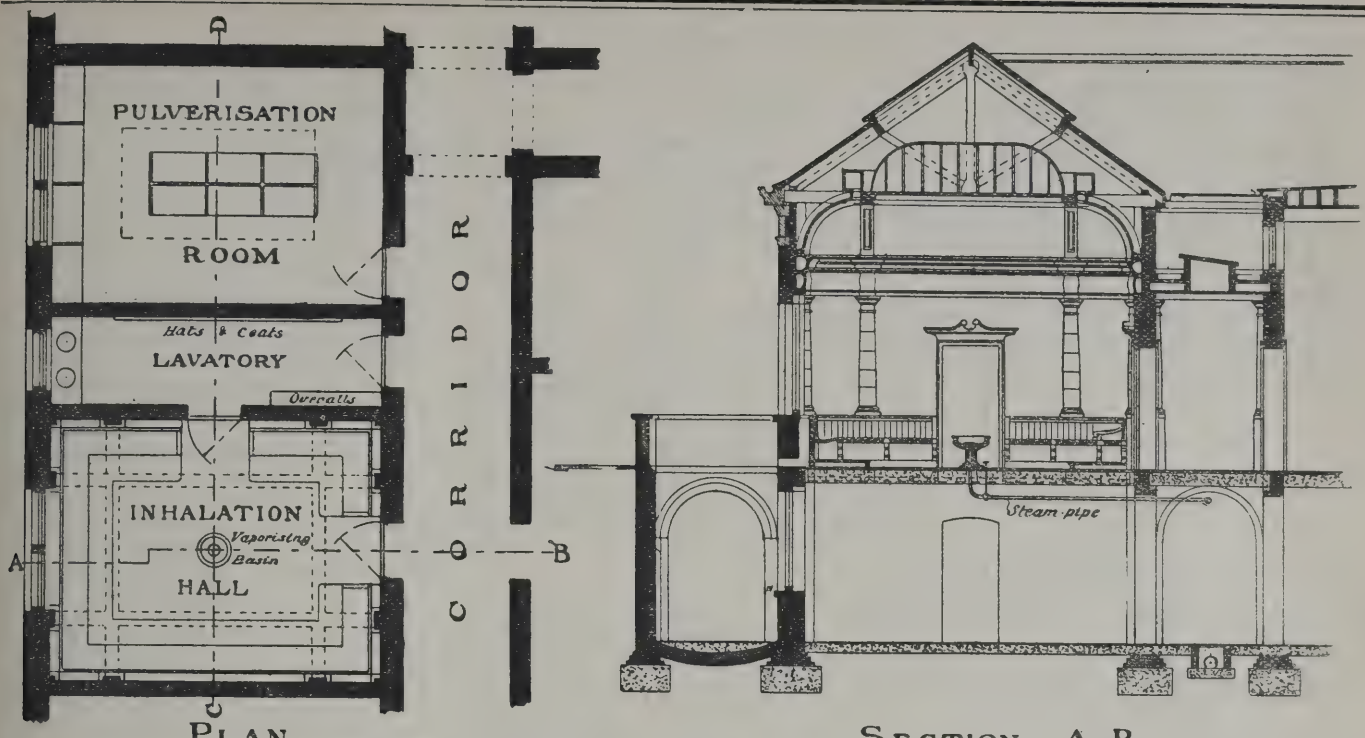
IN the preceding articles* I have dealt with all the baths ordinarily to be found in the hydropathic establishment. The hydropathic practitioner is chiefly concerned with the application of water in a simple way, at varying temperatures and in varying manners, in conformity with the first principles of hydropathy. Cures such as inhalations and pulverisations, the Pine cure, and the Mont Dore cure, &c., belong more properly to the medical bath-house; but just as massage, electricity, the Aix-douche, &c., have crept into more or less general use in hydropathic bath-houses, so other and more novel modes of treatment are constantly being essayed. In describing a few of these, therefore, under the heading of the present series of articles, I may feel every justification, and in the worst event, perhaps, be merely anticipating the future. Moreover, in my introductory article, it will be remembered, I alluded to the intention to deal with medical baths and treatments over and above those strictly pertaining to the Water Cure.

THE INHALATION HALL.

The inhalation hall consists of a room or chamber wherein patients may sit and inhale, for specified times, certain vapours. It is a feature very commonly to be met with in bath-houses on the Continent, particularly at such places as possess natural thermal waters giving off vapour. In bathing resorts where the waters are not of a temperature sufficient to give off a natural vapour, a fine spray is produced by impinging small jets of water against some hard substance, such as a sheet of metal, and this spray, or pulverised water, floats about the inhalation hall. In the inhalation hall for the Pine cure, steam is passed through a receptacle containing a quantity of pine needles saturated with a pine essence, thus filling the air with a pleasant fragrance. Of the latter class of inhalation hall, a good example is to be found at Reichenhall; and at Aix-les-Bains and Marlioz, close by the latter town, are examples of halls wherein the naturally-medicated water is pulverised and floats about the room in the form of spray. Perhaps the largest building adapted for the purposes of inhalation is that at Kreuznach, on the Nahe, in Rhenish Prussia, where there is, at the public bathing establishment, a "vaporarium" or "inhalatorium," 200ft. long, wherein visitors can walk, stand, or sit whilst inhaling medicated air. By means of a steam-pump the condensed and saturated brine is forced, at a high pressure, into the hall, and is thus transformed into spray.

The inhalation of medicated vapours, and vapours of mineral waters, is naturally and perforce confined to such places as possess thermal springs and medicated waters. The inhalation of the volatile principles of the pine, however, is a treatment that may be carried out effectively in any place, and efficacious and pleasant as it is, well deserves the notice of the hydropathist.

THE PINE CURE,



as it is called, has been for many years popular in Germany, and merits more attention in this country. Something, it is true, has already been done in this way. At Bournemouth, complete arrangements were made, when the elaborate baths at the Hotel Mont Dore* were erected, for the administration of the pine cure; and at Farnborough, in Hampshire, is an establishment specially devoted to this system of treatment. The arrangements made consist in the provision of various forms of baths of pine extract, and halls or rooms for the inhalation of the vaporised essential oil. The methods of treatment followed are more or less modelled on those in vogue at the Continental spas, of which that at Reichenhall may be taken as a type.

The pine selected for the preparation of the extracts and essences is that known as the pumilio pine (*Pinus pumilio*), the mountain pine, growing in large forests in the Alpine districts, nearest to the line of perpetual snow. At this high elevation the pines become mere shrubs, stunted and dwarfed; but it is from these small trees that the "needles" are gathered for the purpose of manufacturing the various commercial extracts, and the more refined essence called "Pumiline."

For the purposes of pine cure, all that is required are these commercial products, the coarser extracts for baths, and the refined pumiline for inhalations. It is thus open to

VAPORISING BASIN

the proprietors of hydropathic establishments to avail themselves of the full benefit of pine cure, wheresoever they may be located. All that is required, when once the necessary arrangements are made for the baths and inhalations, are so many bottles of the manufactured extracts and essences. Considering the established repute of the pine cure for the treatment—by inhalations—of throat and chest complaints, which form so large a portion of ailments in these fog-girt islands, and—by baths—of rheumatic and cutaneous affections, it is much to be regretted that more attention has not been bestowed upon the erection of buildings for the especial purpose of a treatment which, besides being efficacious, is extremely pleasant to patients. This neglect is doubtless due solely to want of knowledge on the part of the proprietors of baths and hydropathic establishments, of the power for good of the pine cure, the simplicity with which it may be adapted to existing institutions, and the economy and small cost pertaining to its daily use.

The method of arranging and constructing an inhalation hall for the pine cure is shown in the accompanying illustrations, which also show the arrangement of a room for the Mont Dore cure—the application of pulverised water to the eye, ear, and nose—the detailed consideration of which, however, must be left to another article. Off a corridor in the bath-house is arranged a room, 18ft. 6in. long by 14ft. 10in. wide, with coved ceiling, and lighted, in addition to the end windows, with skylight over a domed curtain-light. Round the room are placed comfortable wooden seats, raised 6in. by means of a platform. In the centre of the room I have shown an improved form of vaporising basin, a device for vaporising the pumiline, and thus charging the atmosphere of the room with the volatile principles of the pumilio pine. It is constructed as follows:—In filling in the concrete between the iron joists of the floor, two round holes, respectively about 2in. and 3in. diameter, are left. Above the small hole, a circular cavity, 5in. diameter and 3in. deep, is left for a stuffing-box, to properly cut off the air of the basement. Over the larger hole, which should be in the centre of the room, is placed a marble or glazed earthenware fountain-like basin, having a steam-pipe 1in. in internal diameter passing through its centre. This pipe is connected below with the steam-supply pipe, with a screw-down regulating valve, the spindle of which passes through the smaller hole in the floor and the stuffing-box, and finishes with a hand-wheel above. Over the pipe passing through the basin and resting in an incision in the basin, is a circular, saucer-shaped disc of gun-metal, freely perforated with small holes. Upon the disc should be placed a layer of pine needles, and upon these a small quantity of pumiline or pine essence should be poured. Thus, when the steam is turned on by an attendant in the hall, the essence is vaporised by the hot steam, and the air of the inhalation-hall filled with a pleasant fragrance.

The ventilation of the hall, a point of evident importance, is effected by means of horizontal shafts round the curtain-light, whence the vitiated air and waste vapour is extracted by a general extraction shaft for the whole bath-house. The fresh air would be admitted from outside, as shown, behind the seats, and warmed when necessary by steam coils. An inhalation hall should be constructed of glazed ware, the present example being intended to be executed in faïence, and glazed bricks and tiles, including the coves and ribs of ceiling. The floor should be of a washable nature. Inhalation

halls should receive some attention from a decorative point of view, since patients must remain some time at each sitting.

Where, as in most cases, it is desirable to keep the air of the inhalation hall from penetrating into the corridors and other bath-rooms, a double-doored lobby, such as recommended to be placed between the hot rooms and cooling room of the Turkish bath should be employed. In the example given the lavatory would, in ordinary cases, be used as an ante-room, and thus serve the purposes of the lobby. A lavatory, as shown, is a useful adjunct, both for its own sake and as a cloak-room and place to keep linen overalls to wear during inhalations.

(*To be continued.*)

NOTES ON BUILDING PRICES.—X.

By John Leaning.

DIGGING.

THE valuation of excavation is comparatively simple in the case of the estimator of building values, as the work is all of a similar character. The digging for a building in London is frequently sub-let, despite the usual conditions prohibiting sub-contracts, and the cases are rare in which the general contractor can get it done as cheaply in any other way. The common practice is to contract with one man for excavation and carting (including general carting) and the supply of sand and ballast. The professional excavator has engines, cranes, and buckets which he brings on the work, and when a basement is required makes an inclined road to bring his carts down to that level. A common price for digging and carting in London is 3s. 3d. to 3s. 6d. When the builder does the work with his own men, the points for consideration are—

1st. The kind of labour available.
2nd. The degree of hardness of the ground.
3rd. The depth from general surface.
4th. The distance to deposit, and whether basketed, wheeled, or carted.

1st. The Kind of Labour available.—Digging can be done best and cheapest by the navvy who has been used to the kind of labour involved in the making of roads, canals, railways, or docks, and when there is a large quantity of digging it is policy to procure such; when the quantity is small, the builder contents himself with the work of the general labourer. A higher rate per hour than that for general labourer is frequently allowed in building accounts for labourers engaged in digging, but it is not always paid by contractors.

Sometimes the builder will let the digging only: it is obvious that the price must be, as a rule, less than the cost by other methods, or the builder would employ his own men. The men who take such sub-contracts work harder and for a longer time each day than those employed by the hour under ordinary conditions.

2nd. The Degree of Hardness of the Ground.—The estimator should satisfy himself of the nature of the ground by inquiring before pricing. When a building is pulled down, the men who do it leave the basement completely filled with building rubbish. This can be removed entirely with the shovel, although it is frequently measured by the quantity surveyor as digging, and included in the item Excavation to Basement. Such as this and other building rubbish requiring no getting is worth least of any. The classification of digging is simple, and may be reduced to four categories sufficient for all purposes.

A. Building rubbish, sand, loose soil, which requires no actual digging, only shovelling; of these a man will fill into a cart, or throw on to a stage or barrow about 22 yards per day of 10 hours. Instances have been known of a man throwing 25 yards per day. Cost at 6¼d. per hour, 2¾d. per yard cube. Constant ·045.

B. Vegetable soil, as in surface digging, dug with a shovel but not picked. A man will dig and fill into a barrow or cart 14 yards per day. Cost at 6¼d. per hour, 4½d. per yard cube. Constant ·07.

C. Clay, which can be dug with a shovel, but not necessarily picked, though sometimes picked for convenience, a man will dig and fill into a barrow, or throw up 6ft. Seven yards per day at 6¼d. per hour, 9d. per yard cube. Constant ·143.

D. In all the foregoing cases one man will do all the digging and filling or throwing. Hardest earth, clay, or gravel requiring picking, 6yds. at 6¼d. per hour, 10½d. per yard cube. Constant 1·67.

When picking is necessary, it is usual to have one man to pick and another to fill. The constant to be applied would be the sum of the constants for each man's labour.

Taking as an instance Mr. Hurst's constants for the excavation of clay, we have—

Excavating only per cubic yard	·100
Throwing with a shovel to a height of 5 feet, per cubic yard.	·055
	·155 = 6·45 yards per day.

Digging to Trenches.—Add to the foregoing prices 20 per cent. for work in trenches.

3rd. The Depth from General Surface.—Additional Throws.—The height of throwing is limited to 6ft. Each additional throw, including staging, 22 yards per day. Cost at 6¼d. per hour 2¾d. per cubic yard. Constant 0·45; staging about 1d.; total 3¾d.

4th. The Distance of Deposit.—Wheeling.—A run is assumed to be 20yds., but in the ordinary operations of the builder where the distance is only two or three runs, the wheeler will do it in one stage, using two barrows; one which he wheels, the other which he leaves to be filled during the time spent in going to the deposit and back, a third barrow and a second digger being used when one is not sufficient to keep the wheeler going. In cases of great excavations and longer distances, a more complicated arrangement is necessary. The runs must be carefully planned and the distances apportioned for the wheelers. The number of barrows for each shoveller is always one more than the number of wheelers. Plans of various barrow-runs are to be found in Seddon's "Builders' Work."

A filler will fill an ordinary barrow in the time a man takes to wheel it 33 yards, deposit the earth, and return with the barrow. A barrow holds one-tenth of a cubic yard. A man will wheel 20 yards, and deposit in a day of ten hours, about 35 cubic yards of earth. Cost at 6¼d. per hour, 1¾d. per cubic yard. Constant ·028. Additional runs, 1¾d.

Filling in and Ramming.—A man will fill in about 22 yards per day, and a rammer must attend on each filler. Cost at 6¼d. per hour each man, 5¾d. per cubic yard. Constant ·090.

Sometimes in a bill of quantities the excavation is all stated as "part filled in and rammed," or "a small part filled in and rammed." The earth returned should always be kept separate by the surveyor, and should appear in the bill as "earth filled in and rammed," or "dig, fill in, and ram." When it is not separated it must either be measured from the drawings or guessed at from the other items of the bill. The proportion will vary, and will rarely be less than five or more than 10 per cent. of the whole quantity.

Basketing.—Ordinary earth and clay per cubic yard would increase in digging about one-fourth, and as all earthwork is measured by the bulk before digging, we have just over 26 bushels per yard to dispose of. The basket holds about a bushel, but would be heaped. We may reckon, therefore, the usual 21 bushels as a yard. The case may be treated as analogous to filling barrows and wheeling. A wheelbarrow holds 1-10th of a yard, a basket about 1-21 of a yard (not quite half so much as a barrow). The difference is, however, enough to compensate for the lifting of the baskets, dealing with the distance as a run. The conveyance would take twice as long, two journeys instead of one. The filling the same as for wheelbarrows. Therefore the cost at 6¼d. per hour per cubic yard, of filling 2¾d. as before. The cost at 6¼d. per hour per cubic yard of basketing 3½d., equal twice wheeling; total, 6¼d.

Crane and Buckets.—The comparative cost of removing earth with and without machinery is arrived at in some such manner as the following. Every calculation of this kind will vary with the circumstances:—

	£	s.	d.
Cost of steam derrick crane with engine 4H.P. (nominal)	250	0	0
Cost of two iron skeps (1 yard)	18	0	0
	268	0	0
Cost of material of timber stage	15	0	0
Expenditure for wages, &c., erecting stage, hoisting, fixing, and removing engine	10	0	0
5 per cent. p.a. interest on capital £268 + £25 = £293 =	14	13	0
7½ per cent. p.a. for depreciation on £268	20	2	0
2½ do. do. on £15	0	7	6
Number of working hours per year, 2,587)	45	2	6

	Per hour	s.	d.
60lb. of coke per hour at 1s. per cwt. (15lb. per horse-power)		0	6½
54 gallons of water (135lb. per horse-power) at 1s. per 1,000 gallons		0	0¾
Engineer per hour		0	9
Three men filling skeps at 5¾d. per hour		1	5¼
Divided by yards per hour filled 7)		3	1½
Cost per yard 5¼d			

	s.	d.
Filling baskets and basketing per yard by previous calculations	0	6¼

The saving on the foregoing item is not great; it, however, illustrates the method of calculation. The difference of cost is more conspicuous in cases of digging deep trenches involving several throws, and the cost of unloading and depositing materials. Observe that the consumption of fuel will vary with the state of repair of the engine, and will be very much greater when it is out of order. On a very large work with deep trenches, temporary rails would be laid, and portable steam cranes used. There are a few general considerations which must be remembered in connection with earthwork. That work in trenches, post holes, wells, or cesspools will cost more than in large surfaces. Small quantities of digging will render it necessary to take a cart from place to place to make up a load at an additional expense. In the cartage of earth or other materials, a good schedule makes a distinction in the price thus:—"Add on the first load when not more than two loads are ordered to be removed on the same day." When earth is wheeled, small quantities differ but little in value for yard cube from larger ones.

Sometimes it is impossible to measure the earth of an excavation before digging; but a proportion can be deducted from the quantity of earth measured while loose after digging, as follows:—

	Increase of bulk.	Deduction
Earth and clay	¼th	⅕th
Sand and gravel	1/12th	1/13th
Chalk	⅓rd	¼th
Rock	½	⅓rd

Profit.—The author of a valuable series of papers on Estimating, which appeared in these columns, says: "A liberal profit shou d be added to excavating, as there must be a foreman on the site superintending this one trade, and the items are not large." The amount of an excavator's bill is generally small, but keeping the cost of foreman separate is to be preferred for the reasons before mentioned.

LARGE EARTHWORKS.

In estimating the cost of large earthworks, the proportion of getters, fillers, and wheelers requires careful consideration, and in any excavation the estimator must realise the method of doing the work before he can decide upon its cost. The "Dictionary of Architecture" says, under the heading "Earthwork":—"The French military engineers make a distinction between the various descriptions of earth, according to the number of men required to execute the description of work in them. (1) Ground easily moved is called earth of one man—terre à un homme. (2) Ground requiring two men, one to get and one to fill, is called earth of two men—terre à deux hommes. (3) Ground requiring three men, two to get and one to fill, is called earth of three men—terre à trois hommes."

There is a simplicity in this method of analysis which is, under some circumstances, most convenient. Rankine's "Civil Engineering" says:—

"The proportion of pickmen to the shovellers in a single rank depends upon the stiffness of the earth.

	Pickmen to one shoveller.
Loose sand and vegetable soil	0
Compact earth	½
Ordinary clay	½ to 1
Hard clay	1½ to 2

Earth is designated as "earth of one man" if one shoveller can keep one line of wheelers at work.

"Earth of a man and a half" if two shovellers and a pickman are need to keep two lines of wheelers at work. "Earth of two men" if one shoveller and one pickman can keep one line of wheelers at work, and, generally, "earth of so many men" according to the number of shovellers and pickmen together, who are required to keep one line of wheelers at work. Let m denote the number, l = horizontal distance the earth has to be wheeled, h = height of ascent if any, then the total number of shovellers, pickmen, and wheelers for each line of wheelers will be, approximately—

$$M = m + \frac{l + 6h}{\text{from 100ft. to 120ft.}}$$

This is most clearly put by Mr. Hurst. He says (Architectural Surveyors' Handbook): "As all ground has to be brought nearly to the same state before it can be filled into barrows or carts, the labour of filling may be assumed to be constant for earth of the same class, and the stiffness of the soil or difficulty of excavating it will affect only the number of getters required. Therefore, the proportion which the latter bear to the number of fillers determines the relative amount of labour required to excavate any particular soil. The unit to be adopted is the average quantity of earth which a man can fill into a cart or waggon per day of ten working hours."

"Let the number of fillers be represented by F, the number of getters by G, and the proportion which represents the labour as compared with that on earth which requires no getting by N.

$$\text{Then } N = \frac{F \times G}{F}$$

In this manner excavation can be described as earth of 1, 1½, 2 or more men, according to the difficulty in getting it. The French division of earth into three degrees of hardness, or four at most, is sufficient for all practical purposes."

Breaking Stone.—Breaking the larger stones in ballast for concrete requires little attention; but if insisted upon, a labourer could do thoroughly 30 yards in a day. Cost at 5¾d. per hour, nearly 2d. per cubic yard. Constant ·033.

The breaking of old bricks (sometimes used for concrete): a labourer would break into 2in. cubes about 4 yards per day of 10 hours. Cost at 5¾d. per hour, 1s. 2¼d. per cubic yard. Constant ·25.

Breaking Kentish rag or limestone. The stone in the sizes generally delivered for rubble walling: a labourer would break into 2in. cubes 2 yards per day of 10 hours. The stone measured after breaking. Cost at 5¾d. per hour, 2s. 4¾d. per cubic yard. Constant ·50.

In Boulnois' "Municipal Engineers' Handbook" we have the following:—"A good stone-breaker will break 2 cubic yards of hard limestone to the ordinary gauge (2½in.) in a day, and some men more. Hard silicious stone and igneous rocks can only be broken at the rate of 1½ or 1 yard per day. Guernsey granite a man can only break on an average half a cubic yard per day." River gravel, field stones, or flints, which are already of small size, can be broken at the rate of 4 or 5 yards per day.

In the construction of a building with rubble walls, the fragments produced by the dressing of the stone are available for concrete. For large works, where steam-power is convenient, Blake's stone-breaking machine may be used with advantage.

Screening Sand.—Sand is generally selected free from stones, and rarely requires to be screened for mortar-making. When it has large stones in it, screening is necessary. With a screen of the usual size of mesh, a labourer will screen 10 yards in a day of 10 hours. Cost at 5¾d. per hour, 5¾d. per cubic yard. Constant ·10. The sand and the screenings will both be usable, the latter for concrete and filling beneath pavings.

Washing Sand.—A man will wash a yard of sand (measured after washing) in three hours. The waste upon the original yard of sand will depend upon the proportion of loam or other soluble elements in it; commonly, a quarter of the original bulk is lost in the washing. The cost of a yard of washed sand would consequently be as follows, dependent, of course, upon the local value:—

	s.	d.	
1¼ yard of sand delivered (5s. 6d.)	6	10½	
Labourer, 3 hours (5¾d.)	1	5¼	
Cost per cubic yard	8	3¾	Constant ·30

Concrete.—The materials for concrete should be delivered as close as possible to their ultimate position, for, as before mentioned, it is the frequent handling of materials that increases the cost of the finished work.

The value of concrete depends upon—first, the amount of void in the aggregate which needs to be filled with the matrix; second, the diminution in bulk of the lime and sand, or cement and sand, as a result of mixing with water.

Stone broken into 2½in. cubes has voids	37	per cent.
,, ,, 2in. ,, ,,	40	,,
,, ,, 1½in. ,, ,,	42	,,
Clean shingle or burnt clay ,,	33	,,
Thames ballast ,,	15	,,

The diminution of sand and lime when made into mortar (matrix), is generally about one-fourth, more or less, and this may be adopted as a reasonable average. For cement and sand one-sixth may be taken as the average.

We may apply these facts to the calculation of the value of concrete in the following manner:

Taking water supplied in London by meter as 1s. per 1,000 gallons, we have less than ¼d. for a yard of concrete. Some water companies charge 1d. per yard of concrete: this is a reasonable average cost. Constant for mixing only, ·125 per cubic yard.

Example 1. Concrete composed of one part ground stone lime to six parts Thames ballast.

	£	s.	d.
6 yards of ballast (one-third sand) 4s. 6d.	1	7	0
25 per cent. on 9s. for diminution of 2 yards of sand in last		2	3
1 yard lime		11	0
Diminution of lime 25 per cent.			
Voids in ballast 15 per cent.			
Total 40 per cent on 11s. ..		4	4¾
	7) 2	4	7¾
		6	4½
Labour mixing (labourer 8 yards per day at 5¾d. per hour = per yard)			7¼
25 gallons water			1
Cost of 1 yard		7	0¾

The result of this calculation would have been the same if 17½ per cent. had been added to the cost of materials for waste.

Example 2.—Concrete composed of one-part Portland cement to six of Thames ballast; the cement 112lb. per bushel.

	£	s.	d.
6 yards of ballast, as before, at 4s. 6d.	1	7	0
16¾ per cent., ⅛th on 9s. for diminution of 2 yards of sand in last	0	1	6
21 bushels (21cwt.) of cement at 35s. per ton	1	16	9
Diminution of cement 16¾ per cent.			
Voids in ballast 15 ,, ,,			
31¾ ,, ,,			
say 32 on 36s. 9d.	0	11	9
	7) 3	17	0
	0	11	0
Labour mixing as last	0	0	7¼
Water as last	0	0	1
	0	11	8¼

Example 3.—Concrete composed of one-part Portland cement to six of broken limestone in 2in. cubes, and two parts sand (presumably in a stone district).

	s.	d.
27 cubic feet of rubble stone, delivered	2	6
Breaking—labourer, 5 hours at 5d.	2	1
9 cubic feet of sand = ¼-yard, at 5s.	1	8
4½ cubic feet = 3½ bushels, of cement at 1s. 9d.	6	1½
Difference between united bulk of cement and sand 50 per cent. and voids in stone 40 ,, ,,		
Difference 10		
Diminution of cement and sand in mixing 17 per cent.		
Deduct 10		
7 on 7s. 9½d.	0	6½
Labour	0	7¼
Water	0	1
	13	7¼

If the concrete is rammed, add 10 per cent. on the cost of ballast and lime, or ballast and cement, and labour per yard equal to earth ramming (see Ramming). The foregoing calculations are made on the assumption that the material is delivered close to the trench, and can be deposited by shovelling; if not, the cost of filling into barrows and wheeling must be added as follows:—

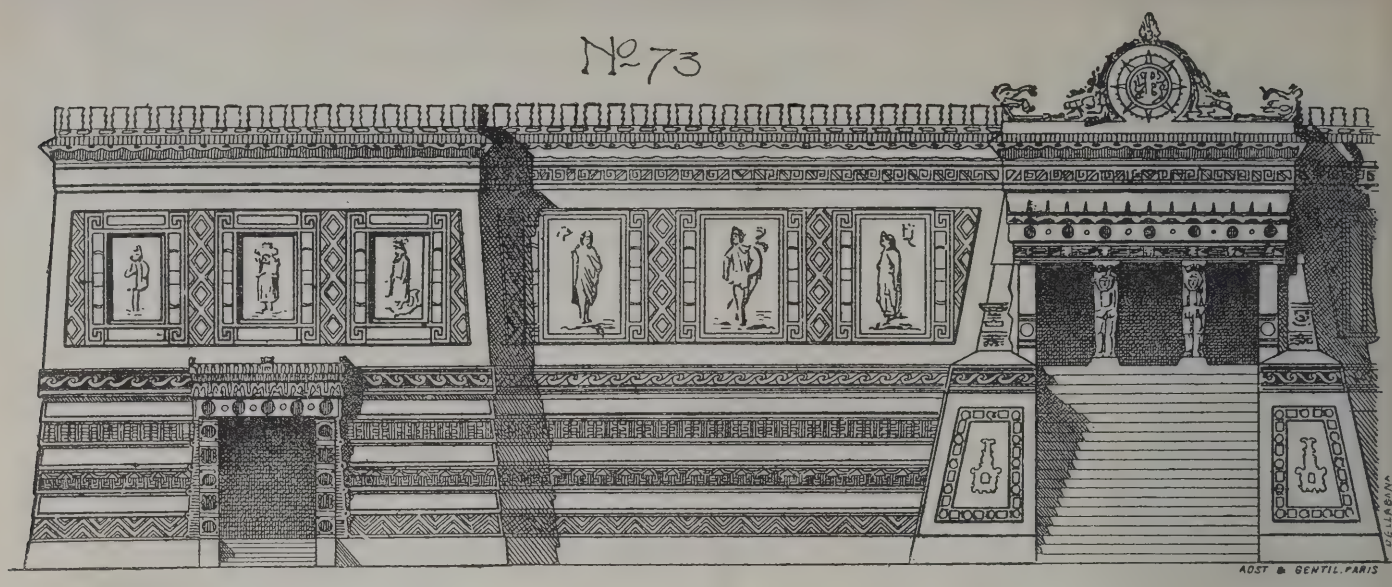
(See Filling) Filling into barrows	2¾d.
(See Wheeling) Wheeling	1¾
	4½

(General labourers at 5¾d. would do this.)

Rankine gives for *mixing* concrete, *wheeling*, and *depositing* ·75 per cubic yard, which is excessive; Hurst ·23—the latter equal to a little over four yards per day, which at 5¾d. per hour gives 1s. 2¼d. per yard. The great difference noticeable between calculated prices of concrete and some prices in estimates is to be accounted for by the fact that the concrete is made to absorb a great quantity of building rubbish surreptitiously used, and this method of saving is often reckoned upon by the builder. Concrete to receive paving in thin layers under 12in. thick involves extra labour for spreading. In a cubic yard of concrete deposited the surface would be levelled under any circumstances. Taking the average depth of concrete arbitrarily as 24in., there would therefore be in the case of a 12in. layer twice the superficial proportion of levelling per cubic yard; cost at 6¼d. per hour, ¾d. The value of a 12in. layer would therefore be one-third of the normal price of a cubic yard plus ¾d. A 6in. layer would have four times as much levelling; its value would be one-sixth of the price of a cubic yard plus three times ¾d. = 2¼d. When concrete is made with broken stone, sand sufficient to fill up the interstices should be added.

Six of Stone to One of Lime.—

Cost of six cubic yards broken stone	
Three yards sand	
One yard lime	
Value of seven yards 7)	
Add labour and water	
Value of one yard	



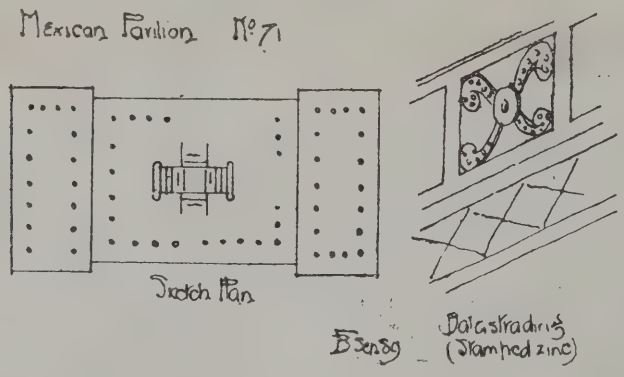
Concrete-Mixing Machines.—The advantage in large works derived from the use of concrete-mixing machines is shown by the following extract from "Newman on Concrete." "At Newhaven a *portable* continuous mixing machine, running on ordinary rails, designed by Messrs. Carey and Latham, was used. It could deliver 70 cubic yards of concrete per hour into the timber framing, and a lineal yard per day of the upper portion of the breakwater was thereby completed. The fixed continuous machine automatically measured, mixed, and delivered into a barge 100 tons of concrete in 20 minutes. At Newhaven Harbour works it was found that the labour on a 100-ton bag of concrete cost 35s. by this mixing machine, and £5 5s. by piecework hand mixing. The cost of mixing the raw materials by hand was about 1s. 2½d. per cubic yard, but only 5½d. by the portable machine." This machine has been improved since the above was written, and Carey and Latham's patent, made by Wilson, of Liverpool, is the best in the market. Its work on the Manchester Ship Canal, and other recent works of large size, has been strikingly successful. The mechanical measuring and mixing of the materials insures a uniformity of quality such as hand labour can never effect. The method of calculation of cost of concrete mixed by machinery would be substantially the same as suggested for use of a derrick crane. The necessity for travelling gear and sand and ballast hoppers varies with circumstances; but without these the cost of the machine on railway at Liverpool, with engine and boiler (list prices), is as follows:—

10 cubic yards per hour,	£325
20 ,, ,,	£520
40 ,, ,,	£640
70 ,, ,,	£720

All subject to 10 per cent. discount.

The power of the engine may be taken as 3 nominal horse-power for each 10 yards of concrete; 15lb. of coke per horse-power per hour; and water for boiler per horse-power per hour about 14 gallons. The use of such a machine requires a system of rails and tipping waggons for the delivery of the concrete. Such circulars as those of Hudson, of Leeds; Kerr Stuart, of Glasgow; and Matheson's aid book will afford all the necessary information as to price of rails, sleepers, and waggons, and their adaptability to the purposes above mentioned.

(To be continued.)



Façade principale du pavillon du Mexique.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XV.

MEXICO.

THE architect of this building was M. Anza, a Mexican.

The plan (No. 71) is composed of one large hall 131ft. × 78ft., and a small hall on either side with its longitudinal axis perpendicular to that of the main hall.

A gallery runs round the three halls, and there is a large lantern light in each, which serves for all the lighting, as there are no windows in the façade. There is a staircase in the centre of the large hall of the form shown, which leads to the galleries above.

The whole of the interior ironwork is painted with two tints of brown. The columns supporting the galleries run from top to bottom of the building and are finished under the laylights with conventional architrave, frieze, and cornice (No. 72).

The laylights are formed with T irons and coloured glass as in sketch. The staircase is of stone with wooden handrailing filled in with hollow cast-iron panels as sketch.

The interior facings are in zinc fixed to the iron framing, whose larger parts are bolted together, in order that it may be taken down and rebuilt with ease in Mexico, as it is intended to form a museum of it.

The interior, No. 73, from *Le Génie Civil*, is painted with two shades of chocolate, which give it a sombre effect, combined with its own architectural style. The walls batter inwards from bottom to top and are ornamented with bands of zinc repoussé in geometrical patterns and with fret patterns.

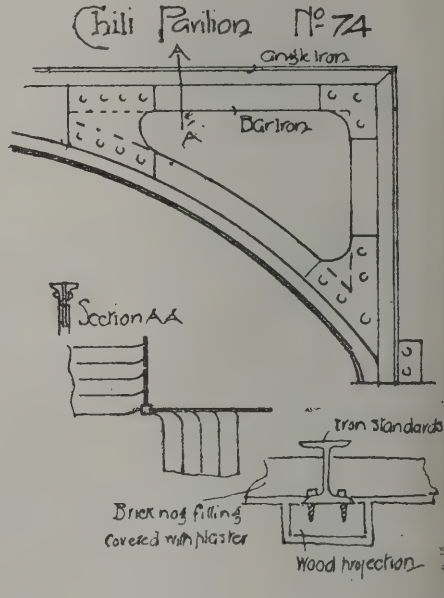
As far as the *motif* is concerned, the architect has reproduced one of the ancient Mexican temples, ruins of which are still found. The design is founded on one particular one, the Teocali (Temple of God) at Xochicalco, and everything in connection with the decoration has been studied in works on the subject.

The central feature is an entrance, No. 73, ascended by steep steps (a characteristic of these ancient temples) which, however, are too steep to be used nowadays, but which were used by the victims about to be sacrificed in the central porch above. Over this porch is a central feature consisting of the symbol of the sun (Tonatuith) presiding at the creation of Capactli, representing the fertilising power of the earth nourishing the human race.

The central parts of the façade are ornamented with symbolic emblems of the periodical feasts of the sun and fire, and the basement is decorated with the principles of this religion.

The frets and other ornamentation to the *zinc repoussé* are from potteries found in the neighbourhood of Texcoco. All along the façade at the gallery level are groups of statuary in bronze representing the arts, the agriculture, and the commerce of Mexico.

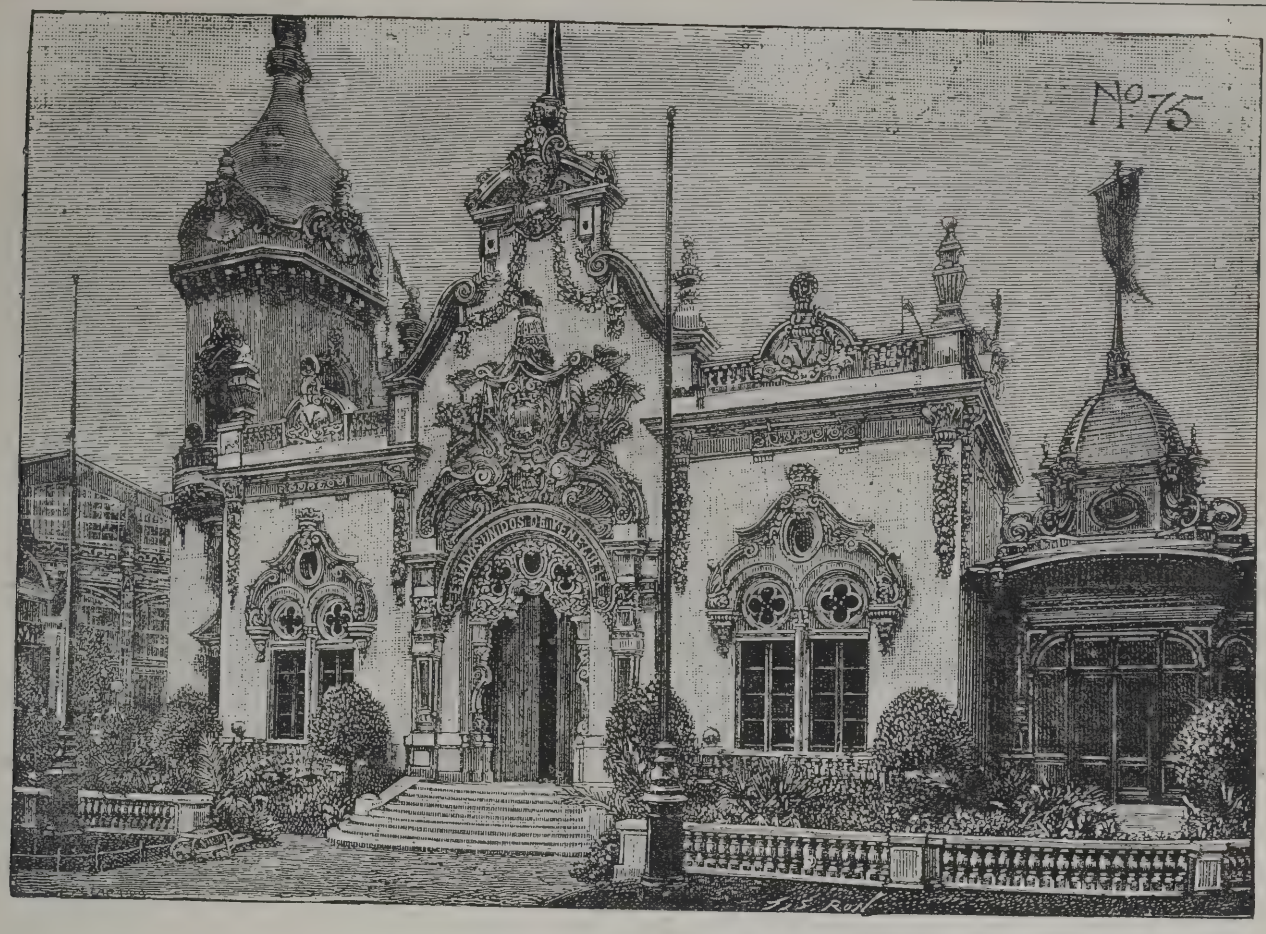
The exhibits consist of a fine collection of marbles and wood of all colours and descriptions, of which Mexico, it is well known, exports enormous quantities.



The crowning feature of the façade, we may add, also the cornices of the entrance doors, are in cast and galvanised zinc, while the rest of the facing is in *zinc repoussé*.

THE BRAZIL PAVILION.

M. Louis Dauvergne (expert to the Council of the Prefecture of the Seine) is the architect. It is situated opposite the entrance to the Argentine Pavilion, and is quite the antithesis of this last-named in regard to colour, being almost entirely white as to its outside, in a sort of Renaissance architecture.



It covers an area of about 480 square yards, and is three stories in height, surrounding a central covered area with lantern in stained glass. The staircase is situated in a tower 130ft. high, leading off the main block.

The circular-headed windows and door openings are filled in with iron framing painted slate colour, and with a border of white and yellow tiles, with floral decorations, relieving the rather dull appearance of the slate-coloured ironwork.

The small circular columns supporting the semicircular arches to the first floor are somewhat bulbous in form.

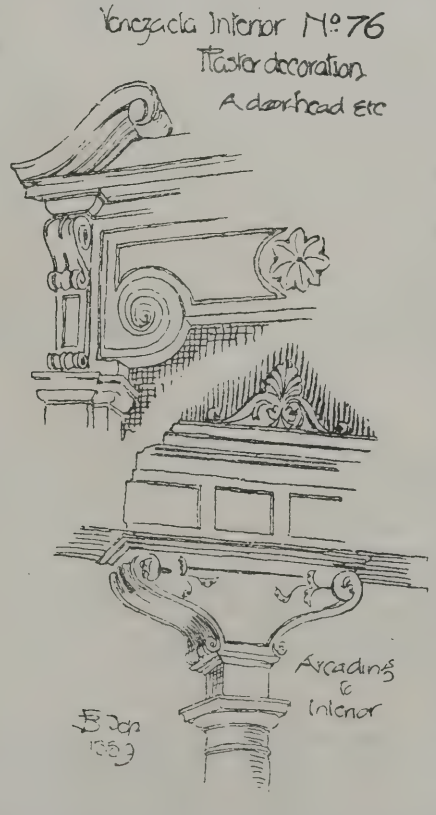
In the interior, the ironwork, which is everywhere exposed (No. 74) is a dull slate colour, which is relieved by the rivets, caps, and consoles, &c., being painted in gold. The plaster ceilings to the galleries are also dark in tone, consisting of Indian red ground, with geometrical

figures in black painted on, and having black border.

A feature in the internal ironwork is the absence of sharp corners, which are avoided by putting in corner-plates between the two angle irons, for example. The internal caps and columns are not worth noticing, as they imitate stonework, and do not teach us the lessons which the "Galerie des Machines" and Argentine Pavilion do.

The steps to the staircase leading to the top of the tower are executed as one often sees them in France (see sketch), and which in a case of this sort is useful as giving more room to the passers at the necessary point.

The carcase of the building (No. 74) is composed of a framework of iron with wooden plates bolted to them to form the projections, &c., for the elevation, the whole pugged and faced with plaster, in this respect not showing the construction internally to anything like the same degree as the Argentine Pavilion. The tower itself is, however, built in brick. The roof and the floors are framed in iron.



The ornamentation to the exterior is performed in "staff" or canvas plaster, differing thus considerably from the Argentine Pavilion, which is filled in with terracotta slabs, glass, &c., and which has the ironwork showing.

The six statues facing the entrance, and resting on pedestals, represent the six great Brazilian rivers (the Tiété, Tocantius, Parana, Amazon, San Francisco, and Parahyba rivers), and the "staff" ornamentation to the building itself has a Renaissance feeling.

THE VENEZUELA PAVILION

Is situated opposite the end of the Mexican Pavilion, and is by M. Paulin, a French architect, and occupies a site of 600 square yards. It is mainly a one-story building, and is grouped round a central covered courtyard, top-lighted, formed with Doric columns. Turning off the left aisle on entering is a small committee-room, and by its side a circular staircase leading to the balcony above. The right aisle gives access to an octagonal room, and also to a room running parallel with it. The design itself, as will be seen, is Spanish (No. 75 from *Le Génie Civil*) Renaissance of the time of Charles Quint. M. Paulin adopted this style because Venezuela had at one time been a Spanish colony, and it has no architecture of its own—like the Mexican, for example.

It is entirely white in colour. The external walls are formed in *pan-de-bois* (brick nog walling), on which the plaster of Paris is placed.

The dome of ogee shape, the heavy ornamentation over the entrance and over the windows (executed in "staff"), and the balustrading over the cornice, remind one of the palaces and buildings of Granada and Seville.

The aisle portion is in exposed wood framing with semicircular tiles, and the porch at the back is in wood also, beautifully executed in the Renaissance style.

The interior (No. 76), however, is the most satisfactory part of the whole design; it is much quieter in tone, and reminds one more of Italian Renaissance.

The modelling of the Doric columns, the entablature over, and the small circular lunette windows over this, are executed with as much care and delicacy as anything in the Exposition, and the whole of this interior is so refined in feeling that it seems a pity that it is all to be pulled down at the close of the Exposition. It is one of the best examples of the temporary pan-de-bois and plaster of Paris type, no ironwork being used.

CHIPS.

The second annual report of the South Wales Art Society, just issued, is of a satisfactory character, and speaks of steady progress in membership and influence, of increase of members, and of a balance on the right side in the banking account. The third annual exhibition will be held at the Public Hall, Cardiff, opening on November 15th.

The local board of St. George, next Bristol, have elected Mr. T. L. Lewis, of Islington, as surveyor, in succession to Mr. Cloutman, at a salary of £175 per annum.

The opening of Pers verance Mill, a new cloth factory, built at Woodhouse Carr, Leeds, for Mr. Peter Laycock, was celebrated on Saturday night. The new mill will necessitate the employment of about 200 more hands. The building, which is of brick, consists of five floors and contains 120 looms. The total floor space is 3,000sq.yds. Mr. W. S. Braithwaite was the architect.

Kinbuck Tunnel, about a mile to the north of Dunblane, on the Caledonian Railway, will soon cease to exist. More than a year ago a large staff of men under Mr. A. H. Boyle, contractor, commenced to convert the tunnel into an open cutting. The soil above the tunnel has all been removed, leaving bare the outside of the arch. Adjoining the operations was a large wet moss, into which the soil has been put, raising the surface to the level of the surrounding land and reclaiming several acres which previously were useless.

The Prince Regent of Bavaria has conferred the Royal Professorship upon Mr. Hubert Herkomer, R.A., who was born in Bavaria, and for some time pursued his art studies in Munich.

Our Illustrations.

EAST RIDING OF YORKSHIRE COUNTY COUNCIL HALL AND OFFICES, BEVERLEY.

THESE buildings are about to be erected in Cross-street, Beverley, on the site of the old Mechanics' Institute, and provide on the ground floor a suite of offices for the Clerk to the County Council, a large strong room for the county records, and four offices for the officials. The entrance is centrally situated in the principal front with a portico, and leads into a spacious corridor having immediately on the right side a large committee-room. The principal staircase will be constructed of oak with a handsome balustrade of fine-grained wainscot and Hungarian walnut. The staircase for the public is of stone throughout. The council chamber is placed upon the first floor; it is semicircular in its arrangement, and the size is 56ft. by 36ft., with deeply recessed windows and fireplaces; the whole of the fittings are of oak, and the ceilings and walls are relieved with enriched panels and pilasters. Upon the same floor a large committee-room is provided, and on each side of the landing are members' room, retiring room, &c. The gallery for the public will be upon the second floor, and access to it is obtained by a side entrance opening into the register square. The design provides for an extension if at any future time increased office accommodation should be required. The style of the building is Renaissance, and it is to be erected with red brick and stone dressings, at an estimated cost of £4,500, from the designs of Messrs. Smith and Brodrick, of Hull, architects.

SOUTH LEIGH CHURCH AND THE PRIORY CHAPEL, BURFORD, OXON.

WHEN the Architectural Association excursion party last month visited Stanton Harcourt and Witney they were within a mile or so of South Leigh Church, one of the most interesting buildings of its kind in the county of Oxford—indeed, we may say in England, because of the curious Mediæval paintings with which its walls are decorated. We give a photographic view of the east wall of the nave looking into the chancel, with the large mural representation of the Day of the Resurrection over the arch. Many of the figures in these pictures, which extend round the nave, are very curious and grotesque, but they are conceived in a devotional spirit throughout, though a love of fun is conspicuous notwithstanding. About 18 years ago the church was very carefully restored, and the architect, Mr. Clapton Rolfe, of Oxford, at considerable personal trouble, reclaimed these decorations from the incrustations of whitewash, the result of many years' coatings, and with the aid of Messrs. Gibbs and Moore, of Great Russell-street, has renovated, and, where necessary, renewed, the pictures. The dado decorations are in good taste, and are modern. The screen and altar were added by Mr. Rolfe, and will be found illustrated in detail in the BUILDING NEWS for April 25, 1873. The Priory Chapel at Burford will be found fully described in the BUILDING NEWS for Aug. 8th last, when we gave a plan of it, and a view of the exterior of the church was also given. The photograph printed to-day shows the altar and reredos of the chapel, as restored by the late George Edmund Street, R.A.

A CROSIER FROM THE R.A.

THE crosier is of silver-gilt with ivory staff, and the crook and knops jewelled and enriched with translucent enamels. The subject in the crook is Our Lord in Glory, and on the reverse Our Lord's Charge to St. Peter, surrounded by the Apostles; in the niches are the donor and certain of the bishops of the see with the tutelar saint of the diocese. The design was made by Messrs. Saul and R. B. North, of South Kensington. The drawing from which our plate is taken was shown at the Royal Academy this year.

PRUDENTIAL ASSURANCE COMPANY'S OFFICES, GLASGOW.

THIS structure, at the corner of West Regent-street and Renfield-street, is built of Corsehill stone and red Ruabon bricks, with red granite substructure, emery polished. The company's offices are at the corner of the two streets, and are lined with Burmantofts faïence, the ceilings being of the same material supported by ribs of walnut. The rest of the building is arranged for shops and suites of offices, the former facing Renfield-street and the latter entered from West Regent-street. Many of the offices look into a spacious internal court, faced with glazed brick-work and buff terracotta. The building is fire-proof throughout, and externally its warm colour contrasts not unpleasantly with the somewhat sombre tone which the atmosphere of Glasgow soon imparts to its excellent masonry.

TIMBER HOUSES IN AMERICA.

THIS sheet of working drawings is practically self-explanatory, with plans, elevations, a section, and a perspective view. The arrangement adopted in the designing of these houses, though based on the requirements of American dwellings, aims at securing the utmost accommodation within the restricted limits of the plan. This is based on the square with a view to cheapness. The walls are entirely of timber-framing and weather-boarding, save in the central part from which the fireplaces are carried up. The basement walls are of stone, and being built some few feet above the ground line to the level of the ground floor, form a plinth all round the house. The roofs are tiled, and the woodwork is painted white. Other houses, also by the same architect for the same proprietor, have on previous occasions been illustrated in our pages. This building contains a roomy hall, two sitting-rooms, and a kitchen, with offices and back staircase to the basement; four bedrooms on the first floor, and four attics above. The flues are grouped in one chimney stack. With the heating apparatus, in which hard coal is used, in the basement, no open fireplaces are required in the bedrooms. In a timber-built house the minimum number of grates is desirable on account of risks from fire. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

ENTRANCE LODGES, CLAYBURY ASYLUM.

THESE lodges form the chief entrance to the vast pile of buildings now erecting at Woodford, in Essex, as a fourth asylum for the old county of Middlesex by the London County Council. Mr. G. T. Hine, of Nottingham, is the architect. The lodges were built by Messrs. Higgs and Hill. Mr. H. Lovatt, of Wolverhampton, is erecting the asylum itself, and Mr. Gabbutt, of Liverpool, put in the foundations, which, with the walls, boundary, fencing, lodges, and gateways, cost £50,000. The contract for the asylum is about £340,000 besides.

OLD FRENCH BOUDOIR FURNITURE.

THE little Secrétaire of Kingwood marquetry is a beautiful specimen of the best period. It is mounted in ormolu, and decorated with Sèvres plaques, the falling front, inclosing drawers, is inlaid with a Sèvres panel, painted with a pastoral group. This elegant piece of furniture, whose value might be reckoned in hundreds of pounds, stands only 3ft. 9in. high, the length being 1ft. 6½in., and depth 11in. The escritoir, besides being made by one of the most skilful of French artists, Riesener—or possibly his master Olben—has over and above its especial merit as a work of art, a deep interest attaching to it, for it is said to have been made for Marie Antoinette. Riesener, who was born about 1730, was frequently employed by the unfortunate Queen, and some pieces of furniture which he made for her are known to be in existence. David Roentgen (commonly known as David) did the chased ormolu work with which it was ornamented. The escritoire is made of tulip-wood, inlaid with flowers and trophies, &c., in plain or tinted wood. The whole of the contour is curved, this greatly adding to the difficulties of its production, and lending also a certain feminine air of softness to its appearance. The falling front is cylindrical, and incloses drawers with inlaid fronts; beneath this is a shelf made to slide in and out. The large drawer, shown open in the sketch, is made with three compartments, having inlaid lids, the central one opening back to form a mirror, and all are fitted with the requisites of the toilet. The height is 3ft. 5in., and the width 2ft. 6in. Both pieces of furniture form part of the the valuable collection bequeathed to the nation by the late Mr. John Jones.

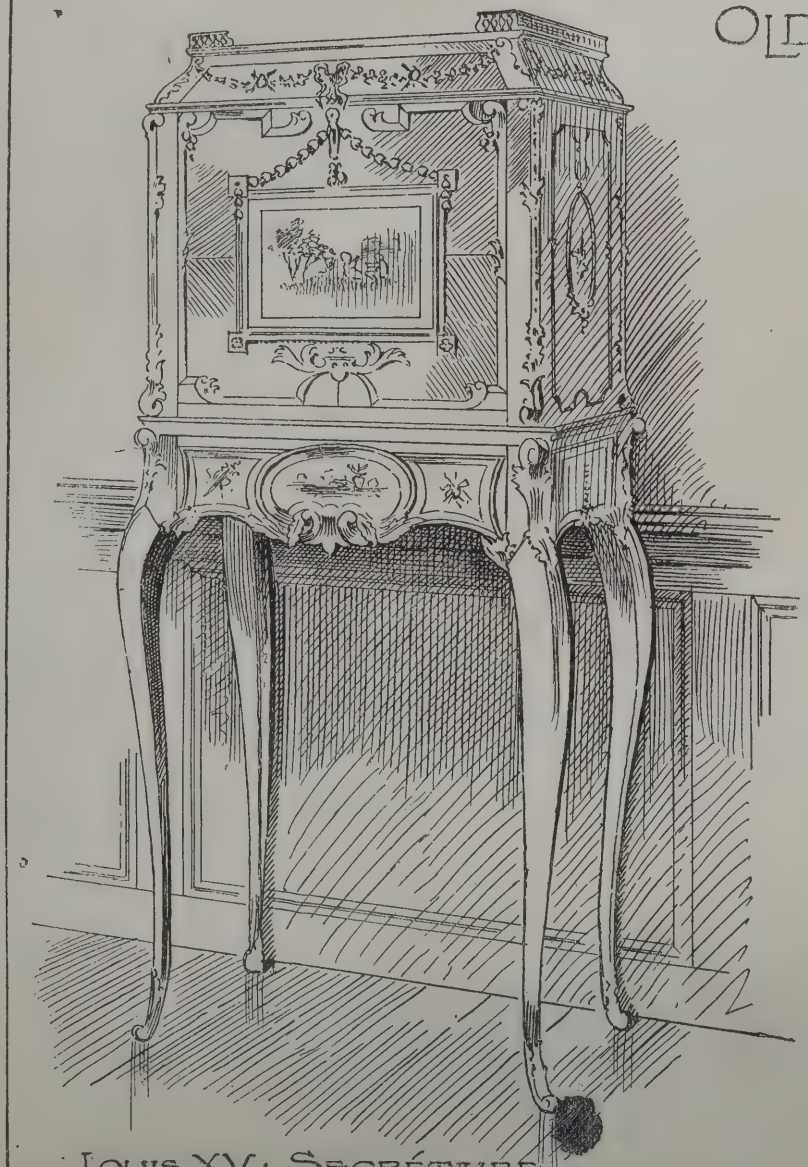
CHIPS.

An equestrian statue of the late King Victor Emmanuel, which has been erected in the new quarter in the centre of Florence, was unveiled on Saturday in the presence of the Royal family. The statue is the work of the sculptor Zocchi.

An organ was used for the first time in Troqueer Church, Dumfriesshire, on Sunday. The instrument was built by Messrs. Forster and Andrews, Hull. The whole of the Established Churches of Dumfries and Maxwellton now employ instrumental aid in the service of praise.

The surveyor to the Local Board of Hunsworth has been missing since the 11th inst. At the last meeting of the local board a letter was read from the assistant local auditor (Mr. H. McRich), complaining that a new book had been substituted by the surveyor for the old one, although the latter was not filled. The surveyor had told him that whilst making out his accounts on the 16th August he had upset an oil lamp he was using, and the result had been that the whole of the book had been burned, with the exception of the stamp given by Mr. J. L. Adams at the last audit. When he disappeared Harker had just received an advance of £28. Harker had received notice to appear before the board to explain matters on the day that he disappeared. The board have placed the affair in the hands of the police.

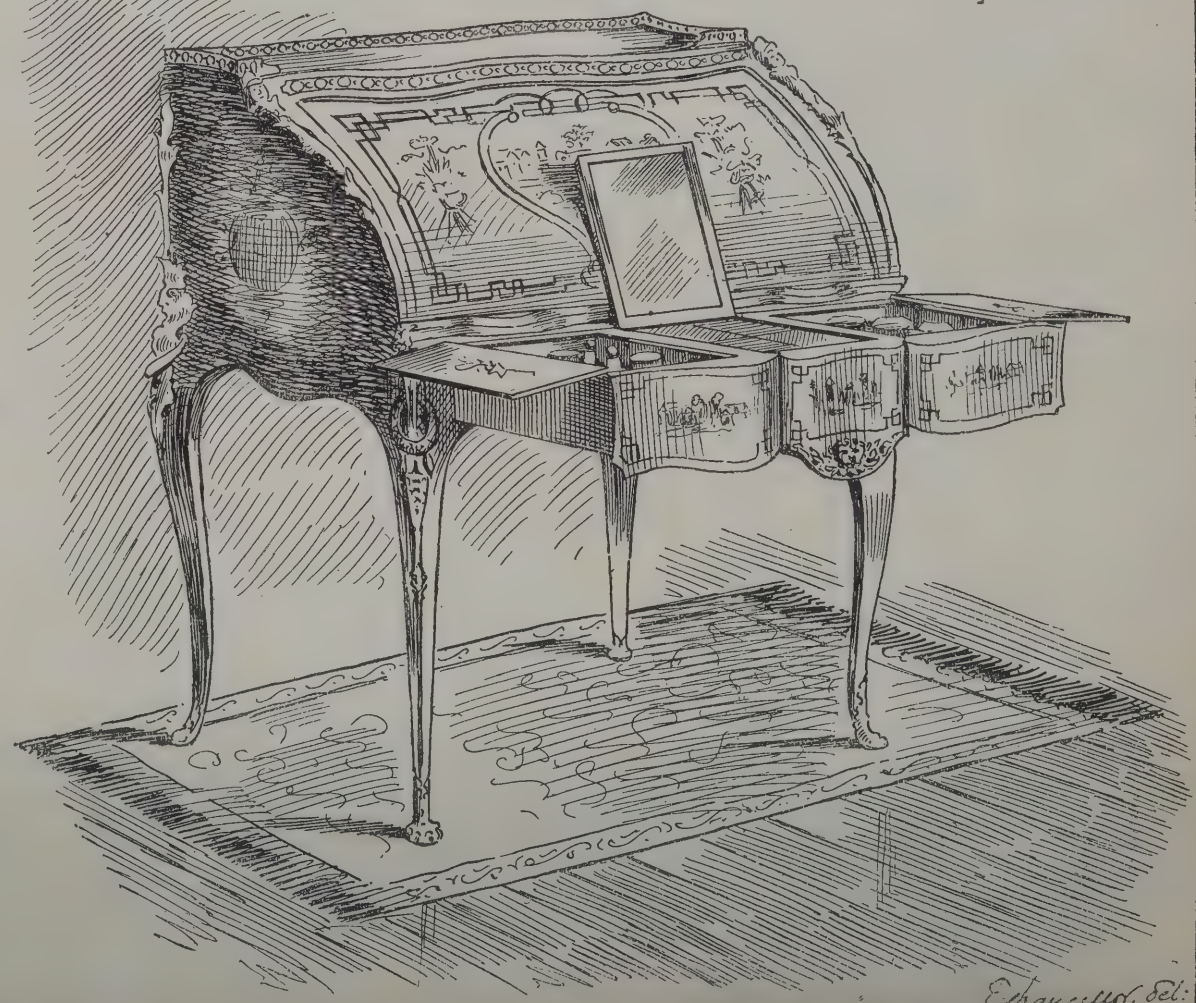
The death is announced, at the age of 84 years, of Mr. George Cousin, formerly in extensive practice in Edinburgh as an ordained surveyor. For many years he was a member of the city council, and took a prominent part in all the questions which came up for discussion, specially the City Improvement Scheme, with which the name of his brother, the late Mr. David Cousin, then city architect, is associated, as also the various schemes for the water supply of the city.



The new premises of the Iron Shipbuilders' Society at Jesmond, Newcastle-on-Tyne, were opened on Monday. Mr. B. Barton was the contractor.

The Ipswich Town Council considered at their last meeting a letter from Mr. Felix T. Cobbold offering as a free gift a valuable corner site in St. Clement's, Fore-street, lately occupied as a wholesale druggists' warehouse, as a site for proposed baths for the district. Mr. Cobbold offered to supplement this gift by £1,000 towards the estimated cost of alterations, with a further sum of £200 if Mr. T. W. Cotman, of Ipswich, be appointed as architect, and another £100 if Mr. Girling be chosen as builder. It was unanimously agreed to accept the gifts, and to appoint Mr. Cotman as architect; but under the Corporations Act the town council were advised that they could not appoint a builder without competition.

The new Roman Catholic Church of the Holy Rood, in Market-street, Watford, was opened on Tuesday week. It is a cruciform edifice, consisting of chancel, transepts, aisles, and nave, with a turret on either side of the junction of the chancel and transepts. The style is Late Decorated, and the materials are local flints and tiles, with freestone dressings. Chairs for 500 persons are provided. Mr. G. F. Bentley is the architect, and the builders are Messrs. Thomas Turner and Co., Watford.



The parish church of Buckland All Saints, near Sidmouth, has been reopened after restoration. A porch and a vestry have been added, the flooring and seating renewed, new windows fixed (the east window being a special gift), and various other improvements have been effected. The work has been done by Messrs. Farr and Sons, builders, of West Alvington.

THE ENTRANCE GATES, CLAYBURY ASYLUM.—G. T. Hine, *Architect, Nottingham.*

WAYSIDE NOTES.

MR. EDWARD J. POYNTER, R.A., writes to the *Times* of the 23rd, in the matter of the preservation of ancient monuments in Egypt. His letter and suggestions are contributions to a discussion on the acts of vandalism and wanton destruction that have been largely committed in the country of length without (much) breadth, during the time of the British control. Mr. Loftie and Mr. Petrie had already written on the subject, showing the losses that have been sustained in the way of damage to temples and tombs along the banks of the Nile. According to the accounts of these gentlemen, there is much to regret in this way. Damage "by tempest and accidental fire," as the lawyers have it, even extended over centuries, accounts nothing, apparently, when compared with the havoc wrought by virtue of the unscrupulous manners and customs of the demoralised "Fellah" and the vandalism of tourists, personally conducted or otherwise—most probably the former—as the men who wander about Egypt in search of the archæologically interesting, accompanied only by a dragoman, are of a stamp not given to cockney pettinesses.

It is unpleasant to be told that the vandalism and destruction have been coincident with the British occupation. It is little to the national credit. Centuries of ordinary decay, say the writers personally acquainted with the antiquities of Egypt, count nothing beside the havoc of the past year or so. The direct cause of this seems hard to explain, unless it be that since English soldiers have been established at Cairo, tourists have had more confidence in grubbing about the deep, sunless recesses, and silent, out-of-the-way galleries, of pyramid, tomb, and temple. A badly-founded confidence this, one would think, remembering the slaughter of the people of Egypt struggling against a grinding taxation, the memory of which must yet rankle in the native breast; and it would seem reasonable to suppose that travellers contemporary with the authors of "Eöthen" and "The Crescent and the Cross," would have been received with more good-fellowship than post-Kassassin and Tel-el-Kebir tourists. Anyhow, the reports of acts of vandalism increased so largely during the last year or so, point to an increase in the number of curious sightseers; and, indirectly, the same cause may lie at the bottom of the destruction and spoliation of antiquities by the natives, who could sell their ill-gotten trophies and spoils for much gold.

The suggestion thrown out by Mr. Poynter, as hon. sec. to the Society for the Protection of the Monuments of Ancient Egypt, is that there should be appointed an official whose duty it should be to supervise the various antiquities, and control the present and appoint new, custodians, to the old buildings and ruins. The arrangements at present in vogue for the guarding of temples and tombs are remarkable only for their inadequacy. The central authority, if so it may be described, is wholly ineffective, and local representatives are open to bribery. A properly qualified and energetic official of the nature suggested by Mr. Poynter would be able to organise a real protection against the wanton destruction and acts of vandalism. Unfortunately there seems to be a very considerable amount of difficulty in the way. The S.P.M.A.E. have done their best for some time past, but have received little or no encouragement either from the English Government or from the Franco-Egyptian Museum. As an architect, one can understand the difficulty. It is hard enough to awaken in the public mind any sympathy with schemes for the protection and reparation of antiquities in this country; abroad the difficulty is four-fold. As a rule, funds are hard to raise; but in the present case the chief difficulty seems more to do with lack of inclination out in Egypt itself. Until this is overcome Mr. Poynter and his friends will make little headway. With their endeavours we all however heartily sympathise, and hope that in the near future they may be covered with the fullest success.

Some details of the recent regrettable fire at the Alhambra have been furnished by Mr. Henry Stainer, British Vice-Consul at Granada, who was awakened from his slumbers on the night of the 21st inst. by the general flurry and bustle attending the conflagration. Mr. Stainer says that when he entered the palace about midnight the nature and vehemence of the fire was such that the building seemed doomed to complete destruction. The flames appeared in three places at a time, leading to the general supposition that a dastardly act of incendiarism had been committed, and causing a chorus of indignant declamation from the assembled people. All Madrid and his wife seems to have been present, and numbers assisted in the work of staying the ravages of the flames. By two o'clock the fire was localised to the Court of Alberca and the Salla de la Barca, the flames being prevented from spreading to the Court of the Lions and Hall of the Ambassadors by prompt cutting away of roofs. At five o'clock the fire was smouldering only, and all danger of further destruction at an end. Neither does the damage appear to be quite so extensive as we supposed last week. The roof of the Salla de la Barca has been entirely burnt; but, although the colouring is "disfigured"—Mr. Stainer doubtless uses a rather mild term—the walls remain intact. The gallery at one end of the Court of Alberca is destroyed; but this, excepting some rooms on one side of the Court, comprises, apparently the whole of the damage. The fortunate possessors of one of the more elaborate works on the Alhambra may, therefore, refer to their pages, and ascertain the extent, on plan, of the damage. I did think it might be worth while to run in to the Museum library, and refer myself; but on second thoughts felt sure that "Jones" would be at a high premium, and architects and artists crushing in numbers the approaches to the dome. Not having my weather-beaten A.A. Soirée hat in readiness, I judged it wise to stay away.

According to Mr. Stainer, what has been burnt can be all restored except the ceiling of the Salla de la Barca and the colouring of the walls, which is much like saying that having lost a sovereign, one had found it again, except nineteen-and-six-pence—for the beauty of the Alhambra is in its colouring. Without that it loses its meaning, and the architecture proper becomes a mere framework or skeleton. If the colouring is destroyed it would be vain to restore the marble, wood, or plaster that had been dignified by its presence, and one can well imagine that given a knowledge of the colours employed, some register of which Owen Jones has doubtless made, it is yet hopeless to give even an approach to the effect produced by the Moorish decorators, by the most careful restorations. Ancient Saracenic colouring may safely be classed among the lost arts. Writers have sought to elucidate the principles upon which the designers of Saracenic ornamentation and colouring worked; but if the result of their teaching are to be found in modern attempts, it has certainly been misdirected labour. We know that there are many things that a man can do and yet not be able to imbue others with the feelings and appreciations fitting them for similar work; in this way it may be that Jones, after all his study and with his love of Eastern colouring, acquired power to do, see, and feel what it was impossible to teach.

All honour to the Rev. F. W. Ragg, M.A., the vicar of Marsworth, near Tring! In the year 1880, Mr. Ragg was appointed to the vicarage, and found the church in a very unsound state. With about £200 subscribed towards the restoration, the worthy vicar set to work himself as an ordinary mason, and with the aid of one professional stonemason and a few farm-labourers who voluntarily assisted, he restored the windows, took down the dangerous buttresses and rebuilt them, made good the south wall, and, with the aid of a carpenter, raised the roof of the nave. Having no funds left to pay the mason and carpenter for further services, he continued his good work, completing the buttresses and walls, building a parapet, refacing the tower, cutting and erecting a chancel arch, &c. After an attack of rheumatic fever, due to exposure when working, the vicar continued his work. Now, some may exclaim that this energetic clergyman was spoiling the church, the property of the nation, &c.; but I see nothing but what is admirable in Mr. Ragg's work. The church will not be cursed with 5 per cent., and not a little poetry will be in its new stones. We may rest assured that nothing except the absolutely essential was done in this novel restoration. The job-making, which I make bold to declare frequently takes place in connection with restorations by the profession—to its lasting disgrace—was absent. In its place we have a vicar who, for the love and interest of his work, patiently, and labouring with his own hands, repairs and restores stone by stone. If in any part the slight innovations be open to criticism, I would despise the man who criticises under such circumstances. And there is no actual need to suppose that the work was other than strictly architectural. Mr. Ragg, doubtless, had advice and assistance from some friendly architect, voluntarily, as from the labourers. He could certainly have commanded such assistance from scores of competent, benevolent men.

If only other vicars of old village churches would follow Mr. Ragg's noble example, and thus work to the glory of God and the dignity of man, it would be well. We should see fewer old buildings tumbling into ruinous disrepair, on the one hand, and sleek, harsh, and over-restored on the other. Such works would always be carried out in the true spirit; nothing would be done but what was absolutely necessary for the good repair of the building. Every clergyman of the Church of England having an old unrestored village church going to decay for want of funds, may not have the ability for work such as that undertaken by the vicar of Marsworth; but there must be several just fitted for the task. And if fitted for the work, and having a liking for practical building, as very many gentlemen have, the leisurely repair of a small village church, on Mr. Ragg's plan, with such assistance as can be afforded, and, in the long summer evenings, voluntary assistance from good souls in the parish, cannot but be a labour of love and delight to those engaged. It would save some of our beautiful English village churches, out of the few that remain undestroyed, from being made "jobs." The occasional crude piece of work, that might be expected here and there, would be far less objectionable than the masses of new masonry, &c., put in in place of old work that should have been repaired stone by stone. In the stead of a contractor scheming to make the job pay, and an architect with a money interest, would be labourers working at a fair wage with those who could afford voluntary labour, and instead of a "job," would result a piece of handiwork imbued with all the poetry of church-work of the Middle Ages. GOTH.

CHIPS.

In Carlisle Consistory Court a faculty has been granted to enable the vicar and churchwardens of Casterton to make extensive repairs and alterations in the parish church. The roof is to be renewed, the floor relaid at different levels, the church reseated, and new pulpit, reading-desk, and communion table provided. The organ-chamber will be enlarged, and a new organ erected. The church will be lighted with gas, and the windows will be reglazed.

Extensive additions are about to be made to the workhouse in Oxford-road, Reading, from plans by Messrs. Charles Smith and Son of that town. The works have been let by the guardians in two contracts, the chief one, that for a new hospital, having been taken by Messrs. Higgs and Sons at £7,100, and that for the remainder of the work, including entrance block, receiving wards, and vagrants, having been taken by Mr. Lewis at £3,373.

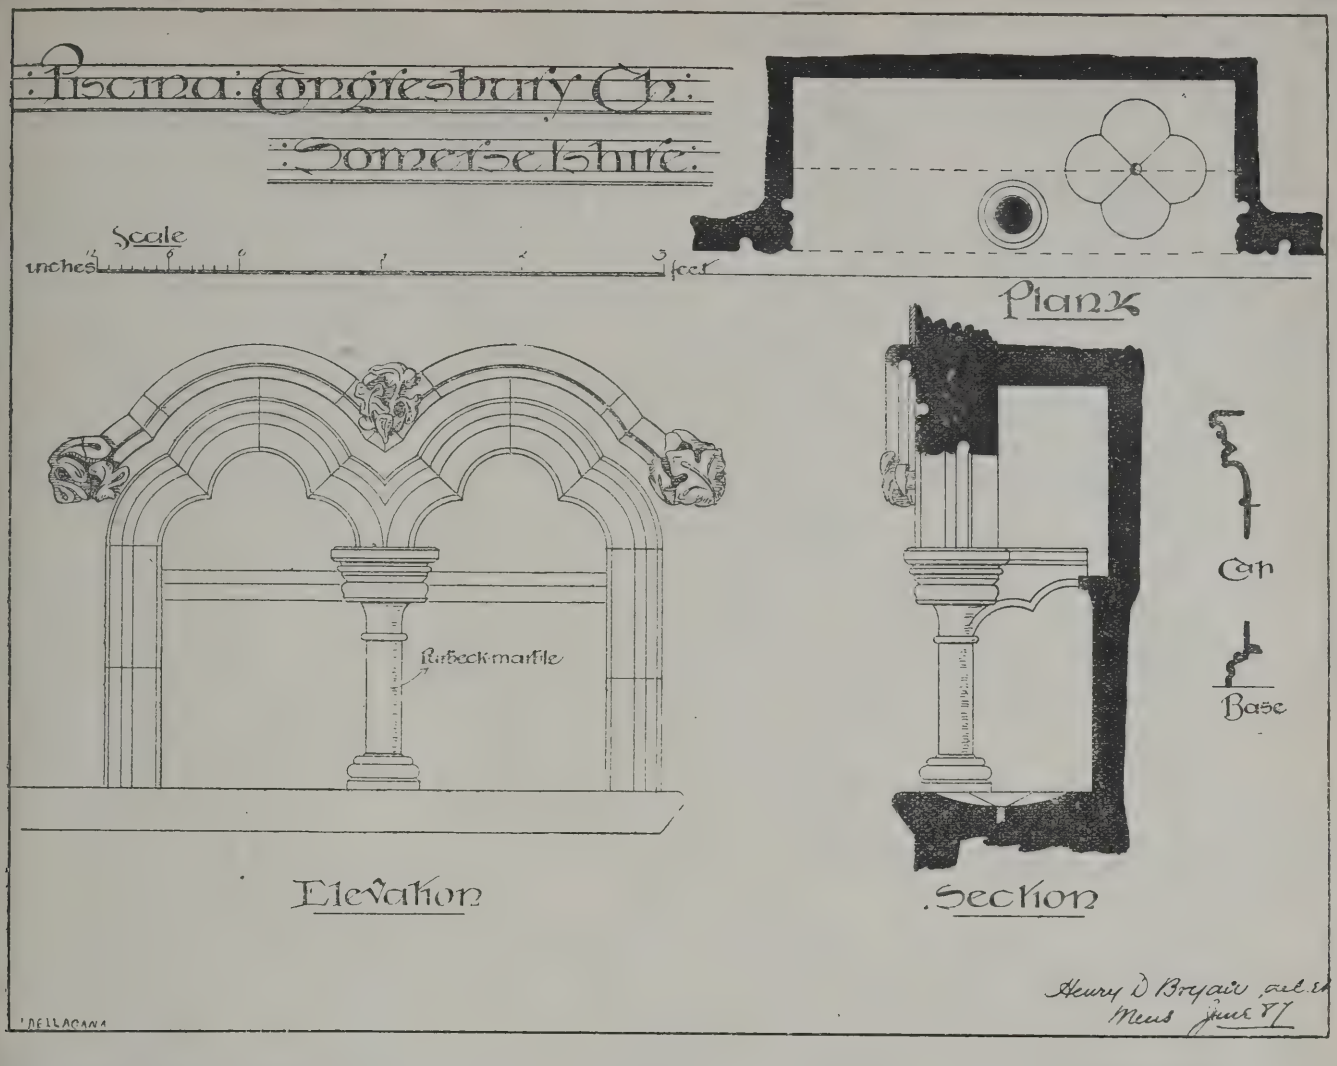
The Queen's Hotel in St. Mary-street, Cardiff, is about to be rebuilt from designs by Mr. J. P. Jones. The new structure, which is estimated to cost between £12,000 and £14,000, will be Renaissance in style, four stories in height, in addition to attics in the lofty roofs, and Massard pavilions to two chief angles; the facing materials will be red bricks, with terracotta for dessings.

Mr. W. H. Thorp, architect, Leeds, has been commissioned to prepare plans for the new medical department of the Yorkshire College, which is about to be erected on the site acquired near the General Infirmary at Leeds. Accommodation is to be provided for about 400 students, and it is intended that it shall be one of the best equipped institutions of the kind in the country. With that purpose in view, Mr. Thorp is at present visiting the Medical Schools of Newcastle, Edinburgh, Cambridge, and London.

The Bristol town council having applied to the Local Government Board for sanction to borrow £30,000 for the extension of the lunatic asylum at Stapleton, Mr. J. Thornhill Harrison, M.Inst.C.E., held an inquiry at the Council House on Friday into the matter. Mr. Oatley, of the firm of Crisp and Oatley, the architects of the new buildings, produced and explained the plans, which have been approved by the Home Office.

THE KNIGHTSBRIDGE IMPROVEMENT.

THIS week the long-talked-of scheme for the improvement of the high road at Knightsbridge has reached such an advanced stage of agreement between the vestries of St. Margaret's, Westminster, and St. George's, Hanover-square, as to render the plan fit for realisation at no very distant date; indeed, so far as we can see, there is no reason why it should not be carried out during the coming year. The cost is estimated at £32,067, of which sum St. George's Vestry, at their meeting on Tuesday last, unanimously agreed to contribute £8,000, as required by the London County Council. The property which will be partly removed extends from William-street, where the Great Northern Railway office stands, to Wilton-place, near the Alexander Hotel. The ground landlords are the Ecclesiastical Commissioners, who have afforded every facility for the development of the plan, and inasmuch as the leases are all about to terminate, none of the tenants can claim compensation. They will, however, be enabled to renew their leases on easy terms on the new frontages. The local authorities will obtain a certain recoupment by the erection of better frontages, and in so far as the public is concerned the improvement will be of the greatest advantage. The roadway, which at this point is now exceedingly narrow, will be made at least 70ft. wide throughout, thus affording relief to the chronic state of congested traffic at Albert Gate, which has of late years become exceedingly inconvenient, in front of the French Embassy, owing to the increasing demand for property in this neighbourhood, followed by extensive rebuilding. This thoroughfare is, in point of fact, one of the only two direct roads out of London westward, and at St. George's-place, Knightsbridge, this great highway is really narrowed to the proportions of a by-street at present. Its limited proportions are rendered all the more conspicuous by the erection of the immense block of mansions, in flats, at Albert Gate, rising up like a Tower of Babel in the midst. Already the old cab-stand next Humphreys's well-known corner at the top of Sloane-street has been removed, and other improvements are about to be carried out by private enterprise. The desirability of making this public alteration a thorough success is acknowledged, of course; but unless a portion at least of the old buildings on the Hyde Park side of the road are set back, the improvement will scarcely deserve the character of completeness. Looking at it only from a commercial standpoint, such an extension of the present proposal could be made to pay, for the existing property at this point is quite unworthy of so important a position, and requires rebuilding. The price, too, just obtained for the land further along, at the junction of the Brompton and Knightsbridge-roads, of £4 a foot, is sufficient evidence of the value of property in this neighbourhood for building purposes. A reference to the map will at once show that a slice requires taking off from Trinity Episcopal chapel to the shops which adjoin the park-railings, and thus a clean sweep might easily be obtained right away from Piccadilly to High-street, Kensington, past the Barracks, the Albert Gate Mansions, and Humphreys's Hall, at once affording ample space and avoiding the present ugly corner. There is one other urgent improvement of a minor kind which certainly needs attention, and it is the suppression of some of the many names which do duty along this great road. Thus, from the Wellington Statue we have at present St. George's-place, Lowndes-terrace, and Middle-row, all occurring one after the other, besides the portion of the road known as Albert-gate; after this the High-road, Knightsbridge, commences. "Knightsbridge-road" throughout would answer every purpose, and be far less confusing. We commend this suggestion to the vestry.



AN EXHIBITION OF ARCHITECTURAL PHOTOGRAPHS.

THERE is now on view, at the Royal Architectural Museum, in Tufton-street, Westminster, a collection of architectural photographs, chiefly from Oxfordshire, by Mr. John L. Robinson, A.R.H.A., architect, of Dublin, which will well repay a visit. The views were taken during the recent excursion of the London Architectural Association, on the trip which the members of that Society made to Oxford and the neighbourhood last month. They include not a few pictures from the city and colleges of Oxford itself, and some, at least, of these illustrate parts of the University buildings not generally familiar, and certainly seldom photographed, notwithstanding the fact that other amateur camera artists are constantly engaged in the colleges and their precincts securing views for their folios. The specimens in the present exhibition are taken necessarily from an architect's point of view, showing the buildings, in the majority of cases, either for some special piece of detail, or, at least, on account of a particular grouping, as characteristic of the type of design under study. Taking these studies in the order in which they are arranged in the hall, we note at starting two views looking up "The High," at Oxford, and giving Mr. T. G. Jackson's admirable new school and college buildings on the right and left of that classical thoroughfare. The old timber-house facing "The Mitre," also in the same street, occupies picture 2, and on either side are interiors of Christ Church Cathedral, that of the choir, showing Wolsey's elaborate groining, being specially interesting. Magdalen College supplies the subjects for some first-rate views, in which the great tower naturally forms a conspicuous object, with its beautiful belfry. Merton College Chapel also has a grand square tower, once part of an important parish church, which shows well in print No. 12. New College Chapel has a vast interior; but the altar screen greatly needs the missing twenty-six statues to fill the remaining empty niches. Already twenty-four of the upper niches are occupied, including the crucifix in the centre, and their effect, so far as they go, is very good indeed. An exterior of this chapel is given on plate 11 looking over the remains of part of the city walls, now surrounded by the garden of New College. Merton College Library is one of the most interesting of its kind in Oxford, and the fittings are particularly so. Mr. Robinson, in photograph 13, gives a very good idea of their detail. Wadham College figures next, and then follow general street views of the "Broad," Radcliffe-street, with St. Mary's spire in the distance, and All Saints' campanile, lately restored, as seen from the north. Iffley Church occupies prints 18 and 19, the second view giving a good idea of its boldly-treated Early Norman ornamentation, for which the building is so justly famous. The figures in these views give scale and add interest to them.

Few buildings seen in this collection are more interesting than the series of structures which form the Grammar School, Hospital, and Church at Ewelme. No. 22 gives the courtyard of the Almshouses, and 21 shows the Church on the north side. The smaller plates 86 to 95 are devoted to other parts of these buildings, including two excellent detail prints of the grand and beautiful tomb, with its perfect statuary, in the ancient south chapel of Ewelme Church. Dorchester Abbey Church and Stanton Harcourt make famous material for some of Mr. Robinson's silver-print pictures, and right well has he managed to depict these celebrated buildings. The group from the latter place, including Pope's Tower (No. 24), is an instance worthy of reference. The ancient kitchen there comes well in print (25). Witney great parish church, with the graceful central spire which forms a landmark for miles, occupies the cards which follow the last named, and then we have a capital interior of Minster Lovel Church, showing how the tower is carried on piers within the walls of the main structure. Mr. J. L. Pearson's new pulpit and reredos are to be seen in the same view. The view of the inside of Burford Church is too dark to do it justice, and the views taken by Mr. Robinson in 1885, after the Banbury excursion, were much more satisfactory of this beautiful building. We give a view of the Priory Chapel in the same church in to-day's BUILDING NEWS, from a photograph done this summer by Mr. Ellis. Kidlington Church comes in picture 35, and the next three views are devoted with good purpose to Water Eaton Manor House, where Mr. Robinson photographed the excursion party, a feature being made of the "Order of the Garter" shown on that occasion. It is unfortunate that no good views of the chapel at this place seem to have been obtained. The screen inside is a particularly interesting example of refined Jacobean woodwork. Asthall, Minster Lovel, and Burford Priory all supply nice subjects for the prints which come next, including a group of the excursionists at Burford and a pleasing street view of the village of Kidlington with the elegant spire of the church in the background. There are about 150 photographs in this exhibition, so that we cannot mention all, even by name, much less give particulars of many of them. None interest us more than the small views which the artist gives of St. John's College, Oxford, showing Inigo Jones' admirable and refined buildings in the second quadrangle. Mr. Phené Spiers' drawing of the doorway leading to the gardens from this building, published in our pages for August 29th last, will give the reader a capital idea of the detail of the work which the photographs under notice display. As we have already said, there is no better Renaissance work in Oxford than this quadrangle. Quartermaster Wellard, in plate 55, gives an additional feature of a personal character, which the excursionists will value. St. John's College Hall is given by the photograph 57, and the garden front in 58. Wren's "Tom Tower" and Queen's College figure in subsequent views. The Mitre Hotel occupies print 71, and the Bodleian Library No. 65. Those who want a good set of photographs of the Jesse window, and other parts of Dorchester Abbey, will find them in Nos. 75 to 85, including the cross in the churchyard there, and the Norman leaden font in the south aisle of the abbey church. Coggs Church figures in plate 103, and 108 of Asthall, seen over the Windrush, is one of the most delightful pictures in the collection. It is just the subject for a good architectural water-colour. Stanton Harcourt, viewed from above the fish-ponds, in No. 96, is another like example. Woodstock Church is shown, but does not make a pretty picture. The concluding prints are occupied with some beautiful photographs from Evesham, showing the world-famed tower there, and some of the old plaster houses in the streets; others from Broadway, Worcestershire, and more prints still from Stratford-on-Avon, including the Memorial Theatre and Shakespeare's Birthplace. The exhibition is open free all day till Friday in next week, October 3rd.

A PATENT HYDRAULIC CALCULATING RULE.

MR. W. F. Stanley, the well-known instrument maker, of Great Turnstile, Holborn, W.C., has sent us a patent hydraulic calculating rule invented by Mr. Arthur Honeysett, C.E., an ingenious application of the slide-rule. The rule is made of boxwood, highly polished, and graduated with great nicety about 16in. long and 2in. broad. From a general examination of this rule, it appears to us to be a very useful instrument, as it will greatly facilitate the labours of the engineer in calculating the velocities and discharge of his sewers and pipes. The rule is constructed according to Bazin's formula $v = \sqrt{\frac{K\ R}{s}}$ where v = velocity in feet per second, R = the hydraulic mean depth, s = distance in which the fall is unity, and K = coefficient of the value $\frac{1}{x\left(y + \frac{1}{R}\right)}$, the values of x and y varying according to the nature of the channel. Eight scales are marked on the rule, A, B, C, D, E, F, G, and H, the four last ones being made to correspond to the four classes of the coefficients, according to the nature of the channel, the first class being for cement or smooth pipes, the second class for brick or ashlar, the third for rubble masonry, and the fourth for earth, river courses. By a sliding index the figure (marked 100) is brought opposite the value of the hydraulic mean depth on one of the lower scales corresponding to the nature of channel, then on another scale (marked D) will be found the velocities in feet per second due to the inclinations given on the slide, which comprise falls from 1 in 6 to 1 in 2,000, though inclinations flatter than the last can be obtained. To aid in adjusting the sliding index over the lower scales, a piece of talc marked with a line slides over the rule. By another adjustment of the slide the quantity discharged can be found. Scale A gives the square root of the fifth powers of values, by means of which the diameter of a pipe to discharge a given quantity can be found. Other tables at the back of the rule enable the engineer to find the area and hydraulic mean depth of segments of circular and oval conduits. All that is needed are a few examples of its application to make the rule intelligible. For sanitary and

hydraulic engineers and contractors, Mr. Honeysett's rule is especially valuable, as it will solve for them many complex calculations, and enable them to obtain results without the expenditure of unnecessary labour and time.

CONGRESBURY CHURCH, SOMERSETSHIRE.

IN the letterpress accompanying the sheet of sketches of the above church, which appeared on the 5th inst., reference is made to the interesting piscina. Of this feature I send a drawing which may prove acceptable to some of our readers. The piscina is situated, as usual, in the south wall of the chancel, and bears evidence of the all-pervading whitewash.

Hy. Dare Bryan.

24, College-green, Bristol.

THE LATE MR. ALLAN-FRASER, Hon.R.S.A.

MR. PATRICK ALLAN-FRASER, Hon. R.S.A., of Hospitalfield, near Arbroath, died on the 18th inst., aged 77 years. As Mr. Allan, he acquired some position as a portraitist and a painter of interiors, and also practised as an architect, one of his works being the mortuary chapel in Arbroath cemetery, but after his marriage with the heiress of the Frasers of Hospitalfield, he ceased to practise either art. He was an honorary member of the Royal Scottish Academy and President of the British Academy of the Fine Arts in Rome, an institution which he had been instrumental in establishing.

By his will Mr. Allan-Fraser has left the whole of his estates in Scotland, comprising properties in Forfarshire and Perthshire, in trust—(1) for the assistance and encouragement of young men not having sufficient means of their own who should be desirous of following out one or more of the professions of painting, sculpture, carving in wood, architecture, and engraving; and (2) to provide for the maintenance and support of aged or infirm professional men, being painters, sculptors, and literary men. For the carrying out of the first purpose of the trust, the deed provides that thirty young men shall be comfortably lodged, boarded, and clothed in the house of Hospitalfield. The age of applicants for admission is to be between 16 and 18, and a test is specified in order to satisfy the trustees of every applicant's fitness for the profession he desires to follow. The students admitted are to be indentured for four years. A qualified certificated teacher in the South Kensington Art Department, or otherwise qualified in painting or sculpture, is to be appointed governor of the house, and is to reside in a separate wing, to be built to Hospitalfield House. The students may be sent by the trustees to classes in Arbroath, and the trustees are to engage carvers and engravers to teach the students the use of tools; also to engage lecturers on subjects of science and art, or natural history. Power is also given to send students who have completed their indentures at Hospitalfield to the Continent for the completion of their education as artists, and an allowance is provided to each student for this purpose. Lastly, young people resident in Arbroath, between the ages of sixteen and twenty, may also be received and taught along with the students in Hospitalfield House. For the carrying out of the second object of the trust—viz., the assisting of aged or infirm professional men—the following are the provisions:—(1) That the number of recipients shall be ten, to consist of four painters, three sculptors, and three literary men, to be selected by the trustees; (2) the annuitants selected shall each receive £50 per annum during their lifetime, or so long as the trustees shall think proper. Among the additional bequests is a conditional donation, after fulfilment of the first two objects of the trust, of £50 per annum to be given to the Artists' Benevolent Institution, London, for the education of orphan children in connection with that institution.

It has been resolved to place a memorial of the late Canon Liddon in St. Paul's Cathedral. Towards the cost over £2,500 has already been subscribed.

COMPETITIONS.

Alexander Thomson Memorial.—A meeting of the trustees of the Alexander Thomson Memorial Fund was held in Glasgow on Thursday, the 18th inst., Mr. John Gordon, President of the Glasgow Institute of Architects, in the chair. The prize, £60, of the Travelling Studentship for the best set of drawings of a hall with side rooms was awarded to Mr. Charles R. McIntosh, 2, Firpark-terrace, Dennistoun, Glasgow. The drawings sent in were exhibited in the Corporation galleries.

General U. S. Grant Memorial.—The final award has just been made by the Grant Monument Association. It will be remembered that in the first competition so little inducement to participate was held out to architects of reputation, that few of them cared to have anything to do with the affair, and the judges agreed that none of the designs sent in were worthy of execution. The committee of the association then began again, rejected all the first designs, and arranged a limited competition between five architects: Messrs. Carrère and Hastings, C. W. Clinton, N. Le Brun and Son, and J. H. Duncan, of New York, and John Ord, of Philadelphia. This has resulted in the award of the commission to Mr. Duncan, who is the architect of the memorial arch in Brooklyn. The cost of executing Mr. Duncan's design is estimated at £100,000 sterling, so there is yet considerable uncertainty as to whether it will be carried out.

Whitefield's Tabernacle.—The plans submitted in competition for the rebuilding of Whitefield's Tabernacle in Tottenham Court-road, have been examined and reported upon by Professor Roger Smith, the assessor appointed by the building committee to award the premiums. We understand that the designs, as a whole, form a series very creditable to the competing architects, and that they will be shortly on view to the public. The report of the referee has been adopted by the committee.

Worcester.—The Victoria Institute, Worcester, Competition has been settled, and the design of Messrs. John W. Simpson and E. J.

Milner Allen, of New Inn, Strand, are the authors of the selected design. Mr. Alfred Waterhouse, R.A., was the professional referee. The architects of the chosen plans have promised us the loan of their drawings for illustration at an early date.

Engineering Notes.

St. Clair Railway Tunnel.—The great railway tunnel under the St. Clair River, by which the chief Canadian and United States railway systems are to be united, has been successfully excavated. It is formed between Port Huron, in Michigan, and Sarnia, Canada, and will allow the lines of the Grand Trunk Railway of Canada and the Chicago and Grand Trunk, Detroit, Grand Haven, and Milwaukee, and the Toledo, Saginaw, and Muskegon Railroads of the United States to be physically connected. The hydraulic shields invented by Mr. A. E. Beach (and also employed on the City and South London Subway), were used, and the sections operating from either bank of the river met on August 30. The tunnel is 6,050ft. in length from cutting to cutting, the width of the river being 2,300ft., and the actual boring occupied thirteen months. Mr. Joseph Hobson, of Hamilton, Ont., the chief engineer of one section of the Canadian Grand Trunk Railway, was the engineer, and the outlay on the tunnel will be about three million dollars, or nearly £600,000.

CHIPS.

The Duke of Clarence opened when at Cardiff, on Wednesday week, the new Grangetown Bridge, which has been constructed at a cost, for structure and apparatus, of £250,000, from plans by Mr. William H. Harpur, engineer to the Corporation. The bridge spans the River Taff, is of iron, is 464ft. in length, with a central span of 196ft., and weighs 500 tons.

Mrs. Welti Escher, of Zürich, has made a donation of five million francs to the Swiss Confederation for the creation of a Federal institution of plastic art.

The papers and plans connected with the scheme of making Paris a seaport have been deposited at the Hôtel de Ville for public inspection. They are to be accessible there until the 15th of November. The proposed canal from Rouen to Paris is to have a length of 180 kilomètres and a depth of six mètres. The seaport is to be constructed between St. Denis and Clichy. The expense is estimated at 135,000,000f. or about £5,400,000.

The work of refixing the bells in the tower of Rostherne Church is being proceeded with by Messrs. Taylor, of Loughborough. The bells are being hung on beams of oak from Tatton Park. When this work is finished the restoration of the venerable church will be completed.

A Wesleyan mission hall was opened at Old Hednesford last week. It is of red brick, with tiled roof and deal fittings, and seats 300 persons. Mr. F. W. Wheatley, of Hednesford, was the architect, and Mr. T. Mason, of the same town, the builder.

At an outlay of £1,100 the interior decoration of Trinity Wesleyan Chapel, Southport, has been completed, and considerable work done to the adjacent day and Sunday schools. The group of buildings, consisting of chapel, manse, schools, and houses for schoolmaster and caretaker, cover the largest site of any church property in Southport; they were erected 26 years ago by the late Mr. John Fernley, their present value exceeding £40,000. The carved stone pulpit and reading desk have been refaced. An enlargement of the organ, which occupies the west end of the nave, is being effected.

A new Sailors' Home and Rest were opened at Fowey, Cornwall, on Thursday, the 18th inst. The building is 40ft. long by 27ft. wide, and of three stories, has been constructed in Italian style from plans prepared by Mr. W. J. Sambles, architect and surveyor, of Fowey. It contains twenty-three rooms, including reading, recreation, and smoking-rooms, bedrooms, and bath-rooms, a mission-room, and premises for the caretaker. The mission-room is seated for 130 persons. The builder is Mr. Penter, of Polruan.

On Thursday, the 18th inst., the new peal of bells presented to the parish church, St Anne's-on-Sea, by the Lady Cecily Clifton, and hung in the newly-built tower of the church, were dedicated. The peal consists of eight bells. The tower, which has just been completed, forms the last portion of the fabric. It is placed at the west end of the church. On the south side of the tower over the entrance a niche is formed, and in it is placed a figure of St. Anne, to whom the church is dedicated. Mr. R. Knill Freeman, of Manchester, is the architect.

Building Intelligence.

Bristol.—A group of almshouses has been built in Dowry-square, Hotwells, from funds left by Lady Haberfield. The buildings have a range of 220ft., and are divided into six blocks, with party walls, as a protection against fire. There is a separate entrance to each block. Cattybrook red bricks are used in construction, the facings being of Box Ground stone; the roof is covered with Westmoreland tiles. All the outside woodwork is of teak, and the lobbies and passages are laid with Minton's encaustic tiles. The style is Queen Anne, and the building is of two stories. Provision is made for 12 aged men and 12 aged women. Each occupant will be given a furnished living room 13ft. by 13ft., with a recess for a bed; and also a kitchen and scullery combined, wherein are larder, coal bunker, dust shoot, &c. The boundary wall to garden is of brick, panelled, and surrounded with balusters of terracotta, and a freestone rail. Messrs. Pope and Paul are the architects, and Mr. Cowlin was the builder; the stone-carving was executed by Messrs. Davey and Bushell, of Bristol. The cost of the almshouses has been £10,000, exclusive of site.

Crickhowell.—The Public Hall, the foundation stone of which was laid on the 18th inst. by the Duke of Clarence, is being erected by a public company on a site in Beaufort-street, close to the centre of the town. The plans, which have been prepared by Mr. E. A. Johnson, architect, of Aberdeen and Newport, show that the building will be in the Renaissance style. The chief elevation has at the corner a tower furnished with an open stage and high mansard roof. The hall on the ground floor will be 75ft. by 40ft., the height from the floor—which will be of wooden blocks—to the centre of the open timber roof being 30ft. The room will be furnished to accommodate about 500 persons. It will be provided with a stage, with dressing-rooms adjoining (convertible into a large supper-room), and there will be as adjuncts the usual retiring rooms. There will also be a caretaker's cottage and armoury for the Volunteers. The walls are to be built of local grey sandstone, with Bath stone dressings. It is estimated that the cost will amount to £2,000, but the contract for building has not yet been let.

Dalton-le-Dale.—The parish church of St. Andrew, at Dalton-le-Dale, near Seaham Harbour, has been undergoing the process of restoration at the hands of Mr. R. Johnson, the Durham diocesan architect. It was reopened on Tuesday by the Bishop of Durham. The larger portion of the church shows the style of the early part of the 15th century. The building consists of nave and chancel, divided by an apparently modern arch. There is no trace of either tower or spire. The altar rails were taken from the cathedral at Durham in the beginning of the present century, and are the same as were presented to the cathedral by Dean Hunt in the year 1620. There is a very old form of sun-dial to be seen on the north wall of the interior of the church. It consists of six Roman figures, VII., VIII., IX., X., XI., XII., running the whole length of the nave, and the windows are so arranged that the sun indicates the time through each in succession. Such a curiosity is believed to exist in England only at St. Andrew's. About £400 has been spent on restoration.

Dublin.—The drainage system of St. Vincent's Hospital (built in 1843) has just been reconstructed from plans by Mr. W. Kaye Parry, C.E., at a cost of over £1,000. The contractor was Mr. Thomas Little, of Dublin and Kingstown. The new system has involved the abolition of all the old-fashioned conduits, and the substitution for them of vitrified pipes, with air-tight manholes placed at every change of direction, for the purposes of cleansing and examination, and also arrangements for trapping and ventilation. The hospital lavatories and laundries have also been entirely renewed, and enamelled washtubs and linen troughs provided. The hospital buildings, including the gardens, occupy a site of two acres in extent. The drain-pipes were supplied by Messrs. Parker and Hassell, of Nottingham; the glazed troughs and tubs by Messrs. Brown and Sons, of Paisley; the Sanitas and National w.c.'s by Mr. Thomas Twyford; the flushing cisterns by Messrs. Shanks and Co., of Barrhead; and the soil-piping by Messrs. McDowall, Stevens, and Co., Glasgow. The hospital will be reopened on Wednesday next.

Duncombe Park.—The beautiful mansion at Duncombe Park, Earl Feversham's Yorkshire seat, which was destroyed by fire on the 11th of January, 1879, is shortly to be rebuilt, the work to be commenced in the spring. Mr. Wm. Young, of London, is the architect, and the contractors are Messrs. W. and J. Kirkwood, of Edinburgh. The former building, of stone, in the Doric style, was from the design of Sir John Vanbrugh, architect of Castle Howard and Blenheim Palace. It was executed by one Wakefield, of Easingwold, and was completed in 1718. Some additions were made to the mansion by Sir Charles Barry, and not long before the fire the central dome had been renovated by the late Sir Gilbert Scott. The fire destroyed some good paintings, also some valuable medallions of the Twelve Cæsars. The servants' apartments, stables, coach-house, &c., which were not destroyed, were built in 1844-5, from designs by Sir Charles Barry. The site of the mansion is a beautiful one, overlooking the valley of the Rye, and with an extensive woodland view in the distance.

Edinburgh.—An interesting architectural find has just been made by the workmen engaged under the superintendence of Mr. Ross, architect, in clearing out the north transept of St. Giles' Cathedral for the purpose of forming a memorial chapel to Dr. Chambers. In taking down the west wall of the transept the workmen have laid bare the remains of a fine window in the Perpendicular style, which is the only large portion of the pre-Reformation external masonry that has been met with in connection with the work of reconstructing the cathedral. The jambs of the window have large bead and hollow mouldings with fine bases, and their capitals also have been carved in an elaborate manner. In the centre there has been an elaborate transom, carried on flat arches, the remains of which are quite perfect. The transom has been decorated with rich battlemented ornaments. The window was part of the original wall of the cathedral before the alterations of the beginning of the century were carried out. The transept was originally the old vestry; it was converted subsequently into the town clerk's office, and it was here that last month the supposed arm-bone of St. Giles was found. (By the way, the bone proves to be that of the *left* arm, and the relic preserved in Bruges Cathedral is also the left humerus of the same saint.) The window will not be built up, but will remain as an opening between the memorial chapel and a small gallery above the north doorway of transept. There was also found above the window parts of the original corbelling supporting the roof parapet. One of these fragments is in the form of a carved lion's head, in an excellent state of preservation, and the other is a large rosette. Both have been built into the responds of the arch between the cathedral and the memorial chapel. In taking down the wall to form this arch a Roman capital was found, the oldest piece of the original masonry of the cathedral yet met with.

Leeds.—A new building is about to be erected for the local branch of the York City and County Bank at the corner of Park-row and Lower Bond-street. The designs are being prepared by Messrs. Smith and Tweedale, South-parade, Leeds, and show a three-story building. The elevation in each thoroughfare is to be carried out in Bradford stone. The façades are divided into bays; the piers on the ground-floor are to be in moulded quoined courses; the upper portions of the bays are divided by coupled Corinthian three-quarter columns with carved capitals; and the whole is surmounted by a carved frieze, bracketed cornice, and pierced balustrade. With the exception of a suite of offices and the entrance in Bond-street to the first and second floors, which will be divided into other suites of offices, the whole of the ground floor is to be devoted to the bank, which will be 45ft. 6in. by 40ft. The manager's room and the waiting-room are divided from the bank proper by a moulded and glazed wooden screen. The chief suite of offices will be so arranged that, should the need arise, they can be added to the bank premises.

Longton.—The new Cottage Hospital was opened yesterday (Thursday). The buildings have been erected from the designs of Messrs. Ford and Slater, architects, of Burslem, selected from a large number of competitive designs. The works have been carried out by Messrs. H. and R. Inskip, builders, Longton, and Mr. Thomas

Blair was the clerk of works. The hospital (which has 38 beds) is said to be the largest of its kind, the nearest to it in size being the "Sister Dora" Hospital at Walsall, which has 36 beds. The ground floors form one level, steps being altogether avoided. The arrangement of the ground plan is on the pavilion system, in three distinct blocks connected by corridors. The central block, the only portion more than one story in height, is devoted to administrative purposes, and the wings right and left are the wards, in part of one of which is the out-patients' department. The warming is by open fireplaces and by hot water combined, the latter part of the work having been executed by Mr. Jackson, late of Newcastle. The amount of Messrs. Inskip's contract was £3,359 for the buildings, to which, however, must be added the cost of gasfitting, laundry fittings, and boundary walls, and that of providing furniture and fittings throughout.

RAMSGILL.—The parish church of Ramsgill has been reopened by the Bishop of Ripon after renovation. The church of St. Mary's, Ramsgill, erected in 1842, is of stone, in the Gothic style as then understood, and consists of chancel, nave, west porch, and embattled western tower, the total cost in the first instance having been a little over £800. Within the last three years the whole of the masonry has been repointed with Portland cement. The old pulpit, gallery at the west end, and the stiff-backed seats have been removed, and their places taken by an oak pulpit and open seats in pitch-pine. A vestry has also been added, the walls decorated, new windows inserted, and further improvements have been made in the building. The amount spent on restoration since 1887 is £300. The whole of the interior of the church has been painted, and the walls and roof have been decorated in colours. A dado in two shades of red is carried round the chancel walls as high as the window-sills, surmounted by a pomegranate border in green and gold. Above this the otherwise plain wall is marked out in strong brown cutline in such a way as to form a series of cusped niches, containing a sacred monogram in each, and arched in by a crocketed canopy, running beneath which is a riband text. Above this the different portions of the walls are diapered in colours. The principals and girders of the roof over the chancel are done in gold, vermillion, and black, forming a kind of feather pattern, tapering upwards. The whole of the windows have been glazed in cathedral glass in various shades, with borders of brown-pink surrounding each, and the east window has been filled with stained glass representing the "Annunciation and the Nativity." The stained glass and the art decoration throughout are the work of Messrs. Powell Brothers, of 30, Park-square, Leeds.

SUNDERLAND.—The new hospital for the treatment of infectious diseases, erected by the Corporation of Sunderland in Hylton-road, will be opened for the reception of patients on Wednesday next. The building stands on about 12 acres of land some two miles and a half from the centre of the town. There are five blocks of buildings—namely, the house department, the laundry block, and the three isolated pavilions, in which patients are to be received. The total number of beds in the hospital will be 42, but should the emergency arise, provision could be made for considerably more. The contractor's work has been executed by Mr. T. P. Shafto, of Sunderland, from designs prepared by the borough engineer, Mr. R. S. Rounthwaite.

The introductory lecture to the ninth annual course of lectures and practical instruction in plumbing will be delivered at the Polytechnic on Tuesday next by Mr. J. Wright Clarke. The Master of the Plumbers' Company will preside, and will also present the prizes to the successful students of last session. Plumbers and others interested in technical instruction may obtain tickets of admission, free, on application to the Secretary, Polytechnic, 309, Regent-street, W.

The memorial-stones of new board schools in Bloomfield-road, Tipton, were laid on Friday. The buildings will accommodate 250 children, and are expected to cost £2,000. Mr. Alfred Long is the architect, and Mr. Warton the builder.

At St. Michael's Church, Islington, last week, a new clock, having three dials, the work of Messrs. John Smith and Sons, of Derby, was inaugurated, and the peal of five bells rung, the latter having been re-hung by Mr. H. Stokes, of Woodbury.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—F. Holloway.—Alexis.—R. P. and Co.—T. C.—W. M. B.—R. Chatterton.

"BUILDING NEWS" DESIGNING CLUB.

WE have received numerous applications from intending members of our club, and have sent to all whose addresses are given copies of the rules on postcards. We shall shortly publish the list of awards of prizes for the last season's work, and at the same time will print the rules for our forthcoming sessional work. Any suggestions should now be made, and we shall be happy to favourably consider any practical methods for improving our club and increasing its usefulness.

Correspondence.

KIRKSTALL ABBEY.

To the Editor of the BUILDING NEWS.

SIR,—In your issue of the 12th inst. you refer to an artice which recently appeared in the *Leeds Express*, headed "Kirkstall Abbey Ruined," in which the Corporate Property Committee are charged with making sad havoc with the building. In reply to this irresponsible writer, may I quote from Mr. J. T. Micklethwaite's report to us on the present state of the building?

He says: "I found that since I had last seen the Abbey most of the suggestions made in Mr. St. John Hope's report had been acted upon, and much good work has been done in clearing the walls of ivy and other noxious weeds; the felling of trees, which in some cases had already done mischief, and in all threatened it, and by the uncovering of much which has long been hidden by fallen ruin, and accumulated earth and vegetation. This last has already made Kirkstall one of the completest and most interesting as regards plan of all the English Abbeys."

Any visitor can see for himself that where we have taken the ivy down the walls are in a much worse condition than where they have always been exposed to the weather. Many of the main stems of ivy were 6in. to 7in. in diam., and had threaded their way in and out, doing enormous damage to the walls. The trees growing between the walls were all more or less rotten, some so far gone as to be simply hollow pipes. The Committee gave strict injunctions to the workmen to take them down in sections, and this was most carefully done, save in the case of the last tree, which they tried to get down whole, but it turned out to be so decayed that it suddenly fell and damaged the refectory wall.

We have not, as has been suggested, been guided as to the treatment of the ruins by gardeners, but we have followed the advice of gentlemen who have a more intimate acquaintance with the subject than the writer in the *Express*.

The amateur photographer may anathematise us for getting rid of these picturesque but deadly parasites; but when it is a choice between preservation of this Abbey, or the ivy, I think the public viewing our work will say we have not abused our trust.—I am, &c.,

JOHN TWEEDALE, F.R.I.B.A., and Member of the Leeds Corporate Property Committee.

12, South Parade, Leeds.

"THERE'S WORK FOR ALL TO DO."

SIR,—Before employing an architect, the question naturally asked is—"Where has he received his training?" Many people, however, do not make inquiries, and it appears to me that no one should be admitted to membership of the R.I.B.A. or S.A. who has not undergone training in an architect's office, so that these letters after his name should be a guarantee that he knows at least something of architecture. Without this or registration I do not see that we should be much better off if "C. F. M.'s" suggestion were adopted, because now any man is at liberty to call himself an architect, whether he is qualified or not.

But these letters would not help the matter, for I believe both societies make it a rule for members not to be associated with the building trade. The Society of Architects should make a fresh start on sounder lines, and alter this rule, or a new society should be formed, and called the Society of Contracting Architects.

Could "C. F. M." give further particulars of the methods adopted by the Co-operative Builders?—I am, &c., CURRENTE CALAMO.

THE LARGEST PARISH CHURCH.

SIR,—The discussion as to which may be entitled by maximum included area in square feet to be described as the largest, or by reversing the order to be considered the smallest, church in England is still going the rounds of certain contemporaries; therefore it may not be inopportune to open the question as to which is the most inconveniently arranged church, be it large, small, or medium sized.

I think that Oswestry parish church was on a par with St. Nicholas, Great Yarmouth, for defect of internal arrangement; very wide light aisles having swamped a narrow nave, the piers of which were close together, numerous, and large, when compared with the voids.

Happily the tower terminated one of the aisles (S.). The central arcade was eliminated, and the interior of to-day is convenient or commodious, and suited for the supposed requirements of worshippers in the 19th century—i.e., most people can see what goes on and hear something, if not all.

The including walls seem to have been retained. At Boston there is a very large church with very vigorous aisles and a very sickly nave and roofing. At Wrexham the beauty is all out of doors. The nave is too crude for description, and the chancel is a badly-connected afterthought, much on a par with the abandoned interior at Oswestry.

I do not claim to have been in Great Yarmouth for over a dozen years, and I have no plan of the parish church to refer to, but I think I may venture to say that for 1 for width of nave 1½ would represent each aisle. Now it may be laid down that "nave and one aisle" is the best for hearing and seeing on the part of the congregation, as the pillar obstruction interferes least.

Supposing the central arcade at Yarmouth is too substantial, or venerable, or interesting to be lost (which I doubt), I would suggest that the tower should be provided for elsewhere, and that the north aisle, &c., roofs should be re-erected over a central arcade, the north side of which should be set back to receive the north side of such transposed roof. This would widen the nave at the expense of the north aisle—perhaps the most suitable place for the tower would be at the west end of the north aisle—probably the present nave roof would suffice for re-roofing the

same. There is a large double organ which would sound well when raised to screen level in each transept; then the size of the church would not be quite such an encumbrance as it is at present.

An excellent example of nave and one aisle is that of St. Magdalene, Paddington (one of Street's). Another church of the same dedication in Munster-square has had a north aisle added; the beauty of the nave seems sadly discounted in consequence; yet, one could only long for the extra aisle and imagine something there, and feel that a pig with one ear is no improvement on the natural arrangement.

What is wanted is that the nave should not be inferior to its adjuncts; four or five equal aisles with one of them somewhat taller in the centre, as at Manchester (the area of which in feet might run Yarmouth close), or at Taunton, which is beautiful outside and in, only brings pity on the nave and a sense of unfitness, much as if the aisles had strayed away from some superior building and become attached inadvertently. I hope someone at Great Yarmouth will follow up with dimensions or remarks.—I am, &c.,

H. W.

CHIPS.

Mr. W. J. Gant, of Hastings, having taken into partnership Mr. C. H. Slatter, of Nottingham, the above named propose carrying on the business of architects and surveyors, at their offices, Havelock-road, Hastings, the style of the firm being "Messrs. Gant and Slatter."

A correspondent writes that, since the foundations were laid four years ago, no progress has been made with the museum for St. George's Guild, on the site in the Forest of Wyre, given by Mr. George Baker, of Bewdley. It is feared that Mr. Ruskin's Utopian project of founding a museum in the seclusion of Wyre Forest will come to nothing.

St. John the Baptist's Church, Broad-street, Bristol, was reopened on Sunday after internal decoration, designed and carried out by Messrs. Joseph Bell and Sons, of College-green, Bristol.

Mr. John Mossman, the Scottish sculptor, died at Port Bannatyne, near Glasgow, on Monday, in the 74th year of his age. Mr. Mossman, whose father was a pupil of Chantrey, was born in London; but his father soon after his birth moved to Leith, where young Mossman was educated. He was afterwards taken into the studio by the late Baron Marochetti, and rapidly gained a high reputation as a sculptor in Scotland. Many of the finest statues in Glasgow were executed by him, including those of Sir Robert Peel, Dr. Livingstone, and Thomas Campbell in George-square, those of Dr. Norman Macleod and Mr. Lumsden in Cathedral-square, while the memorial to Wilson the ornithologist, erected in the grounds of Paisley Abbey, deserves notice. Mr. Mossman's portrait, painted by Norman Macbeth, hangs in the Corporation Gallery of Glasgow.

Extensive building operations have just been commenced at Aldershot for the construction of new barracks in the South Camp, where the foundations are being made on the higher ground near the headquarter offices. In all nearly a million and a half is to be spent at Aldershot in the new structures and in rebuilding and enlarging the old barracks and huts, so that a much larger portion of the First Army Corps may be accommodated in the Camp than has hitherto been quartered there.

It is announced that Messrs. Mather and Platt, of the Salford Ironworks, have nearly completed the provision of electric and other machinery, including hydraulic elevators at each station, for the City and South London Electric Subway, which will be opened between King William-street, E.C., and Stockwell, it is now promised, "early next month."

At Watford a meeting of working men was held in the recreation ground on Saturday afternoon complaining that the School Board should have accepted a tender for new schools on the Fields from an outside firm. At a subsequent meeting of the School Board a petition five yards long, signed by working men of Watford, was presented, stating that the memorialists were of opinion that the contract for the schools should be confined to the town of Watford, as the local working men and the builders would be handicapped by a firm paying a lower rate of wages. The memorialists therefore hoped the Board would see their way clear to re-open the question by having the work tendered for again. After discussion, it was resolved that in view of the strong desire expressed the work should be kept within the town of Watford, and that Messrs. Waterman's tender as amended be accepted at £4,679, subject to the consent of the Education Department, and that the question of compensation to Messrs. Webster and Cannon (whose tender as originally accepted was £4,320) be left to the architect.

Intercommunication.

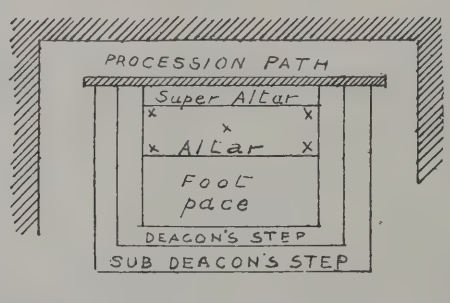
QUESTIONS.

[10387.]—**Windows.**—If my neighbour, who has four windows of irregular size overlooking my premises, replaces these by new ones, increasing the three smaller by a few inches to the size of the largest one, can I compel him to alter the windows to their original sizes, or what remedy have I? Can I also prevent him opening the new ones if the former were fixed casements?—J. W. SIMPSON.

[10388.]—**Nuisance from Chimney.**—A steam laundry has just been started at the rear of my house, and the smoke from the chimney and the steam, when the wind sets towards me, completely smothers my lawn, the smoke leaving smuts everywhere—on the window-sills and even in the rooms. It is, in fact, at times impossible to have the windows open. Will anyone kindly say whether I have any remedy? Can I compel the owner or occupier to abate what is a terrible nuisance and is materially damaging my property by reducing its value? I may remark that the neighbourhood is entirely residential, and, with the exception of this laundry, there is no factory within sight. The chimney is about 130ft. away.—J. M. J.

[10389.]—**Drainage.**—Will some reader kindly inform me (1) whether it is usual to provide both inlet and outlet ventilators to the main inspection manhole near intercepting trap, or should the outlet be placed at the highest point in the course of the drains? Is a soil-pipe at this point continued above roof sufficient for the outlet, or should the soil-pipe be trapped at foot and a separate ventilating pipe provided? (2) Is it advisable to provide gully-traps to rain water pipes which lead into rain-water tank?—SUBSCRIBER.

[10390.]—**Pointed Architecture.**—Has any work been lately published on the origin of Pointed architecture? How is the vast difference between the Norman and Early English arch accounted for, unless the interlacing Norman arches suggested the pointed arch?—SUBSCRIBER.



[10391.]—**Sussex.**—I shall be glad if some kind reader would let me know of some good cheap books on the churches of Sussex and Kent, and if any one knows the age of New Shoreham (Sussex) Church.—J. H. MASON.

[10392.]—**Churches.**—Can any of your readers tell me where I can find the best architectural and historical description of St. James' Chapel, Okehampton, Devon; and Saltford Church, Somerset?—J. E. P.

[10393.]—**Wood Block Flooring.**—I should be glad if any of your numerous readers would give me their opinion as to whether a wood block floor would be a suitable pavement for a public market hall, and if it could be effectually drained and cleansed, also made impervious? About how often would the paving require renewing? I am anxious also to ascertain if a market hall so paved could be used on other than market days for concerts, lectures, &c., without in any way being a nuisance or offensive—i.e., smells arising from paving? Could such a floor be used for dancing upon with success, or should a false floor be laid down for dancing? How should it be constructed so as to be readily laid down, and of what material, &c.?—C. W. S.

REPLIES.

[10354.]—**Steps to Chancel and Altar.**—The distance from the Communion-rail to the east wall of chancel would, of course, depend largely upon the size of altar and the arrangement of the reredos or baldachin. If it is intended to have a procession path behind the altar, 17ft. would be a good space, allowing 3ft. for path, 3ft. 6in. for altar, and 5ft. from riser of sub-deacon's step to rail; but circumstances alter cases. One can lay down no hard and fast rule. The arrangement of the approach to the altar must be governed by the whole building, and be a proportion of the whole mass. This applies to the minutest detail, much more so to the appointments of the chancel, which is the focus of the whole building. There should be three steps within the rail—one for the sub-deacon, one for the deacon, and the highest, called the

foot-pace, for the celebrant. It is a very common error to have this too narrow, and thus retard the movements of the priest—it should be 2ft. 6in. wide at the least. The accompanying sketch shows an arrangement that is generally found convenient.—FRED. R. W. MAYER.

[10362.]—**Fire-proof Floor.**—Mr. Christie, in his reply to the query of a correspondent, in your issue of the 19th., says that the most effective plan of preventing transmission of heat (in case of a conflagration) is to use a non-conductive material—such as asbestos or slag wool;—that, unlike concrete or brick, they yield to the expansion of iron in the event of the latter becoming hot, and are better non-conductors than air spaces; and that an experiment made with wood joists, covered with an inch in thickness of slag wool, backed with ordinary plaster, proved they were effective against fire. These statements are in direct opposition to the experiments made by others—for instance, Mr. Hyatt, who made a number of practical tests with the same object, says in his book, page 19: "The synchronism existing between the expansion of the two materials—concrete and iron—whatever the size of the metal, was thus placed beyond question; and in respect to this (expansion under great heat) the two materials may be regarded as practically homogeneous." And again on page 20: "The result of all being that the best material to protect metal against heat was found to be that which was strongest in compression—viz., Portland cement concrete of best quality, *no advantage for any purpose being found from fibres of any kind, not even asbestos.*" It is very desirable to know definitely what general principles are best to adopt in fire-proof construction, as conflicting advice and opinions tend to want of confidence. My own experience is that an inch or more of asbestos is a protection against fire for some time; but that the heat before long penetrates, and the asbestos is practically no longer of any service. As a covering to steam boilers, for which purpose it is very largely used, the conditions are different, and the heat is retained for a very long time; even then it requires to be not less than 2in. thick.—THOMAS POTTER.

[10383.]—**North Devon.**—There are the following churches near Ilfracombe, which are worth seeing. Braunton has a splendid series of ancient carved bench-ends, also some 17th-century oak-carving in gallery, pulpit, &c. Morthoe has a 14th-century tomb and some fine bench-ends; and both Georgeham and Heanton have interesting features. Barnstaple possesses a great number of Jacobean monuments; and close to the town is Pilton, with a magnificent screen; and in an out-of-the-way part is Marwood, with another beautiful screen and loft. Combemartin has also a fine screen; and Berry-narbor, East Down (Late screen), and West Down are all worth a visit. Ilfracombe Parish Church is itself an interesting one, with a good roof; and if Clovelly is made the object of an excursion, the church there, which has Norman portions and some good brasses, should be seen. Still further in that direction, near Hartland Point, is Stoke St. Nectan's, with a tower 126ft. high, a stone altar, and a glorious wood screen. Northam Church has a few interesting details; Bideford is modern; Tawstock (three miles from Barnstaple) is a fine church, with a good screen and handsome old monuments.—L. A. F.

[10386.]—**Charges for Laying Out Building Land.**—In reply to "G. A. H." I should advise him to make an arrangement with his client. The skill required and trouble ought to be the principal considerations in every case. If the plan consists of merely dividing the land into suitable plots, "G. A. H." may make a charge on the number—that is, charge a fair percentage on the ground-rents, say, from 2½ to 5 per cent. Several hundreds of acres would represent a large number of plots for letting, and it would compensate the surveyor if he were to charge a moderate percentage on the total ground rental, say, 1 to 2 per cent. For letting the plots it is customary to charge a whole year's ground-rent. "G. A. H." may be employed to let and to inspect the buildings during their erection, to see that the covenants are complied with, and to certify for lease; if he is, a small percentage would pay him for laying out. A fair way of charging is to keep an account of the time and labour expended and charge per day.—G. H. G.

LEGAL INTELLIGENCE.

ASSAULTING THE FOREMAN.—A joiner, named Pointer, living at Dagmar-terrace, Islington, was, on Tuesday last, summoned to appear at Clerkenwell Police-court for assaulting John Foot, a foreman in the employ of Messrs. McCormick and Sons, builders, at Canonbury road, N. Foot being dissatisfied with the amount of work done by Pointer, sent him to the yard, and Messrs. McCormick, having had other complaints of his idleness, discharged him; whereupon he went back and assaulted the foreman Foot. He was sentenced to pay 40s. fine or go to prison for one month.

Alterations have been made to the district Lunatic Asylum, Killarney, including the ventilation, which is now carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

The Commissioners of Woods and Forests have given authority for the erection of a bronze equestrian statue of the late Lord Napier of Magdala in the centre of the roadway in Waterloo-place, between the United Service and Athenæum Clubs. The statue is being executed by Sir Edgar Boehm, R.A., and will be finished before the end of the year.

Important and extensive works are now in progress in connection with the widening of the Great Western Railway between the Reading and Didcot junctions, in continuation of similar works carried out between Paddington and Reading. The present Moulsford Station is to be demolished, and a new station will be erected somewhat lower down the line. The contractors are Messrs. Lucas and Aird, of Westminster, and Mr. Lovett, of Wolverhampton.

The Llandudno Improvement Commissioners considered at their last meeting a report from the committee appointed to inquire into the proposed rearrangement of the duties of the officials. It was recommended that Mr. T. T. Marks at present should be relieved from indoor work, and be appointed engineer and surveyor at an increased salary and a five years' engagement. It was pointed out that since 1876, when Mr. Marks was appointed clerk and engineer, the rateable value of the town had increased 60 per cent., while the increase in salaries had been but £50. The section dealing with the separation of offices was adopted, and the rest of the report was referred back to the committee.

STAINED GLASS.

EDINBURGH.—A stained-glass window to the memory of the late Mrs. Cameron Lees has just been placed in the nave of St. Giles's Cathedral. The memorial window is that above the session-house on the west side of the north transept. The window—a three-light one—is divided by a transom into an upper and lower half, the compartments of which are filled with figures symbolical of Christian virtues. In the upper half the figures are those of Faith, Hope, and Charity; and in the lower half those of Truth, Justice, and Mercy. In the tracery are a scroll, with the motto, "Gloria in Excelsis Deo," a cross, and two angelic figures with scrolls. The inscription runs in double lines under the figures in both divisions of the window. The window is by Cottier, of London.

ANTRIM.—One of the old windows of the parish church at Antrim, which dates from 1598, has been filled in with stained glass by Viscount Massereene in memory of his mother. The window is a three-light one, the centre compartment containing a figure of our Lord, and the side lights being figures of St. John the Divine and St. John the Baptist. Underneath the window is a memorial brass bearing an inscription. The work has been executed by Mr. Aldam Heaton, of Bedford-square, London.

STATUES, MEMORIALS, &c.

ADEL, LEEDS.—A memorial has just been erected in Adel Churchyard to the late John William Inchbold, the well-known artist and poet. It has been designed by his cousin, Mr. Richard Mawson, architect, of Bradford, and is founded on an Early Fourteeth-century cross from St. Cirques, in Auvergne. The base is a block of white marble, placed on a plinth; from it springs the shaft, also in white Sicilian marble. At the intersection of the cross, where on the original is a representation of the Virgin and Child, there is carved a wreath of passion-flowers. A shield is placed in the centre of the shaft, with the monogram, "J. W. I." On the base of the shaft is an inscription; on the north side is a memorial sonnet written by another of his friends, Mr. Dennis, whilst on the south is his own exquisite sonnet to Art from the "Annus Amoris." The execution of the work has been intrusted to Messrs. Farmer and Brindley, of Westminster.

WATER SUPPLY AND SANITARY MATTERS.

CLECKHEATON SEWERAGE.—The Local Board of Cleckheaton have called in Mr. W. H. Radford, C.E., of Nottingham, as consulting engineer to report on a scheme of sewerage and sewage disposal prepared for the board by Mr. J. C. Haller, C.E., of Rotherham. The estimated cost of the scheme is £20,000.

WHITCHURCH, SOMERSETSHIRE.—The Keynsham rural sanitary authority have instructed Mr. A. P. S. Cotterell, C.E., of Bristol, to report upon a scheme of sewerage to the village of Whitchurch, within their district.

CHIPS.

Lady Wimborne opened at Poole on Wednesday a gymnasium and museum, which have been presented to the town by Mr. John Joseph Norton, who three years ago gave a free public library in commemoration of the Queen's Jubilee. The present building has cost about £5,000.

Earl Cowper has erected a new church at Selston Notts, which will be consecrated on Monday next, the 29th inst., by the Bishop of Southwell.

The School Board for Swindon have adopted plans by Mr. Brightwen Binyon, of Ipswich, for new schools at Westcott.

A monument to the late Dr. Currie, of the Church of Scotland Normal School, Edinburgh, has just been erected in Warriston Cemetery by public subscription. It is an obelisk, of Peterhead granite, and consists of three pieces—base, dado, and spire. The monument (8ft. 6in. high and weighing about four tons) has been executed by Mr. Calder, Heriot Hill, Bellevue.

Colonel S. Bevington laid the foundation stone of the new building for Bacon's school, Bermondsey, on Thursday, the 18th inst. The cost of the edifice, which is being erected by Mr. Gerard, from plans by Mr. Gale, will be about £3,300.

Dr. Campbell, the late Bishop of Bangor, has been presented with his portrait on retirement from the episcopal chair. The portrait is the work of Mr. J. J. Shannon, and represents Dr. Campbell clad in his episcopal robes and seated in his study.

The foundation-stone of new Sunday-schools and parish-room for St. Peter's, St. Alban's, was laid last week by Lady Jane Grimston. Mr. F. W. Kinneir Tarte, M.S.A., of Furnival's Inn, E.C., is the architect.

Our Office Table.

IT is reassuring to learn from a letter by Mr. Henry Stanier, the British Vice-Consul at Granada, that all that was burnt in the disastrous fire at the Alhambra on the 13th inst. can be restored, except the ceiling of the Sala de la Barca and the beautiful colouring on its walls. The fact that the palace was on fire, when he first saw it, in three distinct places convinces Mr. Stanier that it was the work of an incendiary. By some judicious cutting in the roofs the fire was prevented from extending to the Court of Lions and the Hall of Ambassadors, and was confined to the Court of the Alberca, and this court, having a large tank of water in the centre, enabled the fire-engines to have an abundant supply, and by 2 o'clock the fire was localised to the Court of the Alberca and the Sala de la Barca. The roof of this hall has been entirely burnt, but its walls are intact, although calcined, and the beautiful colouring disfigured. The gallery at one end of the Court of the Alberca has also had its roof entirely destroyed. This and some rooms extending all on one side of this court form the total of the parts burnt. The Court of the Lions and all the other courts and halls are intact, and have not suffered in the slightest degree. It is a miracle how anything has escaped, for the fire was most intense, but the immense thickness of the walls of the Tower of Cemares prevented the fire extending to the Hall of Ambassadors, and the cutting away of the roof prevented its extending to the Court of Lions.

PROFESSOR ROGER SMITH will give a public lecture on the Technical Education of Architects, at University College, on Thursday evening next, the 2nd of October, at 7.30 p.m. He will, in the course of the lecture, criticise the "Curriculum" issued by the committee appointed for that purpose by the Architectural Association. With this lecture the courses of lectures on "Architecture, Construction, and Practice" at the college begin. These courses are three in number, dealing respectively with Architecture as a Fine Art, and as a Science, and with Modern Practice.

THE sixty-eighth session of the Birkbeck Literary and Scientific Institution, Bream's-buildings, Chancery-lane, will open on Wednesday next. About 200 classes meet weekly in commercial and technical subjects, mathematics, natural, applied, and mental science, languages, history, literature, art, music, law, &c., &c. Special classes are arranged for university, civil service, and other examinations. The classes are open to both sexes. During the past session the students have met with their usual great success at various competitions. On Wednesday evenings lectures will be delivered in the large theatre of the institution. Amongst those who are already engaged may be mentioned, Sir Robert S. Ball, Dr. Dallinger, Mr. Samuel Brandram, M. Max O'Rell, Mr. Clement Scott, Dr. Rentoul, M.P., Mr. Charles Dickens, Mr. J. T. Carrodus, Mr. Fred Villiers, and Mr. John Thomas.

MR. G. F. LYSTER, the engineer of the Liverpool Docks Board, having, owing to advancing years, intimated that he desired to be relieved of a portion of his work, a committee recommended a rearrangement of the duties which will enable the engineer to retain his position at a salary of £3,000 instead of £4,500, which he is at present receiving, some portion of the general management and supervision of the works being delegated to his son, Mr. A. G. Lyster, whose salary will be increased from £500 to £1,500, while the salary of Mr. W. Le Mesurier will be raised from £850 to £1,000. In bringing this report before the Docks Board, the chairman of the committee repudiated the idea that in making the changes proposed there was any intention to prejudge the question of succession to the chief office in the event of Mr. G. F. Lyster's retirement or removal by death. Having regard to the responsibility of the trust reposed in them, the committee would "go for the best man," and Mr. Lyster, jun., would take his chance with the other aspirants to the post. The consideration of the proposal has been deferred for a week, but it is morally certain to be adopted.

THE death is announced, at the age of 83 years, of Mr. Thomas Nelson, of Friars Carse, Dumfriesshire, for many years engaged in business in Carlisle as a builder and railway contractor. He owned large marble works there, and was Mayor of the city for several years. He constructed the Silloth and Carlisle Railway and Dock, and executed much work of a similar character for the North-Eastern and London and North-Western Railway Companies. In partnership with his sons he also made a dock at Cardiff. About 20 years ago he purchased the Friars Carse estate, upon the banks of the Nith, near Dumfries, and the Hermitage, in which Burns wrote some of his poems. Mr. Nelson made a valuable collection of Burns's manuscripts and other relics, including a pane of glass upon which the poet had scratched some verses in the Hermitage.

MR. T. C. SMALES, architect, who died recently in St. Joseph, Missouri, had gone through many vicissitudes in his short career. He was born in England about forty-five years ago, and began life as an engineer officer in the British army. Twenty years ago he went to America, and bought a farm of a thousand acres in Minnesota, which he stocked and carried on for several years. He was elected to the Minnesota Legislature, and served one or two terms. Becoming tired of raising cattle, he sold his farm and opened a banking-office, but was unfortunate, and soon lost all his property. He then went to St. Louis, and entered an architect's office as a student, and about ten years ago appeared in St. Joseph as an assistant in the office of Messrs. Eckel and Mann, architects. Three years later he commenced practice on his own account, and was popular and successful, having been recently appointed architect of the public schools.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY.—University College, London. Classes of Architecture. Free Opening Lecture, by Professor T. Roger Smith. 7.30 p.m.

FRIDAY.—King's College, London. "Architecture: the Pleasure Derived from its Study," by Professor Banister Fletcher. Free Opening Lecture. 8 p.m.

Architectural Association, 9, Conduit-street, W.—The opening Conversazione will take place on October 3, at the Westminster Town Hall, at 8 p.m.

FRED. FARROW. } Hon. Secs.
ERNEST GALE. }

The Local Board of Cleckheaton have called in Mr. W. H. Bradford, C.E., of Nottingham, as consulting engineer, to report on a scheme of sewerage and sewage disposal prepared for the board by Mr. J. C. Haller, C.E., of Rotherham. The estimated cost of the scheme is £20,000.

The county council of Wigtownshire have raised the salary of their surveyor, Mr. Goodwillie, from £160 to £200 per annum.

Surveyors are now engaged in taking levels in the Eccleshall section of a proposed new railway from Stafford to Market Drayton. It is stated that the route will be quite independent of the present North-Western line, and will be viâ Chebsey, Eccleshall, and Croxton. A Bill in connection with the scheme will be presented to Parliament next session.

The parish church of Marbury, Cheshire, is about to be restored, in accordance with plans and report made by Mr. John Douglas, of Chester. The works will include the strengthening of the tower, the placing of a new roof in oak over nave and aisles, reseating the building throughout in oak, and opening out the tower arch, together with the removal of the west gallery. The estimated outlay is £2,000.

In memory of the late Rev. Alex. Lawson, who for sixty years—from 1815 to 1875—officiated as parish minister at Creich, N.B., a stained-glass window has been presented to the church and parish by relatives of the deceased. The window, which has been designed and executed by Mr. Nathaniel Bryson, Leith-street-terrace, Edinburgh, is Gothic in character, and measures 12ft. from sill to apex. In one of the lights there is a figure representing John the Baptist, and in the other St. Paul, while the tracery contains a portrait of the deceased clergyman.

The public rooms at Newtown, Mont., are now in the hands of Messrs. Edward Davies and Son, builders, who have undertaken some important structural alterations. The plans were prepared by Col. Walker, of Liverpool. It is intended to enlarge the chief rooms to 79ft. by 39ft. and 28ft. high. On the ground floor will be, besides this large room and the post-office, the court (remodelled for Assize and other business), counsel's robing and grand-jury rooms. On the upper floor will be a large banqueting-room, and on the west side a kitchen, scullery, and petty-jury room, &c.

Holloway's Ointment and Pills exercise priceless power over Lumbago, all pains of the muscles, nerves, and joints, and quickly reduce all swellings caused by accidental injuries, weakness, or hereditary taints. The intelligible instructions enveloping Holloway's medicine give full counsel for using it most advantageously for regaining health, strength, and mobility.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1865.

FRIDAY, OCTOBER 3, 1890.

THE PROFESSION AND THE BUILDING TRADES.

CO-OPERATION between architects and the building trades implies a few sacrifices on each side and a clearer perception of the duties of each class. We hear it often said that there is no sympathy felt by the builder for the work he is engaged upon, it is simply a matter of business with him, while the architect in the like manner practises his profession in much the same spirit as an agent who gets paid by commission for what he does. When we find such advertising "puffs" as those with which we have amused our readers for a week or two past, it is not surprising that the business transaction in its purely mercenary character is the sole motive of a few at least in the profession. To such men the art of architecture is the preparation of so many schemes, *alias* drawings, for a certain commission, or the rendering of services the value of which is not guaranteed. Little interest or sympathy is to be found among practitioners of this class, for their main object is to catch as many clients as they can, and to get through the business as soon as possible. Professional skill or high art can never be dispensed or ground out in this mill-like fashion; but he who endeavours to score a victory, or to make every commission he receives a means of mastering a new problem, or adding to his reputation, can alone achieve success. The "contracting architect" is a creation of the spirit to which we are alluding. Not being able or competent to win a place in the profession, he assumes the rôle of contractor, and seeks to unite the two businesses. What wonder if we hear of contracting companies starting which will guarantee everything necessary, the architectural design, plans, and superintendence included, the contractors employing architects, or *vice versâ?* There are many calling themselves architects, who are willing to undertake contracts, by carrying out the work themselves, or employing builders to do so. Co-operation, we imagine, of this sort, is not very likely to enlist the favour of the discerning public. It is merely rolling architect and contractor into one for the sake of doing a big business, and securing both the architectural and building branches. A correspondent suggests, ironically, a society to be called the "Society of Contracting Architects," and the Co-operative Builders, we believe, undertake work on similar lines. The weakness of this combination would be that the design would be "supplied to order," and become subservient to the cost. The interests of architect and contractor would be identical, and we know which is likely to suffer the most—the design or the pocket. Whether an architect undertook the contract, or the builder undertook to furnish designs, the identification of interests would lead to the same results. We can imagine what the effect would be if an employer or a committee wished to build. A design would be submitted to cost a certain sum. What security would the employer have that the same design or specification had been adhered to, if the contract amount was found to be inadequate? But it is needless to point out the one-sidedness of a contract of this sort. No; co-operation in the building trades is not a combination of architect and contractor. Co-operation, to be of real value to the trades and to the employer, must proceed on different lines. First, there ought to be sympathy between the profession and the building trades; and, second, there ought to be co-operation between the trades themselves. Neither of these conditions prevail. As we have before affirmed, the building trades hold aloof from the architect, because they have no immediate concern with him: they are bound under a contract, they work under a middleman. Craftsmen under him have little common interests; they are machines, and have no voice in each others' labours, as the tendency of competition is to dissociate—to encourage one workman to encroach on another and to underbid him. These are serious impediments to building co-operations. The ancient trade guilds supply us with a model of the system which we desire to see inaugurated. In the first place, excellence of craftsmanship was maintained by a sort of hereditary training or apprenticeship. In this way the knowledge or mystery of the trade was transmitted through master and pupil. In due time the apprentice became a master, and rose into the higher grades of the craft. Certain privileges were secured to him, the workman, instead of having to fight his way through the ranks of untrained workmen, became a member of a fraternity of a certain grade, privileges were accorded him from the Corporation of the City, and he rose to be a respected member of his craft. How different to the building craftsmen of to-day, who have to fight their way single-handed against the rank and file of unskilled and imported labour, who are scarcely recognised, and who have no provision for illness or old age. Trade-unions have, to a certain extent, supplied these benefits, and their advantages are chiefly on this ground to be valued; but they do not secure all that the workers require; they do not, for instance, guarantee the efficiency of the craftsman which was the main object of the guild. We have therefore to look for a revival of the old corporate principle under new conditions. By limiting the number of subscribers to the unions on the principle of restricting the supply of labour, rather than that of securing competent workmen, a vast number of good workmen are placed in a position of hostility to the unionists. The whole body of craftsmen in a particular branch ought to lay down the rules, and we have in the recent organization of the Plumbers' Company and the registration of plumbers a good example of the revival of the old system. What we require is the extension of the same action to other building trades. If bricklayers, carpenters and joiners, masons, smiths, plasterers, and other trades were to co-operate to secure a supply of skilled labour, the present chaos in the trades could not exist much longer, and contractors would be obliged to engage workmen who have been well trained for their contracts, just as many water and gas companies require their work to be done by hands who are skilled and who agree to comply with certain rules.

The profession and the building trades can do much between them to ameliorate the present condition of affairs; they can agree to work together under certain conditions and frame rules for their own guidance. There would not be so much encroachment on each branch if architects agreed together not to let their work to irresponsible builders, to accept fair tenders for contract work, and to prepare contracts that should not endeavour to overreach or take undue advantage of the contractor; and, on the other hand, if builders agreed not to undertake any work unless a proper set of drawings and specifications were prepared, and a fair contract be drawn up. The terms of a model contract in which the requirements of employer and architect, and also of the contractor, should be studied, and both have means for redress provided, is one of the essential things demanding attention from architects and contractors. A few general rules forming a code on each side would bring both classes into more agreeable relations. Let us mention a few. Plans submitted for competitive tenders should be drawn to a good scale, not less than one-eighth of an inch to the foot; they should be inked in, and every portion of the building should be shown, and details of any particular parts furnished. As to specifications, they should be full, clear, and written in ink. The quantities should be prepared from them, and their correctness guaranteed. Referring to underletting, we believe it would be a benefit to the contractor and to the trades generally, if it was permitted under certain conditions, one of these being that the sub-contractor would be held liable under the terms of the contract. Whether he should be under the general contractor or not is a question that might be left to circumstances. The contractor ought to be allowed a percentage on all sub-contracts. On the contractor's side it may be agreed that the contract price having been based on sub-contracts, the lowest bidders should be awarded the work. Some of these rules are introduced in the code prepared by the National Association of Builders of the United States, and are well worth the attention of builders in this country. The great division of labour that now exists renders it almost out of the question for the architect to engage special craftsmen for each branch of the work in a large building, as was the practice in the old times, or even to invite a number of contractors. But as specialism is the order of the day, why should we not boldly recognise the fact by subdividing the contracts into leading trades, or by allowing the general contractor to sub-let. No doubt it will be said the labour entailed in preparing separate contracts and specifications will be more than the ordinary architect would care to undertake, yet it is a method that cannot fail to insure the best results, as the architect would be "in touch" with each craftsman, and could make his meaning known to him better. We do not say that in every case of building this method would be desirable, but in many the division would be beneficial, and would check the multiplication of small contractors who now undertake all the branches.

HYDRAULICS OF FIRE STREAMS.

THE efficiency of the means of extinguishing fires is a branch of hydraulics not so much studied in this country as it deserves to be. No doubt in London, Manchester, Birmingham, and some other large towns, it is well understood; but in the great majority of towns we believe it is much neglected. Not so in America. There the best conditions are desired, which can only be determined by elaborate experiments. To this end numerous and well-devised tests have been made by Mr. John R. Freeman, M.Am.Soc.C.E., relating to the hydraulics of fire streams, not one item of which seems to have been unnecessarily observed. The report in which these experiments are recorded extends to 180 pages, with a great number of diagrams, plates, and tables for practical use. In reading these it is necessary to remember that the American gallon contains 231c.in. only, being five-sixths of the capacity of our gallon of 277$\frac{1}{4}$c.in. In other respects the measurements are the same.

The height to which a jet will rise under a given head of water may be universally known from the general laws of hydraulics and the few experiments which have been made on the special subject, but in fire-extinguishing apparatus the interruptions to the flow of water are so numerous and unconventional that direct experiment on a large and practical scale is absolutely necessary to insure anything like accurate results. These have hitherto been few in number.

Mr. Freeman's experiments were made on a large and practical scale, and extended to the conditions of the hose pipe as well as of the delivery or "play pipe," and the form and dimensions of the nozzle. The experiments were made in the latter part of the year 1888. The subjects investigated were: (1) The coefficient of discharge of nozzles of various forms; (2) Loss of pressure by friction in fire-hose with interior surface of various degrees of smoothness; (3) Effect of curves in line of fire-hose upon loss of pressure; (4) Effect of reduction of area of waterway at couplings upon loss of pressure in hose; (5) Height and distance reached by jets of water under various pressures; (6) Influence of size of jet upon height attained under a given pressure; (7) Comparative efficiency of various kinds of nozzles; (8) Distribution of velocity in jets. The author, realising the aversion of the busy practical man to algebraic formulas, and to a long array of figures, has embodied the final practical results in tables covering the range of sizes and pressures commonly met with in practice. For practical purposes the pressure per square inch in pounds is preferred to the height in feet of the head of water; but the one expression is easily converted into the other when desirable, the pressure in pounds per square inch being 0·4341lb. per foot in height of the head of water, and, inversely, the head of water in feet is 2·3 times the pressure per square inch.

It was found by the experiments that the fire-stream tables, hitherto in most general use, under-estimated the quantity of water discharged from fire-hose nozzles by 15 or 20 per cent. The coefficient of discharge from smooth nozzles of different forms was pretty constant under different pressures when these were high—so much so that measurements of the quantity discharged by any nozzle might be in that way ascertained. When accurate measurements are required the pressure must be measured near the base of the play-pipe, by means of carefully made piezometers, and the orifice of discharge should be as carefully calipered. The loss of pressure by friction of the flow of water through the hose was found to vary much with the quality of the hose; as much, indeed, as 40 per cent. The degree of roughness of the interior surface of the hose was made visible by means of plaster casts photographed.

The loss by friction in the very smoothest solid rubber hose is represented by	13·4
With ordinary solid rubber hose	14·0
The very smoothest rubber-lined fabric hose	14·1
Very rough rubber-lined fabric hose.....	25·5
Excellent leather hose	21·5
Ordinary unlined linen or canvas hose....	33·3

The nominal size of hose was 2½in. diam., but the actual diameter of the ordinary makes varied from 2⅞ to 2¾in. internal diameter. This alone makes about 50 per cent. difference in loss of pressure by friction, and indicates that previous data, based on nominal diameter, are not reliable for determining comparative loss in different kinds of hose. The sinuosity of a line of hose was found not to increase friction more than about 5 per cent. Curves of any radius short of cramping the hose were found to retard the flow of water but little. The sudden reduction of the area of the waterway of a hose, and its sudden enlargement again to the ordinary size, as with couplings of small diameter, was found to decrease the pressure by about the same amount as is generally understood—viz., that it equals the head corresponding to the difference in velocity due to passing from a contracted channel to one of larger sectional area.

An important point observed in the experiments is the height and distance attained by jets within the limits of practical fire streams. Previous experiments mostly went to show the height or distance of the extreme drops, a fact of almost no value to the practical fire engineer. Jets from about forty different nozzles were compared in order to find the form giving the most perfect jet. A smooth nozzle was found to give a jet a little superior to that from a ring nozzle. The actual velocity of discharge in the central portion of a jet was found to equal the full theoretical velocity, in both sharp-edged and conical orifices, and the fact that the mean velocity of the whole sectional area of the stream was less than unity was found to be due to retardation close to the walls of the orifice.

The gauge adopted for measurement of pressures was an open mercury column. The ordinary Bourdon gauge was not found sufficiently accurate for first-class scientific work such as requires accuracy within 1 or 2 per cent. The mercury columns were each 20ft. in height, erected against the walls of mills and other buildings, and reading to about 117lb. per square inch pressure, and it is reasonable to expect these mercury gauges to measure a pressure correctly within the tenth part of 1 per cent. The quantity of water discharged at each experiment was measured in a tight and rigid rectangular tank holding about 1,350 gallons, built of heavy plank and smoothly lined with sheet zinc, with joints soldered perfectly tight. The height of the water in the tank before and after each experiment was determined by a glass tube about 1in. internal diameter, thus avoiding, by the large diameter, errors due to capillary attraction, to which was attached a scale graduated to hundredths of a foot, and Mr. Freeman considers that any error of measurement could not exceed the third part of 1 per cent. The coefficients of discharge determined by the experiments were those due to the play pipe and nozzle combined, a taper play pipe being really a part of the nozzle.

The loss of pressure by friction in hose was determined for different kinds of 2½in. hose in ordinary use, and for each kind of hose the friction was determined with 1in., 1⅛in., 1¼in., and 1⅜in. smooth nozzles attached, and with some kinds also with ¾in., ⅞in., and 1½in. nozzles attached. The hydrant pressure in the various experiments varied from 15lb. to 125lb. per square inch, and the quantity of water delivered by the hose from 50 gallons to 325 gallons per minute; the corresponding mean velocity in some of the kinds of hose ranging from 3ft. to about 21ft. per second. The loss of pressure by friction in hose was found to follow the usually understood theory that it is proportional to the square of the velocity, closely enough, at least, for nearly all practical purposes; and, as was to be expected, the friction loss was found to be substantially proportional to the length of the hose, which varied in the experiments from 50ft. to 325ft. The important point of determining how far a jet reaches as a good fire stream, as distinguished from the extreme limit of the farthest drops, is chiefly a matter of judgment on the part of the observer. In recording the maximum distance to which the jet under experiment could be classed as a good fire stream, Mr. Freeman laid down a few rules which should be observed:—

1. A stream which at the limit determined upon had not lost continuity of stream by breaking into showers of spray.

2. A stream which up to the limit named appeared to shoot nine-tenths of its whole volume of water inside of a circle 15in. diameter, and three-quarters of it inside a 10in. circle, as nearly as could be judged by the eye.

3. A stream which would probably be stiff enough to attain, in fair condition, the height or distance recorded, even though a fresh breeze were blowing.

4. Which at the limit named would, with no wind, enter a room through a window-opening, and barely strike the ceiling with force enough to spatter well.

With regard to the height to which a jet of given diameter will rise under a given head of water, it would require, to express it accurately, a complicated formula; but as an approximation the following may serve very well within the range of fire streams, with nozzles from ¾in. to 1⅜in. diameter, and with pressures of not more than 80lb. per square inch. Its use, Mr. Freeman says, will not lead to an error of more than 3 or 4 per cent.

The approximate formula is thus given—Let J = extreme height in feet to which the average extreme drops of a vertical jet will rise in still air. Let h = static head of water in feet acting at base of play-pipe, and d = diameter of jet close to nozzle, in inches. This, it may be remarked, for smooth nozzles is the same as the diameter of the orifice: for ring nozzles d may be taken as 86 per cent. of the diameter of the orifice. Then

$$J = h - \cdot00135 \frac{h^2}{d}.$$

VESTIGES OF OLD NEWCASTLE AND GATESHEAD.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

ONE of our double-page plates this week, and the marginal illustrations given with this article, are taken by permission from the book just published* under the above title by Messrs. W. H. Knowles, architect, and J. R. Boyle, F.S.A., the author of "The Lost Towns of the Humber." All the drawings given are by Mr. Knowles, and the letterpress is due to his collaborator, whose notes he has both cleverly and copiously illustrated in a thorough and useful style, without aiming at any exceptional artistic effect, and yet deserving the character of being substantially accurate Mr. Boyle says that "the history of Newcastle in any finally satisfactory way is yet unwritten, and probably too the writer is yet unborn. At present his task is scarcely an achievable one—for his records of Newcastle remain in a sealed book." Mr. Boyle promises, at no distant date, a work, uniform with his present "Vestiges," on the walls and gates of the city, and the "Chronicles of Tyne Bridge." His task now, which he has admirably performed, is to take the reader through the towns he describes, showing all that actually remains worthy of note, and here and there he illustrates, by means of old prints and engravings, what the buildings, now so changed, really were in the past. Commencing with "The Side"—quaintest of streets and strangest of names—he tells us its origin, and how, in Gray's day, it was the centre of the best retail trade in Newcastle, with its gabled fronts and overhailing stories almost meeting in parts in the middle. The woodcut in Richardson's Table Book serves to afford an idea of its appearance at the commencement of the present century. The corporation shortly afterwards widened the thoroughfares and removed the south side. One of the best sketches in the book is the view of a passage below Kelly's shop in "the Side." Some of the old interiors there still have good staircases and fireplaces. The Classic ground of "Sandhill," "a spacious place adorned with buildings very high and stately," is next referred to, with its rich historic associations, including the romance of John Scott and Bessy Surtees, the families of Carr and Cock, and "Katy's Coffee House." We give a sketch (Fig. 1) of the Merchants' Court, the magnificent room above the present Exchange in Sandhill where the Merchant Adventurers hold their court. The splendid, carved mantelpiece in this chamber was taken from the ancient room over the Maison Dieu, as Thornton's hospital was usually called, and re-erected with suitable surroundings of panelled walls and elaborate frieze. It bears the date 1636. The subjects of the two principal panels are the Judgment of Solomon and the Miraculous Draught of Fishes. The author gives a history of the "Mercatorial Guild," with the privileges of that body, the arms of the governors, and their customs. The Guild Hall is a very quaint apartment with an arcaded gallery on one side, and a curious hammer-beamed roof. It was erected by Robert Trollope, whose name is chiefly known by an apocryphal and vulgar epitaph.

* Vestiges of Old Newcastle and Gateshead. By W. Knowles and R. F. Boyle, F.S.A. Newcastle: Andrew Reid, Sons, and Co. London: Elliot Stock. 1890.

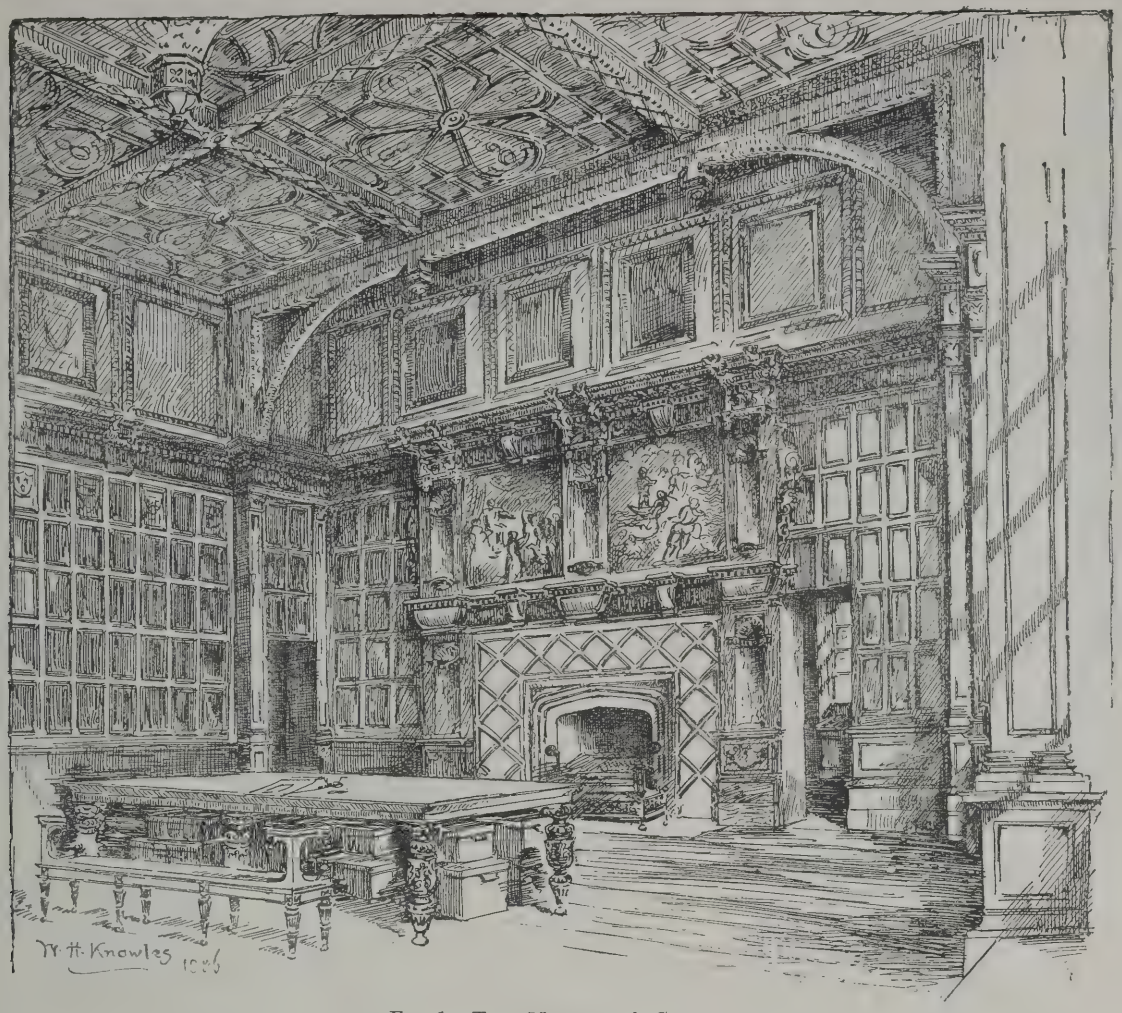

Fig. 1.—The Merchants' Court.

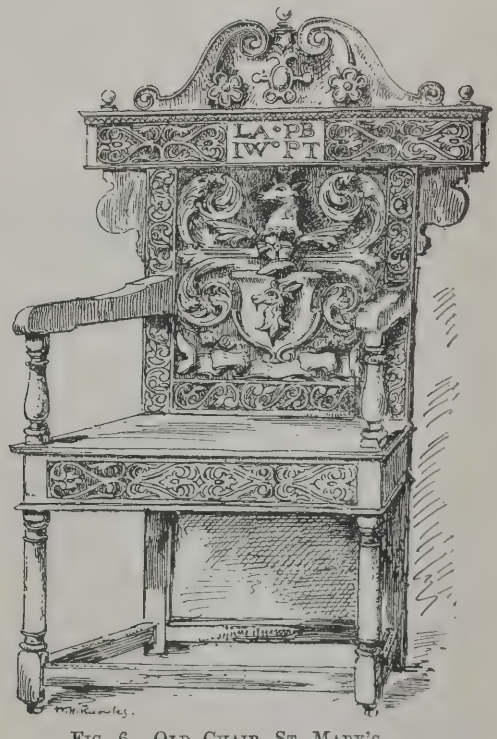
Fig. 2.—Plan of the Castle.



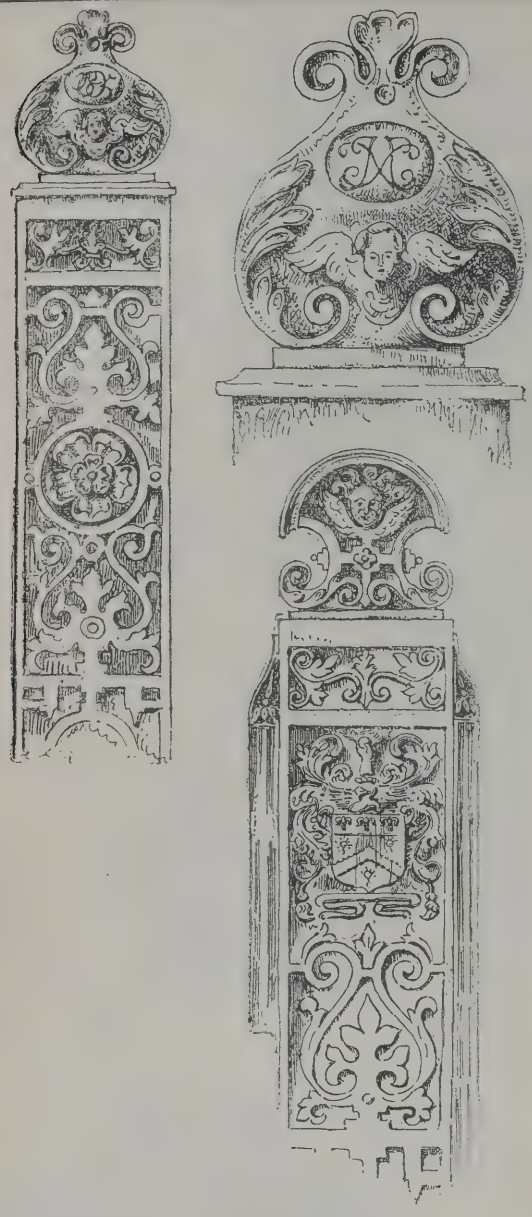


Fig. 6.—Old Chair, St. Mary's.

In the City Treasurer's office may be seen "the Town Hutch," an old coffer of fabulous antiquity, but bearing the date 1716. The early Quakerism of Gateshead associated with Fox is the interesting matter which furnishes much of the next chapter, and we are introduced to not a few singular characters, their troubles and experiences. Turning from these, we study under Mr. Boyle's guidance the Castle, which may, according to some, have been built on the identical site of the Pons Ælii of the Romans and the Monkchester of the Saxons. The history of the fortress as we now see it is of no mean character, of course, "The New Castle upon Tyne," and in the book before us a somewhat full account is given, supplying notes of most of the more important events in its records. Mr. Longstaffe and Mr. Ventress have assisted in describing the parts of the Castle no longer existing, but some portions, even with the aid of such able authorities, are necessarily conjectural. The plan (Fig. 2) of the place, together with the bird's-eye view worked out from a model, are very helpful to the reader, and Mr. Knowles' sketches leave nothing to be desired. The Guard Room, Blackgate, is specially well done. We reprint an east view of the keep, which is rectangular on plan, but not quite square. Its walls are of enormous thickness, between 14ft. and 16ft. in parts. To the roof of the keep is 82ft. high, and 107ft. to the top of the flagstaff turret. The newel staircase in the S.E. angle is very interesting. It consists of 123 steps from the

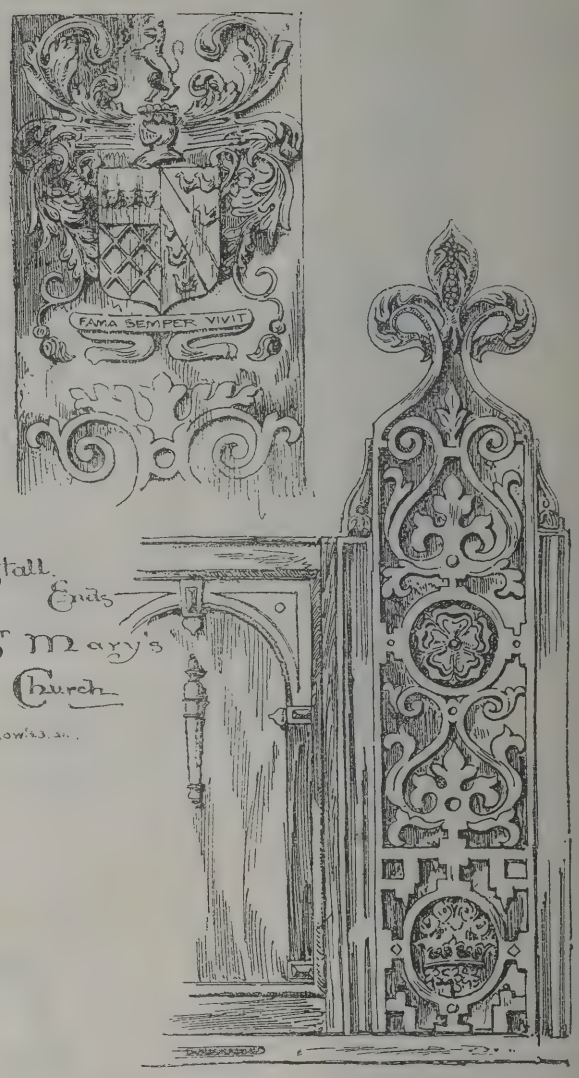

Fig. 5.

ground floor to the roof. The walls are honeycombed by almost innumerable passages, galleries, and chambers. We add a sketch of the Guard Chamber, the principal room of the basement. It measures 26½ft. by 20½ft., and it is vaulted, springing from a plain cylindrical central pillar. The chapel is elaborated with the Norman chevron ornament to the arches. Space fails us to tell even an outline here of all that is added about the Castle. The now cathedral church of St. Nicholas, the famous parish-church, founded, it is said, by Osmund, Bishop of Salisbury, in 1091, naturally also has received Mr. Boyle's particular attention, both from the archæological and ecclesiastical point of view, thus grouping together much useful and entertaining matter of special interest to the student and ecclesiologist. We are enabled to reproduce Mr. Knowles' sketch of the interior, looking S.E. from the north aisle of the nave, and we add a study of the north aisle itself, Fig. 3, and a view of the crypt, Fig. 4. No part of the Early Norman Church remains, and only a small portion may be said to comprise the Early English masonry. The conversion of the church and its recent improvements have been admirably done by Mr. R. J. Johnson, F.S.A., of Newcastle. The Maddison Monument, shown on our lithographic plate, is an odd composition of unusual shape. It originally was fixed to the pillar at the west end of the small aisle of the chancel, but was moved to its present place in the south transept during the late restoration. The principal figures on the front of the monument are those of Henry Maddison and his wife. The two larger figures on the left are his parents. The ten sons and six daughters of Henry kneel in the small panels below. Faith with a cross, Charity with a flaming heart, and Hope with an anchor, surmount the pediment above. The inscriptions are very lengthy, and date from 1624 to 1653. Pilgrim-street, King John's Palace; St. Mary's, Gateshead, where there are some fine old Jacobean stalls (Fig. 5) and a good old chair (Fig. 6); Percy-street; the Keelmen's Hospital; St. John's Church, from which we illustrate the pulpit (Fig. 7); The Quayside; Silver-street and Pandon; the Black Friars; and Trinity House, with its old chapel, each in turn command attention. Then the book is devoted to Gateshead, with the Jesus Hospital; Akenside Hill and Dog Bank. All Saints' Church and the

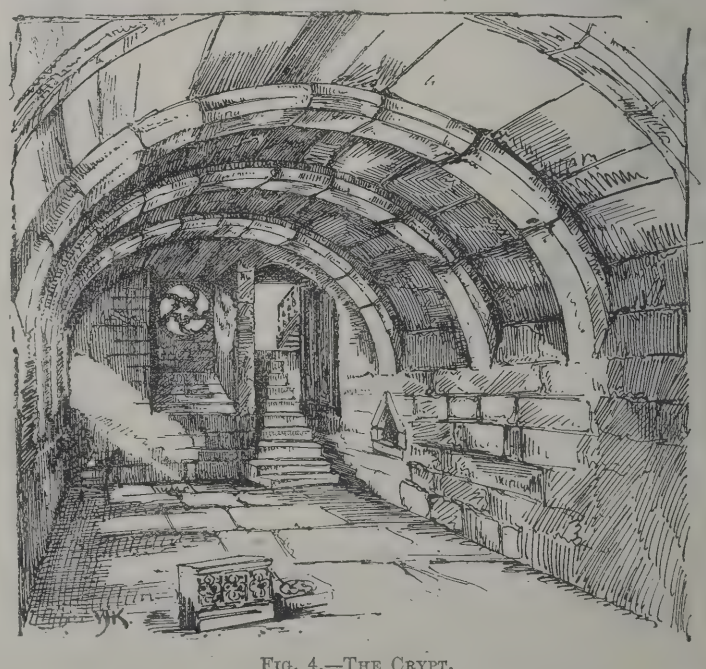

Fig. 4.—The Crypt.

Fig. 3.—In the North Aisle of the Nave.

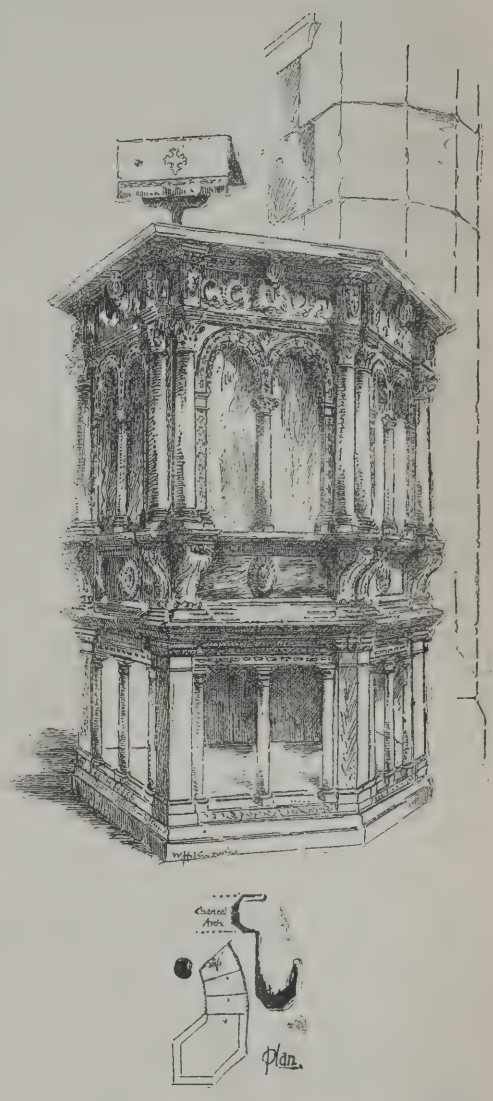

Fig. 7.—The Pulpit.

celebrated Thornton Brass are illustrated and described, with a chapter on the Jesus Chapel at Jesmond (Jesumunde), where there is a holy well, an ancient mill, and its "Free Chapel of the Blessed Virgin Mary." The hospitals of Gateshead, with the early English Chapel of St. Edmund the Confessor, are all fully described by Mr. Boyle, who concludes his useful and entertaining volume with particulars of the "Close" and Riverside, Newcastle, not forgetting the ruined chapel of St. Lawrence, less than a stone's throw from the Tyne Steam Ferry, at Mushroom. With the "Close" the book ends. It is well bound and capitally printed on good paper, and the illustrations are, for the most part, photographs by Mr. James Akerman, of Queen's-square, who always does his work well.

THE WHITEFIELD TABERNACLE AND TOPLADY MEMORIAL HALL COMPETITION.

THE following is an abstract of Professor T. Roger Smith, the professional referee's, report in this competition. The selected architect is Mr. F. Boreham, A.R.I.B.A., of 75, Finsbury-pavement. His design was marked "Winged Heart." The second place is awarded to Mr. J. M. Brydon, F.R.I.B.A., for his plan having the motto "Lux Mundi":

To contrive and design a large Nonconformist place of worship, large public hall, and an underground Sunday-school for 1,000 children are neither of them simple tasks, but in this case the three have to be combined; a very considerable amount of gangways, staircases, rooms, and services of different sorts have to be provided for, and a portion of the accommodation has to be let off. The site is only just large enough for the purpose—in fact, should there be any difficulty about securing unobstructed light over the adjoining land, it is not large enough, and the money proposed to be spent, though in itself a large sum, will require great economy if it is to suffice for securing such ample and varied accommodation. A combination of the best planning, the best interior design for chapel and hall, and the best exterior with the most economical contrivance is what one would desire to find, but, as was perhaps to be expected, no competitor has, in my opinion, been so fortunate as exactly to hit upon such a combination, and the decision which I have arrived at in selecting two designs to receive the premiums has necessarily been based upon a compromise. I will endeavour to state clearly the principal reasons for that decision; but it must be quite understood that I do not propose to commit to writing more than the most important peculiarities of individual designs which have presented themselves to my notice. The most important part of the competition is undoubtedly the chapel, its plan and the architectural treatment of its interior. In so large a place, it is desirable that the ceiling should not be thrown across from wall to wall, but in some way carried in part by columns, so that the centre part is higher than the sides. This difference of height gives the means of introducing light through what is known as a clear story, at a point where good illumination is generally procurable, and where the interior benefits much by the introduction of light. The next most important matter for you is the hall, which, as it is to act as a pioneer building, should be spacious, convenient, and attractive. Next to this comes the appearance of the exterior, especially the front to Tottenham Court-road, and lastly the schools, classrooms, approaches, staircases, and other accessory parts. I think it fair to the competitors to add that, in my opinion, it is virtually impossible to erect buildings giving the amount of accommodation which you require for £15,000, if they are to have such an amount of elegance, dignity, and convenience as will be appropriate at the present day. The designs submitted were ten in number, and were sent in under mottoes.

1. "Arcanus."—In this design the chapel is a simple unbroken rectangle, measuring about 93ft. by 63ft., lying east and west, with no recess for platform. The ceiling is carried across level from wall to wall, with a kind of groined cove at the walls; there are lofty windows above the gallery level, the seats are arranged circularly, with the platform as a centre, the gallery front approaches an ellipse in outline, and there is 35ft. between the gallery fronts. The hall lies north and south, measuring 80ft. in extreme length by 40ft. wide, and the space between its gallery fronts is barely 20ft., which is too little. Roomy staircases are provided at the north end of hall, and a platform at south curved in outline, and with good retiring rooms. The school is large and well lighted; but the provision of conveniences is scanty. Generally speaking, the arrangement and distribution of the various smaller services, classrooms, vestries, and that of the staircases and approaches are carefully contrived, and the kitchen (for tea meetings, &c.) is much better in this plan than in most. It is admitted in the report that the hall is too small to accommodate 1,500—a serious defect. The elevation to Tottenham Court-road is of Renaissance character, and rather striking with an angle tower. The interior of the chapel does not seem to have been so carefully studied as it deserved. I consider that economy has been fairly kept in view in the arrangement of this design.

2. "Forward."—In this design the chapel is a rectangle, measuring about 100ft. by 56ft. within the walls, with the axis north and south, and with a recess for the platform in the centre of the long side, putting the preacher in a position common enough in Scotch Presbyterian churches, but rare in England, and much better suited for small than for large places of worship. The seats are arranged amphitheatrically. There is an arrangement of arcade and clear story. The gallery may be described as occupying three sides of a square with rounded corners. The hall is a rectangle of 100ft. by about 54ft., but with two staircases cut out of it, and here again the platform is in the middle of one of the longer sides. The gallery has a semi-circular front line. The schools are roomy and good, and fairly well lighted; but neither the large room nor any other room receives light from two sides. The classroom arrangements are very good indeed, as are the ground-floor classrooms, but the secretary occupies one of the rooms that should be let as offices. There are three rooms to let. The architectural character of the interior of the chapel is decidedly good, and both it and the hall would, I think, be pleasing. The exterior is in a round-arched style, which may be called Romanesque, and with two moderate flanking towers. No design submitted seems to me to have a more appropriate front to Tottenham Court-road than this, or to have so successfully grappled with the difficult problem how to design an exterior which shall be at once appropriate to a public hall, a series of business offices, and the entrance to a large place of public worship. I believe that, if built, this elevation would look even better than it appears on the drawings. There is no definite estimate, and I much regret to be obliged to place this design, which has many merits, among the more expensive ones submitted. I consider also that the shape of the ground plan of the chapel (and of the hall) is open to serious objections, and would not be found satisfactory, especially in so large a building.

3. "Hearing and Seeing."—In this design the chapel is a rectangle, measuring within the main walls about 100ft. by 75ft., and with a small end recess for the platform in the upper story, not visible on the ground plan. Its axis lies north and south, and there is a clear story arrangement. The gallery plan is an oblong with the corners slightly rounded, and the gallery fronts are only 23ft. apart, which is far too little in so large a building. A flat ceiling over the clear story in the central part is provided, and wooden columns and corbels seem to be intended, and flat ceilings at a lower level over the aisles. The hall is oblong, with two square staircases cut out of it, and the platform is in the centre of the long side. The staircase projections divide the gallery into three. The schools are less satisfactory than in some of the designs, and there is not classroom accommodation on the school floor. The design seems to encroach on adjoining land with steps and areas. The arrangement of church parlour and classrooms seems suitable, but the inquiry rooms and cloak-rooms are ill-lighted, and the secretary badly placed. There are four small offices to be let. The exterior is of brick of a very simple Renaissance character, with two large angle towers, surmounted by domed roofs; but the general effect is extremely plain, and if the domed roofs were omitted would not be equal to such a purpose as this building is designed to serve. The architects definitely estimate this building at £15,000; but I consider that in this design the desire for economy has led the designers to lower the quality both of the exterior and of the interior below that which so important an undertaking requires.

4. "Lux Mundi."—This design is illustrated by the most artistic drawings submitted by any of the architects, and its interior, at any rate, is the most artistic piece of design shown. The two main parts of the building form two blocks with staircase between. The chapel is almost a square, with the corners slightly cut off, measuring 85ft. by 73ft. The seats are amphitheatrical in arrangement, and the gallery follows the same lines. There is no recess for the pulpit. The clear story arrangement is very prominent. It consists of a central hexagon with arches springing from piers, and carrying a very considerable dome. This and much of the general treatment recalls one of Sir Christopher Wren's finest churches. The hall is a rectangle measuring 45ft. by 99ft. The seating is not shown. The approach and the ground-floor rooms are convenient and there are four offices to let. It will be noticed that the square shape of the plan brings every person within a moderate distance of the platform, and also assists materially in the lighting of the chapel. The schools are roomy, and on the whole well lighted. The accommodation in the chapel is over the prescribed number. My estimate is 1,069 seats on the floor, and 575 in the gallery. The seating is particularly well arranged. The general arrangements are simple and suitable; but I think the staircases placed between hall and chapel would have to be extended were this design erected, as the space at the main entrance to chapel is cramped. The exterior is a squarish and rather plain block, of English 17th-Century character, and the dome hardly rises sufficiently above the adjacent roofs to be distinct; still, the architectural effect would not be bad, though not at all equal to that of the interior. I feel serious doubts, looking at the great size and height of the dome, and at the position of the platform under its edge, whether it would not be found materially to interfere with distinct hearing (at any rate, in part of the chapel) unless special precautions were taken. The author is satisfied, he states, that his design can be carried out within 10 per cent. of the sum fixed by the committee; but I cannot admit that this is a very economical design, though not an extravagant one. It is one which reflects the greatest credit on the designer and draughtsman.

5. "Lux."—In this design the church is of an irregular shape, of which the extreme dimensions are 94ft. by 64ft., consisting of an octagon with transepts and recesses. The gallery front forms five sides of an octagon. The seating makes some approximation to be amphitheatrical. The hall is a rectangle 49ft. by 82ft. The gallery plan of the hall is not shown. The school is roomy, but hardly well lighted. The author does not profess to give the accommodation asked in the instructions. He states that his hall only seats 1,200, and his chapel only 1,300. I am unable to make out anything like so many as even 1,300 seats in the chapel, and, after recognising the failure to supply in the chapel the required accommodation which the other architects have found it quite practicable to provide, it appears to me necessary to set this design aside at once. The architect's estimate of cost is £23,350.

6. "Red Cross."—The author of this design has occupied more space than most of the other architects. There appears to be a discrepancy between the actual site and the plan, and he has permitted himself to extend the Tottenham Court-road front to the actual dimensions of the land, and though I regret this, I have not considered that in fitting his design to the real site this architect has infringed the spirit of the instructions issued. The chapel is an amphitheatre in outline as well as in arrangement of seats. It is 78ft. wide and 84ft. deep from the wall behind the organ gallery to the back wall. The platform is next Whitefield-street. I doubt whether this arrangement as here planned would be quite satisfactory either to the preacher or the hearers. The gallery follows the same lines as the ground plan. There is no clear story, but the central part of the ceiling is raised higher than the sides on an arcade. The hall runs north and south, and has a gallery with curved front and the sides prolonged. The hall measures 90ft. by 52ft., and has good retiring rooms. The schoolrooms, &c., are well disposed, but unequally lighted. I have not found any reference to cost in the short report which accompanies this design; but the design is not an extravagant one.

7. "Spero."—The plan shows a large rectangle for the chapel, measuring 71ft. by 72ft., and with no pulpit recess. The seats are arranged amphitheatrically, the platform being at the north, and a similar disposition is adopted for the hall, with the platform to the west, and a semi-octagonal gallery. A large central dome over the chapel is carried on columns, two of which stand very much in the way near the platform; but the pulpit is not under the dome, as in the design of "Lux Mundi." Externally there is also a domical roof to each of the six square staircases. Access is obtained on the south, and projecting steps are shown there. These and an access at the north from Whitefield-street appear to be outside the boundary of the building line shown on the plan. The schoolrooms are spacious, but would in parts be extremely dark. The exterior possesses a four-storied elevation to Tottenham Court-road, and would depend largely for its effect on the numerous and costly domes. This design has been surpassed by several of those sent in, especially in its internal treatment. Its general arrangements, no doubt, are good; but they would be much curtailed if the projections were cut off within the building line. I do not find any reference to the cost of the design.

8. "Taxis."—This design is beyond all comparison the most original submitted; in some respects it is extreme, in others it is good, and in one respect (the internal design of the chapel) it is extremely good. The plan of the chapel is an irregular polygon 88ft. wide and 92ft. deep, having, like the design "Lux Mundi," a central hexagon for its heart. The gallery has a hexagonal front, but each side of the hexagon is a hollow curve instead of being straight. The hexagon is finished with a cleverly designed groined ceiling springing from pointed arches, and there are large windows filled with tracery. The hall is rectangular, and with two galleries. The schoolroom is large and lighted on three sides, and there are ample classrooms, but in not a few instances open to small objections, especially as to lighting. There are three rooms to let as offices. The secretary's office occupies a front space. The architect proposes to form a basement under the entire building, hall as well as chapel — a serious additional expense. The exterior is extremely picturesque, of Gothic architecture, rather Flemish in character, and a high tower with a very steep roof is a prominent object. There can be no doubt that if erected from this design the buildings would be extremely striking in appearance, and, as I have already observed, the interior of the chapel would be very successful and appropriate with its octagon of pointed arches, its tracery, and groined ceiling. The front to Tottenham Court-road also would be striking, interesting, and original; but there can be no doubt that the design would be one of the most expensive of those sent in, even without the lofty tower, while omitting the tower would diminish its attractiveness sensibly. The author of this design says that the tower is not included in the amount named by the committee, but does not give a definite estimate in his report.

9. "Winged Heart."—In this design the chapel is a rectangle 68ft. by 80ft., with recesses, making it 68ft. by 104ft. in extreme dimensions, and the seating on the ground floor is all straight and very well arranged. There are four staircases at the angles which serve to form the recesses alluded to above. The gallery has a semicircular sweep; there is 40ft. clear between the gallery fronts. The design provides an effective clear story and an open roof, forming a very successful interior, illustrated by a telling, but not, I think, an unfair, perspective view. The hall has an open span roof from wall to wall, it is a simple oblong, 101ft. by 51ft., with a gallery on three sides, and ample space between the gallery fronts. There is a great deal of good sense shown in the general arrangement of the building, but it depends to a considerable extent on the side entrances for ingress and egrees to the gallery of the hall, and partly to the school and chapel gallery. The author of this design has (like "Red Cross"), occupied more space next Tottenham Court-road than the plan issued to competitors shows, and having decided that "Red Cross" was justified in doing this, I of course decided similarly in the present case. The exterior is of round arched brick and stone treatment, with almost too many openings, better shown on the pen-and-ink perspective than on the coloured elevation. This exterior has no very strongly-defined architectural character, and is decidedly less successful than the interior, yet some features, such as the high roof over the hall, the lanterns, and the pinnacles on the buttresses, serve to counterbalance the uninteresting and very secular treatment of the ground story; and the grouping of the two blocks of buildings with their high roofs, as seen from the N.E. and S.E., promises to be very telling and picturesque. The general schoolroom, by no means so large as in some designs, is well lighted, the infants' schoolroom unequally lighted. The general arrangements of the approach, the church parlour and classrooms, and other ground-floor planning are good and well judged, and no fewer than six good offices have been contrived for letting. The author estimates

the design at £15,000. It is among the more economical designs.

10. "Wisdom, Strength, and Beauty."—In this design the chapel is rectangular, measuring 69ft. by 87ft. (or 98ft. to back of organ recess), with two square staircases at the south end. The gallery plan is an elongated octagon, and a large circular dome rises from the ceiling over this space. The principal entrance, steps, &c., are placed to the south, and though a large entrance passage from Tottenham Court-road is provided, but little use is made of it. The architect has departed from the instructions by placing his schools, &c., under the hall, neglecting the excavated basement existing under the chapel site, and, as designed, his schools would be so extremely dark as to be of practically little service. The exterior really has its principal front, which is very ambitious, to the south, and here a great dome and flanking towers appear. Towards Tottenham Court-road a very different elevation has been shown. The architect's estimate is £20,000, and the design is no doubt a very expensive one, and I think the author of it deserves some credit for not having put it down at £15,000. I consider, however, that its costly nature, its departure from the programme, and other reasons, practically render it impossible to entertain it.

In the above review of the designs I have intentionally avoided considering minutely the question of administrative rooms and school and class room arrangements. I think whatever design is adopted will have to be recast in many of these respects, and though the skill, or otherwise, with which these parts have been arranged have not passed unnoticed, I have not thought it necessary to extend this report by going into those particulars.

It appeared to me that, on various grounds already mentioned, I might set aside the plans of "Lux," of "Spero," and of "Wisdom, Strength, and Beauty." Of the remaining seven designs I have made approximate cubed estimates in order to see which are the most economical, and though the process known as cubing may not be always very safe as a guide to the actual cost of any one building, it is a very good way of finding out the comparative cheapness or expensiveness of several designs. I find that four designs are very considerably more economical than the others. I consider, therefore, that the first premium must be given to one of these four. They are "Hearing and Seeing," "Red Cross," "Arcanus," and "Winged Heart," and among these it appears to me that the balance of advantages rests very decidedly with "Winged Heart," to which design accordingly I award the first prize. The author of "Winged Heart," whose design I have already described, has secured very wide and spacious buildings both for the hall and chapel, so that while seating your people easily, no one will be remote from the speaker, and as the hall will have to serve as your place of worship at first, it is of importance that it should be capacious, not cramped, and with good space between the gallery fronts. As regards architectural treatment, I attach more importance to the interior of the chapel than to anything else, and that certainly has been very well designed. Access: numerous and fairly roomy staircases and good corridors where such would be useful are provided, and the design on the whole (though not the best in all respects) is, in my judgment, decidedly the best, taking every consideration into account.

The three designs which I consider ineligible for the first prize, "Lux Mundi," "Forward," and "Taxis," are all of them remarkable for artistic merit, and among them I select "Lux Mundi" as the design to receive the second premium; it is in my judgment the most artistic of the three named above, it is excellently planned, and it also is the least costly of the three.

[We shall notice the designs ourselves shortly. Considering that this report was sent in on September 10, they might, we should have thought, been visible, and the award made known before this.]

THE PHOTOGRAPHIC EXHIBITION, PALL MALL.

THE gathering of sun-pictures this year in Pall Mall affords nothing specially fresh or remarkable; but, on the whole, the exhibition may be described as a good one, comprising some exceedingly clever specimens of photography. The architectural subjects represented are less numerous than usual. The most important of this class, on account chiefly of its size, is an enlargement of Messrs. Bourne and Shepherd's fine photograph of the Taj Mahal at Agra, exhibited by the Autotype Company. The same firm show a whole series of plates illustrative of sculptures and designs by the late Alfred Stevens, besides some facsimiles by that artist of figure studies, lent by Sir Frederic Leighton. The Chimneypiece in the Dining-Room of Dorchester House, Park-lane, and the Wellington Monument in St. Paul's Cathedral are well represented in detail. We believe shortly a folio is to be published of these prints, under the direction of Mr. Hugh Stannus, and they will make a fine book, worthy of the man whose work the photographs so ably represent. The series of portraits of members of the Royal Academy which Mr. Ralph W. Robinson is publishing are continued this year, showing the artists at work, or in their own studios, posed for the occasion. Our readers will be more specially interested in seeing Mr. Alfred Waterhouse, R.A., seated before some plans; Sir Arthur Blomfield, A.R.A., looking up as if surprised, at his escritoire; Professor Geo. Aitchison, A.R.A., standing at the bookcase in his private room; and Mr. J. L. Pearson, R.A., engaged with a serious batch of papers, drawings, and correspondence, all seemingly taken while in harness with the surroundings of home. The likenesses in each case are good; but the light in which they necessarily were taken has not in every instance been equal to the requirements of the camera. Mr. G. Davison has gained a medal by his highly artistic study of "An Old Farmstead" seen over the onion-field at the time of harvest. It is a capital picture on grained paper, and having almost the effect of a sepia water-colour. Another medal is awarded to Mr. Lyddell Sawyer's "Two's Company," a scene by the road side, where an attractive country lass is engaged flirting with a young fellow leaning against the old stone steps in the wall, the girl being seated at the top. To the right stands a second swain, fired with jealousy, and looking on, consumed with a determination to do something desperate. The figures enact the characters well, and Mr. Sawyer has chosen a very happy setting for the incident, which he has represented thoroughly in taste and reserve. Nothing, however, is more easy than to overdo a subject of this kind. We have no comment but praise, too, for Mr. John E. Austin's medal picture of "The Love Letter," a scene on the shore where three fisher-girls, standing or seated by some old boats and baskets, are discussing the contents of a missive from one in whom they all clearly have more than a passing interest. The picture is eminently simple; but it is equally good, and certainly deserves the prize awarded to it. Mr. Harry Tolley obtains a medal for a splendid view of Bantry Bay, one of a grand series of fine landscapes. Mr. Lionel E. Westropp shows some artistic architectural photographs, to which we draw attention, particularly the views of Elmley Church, Worcestershire, standing overshadowed by the trees by the side of a stream, with its great square tower and Late Gothic windows—a most pleasing subject for the water-colourist inclined to old buildings. Mr. Westropp also shows Sir Walter Scott's tomb at Dryburgh Abbey by a brilliant silver print of good size. The hoar-frost views, "Christmas Eve at Kenilworth," are the best things of their kind in the gallery, showing the castle in the coldest of weather, 'midst the snow. There are a good many interiors of modern houses of the better sort, exhibited by Mr. H. W. Reeves in some very nice platinotypes, such as those of Morden Grange; the Hall, Kinmel, Abergele; and Lyneham, Wimbledon. Mr. H. Dudley Arnott's grand view of the choir and apse of Norwich Cathedral, taken from the screen looking east, is unquestionably a very beautiful photograph. We hope before long to give a reproduction of one of his similar studies of this vast interior kindly placed at our disposal some time since. The porch of Winchelsea Church, Sussex, is illustrated here by a bromide print showing the wall-flower covered gable of this crude structure which stands at the end of the famous remains of that once magnificent fabric, the nave of which is now all gone. Mr. Lyddell Sawyer, whose work we have before noticed, has an exceptionally clever scene over Durham, with the cathedral crowning the city in the distance. The atmospheric effect, as here portrayed, is admirably managed, and we must praise with equal warmth the same artist's "Wind against Tide," as well as "Towing up Stream." The Rococo Altar-piece from the Canary Isles, by Mr. G. Graham Toler, and Mrs. Wrigley's "Nave of York Minster" hanging near, may be mentioned—the latter as a study of light and shade. Mr. Fred Hollyer, ever thorough and artistic, sends some of his sympathetic renderings of Mr. E. Burne Jones's designs and copies of paintings by Messrs. G. F. Watts, R.A., and W. B. Richmond, A.R.A. Mr. Mendelssohn's portraits are good, and Mr. Van der Weyde shows a group of the children of Mr. Mortimer Mempes, dressed in Japanese costume. For this picture he takes a medal. Mr. Bedford Lemere contributes several good architectural studies of Grosvenor-square houses, and Mr. W. Bedford shines with some charming landscapes.

MUNICIPAL AND SANITARY ENGINEERS' ASSOCIATION.

THIS Association held a meeting in the Royal Scottish Society of Arts' Hall, Edinburgh, on the 25th ult. Mr. Boulnois, city engineer of Liverpool, presided. Mr. Cooper, the local burgh engineer, read a paper on "Municipal Work in Edinburgh." He said that the population of Edinburgh at present was 271,135, being a density of 54 persons per acre, and representing an annual rate of increase of somethink like 6,000. The maximum rate of density —900 persons per acre—was found in the Cowgate district, although it was rapidly becoming depopulated. The practice of erecting flat upon flat had become the bane of their slums, and had left them a heritage of insanitary and disease-producing conditions, which were to this day prevalent and disastrous. The death-rate of Edinburgh, previous to Dr. Chambers's improvement scheme, which cost the city £300,000, and unhoused 14,000 inhabitants, was 27 per 1,000; last year it was 16·54. The number of uninhabitable houses dealt with during the last five years was 2,000, of which 1,006 were closed, and the number of tenements where the drains had been overhauled was 3,400. The annual cost of inspecting the drainage arrangements and sanitary appliances of existing houses was £1,800, or thereabouts. With the exception of the sewage used in irrigating the Lochend and Craigentinny meadows, the sewage of the city, to the amount of nearly three million cubic feet per day, was drained into the Firth of Forth. The Chairman said that in Liverpool large sums of money had been spent in the destruction of rookeries. At one time they erected two large blocks of sanitary dwellings, but they had not met the requirements of the poor, and they were trying to sell them, almost to give them away. He was surprised that the far-famed meadows of Craigentinny were not the success which they at one time were led to believe. Mr. E. Pritchard (Birmingham) said that he was much pleased with the good condition of the Craigentinny meadows after so many years' usage. These meadows compared very favourably with the sewage farms of England.

CHIPS.

On Thursday, the 25th ult., a parish-room and Sunday school for St. Margaret's, Ilkley, was opened. The building is in the Gothic style, and the architects are Messrs. J. and E. Critchley, Bradford and Ilkley. The cost has been £3,100.

The extension of Atherton Parish Church has been commenced this week by taking down a block of old buildings at the west end, where the proposed addition is to be built. The site is to cost £1,200, and the extension of nave another £6,000.

The Girls' High School, which has been erected in Dundee at a cost of upwards of £25,000, through the liberality of Miss Harris and of her late brother, Bailie Harris, was opened on Friday by Dr. Craik, secretary to the Scottish Education Department.

With a view to discover some healthy method of spreading the working-class population of Newcastle over a greater area, a deputation of the corporation of that city, consisting of the chairman of the sanitary committee, the deputy-mayor, three members of the town council, and Mr. Law, city engineer, visited Glasgow on Friday for the purpose of inspecting the artisan dwellings erected by the City Improvements Trust in the Saltmarket and the other lodging-house accommodation provided by the Corporation in different districts of the city.

BANQUETING HALL STAIRCASE, GLASGOW MUNICIPAL BUILDINGS.

Mr. William Young, the well-known architect of this great work lately completed in Scotland, has within the past few days published an exceedingly well-produced folio, comprising some twenty collotype illustrations of the buildings, giving general views chiefly of the interior, and details of their parts, together with plans of the principal floors. These illustrations are from photographs of the actual work taken specially by Messrs. Bedford Lemere and Co., of London. The book opens with a tersely-put epitome of the history of the Glasgow Municipal Buildings Competitions, their origin and progress. The descriptions of the work in its several stages which Mr. Young furnishes are interesting, and we observe that he carefully avoids unnecessary reference to his own share in the designing and supervising of the vast undertaking now brought to a successful issue. It certainly is one of the most satisfactory buildings of the present generation, and illustrates much refined design and artistic ability, while a unity of scale is one of its best and most prominent characteristics. The structure is not, of course, devoid of faults, but it is not liney nor wirey, neither is it thin. The buildings contain 350,000cub.ft. of stone, 19,000cub.ft. of granite, and 10,000,000 bricks. The plinth is faced with granite 4ft. to 5ft. high, and above this the façades are faced with Polmaise and Dunmore stone. Every stone in the building has a V-groove cut in the vertical joint, which is run with pebbles and cement, thus uniting the whole in one homogeneous mass. The stone domes are similarly constructed without chain bond, but with brass dowels to every stone. The floors are fireproof. No general statement as to the actual cost of the buildings and their fitments, &c.; is given, but the sizes and dimensions of the structure are furnished. The illustrations are separately described in detail, commencing with the main front in George-square, then the principal entrance, with Mr. G. A. Lawson's beautiful sculptures, the loggia, the council-hall staircase, and the banqueting hall staircase. Of this part of the building we give two views, prepared for us from the original photographs, and showing one of the most interesting features in Mr. Young's elaborate conception. As will be seen from the prints, the work is built entirely of various coloured marbles, excepting the groined and domed ceilings. This marble work was entirely done by Messrs. Galbraith and Winton, of Glasgow. The dado is of alabaster, with a plinth of veined marble. The steps, also of marble, are 11ft. long, and solid. The balusters are of turned alabaster, with a capping to match the dado. The columns are of blocks of alabaster and Brescia, having white marble caps with purple Brescia, veined Carrara, and red transparent alabaster spread over the walls the whole height, three stories, to the top. The ceiling is of rich plaster-work. The floor is veined marble, with Numidian in squares relieved by white. The design is a work of the Renaissance corresponding with the general style of the building. Other views in Mr. Young's book give the "Faïence Corridor" with its keramic mosaic floor; the Council-hall, the Satin-wood Salon, the Octagon Salon, and the Mahogany Salon, the library, and the Lord Provost's room. The reception-room, elaborated in an Italian treatment of elegant forms, seems to be a particularly rich apartment, with panels in solid gilt on a dull yellow-green ground, relieved by festoon and pendent enrichments also in silk and gold, and the walls between the pilasters are filled with brocaded silk in character with the rest. The high dado and other woodwork is of Cuba mahogany. The *chandelle* ornaments are gilt. The fine ceiling is of fibrous plaster like the deep architectural frieze under a plain deep cove, which is effective. The detail of all this work, and the furniture specially designed by the architect, is very good. The library, chimney-piece, and book-cases are equally satisfactory, neither care nor expense being spared to make them so. The Lord Provost's room we like less than the others perhaps, and in the views the gas pendants seem needlessly large. This may be due to the tricks of the camera. The views which we give indicate sufficiently the style of work adopted. Messrs. David Bryce and Son, of Glasgow, are the publishers. The cover would have been more in keeping without the diagonally-placed lettering. Other illustrations of the Glasgow Municipal Buildings will be found in the Building News for Jan. 16th and May 1, 1885; Sept. 16th, 1887; April 20th, 1888; and March 29th, 1889.

ST. JUDE'S CHURCH, SOUTHWARK—DESIGN FOR REBUILDING.

The present church, which was originally the chapel of the Philanthropic Society's schools, was once crowded with fashionable congregations, attracted by the music and preaching, for which the church was renowned. Efforts have from time to time been made to communicate to the structure some more ecclesiastical appearance, but without success; and on the progress of decay rendering some extensive repairs imperative, the present vicar, the Rev. J. Watkins Pitchford, M.A., wisely determined upon entire reconstruction. The design illustrated was selected in a limited competition. Several advantages are gained by placing the new church with its axis at right angles to the old, one of these being the opening up of space for a playground to the schools adjoining. As the church is of somewhat short proportion, a continuous line of roof over nave and chancel has been adopted. The building will be seated for 500. The estimated expenditure is £4,000, towards which the vicar has in the past two years collected £2,700.

VESTIGES OF OLD NEWCASTLE AND GATESHEAD.

(See description and further illustrations on pp. 458-461.)

JEWISH WORKING MEN'S CLUB-HOUSE AND PUBLIC HALL.

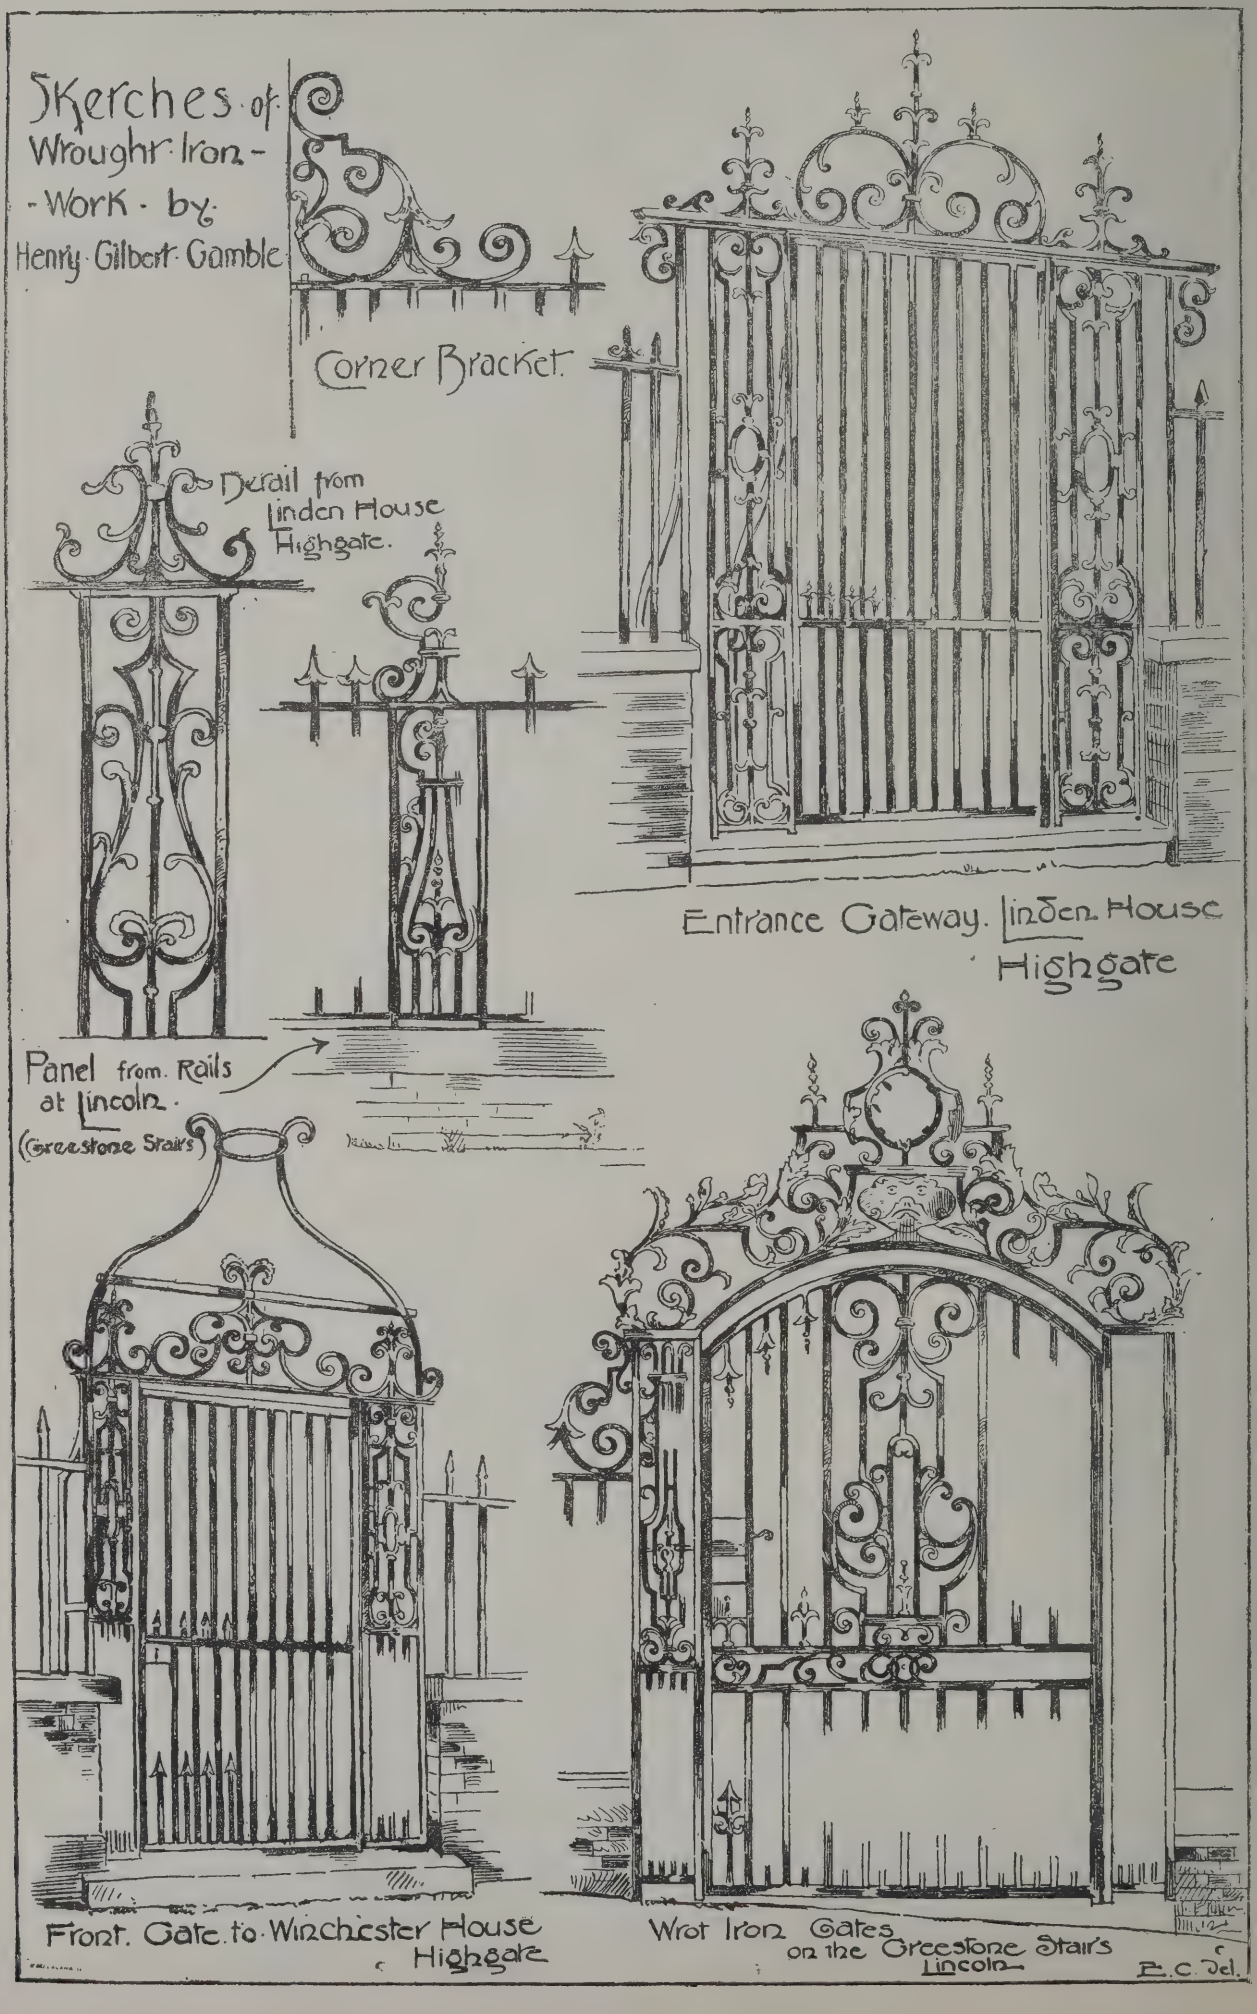
These buildings are now in the course of erection for the committee, Mr. D. P. Schloss, chairman, in Exchange-street and Knowsley-street, Cheetham, Manchester, in the centre of the Jewish working-men's colony. The accommodation is very ample, and at a cheap rate, the total cost of the buildings, ready for occupation, including architect's charges, being only £2,640 10s. The front is in grey end headers, set in black mortar, with quoins of red stocks at all angles. The public hall is roofed with semi-circular principals made in three pitch-pine ribs, and is arranged to give the best acoustic results. The heating is by hot water, low pressure. Special attention has been given to ventilation, fresh air being supplied at floor level, and 6ft. above same, over hot-water pipes, foul air being extracted by a special ventilating shaft in connection with heating apparatus, and with ventilating shafts in connection with sun lights. The contractors are Messrs. Burgess and Galt; bricklayer, Mr. Evan Roberts; mason, Mr. J. B. Kendall, and the works are being carried out under the superintendence of the architects, Messrs. Goldsmith and Son, 63, Faulkner-street, Manchester.

SKETCHES OF WROUGHT-IRON WORK.

The examples of wrought-iron gates published herewith are taken from Highgate and Lincoln, and their date may be assigned to the 17th century. The people of Highgate, no doubt influenced by the nearness of the Protector, who once occupied Cromwell House there, erected a great many of these gates and over-gates fronting their villas, several of which still remain. Generally, as in the sketches from Winchester House and Lincoln, a place was provided in the overgate for the lamp. Many of the gates still have, attached to their imposts, the extinguisher in which the link boys put out the light of their torches. The gate at Lincoln is only one example of many of which the neighbourhood of the city can boast; they all possess a distinctly similar manner of work, which would lead one to suppose they were wrought by the same smiths. The Halls of Nettleham and Fulbeck, villages within a few miles of Lincoln, possess similar entrances of great beauty and elaborate detail.

SHERRICK LODGE, SKERRIES, CO. DUBLIN.

The pen-and-ink drawing which we reproduce was hung at this year's Exhibition of the Royal Hibernian Academy. It represents a small summer seaside box, designed for Mr. T. S. F. Battersby, B.L., by Mr. Howard Pentland, B.A., Bac.Eng., F.R.I.B.A. The ground floor consists of a top-lighted saloon, with sitting-rooms, kitchen, and offices disposed around, and is built throughout of 9in. brickwork, exposed both inside and outside. The upper part consists of a gallery around the saloon, off which the bedrooms open, and is built with timber and plaster. The roof is covered with double roll tiles. There are two sitting-rooms and five bedrooms. The contractor was Mr. Michael Heeney, of Balbriggan, and the cost was about £450. The floors of the saloon and vestibule are tiled, and those of the sitting-rooms are laid with 1in. American ash, in narrow widths. A 9in. by 6in. moulded plate runs round all the walls, over the doors, and windows, and on this rest the joists, which are exposed and moulded. The internal effect of the red-brick walls is very cosy and picturesque. The house, which commands an extensive view of islands and coast, stands on the sea-sand at the mouth of a small river, the banks of which are planted with sallies, Austrian pines, tamarisks, and sea-buckthorns. The foundations are of concrete, and were made by digging out the sand, mixing it with cement, and throwing it back into the trenches.



CHIPS.

The Poorhouse Committee of the Dundee Parochial Board instructed Mr. Alexander, city architect, on Friday, to prepare plans for a sick hospital to accommodate 300 patients, the building to be on the pavilion system, two stories high.

The Bishop of Durham consecrated on Friday the new portion of the cemetery at Bishop Wearmouth. The *Sunderland Echo* states that Mr. D. Balfour, C.E., the surveyor from whose designs the grounds were laid out, was present at the ceremony "in wig and gown."

The plans for the new General Post-office for Leeds, to be erected on a portion of the site of the old Coloured Cloth Hall, have now been completed. They show a building having its front to the open space abutting upon Park-row, and its sides to Infirmary-street and Quebec-street. It will be a stone structure of four stories, and somewhat plain externally.

The coming of age of Mr. William Edward Godwin, eldest son of Mr. William H. Godwin, of Withington Tile Works and the Ferns, Lugwardine, was celebrated on Thursday, Sept. 25th. At the Tile Works, Mr. W. E. Godwin was made the recipient of a handsome Gladstone bag and dressing-case from the employés of the firm at Withington. Mr. Robert Hooper made the presentation, as one of the oldest workmen of the firm. In the afternoon the workpeople formed into a procession, and, headed by the Lugwardine Works Drum and Fife Band and the Withington Brass Band, marched to the Ferns, where tea on the lawn was followed by sports.

WAYSIDE NOTES.

RETURNING to town after a few days' absence, I learned that something mysterious had happened in connection with our only London Bridge. Rumours of the displacement of certain stones of unwieldy dimensions from their positions in the abutments of the wide-spanning arches were abroad, and made me curious to ascertain the nature and cause of the damage done. Crossing the bridge on Wednesday morning, from the Surrey side, a gaping crowd opposite the Pearl Insurance Company's premises seemed to indicate the whereabouts of the object of my search, much as the stealthy pointer discloses a covey of birds to the wily sportsman. Sure enough, above the cut-water of first river pier some disturbing agent had been at work, and massive stones had been displaced by something more than the whisk of a dolphin's tail. How came it about? I had missed any newspaper accounts that may have been given of the occurrence, and only understood that, apart from certain rumours as to a certain vessel having had its nose under the projecting courses and thus displaced the stones with the rising of the tide, the cause of the injury was not precisely known, even to the proper "authorities." Whatever the cause—which will probably be found to be the careless handling of some vessel of large tonnage, judging from the aspect of displaced masonry—it is pretty certain that the sooner the stones are replaced the better, even if the roadway of the bridge have to be contracted a bit for a short time. The consequent congestion of traffic will be deplorable, it is true; but if it is impossible, as I understand, to repair the abutments from the river, there is no help for it, and the sooner repaired the sooner will the anxious crowd disperse. Fortunately for the condition of the eastern side-walk, it is impossible, on account of the projection of the cornice, to glimpse the displaced stones over the parapet. If it is possible to lay the charge of the damage to some shipowner, by all means let him be supplied with a little bill; but it is no use making a mystery of what, I should say, can only have been done in one way—by the enormous leverage force of the tide acting through the medium of a large vessel. A mere collision could scarcely have displaced the blocks, and they certainly were not caused to assume their present position by anyone sneezing in the vicinity.

The Tower Bridge progresses, though, as only natural and proper with a work of such dimensions, somewhat slowly. The present condition of the works has not been attained without the laying-down of some 80,000 tons of stone—as I learn from the report of the visit of the Bridge House Estates Committee, made on Tuesday last—and this merely in the construction of the two great piers, now drawing towards a satisfactory completion. The statistical figures of the complete bridge are impressive:—31 millions of bricks, 19,500 tons of cement, and 70,500 cubic yards of concrete, not to mention the 15,000 tons of iron and steel. It is reported that the Committee "witnessed with interest" the riveting of some of the ironwork by means of hydraulic pressure, but this method of riveting is now becoming so general in works of any magnitude that it must soon cease to be a novelty to even the ordinary sightseer.

Having been on the South Coast for a few days, I have noted two or three facts. The works for the new harbour at Newhaven, destined to obviate the necessity for the Continental boats waiting for the tide before they can cross the harbour bar, are progressing favourably—so far as could be judged from a distant point of view,—the contractors being busy throwing down tons of concrete at the head of the pier, which now projects considerably into the sea, and will apparently form a shelter from stiff sou'-westers after the manner of the pier at Dover. It will be a blessing to travellers by this route to Normandy, Paris, and the Continent generally, as I can say from experience after spending several long night hours on the Newhaven quay waiting for the tide. The pier, let us hope, will be of a very different stamp to the sea-wall towards Seaford. In its present condition that ill-fated structure is a warning and lesson to the constructors of deep-sea piers, breakwaters, and walls. For a mile or more it is overthrown—here with a wild, chaotic look, there in a quiet, dignified manner, as though the sea had gently but irresistibly rebuked the attempt to stay its freedom of action. Block after block of massy concrete is evenly and regularly overturned towards the land, and the next phenomenal gale with a high tide will flood the low-lying ground and wastes behind the beach. Judging by the design, arrangement, construction, position, and surroundings of the wall—an insignificant portion of which alone stands intact—I do not greatly wonder at its present humbled condition.

Seaford, some two or three miles east of Newhaven, should some day be a considerable seaside resort. It has several good attributes. The place is swept freely by breezes from both sea and land, and, though not having the snug, sheltered nooks of a place like Hastings or St. Leonard's, it reaps in summer the advantage of its open situation. The encircling downs may protect it in a measure from northerly winds; but the hills are so far back that they could not make the place close in hot weather. Under a fine bluff at the east of the town there may, however, be found some sheltered sites for building, which, though actually on a small scale, is relatively brisk at Seaford. Upon the newly-constructed sea-wall and esplanade a considerable hotel is now being erected, and several houses close at hand. Unfortunately for the older houses constituting the picturesque front of old Seaford, the new sea-wall cuts off all their view of the sea, and moreover a somewhat dull tract of ground is formed by the same cause. The sea-wall being considerably higher than the ground behind, and the old sea front being set back inland at the same low level, the best course to pursue in future building operations would be to incline the approach roads to the esplanade, as has been done with the approach to the new hotel; but whether this course will be adopted throughout remains to be seen. Unfortunately, things are so often done in a haphazard manner at new seaside resorts, care for future effect and well-being generally being absent, and the conveniences of the present moment alone regarded. Thus we often find districts spoiled to all time by this want of foresight, builders plumping down houses of a size and description unfitted to make the most of the several sites available. It would be a pity if Seaford were spoiled as many other places have been; for it has its opportunities, and the old town is picturesque with its simple buildings and grey old church with its quite typical square tower, and pyramidal, red-tiled roof.

They seem to be doing well at Worthing. Quite in contrast to the usual state of things, there are wonderfully few buildings to be let or sold in this pleasant place, notwithstanding the fact that many houses have recently been erected in the western portion of the town, conveniently placed for the new station. The Worthing builders, in their leisure hours, go down to the sea and play "ducks and drakes" with Jubilee five-pound pieces.

The Brighton Métropôle is a success, and Mr. Waterhouse has placed an ornament on the Brighton sea-front. A certain flatness of effect has been pointed out to me, and if existing is referable to want of contrast somewhere in the façades. Perhaps it is as well to be on the safe side: it is so easy to set powerful contrasts, if one puts one's mind to it at the outset; and a scarcely appreciable tameness arising from too great caution in securing gradation and harmony is excusable. I don't quite see how the buff terracotta crops up when the elevation is almost completed, as if the manufacturer had run short of the red variety. Breadth of effect is not enhanced thereby. In pointing out slight defects, which, after all, have to do with individual taste, more than with strict canons, it will be seen that there is not much with which to find fault, and this is the case. The new hotel adds an extra attraction to the Brighton front, and is very welcome in a place where, as usual in seaside towns, mud houses are the chief wear. The building is eminently expressive of its purpose, which is always a great thing, and without which many authorities would declare a work of architecture to be a mere vanity. The general tone of colour of the elevation is wonderfully soft and pleasing, and many of the details and features are interestingly original, and finely stamped with the individuality of their designer. The whole work is a credit to its architect, an acquisition to Brighton, and should be a fortune to its owners. So much as regards its esteemed design; its internal economy and design I hope to become familiar with on another occasion.

Hove parish church will be one of the finest of modern times. At the corner of The Drive and the Eaton-road, in West Brighton, Mr. Pearson is now erecting a church to become, when complete, the new Hove parish church. It will certainly compare favourably with anything of its class heretofore erected. By the courtesy of Mr. S. Chivers, the clerk of the works, whose skill in church-work has been well established since his connection with Mr. Pearson's grand building at West Croydon—St. Michael's—I have been enabled to inspect the works at Hove. The new church is on an extensive scale, and the degree of elaboration of the mouldings, throughout the design, quite unusual. A beautiful type of Early Decorated has been employed, and Mr. Pearson has thrown all his strength into the work, notwithstanding the fact that the style selected is not such as he himself chose and submitted to his client in the first design. But disappointing as it is to have to abandon one's favourite scheme, all true architects have risen superior to such difficulties, and so, judging by the thought and care displayed in the design of every detail in his building, has the architect of the present church. I was much struck by the beauty of the outlines of every moulding employed. The oak work in the roof too will have a fine effect, being bold and massive, as may be imagined when trusses weigh three tons each, and common rafters, 6 × 5, measure 32ft. in length—a length, by the bye, cut out of solid Sussex oak. The oak was grown near Horsham, I was told, and some fine trees must have been felled for these mighty common rafters. Altogether I was well pleased with my visit to the new building, and feel satisfied that, when complete, it will be pronounced one of the most beautiful churches of modern times.

I was at Ostend recently, and I find this fashionable and rapidly rising watering-place is likely to be much further developed by an English company now in course of formation, for the purpose of purchasing and covering all the principal remaining building sites. Mr. H. Roumieu Gough, F.R.I.B.A., is now in Belgium, and on Monday last had the honour of a lengthy interview with the king, to whom he submitted the details of the scheme, together with designs for some of the intended new buildings, which will include a grand residential club, mansions, flats, and villas, and to these will be added a summer and winter garden, proposed by the King, an aquarium, &c. His Majesty expressed his cordial approval of the scheme, and of the designs submitted. The works will be carried out by Messrs. H. Roumieu Gough and Roberts, of Carlton Chambers, Mr. Herbert A. K. Gribble being associated with them in these, as well as in some other important Continental works.

GOTH.

CHIPS.

The memorial stone of St. Mary's Roman Catholic Church, which is being erected in George-street, Paisley, was laid by Archbishop Eyre on Saturday.

Steps are being taken at Torquay to perpetuate the memory of the late Duchess of Sutherland, and the memorial will be in the shape of a stained-glass window at All Saints' Church, Babbacombe. The subject is "The Holy Woman at the Well."

New schools in Middleton-street, Hull, were formally opened by Mr. Mundella last week. They have an area of 4,840 square yards, and cost £8,416, equal to £10 4s. 3½d. per head.

The Hampshire Field Club visited on Thursday, the 25th ult., Sherborne St. John, Monk Sherborn, and the Vyne, near Basingstoke, Mr. T. W. Shore and Dr. Andrews acting as guides.

Active preparations are now in progress for the construction of the new railway to Easingwold, which is to commence with a junction with the North-Eastern main line at Alne Station, and terminate in Alne-road, at the upper end of Long-street, Easingwold. The contractor, Mr. W. E. Death, of London, has just commenced the works.

St. Michael's Bassishaw, in Basinghall-street, E.C., one of Wren's churches, was reopened last week, after internal decoration, carried out by Messrs. Campbell, Smith, and Co., under the direction of Messrs. George and W. R. Low, architects. Various structural repairs have been executed at the same time by Mr. Oatley, contractor, also from designs and specifications by Messrs. Low.

CONTEMPORARY ART WORKERS AND MANUFACTURERS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

MR. JAMES HILL, the well-known City locksmith and wholesale and export ironmonger, is a native of Glasgow, and came to London in 1866. He commenced business on his own account in 1870, in Upper Thames-street, where he remained until the growth of the concern necessitated removal to larger premises in Queen Victoria-street. Mr. Hill's specialities in locks, door furniture, fanlight and skylight gearing, sash and casement fittings, &c., &c., are largely used by many of the leading architects and builders at home and abroad. Among many other buildings where his specialities are in use may be mentioned the National Liberal Club, Whitehall-place, under Mr. Waterhouse, architect; the Great-Eastern Railway Hotel, Liverpool-street, under Mr. Barry, architect; the Hôtel Métropole, Monte Carlo, under Messrs. Giles, Gough, and Trollope, architects; the Hotel des Anglais, Nice; Las Palmas Hotel, Canary Islands; the new Hotel, Madeira; Hotel Australia, Sydney; the Grand Hotel, Kimberley, South Africa; the Grand Hotel, Johannesburg; the Grand Hotel, Hong Kong, &c., &c. Mr. Hill has executed large contracts for locks and other fittings for numerous public buildings throughout the world—including hospitals, asylums, workhouses, municipal buildings, colleges, churches, libraries, clubs, schools, banks, theatres, railway stations, &c., &c. He has for some years held a Royal warrant as locksmith to Her Majesty, and has carried out many important contracts for various departments of the Government, both at home and in the Colonies. The Knightsbridge Barracks, Hyde Park, and some fifty other military barracks in the United Kingdom, together with numerous post offices and Admiralty buildings, have been fitted throughout with his locks and door furniture. Abroad he has executed many orders for war department buildings, dockyards, embassies, consulates, &c. Mr. Hill during his career has been an extensive traveller, having visited Italy, Greece, and Egypt twice; Palestine once; and the United States of America four times. In October last he started (accompanied by Mrs. Hill) for a trip round the world, from which he has recently returned. He visited in succession the leading cities of India, including Bombay, Poonah, Baroda, Jeypore, Delhi, Agra, Cawnpore, Lucknow, Benares, and Calcutta. From India he sailed to Ceylon, and thence to the principal cities in Western Australia, South Australia, Victoria, New South Wales, Queensland, and New Zealand. His route then led him to Penang, Singapore, Hong Kong, Canton, and Shanghai. From China he sailed to Japan, visiting in turn Nagasaki, Kobe, Osaka, Kioto, Yokohama, Tokio, and the far-famed temples and tombs at Nikko. From Yokohama he took passage to San Francisco, thence across the great American Continent to Quebec, returning home by New York to Liverpool. He broke his journey at various interesting points on the American Continent, including Salt Lake City, Denver, Chicago, Niagara Falls, Toronto, Ottawa, and Montreal. Mr. Hill contested Brixton in the Liberal interest in 1887, his opponent being the Marquis of Carmarthen, and he may enter the arena of politics again. In January last he took into partnership his joint-managers, Mr. E. J. How and Mr. Henry King, who for many years had rendered him valuable and faithful services. We understand, however, that the title of the firm remains unaltered. During the past few years his business has rapidly increased, and a new department has lately been added for the development of his patent fanlight, lantern-light, and skylight ventilating gearing. This latest speciality of his is already commending itself to many of our leading architects and Government engineers, and has been fitted throughout the New Savoy Hotel, the Polytechnic, Regent-street; the new publishing and printing offices of the *Queen*, the *Field*, and the *Law Times*; Prince's Club, Knightsbridge; Fulham New Town Hall; the Post-office Savings Bank new buildings, Queen Victoria-street; and many other public buildings at home and abroad. Mr. Hill's portrait is by Mr. R. Lang Sims, 437, Brixton-road.

Our next portrait is that of Mr. Henry Bassant, parquet-floor manufacturer, of 87, Charlotte-street, Fitzroy-square, W. He came to London from Faversham in 1862, when 19 years of age, and learnt the business at Mr. Steinitz, at Camberwell. He was afterwards with Messrs. Howard and Sons, of Berners-street, for many years, and then started on his own account in 1879, and since that time, owing to the cheapness and good quality of his work, which has gained him five gold and silver medals from the Society of Architects, his business has now developed into a very extensive one. Among many works that he has been intrusted with, we may mention those at Earl Beauchamp's, Earl of Aberdeen's large Indian music room, Earl of Rosebery, Lord Norreys, the Duke of Sutherland's yacht, Admiral Inglefield, Sir Henry James, Q.C., and many others, altogether too numerous to refer to here. Mr. Bassant's photo. is by the London Stereoscopic Company.

Mr. H. F. Oscar Timme (partner in Rottman, Strome and Co., manufacturers of the Japanese leather-paper for wall decoration) was born in 1848, at Coblenz on the Rhine, and educated there. He entered on a commercial career in the year 1866, at Barmen, in Rhenish Prussia. In 1869 he went to Havre (Normandy) to extend his knowledge of the French language, but was obliged to leave that country in consequence of the War between France and Germany in 1870. He joined the German Army (8th Artillery Regiment at Coblenz) in June of that year, took part in the siege at Metz, and was later on severely wounded before Amiens. In 1871 Mr. Timme came to England to make himself acquainted with the commerce and language of this country. In 1873 he established the firm of Boseck and Timme (in conjunction with his then partner, Mr. C. F. Boseck) in London. In 1875 he became a naturalised British subject. When Mr. Alex. Rottmann went to Japan early in 1882 to develop the manufacture of leather-papers for wall decoration, Mr. Timme undertook to act as his agent in Europe. Finding the Japanese Department growing in importance very soon, he joined the firm of Rottmann, Strome and Co., in Yokohama, as a partner, at the end of 1882, and established then the London house. Mr. Timme has ever since given particular attention to the artistic and practical development of the leather-paper trade, for which speciality his firm is so well known in every civilised country of the globe. Mr Timme's portrait was taken by the Stereoscopic Company, Cheapside.

We represent the firm of Messrs. Young and Marten, Caledonian Works, Stratford, London, E., by giving a portrait of Mr. Harry Holdich Marten, the sole proprietor of the business, and also one of Mr. Edward Montague Edwards, his able and enterprising manager. Messrs. Young and Marten style themselves "merchants and manufacturers." The business is essentially one of purveying for the building, plumbing, and decorating trades. In fact, at their Stratford depots any conceivable article required in the construction of any class of building can be obtained. A very extensive stock is kept in every department, and the firm have gained the reputation of supplying a good article at a low figure. They have several specialities which are much in demand, notably their iron and sanitary departments. They also manufacture several specialities themselves; perhaps the most interesting is in the glass department. Leadlight glazing forms a special feature. The head office of the firm is at their Broadway establishment, with which is connected the iron, marble, and builder's ironmongery departments and showrooms, containing every variety of mantels, overmantels, kitchen ranges, grates, and sanitary goods. The projected showrooms, for all kinds of gasfittings, chandeliers, hall lamps, brackets, globes, &c., and paper hangings, will be *en suite* with the showrooms as indicated above, in connection with the iron department, and adjoining and connecting with same. Within sight—only 300 yards distant—is the lead, glass, oil, and colour department—namely, in Romford-road and the Grove. Adjoining this is the wholesale plate glass-cutting and sash-glazing department. The bulk of the heavy stock, from which wholesale orders are executed, is kept at the firm's wharf and stores on the Channelsea River, in direct communication with the Thames. On account of the rapid increase of the output, the acquirement of waterside premises became a necessity; and in June, 1889, Messrs. Young and Marten took possession of their new wharf—namely, Caledonian Wharf, Stratford Market, E., (1) to lessen cost of freight on the heavy importations of foreign window glass, sheet zinc, and marble goods; (2) to provide warehouse space for same and the many other products of English manufacture, such as white lead, sheet lead, Staffordshire goods, timber, cement, &c., which are carried considerably cheaper by water than by rail, the initial cost being thus lessened. The business, prior to Mr. Marten's connection with it, was a much smaller concern. His deceased partner, the late Mr. Young, commenced business in Stratford in March, 1872, bringing with him a nucleus from an older established business in Whitechapel Road. In 1880 he was joined by Mr. Marten, and from that year commenced the progress, prosperity, and popularity of the firm. Mr. Edwards has been connected with the firm from the first day of Mr. Young's advent at Stratford, namely—March 5, 1872; and during that time—upwards of nineteen years—has naturally gained a very extensive knowledge of the business in each respective department. Mr. Marten's portrait is from the studio of Mr. J. Edwards, of Hyde Park Corner, and Mr. E. M. Edwards's photograph was produced by Mr. W. G. Stone, Stratford, E.

Mr. Robert Marr Wharam, of the well-known firm of Messrs Thomas Crapper and Company, manufacturing sanitary engineers, of Chelsea, London, was born in Yorkshire. His early days were spent at Rotherham, where he had ample opportunities of making himself acquainted with the various manufactures of that town, and in which he always exhibited a lively interest. Among these may be mentioned the manufacture of sanitary appliances, with which business he has been more particularly connected for the past twenty years. His parents removed to London in 1867, and in the following year Mr. Wharam was employed by his father, from whom he learned the importance of the correct carrying out of details, and to whose training he attributes a large measure of his subsequent success. Quitting his father's office in July, 1870, he entered the service of Mr. Thomas Crapper, of the above-named firm. We do not now intend to detail the merits of this firm, as we hope at an early date to give our readers a brief record of the successful career of its principal. We will, therefore, content ourselves by stating that they hold the unique position of sanitary, warming, and ventilating engineers by special appointment to His Royal Highness the Prince of Wales. This, of itself, is sufficient proof of the excellence of the respective designs and quality of their appliances. It is apparent that Mr. Wharam's position is no sinecure, for while he is actively engaged in the counting-house, of which he takes the entire management, he is also deeply and usefully interested in the efficiency and progress of the manufacturing department, and some of the sanitary specialities introduced by the firm owe their origin to his efforts. Several excellent catalogues issued by the firm from time to time have been compiled by the subject of this notice. The most cordial relationship has always existed between Mr. Crapper and Mr. Wharam, and it is evident that in this case the aims and objects of the employer and the employed have been identical, resulting in their mutual benefit. This good feeling found practical expression in January 1st, 1888, since which date Mr. Wharam has had a more direct and more substantial interest in the business. The likeness given is the work of Messrs. H. and R. Stiles, of Kensington.

JAPANESE POTTERY.*

A VALUABLE work on Japanese Pottery, illustrated by a very choice series of examples representing the various wares, schools, and kilns in the Bowes collection, has been published by Mr. James L. Bowes, author of several interesting works on the Japanese marks and seals and enamels, and well-known as joint author of the "Keramic Art of Japan," which we noticed at the time of its appearance. Mr. Bowes has, from his position as honorary Consul for Japan at Liverpool, had opportunities for writing a treatise on this subject which very few possess, and his unique collection, formed during a long period, and studied with unremitting zeal, has enabled him to master the subject of classification, and to arrange the wares into groups in accordance with the peculiarities of the styles and

* Japanese Pottery: with Notes and Illustrations. By James L. Bowes, His Imperial Majesty's Hon. Consul for Japan, &c. Liverpool: Edward Howell, Church-street.

potters. Many obstacles and difficulties have to be encountered in studying Japanese art generally. The transference of so many of the art works of Japan to foreign countries after the deposition of the last of the Shoguns has been an impediment in the way of properly classifying, added to which native reports and collections have been exceedingly meagre. Many of the wares thus scattered have been wrongly described, and the author states that their classification has been only achieved by the help of connoisseurs, potters, and friends who have visited him, and who have verified or corrected his own efforts in this direction. Mr. Bowes has availed himself also of a valuable native record upon the arts of Japan, compiled by Mr. Kurskawa Mayori and Mr. Murayama in 1878, which was, no doubt, the authority for the Government reports for the Paris Exhibition of that year, though about the splendid development of art during the 17th and 18th centuries very little is found. Without entering into the long, unpronounceable names of the inventors of Japanese pottery, we will content ourselves with briefly saying that the author recounts the mythological and legendary ideas of the origin of the world entertained by this imaginative race, which are to the effect that heaven and earth were originally not separated; the female and male principles were united; that there was a chaotic state containing all germs, the purest of which rose and formed the heavens, and the heavy and opaque fell downwards and coagulated. Surely a sort of nebular hypothesis. The earth was last formed, and a divine being, Kami, was born in the midst. To this being the title of Kuni-toko-tachi-no-Mikoto was given, and he was the first of the seven Celestial spirits, who each reigned some millions of years. The first three spirits were males and self-born, and the last three had female companions; but there was no sexual intercourse, as they produced each other by mutual contemplation. Then two spirits arose, Izanagi and Izanami, representing the male and female principles, and these, according to the legend, met—the art of love was then invented.

Traditional ware found in mounds and tombs of the time of Jimmu exhibit a form and kind of decoration that appear in most early Phœnician and Trojan relics. These discoveries show a state of art anterior to the use of the potter's wheel, and some interesting illustrations are given. The historical records commence with the 8th century of the Christian era. First we have examples of undecorated ware often used for holding tea in the ceremonial tea parties or *chanoyu* of these ages. But it was not till the 17th century that Japanese art, as we know it, commenced. It was the most brilliant period, and of the various descriptions of faïence and porcelain Mr. Bowes's book furnishes a very complete guide. Many of these splendid works are unmarked and unsigned. The artists worked in factories established by princes like those of the princes of Satsuma. Tangen is the only name on record, but who painted the superb *nishiki* ware of this factory is not known. But we can only glance over the delightful examples described and illustrated, such as the Satsuma, the Hizen, the Kaga, Yamashiro, Owari, and other wares produced from kilns under those names. The photographic illustrations of pottery in the Bowes collection include examples of prehistoric pottery, some fine wares of Kuratzu and Shosin, Jimmu, and Gioki ware. Hizen, Satsuma, Kaga, Owari, are represented by many beautiful examples. The crests and seals, inscriptions, and marks which accompany each kind of ware render the work of the utmost value to the student of Japanese pottery, the connoisseur, and collector. The volume is handsomely printed.

THE SURVEYORS' INSTITUTION.

THE next preliminary examination for the admission of students will be held on Wednesday and Thursday, the 21st and 22nd of January, 1891.

It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland, and Northumberland at Manchester. Candidates from other counties in England and Wales will be examined in London.

The next annual professional examinations for land agents, valuers, and building surveyors (held under the provisions of the Charter, and qualifying for the Fellowship and Associateship of the Institution), will commence on the 16th of March, 1891. Candidates for the professional examinations will be examined in London only. All particulars as to days, subjects, course of examination, prizes, and scholarships can be obtained of the secretary.

The next special-certificate examinations in forestry, sanitary science, and land surveying and levelling will be held on Tuesday, Wednesday, and Thursday, the 16th, 17th, and 18th of June, 1891.

THE TECHNICAL EDUCATION OF ARCHITECTS.

IN his opening address at University College, Gower-street, W.C., last (Thursday) evening, Professor T. Roger Smith, F.R.I.B.A., took as his subject technical education for architects, with special reference to the curriculum drawn up in May last by a special committee of the Architectural Association, and still under consideration by that body, also to the R.I.B.A. examinations. Professor Smith urged that no profession, and especially that of an architect, was a theoretical or collegiate education, however complete by itself, an adequate preparation, and, therefore, he thought it was not likely that pupilage would cease. This was hardly his belief years ago; but the more he had seen and experienced of what could and what could not be learnt under class instruction and under pupilage respectively, the more he was convinced that neither could dispense with the other, although changes in form might take place. A radical change did take place when for the old apprenticeship for seven years was substituted the now customary short term of three years; an alteration, made without supplementing this briefer period by some course of preliminary or concurrent systematic study, that had flooded the profession with young practitioners, not a few of whom were lamentably ignorant. Any young man who was to be an architect ought to take a course of preliminary technical instruction extending over one year at least, and, when practicable, over two, and then to begin his three years as a pupil, continuing part of his theoretical studies in his evenings, and doing the practical work in the day. He proposed, in considering the technical education of an architect, to point out what kind of course such a student should take up. What technical education for architects must consist of should be looked for in the programme of the intermediate and the first examinations established for the Institute of Architects. That education ought, in order to conform to the Institute minimum, to include, at least, drawing, elementary mathematics, and physics, and their application to construction. The history and the actual forms, features, and details of architecture, materials and construction, and sanitation, together with reasonable skill in designing and in preparing working drawings and specifications, and in estimates. Professional practice and dealing with dangerous structures were also required. Passing on to examine the scheme suggested by the special committee of the Architectural Association, Mr. Roger Smith pointed out that it was proposed to be carried out entirely by means of evening work, and entirely by classes and lectures to be established by the Association. He doubted whether the technical part of this programme could be thoroughly and efficiently carried out by evening work alone; and though the conditions under which the Association worked entirely precluded their committee's shaping its programme otherwise, this was a weak point in the proposals. Again, the Association, if it was to become the Architectural College for the Metropolis, must ultimately be prepared to give instruction in all the subjects of study in this programme. Why should not arrangements be made to utilise that college for the Association students, so that they might take up some of those subjects under existing teachers, while others might be from the first taken at Conduit-street? The scheme, if carried out, would need revision; an hour and a half was too long a period for a lecture, though it might not be for a class, and the advantage of two such attendances immediately succeeding each other was very doubtful. The subjects outside the R.I.B.A. programme rather overweighted the course, already very arduous, set before the students in the curriculum. And it seemed open to question whether all these should not be more distinctly set aside as *extra subjects*, both as to position in the programme of education and as to their place in the distribution of time. The programme was indeed too full. This curriculum was, however, an admirable statement of the subjects which students ought to become familiar with; it arranged them very intelligently, and stated them with much clearness, and formed a good statement of what might be definitely included under technical education for architects. Besides, he thought men of cultivation, apt to teach and willing to accept what must necessarily be a modest remuneration for teaching, would not be easy to find. One other sort of person would also be required, though no hint of him nor his office was included in the report, and that was a kind of general superintending and advising head, who should be able to give counsel, direction, sympathy, and encouragement to all the students, and to all the instructors. The lecturer proceeded next to consider the case of those who could spend one or two sessions at University College, London, with a view to show how a man with a year to devote to his studies might there take them up. In the Professor's own class of construction all the more important building materials, such as wood, stone, slate, marble, brick, terracotta, lime, cement, and iron are, he continued, taken up in succession, their strength, weight, durability, and other properties described, and the defects and excellences of bad and good specimens are pointed out, and the part they play in building construction is explained. The general principles of construction, trussing, walling, arching, vaults, domes, and so on are also taken up in succession, and are passed in review, and thus the whole of the subjects named in that part of the programme for the examinations which deals with materials and construction are in turn dealt with. Judging from the published programme, a student going through this course, and doing a proper amount of preparation work at home, ought to be well able to pass the intermediate examination, and the lectures will be adapted to secure that aim. That part of the course of engineering and mechanical technology at University College will with advantage be taken by architectural students, in which the manufacture of iron and steel, and the strength of materials and structures, forms the subject; and also that part of the course of chemical technology which covers the technology of building materials. The instruction given in the architectural or art class takes up the subjects required for the art side of the examinations, but they must be supplemented by drawing and measuring existing buildings, and by other study. In order to enter for the intermediate examination, the student has to do an amount of preliminary work which will be of great value in making him familiar with the forms, features, and ornaments of Classic and of Gothic art, and it will usually be best for him to do that in the office where he is a pupil. Here, in the classroom, the history of the art is pursued, beginning, with Greek (which is taken more in detail than any other part of the course) and the styles on which Greek are founded, and then taking up successively Roman, Basilican, Byzantine, Romanesque, Gothic, Renaissance, and modern art, and, in addition to the history, pointing out the distinctive qualities and features of each, and some of the principles of design which were dominant in the successive periods. Drawing is a subject of which the importance cannot be overrated. In order to be a good architectural draughtsman, a man must learn something of freehand drawing, and should begin within it. An architect's pupil should devote whatever time can be spared from other subjects to figure-drawing, and postpone all geometrical drawing and the study of architectural features till his pupilage. While for this work there are great facilities in the Slade school, forming part of this college, a school of architectural drawing at University College would be of service, and he did not doubt the feasibility of establishing one as soon as a sufficient field of usefulness seems open for it. The study of drawing is calculated not merely to make a man a draughtsman, but to promote his becoming an artist. And among auxiliaries for helping to learn the nature of art he would include the lectures given there by the newly-appointed lecturer on applied art, Mr. Stannus. Having referred to his course of lectures on Professional Practice, intended for men who, however, had some practical training to the profession, he warned his hearers in conclusion not to set too high a value on any form of education *per se*.

BOOKS RECEIVED.

The Chemistry of Iron and Steel-Making, by W. Mattieu Williams, F.C.S., F.R.A.S. (London: Chatto and Windus), is a bulky octavo volume, in which the author has amplified a few lectures—the Cantor Lecturers on Iron and Steel in 1876, and certain articles on the "Rationale of Practical Metallurgy" in *Iron*. The author was formerly chemist in the iron and steel works of Sir John Brown and Co., of Sheffield, and is therefore no mere theorist. His treatise is strictly technological, and relates to the chemical branch; the language simple, and intended to convey to those employed in iron and steel-making the scientific basis of their work; but the ordinary student will also find much of interest and instruction relating to one of our greatest British industries. Mr. Williams treats of the ores of iron; explains what is meant by technical terms such as "reduction" and "dissociation"; describes the operations of fluxing, roasting, calcination; the blast-furnace and the theory of puddling, hammering, and rolling, cementation, Bessemer process, and other operations. The style of exposition is plain, and intended to convey to those engaged in the process of manufacture the principles and science of their vocation. Thus in explaining the theory of "reduction" which formerly existed (that all combustible substances were composed of a basis combined with a fiery principle named "phlogiston," and that when they were burned the fiery matter was driven off, and they became "dephlogisticated"), the writer observes that Dr. Priestley was the first to show what real metallurgical reduction was. He showed that instead of something being taken from the metal to produce the calx (or dephlogisticated metal), there was something in the calx, the removal of which produced the metal—namely, a gas we call oxygen. Thus the idea of "phlogiston" was set aside, and we see the simplest case of reduction of a metal from its oxide, which means the removal of the oxygen and the liberation of the pure metal. The theory of the blast furnace and puddling is rendered intelligible to the workman. Thus it is explained that in the first class of "finery" or "running out fine," it is found "that all the silicon is oxidised and carried away as fusible cinder by combining with the oxidised manganese of the pig, and with some of its oxidised iron or with calcium. Thus one of the impurities of the pig is removed by simple oxidation." Some of the carbon was also oxidised; the graphite carbon is converted into combined carbon, or grey into white iron. "Thus we have an iron well adapted for foundry purposes, the combined carbon giving it fusibility, while the removal of the silicon diminishes its brittleness." The sulphur and phosphorus remain unaffected. The Bessemer process was based on purification of the pig by mere oxidation; but this was not sufficient, for it was found that no amount of exposure of the heated pig-iron to air, even when agitated in the Bessemer converter, can effect the oxidation of the sulphur and phosphorus without oxidising the iron itself. A further advance was made when other agents for oxidising were employed, known as "fettling" materials. So again the author discusses the mystery of the fibre of wrought iron, and shows that after the puddled ball has been hammered and rolled, the granules become drawn out or elongated, each grain being drawn out as a fine wire or fibre. The remarks on steel and its value for structural purposes, and the conclusions of the author, are of interest, as he calls in question the alleged value of steel for boiler-plates, girders, armour-plates, &c. He claims for good soft wrought iron a higher degree of strength and resistance to shocks and strains than steel. A high degree of tenacity has been found to be consistent with weakness under shocks, and it is this peculiarity of steel that Mr. Williams discusses in a philosophical and practical manner. His work is a valuable manual for the iron and steel manufacturer, and for the student of metallurgy. —— *Practical Plane and Solid Geometry*, including Graphic Arithmetic, by J. H. Morris (London: Longmans, Green and Co.), is another textbook in geometry, intended for candidates in the exams. of the Science and Art Department. The author's work on "Geometrical Drawing for Art Students" we recently noticed. The present treatise is clear, the diagrams face the letter-press, and the problems are grouped together according to their similarity of conditions. Numerous examples are worked out, and exercises are given. For the student studying geometry in its many practical applications, we should recommend Mr. Morris's manual.—— *The Timber Merchant and Builder's Vade Mecum*, by George Bousfield; fifth edition, considerably enlarged (William Rider and Son: *Timber Trades Journal* office), is a well-known and useful guide for builders and timber merchants. The tables include all the most useful; the number of feet lineal in a standard, equivalent price per standard and per foot; number of lineal feet per square yard, and price per square and per foot; prices per standard at per square; prices per superficial foot at per cubic foot and per standard, and numerous other tables to facilitate calculation. The rules for reducing foot lineal to standard, and to assist in other calculations respecting timber; the problems that follow for converting quantities, and of every-day practical value to the builder, render the handbook of the greatest use in the office and workshop. Several useful tables and problems have been added to the present edition.—— *The Folkestone, Sandgate, and Hythe Pictorial* (J. English, *Express* Office, Folkestone) is not published on the lines of an archæological guide-book, but as a description of the recent developments and present popularity as a health resort of the three towns forming the old Parliamentary borough of Hythe. The book contains clear, process-block views of Folkestone harbour and beach, the Lees and Church, the Harvey statue, the Warren, Sandgate, and Hythe from recent photographs; the chief fault we have to find with it is its inconvenient form, a paper-covered folio.—— *Hoppus's Measurer*, by W. Richardson, new and revised edition by J. G. Vine (London: Frederick Warne and Co.), is a well-known handbook—a familiar name to every timber merchant and measurer. Mr. Vine's edition contains much new matter and tables, which render this "measurer" not only of value as showing at a glance the solid or superficial contents of any piece of square or round timber, but also the value of timber, stone, &c., cut to any size or scantling, at prices from 1s. 6d. to 10s. per foot cube; the superficial measure and value of board and glass, or other surface. The great use and value of these tables to the measuring surveyor, and to everyone who has to calculate solid or superficial contents, must be apparent. The tedious operation of finding, for example, the number of superficial feet and inches contained in a board of, say, 13ft. long and 5½in., is dispensed with by merely casting the eye over two columns, where the contents in feet, inches, and parts are found immediately. What a saving is it also to be able to find the value of any scantling of timber or stone at any price per foot cube any quantity surveyor or builder's clerk will at once appreciate. The revised edition of the "Measurer" should find a place in every office and pocket.

CHIPS.

Mr. W. W. F. Pullen has been appointed assistant to the professorship of engineering at the University College, Cardiff, for which appointment there were thirty-six applications.

The autumn term of the School of Handicraft, 34, Commercial-street, E., opened on Wednesday evening, when Mr. Hugh Stannus, F.R.I.B.A., delivered the inaugural lecture on "Construction and Decoration."

The man who committed suicide in St. Paul's Cathedral on Sunday has been identified as Edward Easton, aged 38, a surveyor's clerk, of Favart-road, Poole-park, Fulham.

Judge Hughes and a jury tried on Wednesday week an action in Hyde County Court, in which the West-end Building Society, Denton, sued William S. Fidler, surveyor, Haughton, for £50 or the recovery of certain books and documents. It was alleged that the defendant, the former secretary of the society, had not given up a number of books, &c., which had been in his possession and which belonged to the plaintiffs. The jury gave a verdict for the plaintiffs.

The Bishop of Southwell consecrated a new church on Monday at Underwood, in the parish of Selston, near Alfreton, Derbyshire. The church, which is dedicated to St. Michael and All Angels, has been presented to the parish by Earl Cowper, and seats 400 persons.

St. James's Church, West Bromwich, was re-opened on Friday, after being partially restored at a cost of £1,000. Mr. E. Pincher, of West Bromwich, was the architect, and Messrs. Smith and Sons were the contractors.

Engineering Notes.

Glasgow.—The proposed subway, or underground railway, which is to run round the city of Glasgow from Buchanan-street westward to Partick, is to have fifteen stations (eight on the north and seven on the south side of the river) in its course of 6½ miles. The estimated cost of construction is £750,000, which it is proposed should be raised in 75,000 shares of £10 each. It is also proposed that borrowing powers to the extent of £187,500 be obtained to meet extraordinary expenses after completion.

The New Tower Bridge.—The members of the Bridge House Estates Committee of the Corporation of London paid a visit on Tuesday to the works of the new Tower Bridge to inspect the progress which had been made by the contractors, Messrs. Arrol and Co. The total length of the structure, including the approaches, will be 2,640ft. The temporary platform on which to lay the permanent superstructure of the two spans has now been completed on both sides of the river, and the committee were able to traverse the whole distance to the centre abutments. Some 80,000 tons of stone has been used in the construction of these two piers, which are now in a fair way of completion. Satisfactory progress has also been made in the north towers, which, when finished, will stand 275ft. above high water mark. About 31 millions of bricks, 19,500 tons of cement, and 70,500 cubic yards of concrete will be used in the construction of the bridge, independently of 15,000 tons of iron and steel. The contractors fully anticipate being able to comple the works within the time allowed them—viz., the end of 1892. Mr. J. Wolfe Barry, C.E., the engineer, and a member of the firm of Messrs. Arrol and Co., conducted the committee over the works.

ARCHÆOLOGICAL.

Silchester.—Mr. St. John Hope and his fellow-explorers at Silchester, a correspondent of the *Times* states, have found in the foundations of one of the houses recently excavated a dry well, which has proved quite a little museum of antiquities. Some 15ft. down the diggers found an urn-shaped pottery vase, about a foot high, quite intact, but empty. Above it were deposited a great number of iron implements, in a wonderful state of preservation. They seem to have been the tools of a carpenter and a coppersmith or silversmith, with some miscellaneous objects of blacksmith's work thrown in. The principal specimen is a carpenter's plane of quite modern type, three or four axes, retaining their fine cutting edges, chisels and gouges of all shapes and sizes, hammers, adzes, saws, files, &c. There were also a brazier for burning charcoal, two or three anvils of different sizes and shapes, a pair of tongs for lifting crucibles, and a tripod candelabrum. In addition, there are several large bars of iron, a couple of ploughshares, and a broken sword. This is undoubtedly the most important find at Silchester since the discovery of the bronze Roman eagle, now at Strathfieldsaye, some years ago.

The churchyard adjoining St. Mary the Virgin, Aldermanbury, has been laid out as a recreation ground, and has just been opened to the public. Mr. Deputy Rogers is about to provide the new open space with a drinking fountain. The church itself, one of Wren's, has many interesting features. The notorious Judge Jeffreys, who lived in the parish, was buried under the Communion table, and the poet Milton was married in the church to his second wife, Miss Woodcock.

Mr. Goodwin S. Packer is the architect for a proposed new mission room in Southport, with classrooms and house at the back. The size of the room is 51ft. by 33ft. by 20ft. in height, the ceiling, which is flat, will be in ¾in. tongued, grooved, and beaded pitch-pine boards, 4½in. wide, and will be left unvarnished. There will be a dado of glazed bricks, formed into a design by cream and light green coloured bricks, 4ft. 6in. in height, the rest of the wall being in plaster. The foul air will be taken away by four openings in the ceiling; the ventilators on roof and the openings will be connected one to the other with a 9in. pipe, up which the foul air will be drawn. There will be no sole contractor, the different branches being tendered for from quantities by the architect, and let direct to the separate tradesmen. By this method a saving in the cost is expected.

Building Intelligence.

Beverley.—The foundation-stones of a new Wesleyan chapel were laid yesterday (Thursday). The building is from the designs of Messrs. Morley and Woodhouse, of Bradford and Bolton, and is in the Italian style. It is arranged with transepts, and seats 870 people. A minister's vestry, inquiry-room, and kitchen are provided at the rear. The internal woodwork is to be of pitch pine, the gallery front being supported by iron columns, and to have carved wooden panels. A rostrum, with carved panels and capitals, will be provided. The ceiling will be coned and divided into panels with mouldings and enrichments therein. The organ recess will have pilasters with capitals and trusses, supporting an elliptical arch and pediment. The front elevation of the building will be of stone, with ashlar dressings and pilasters surmounted with a carved pediment. The contracts, which are separately let to local men, amount to £3,540.

Birkenhead.—The Corporation of Birkenhead have handed over to Messrs. A. White and Son, of Liverpool, the decoration of the assembly rooms in the Town Hall. This work has by them been intrusted to Mr. T. B. Kennington, figure painter, who has now completed a mural oil fresco representing Learning, Valour, Art, and Commerce bringing gifts to Birkenhead, represented by a female figure. The size of the fresco is 10ft. by 5ft. It is painted above the stage, and is surmounted by the arms of Birkenhead, executed in the old Italian style of ornament. The walls and ceiling are treated in terracotta and buff, verging to a rich maroon in the lower part of the room, the whole being relieved by gilding. The style of decoration is Renaissance, somewhat after the method of the late Alfred Stevens, the entire colour scheme leading up to the central feature, the fresco.

Broxburn, N.B.—By the building of a tower and spire, Broxburn now possesses one of the finest and largest Catholic churches in the east of Scotland. The main body of the church was built in 1880 from designs prepared by Messrs. Shields and Thomson, architects, Edinburgh. The tower and spire have been erected according to plans from the same architects. In the nave and aisles of the church accommodation is found for over 500 persons, while in the organ gallery 50 more may be seated. In the entrance porch, and in continuation of the western aisle, is placed the baptistry. The basin of the font is part of the ancient font of the old Catholic Church of St. Nicholas, as the inscription still indicates. The high altar, which is designed according to the richest form of 15th-century Gothic by Messrs. Pugin and Pugin, London, is constructed out of Caen stone, and decorated with marble. The new tower and spire rise to a height of 110ft.

Crosby, Liverpool.—The foundation stones of a new Wesleyan chapel about to be built in Mersey-road, at a cost of £3,000, were laid on Tuesday. The style is Late Decorated. The chapel is cruciform in plan, with nave, aisle, and transepts, narthex, tower, and spire, octagon chancel and organ chamber. The dimensions are: Narthex, including tower and gallery entrance, 55ft. by 11ft.; nave, 70ft. by 41ft.; transepts, 26ft. by 17ft.; chancel, 28ft. 6in. by 21ft.; and organ chamber, 20ft. by 14ft. 6in. The height of the ridge is 50ft., and to the wall-plate 25ft. At the western side of the chancel are placed vestries, lavatories, and classrooms. The walls are faced with Yorkshire shoddies and Storeton-stone and dressings; the interior part of walls of brick, all the foundations being of solid concrete, the timber-work throughout of pitch-pine, and the roof-timbers unstained and unvarnished. The floors are to be of oak below, set parquetry, and the windows will be filled in with leaded lights to the architects' design. The architects are Messrs. J. F. Doyle and T. W. Doyle, the clerk of the works being Mr. Samuel Gunning. The sole contractor is Mr. S. Webster, of Bootle. The chapel will seat 650 people.

Exeter.—The ceremony of laying the foundation-stone of the chancel of the church of St. Matthew, Newtown, Exeter, was performed on Friday. The work of building the church was commenced about ten years ago; but after the nave, aisles, transepts, and base of the tower had been completed, operations, owing to the want of funds, were suspended. Mr. Medley Fulford, Exeter, is the designer of the chancel, and Mr. Luscombe, Exeter, the contractor for its construction. The style will be Decorated Gothic, and in keeping with the rest of the church. In length the chancel will be 36ft.; in width 22ft. 6in. There will be aisles on either side, two vestries, and an organ chamber over the north chancel aisle. The estimated cost of the whole work, including a new organ, is £2,500. When the chancel is finished there will be additional accommodation provided for 300 persons, so that the seatings will be raised to 930.

Lydford.—The Church of St. Petrock, Lydford, was reopened on Friday by the Bishop of Exeter, after having undergone enlargement and complete restoration. The church was restored in 1873 at a cost of £1,100, when a rectory was added from Mr. G. E. Street's designs at a cost of £5,000. The present work of restoration and enlargement was commenced in the year 1888, when the chancel was restored. In 1889 a new vestry was built, and in the present year a new north aisle, 42ft. by 8ft., and seating about 50 persons, has been added to the church, corresponding with the south aisle opposite. The nave roof has been restored in oak, and under the tower arch a new oak screen has been placed. The architect is Mr. S. Hooper, of Hatherleigh, and the contractor Mr. William Petherick, also of Hatherleigh. The interior carving has been effected by Mr. Harry Hems, of Exeter.

Maidstone.—The Bentliff memorial wing, which has just been added to the museum, was opened by the mayor on Monday. The wing has been built for the reception of the pictures which the late Mr. Bentliff and others have presented to the town, and which are valued at upwards of £40,000. It has a frontage to the street of 45ft., and measuring 56ft. from back to front. On the ground floor are a reference library, 31ft. by 22ft., and a room 54ft. by 20ft., the latter having windows the entire length on its east side and large window at each end. Both these rooms open from a lobby, in which is an oak staircase leading to the floor above, which contains two galleries for the exhibition of pictures, both having top light and connected by arches. The floors throughout are fireproof, and are laid with solid oak blocks. The heating is by hot water, supplemented by open fireplaces with Mansfield stone mantelpieces, and by one in the library, the latter being of Caen stone, also carved. The exterior of the building is designed in conformity with the older wings. The work has been carried out by Mr. Jas. Clements and Mr. Henry Brennan, under the direction of the architect, Mr. Hubert Bensted, of Maidstone.

Sunderland.—New premises have just been erected in Fawcett-street for Messrs. A. Corder and Sons, and from the plans of Mr. Frank Caws. The old building having been burnt out, it was decided to erect the new in fireproof materials throughout, and to dispense with the use of iron as far as possible. No timber has been introduced into floors, walls, and roof; slabs of thick concrete of unusual dimensions have been used. The building is three stories in height, besides attics, and the frontage to the street is red terracotta from Ruabon. The contract for the whole of the building has been carried out by Messrs. D. and J. Ranken. Mr. J. C. Edwards, of Ruabon, manufactured all the terracotta; and the pavement lights were supplied by Messrs. Hayward Brothers and Eckstein, of London.

Spanish-place, W.—The new Roman Catholic Church of St. James, which has superseded the mission building in Spanish-place, Manchester-square, erected a century since, was formally opened on Monday. The building lease for the old structure could not be renewed, and the present site in George-street, immediately behind the old church, was purchased for £30,000. The architects are Messrs. Goldie, Child, and Goldie, of Kensington-square, whose design was selected in competition by the late Mr. James Fergusson, and Messrs. Dove Brothers, of Islington, were the contractors. The style is 13th-century Gothic, with plain lancet windows. The exterior is of Portland and the interior of Bath stone. The nave at present is 104ft. by 28ft., and consists of seven bays, there being space left for extension, when required, and for the erection of a tower. At the end of these seven bays the finishing off is of a temporary character only. The exterior of the transepts is also incomplete, for they are at present covered flat, but it is intended that they shall be finished off with gable-ends, pinnacles, &c. The inner aisles are 10ft. wide each and the outer 8ft. each, while the chancel is 37ft. in length, having the same breadth (28ft.) as the nave. It is paved with mosaic, and has marble steps. The height from the floor to the centre of the vaulting is 60ft. The Lady chapel consists of five bays of 7ft. 7in. each, with a width of 19ft. The triforia are approached by stone steps from the porches, and will accommodate 500 persons, the capacity of the nave being for 1,500. The building is vaulted throughout with stone, and the inner walls are faced with the same material. The columns are of Hopton Wood stone, with shafts of grey fossil marble. Adjoining is a new presbytery.

COMPETITIONS.

Sunderland.—The Corporation of Sunderland recently invited designs for laying out the land on the lower promenade at Roker. The schemes marked "Seaside" were recommended to the Council for approval, and have been approved by that body. The proposed scheme comprises restaurants, shops, stalls, covered shelters, bazaars, studios, café, reading-rooms, smoke-rooms, promenades, public cloak-rooms and conveniences, and a large saloon. The materials proposed are cement and iron, with zinc roofs. On opening the sealed envelopes, the successful architect was found to be Mr. Thos. R. Milburn, A.R.I.B.A., 20, Bridge-street, Sunderland.

CHIPS.

The new post-office at Wokingham, near Reading, was formally opened on Friday. It has been built by Mr. E. C. Hughes, of that town.

St. Nicholas's Church, Birmingham, has been reopened, after being internally decorated from the designs by Messrs. Cotton and Bidlake, architects.

We understand that Mr. William Landless, architect to the Leeds School Board, has been appointed assessor by the Oldham School Board in connection with a competition for a school.

On Monday last the opening of the People's Park at Kingstown, Co. Dublin, was performed by the Chairman of the Commissioners, Mr. John L. Robinson, A.R.H.A., M.R.I.A. Mr. Robinson has designed the laying out of the park, and acted as honorary architect for the stand, house in the grounds, the lodges, and other buildings which form part of the scheme.

The committee for the erection of a monument to William Tell has decided in favour of the site in front of the Town-hall of Altorf. The hero is to be represented with his crossbow in his hand, and in the garb of the Swiss peasantry of his time, but without his son. The statue is to be of bronze, and will stand more than 10ft. high, while the pedestal is to be of stone, quarried in the Canton of Uri, and adorned with four reliefs.

On Friday Lady Vivian laid the foundation-stone of a new mission church for the populous districts of Plasmarl and Landore. The building is to be of native stone, rough cast on the outside and plastered to a smooth surface inside, with the chancel arch window and doors of red brick quoins. The nave is to be 60ft. by 25ft. 6in., the front gable being capped by a bell turret. Accommodation is provided for 300, and the contract is for about £600. The work is to be carried out from the designs and under the superintendence of Messrs. J. Buckley Wilson, F.R.I.B.A., and Glendinning Moxham, M.S.A., architects, Swansea. Messrs. Gustavus Bros. are the builders.

The recent excavations for the new Money Order Office in St. Martin's-le-Grand have led to the discovery not only of by far the most perfect piece of the Roman wall laid bare in recent times, but also of a complete outline of the old town ditch which defended London during the Middle Ages. It was outside the wall and separated from the foundations of that structure by a space of some 8ft. or 9ft.; the ditch has a width of about 75ft.

St. Thomas's Church, Stourbridge, was opened last week, after extensive additions and alterations by Messrs. Cotton and Bidlake, architects, of Birmingham.

The contract for the construction of the commercial graving dock at Barry has been let to Mr. John Jackson, of London. The entire works connected with the new dock will cost about £130,000, and must be completed in twelve months. The consulting engineer is Mr. J. Wolfe Barry, London, and the work will be carried out under the supervision of Mr. John Robinson, C.E., the resident engineer of the Barry Company. The dock will be 700ft. in length and 85ft. in width.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

WHITEFIELD TABERNACLE COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—From the report of Professor Smith, the assessor in this case, he appears to have given the first premium to a design, "Winged Heart," which has exceeded the frontage to Tottenham Court-road by some 6ft. above what was shown by figures on the site plan issued to competitors. As one who kept strictly to these figures, I should like to ask by what authority "Winged Heart" adopted a greater frontage. The assessor also states that "Lux Mundi" has done the same thing, which he notices "with regret, but thinks it does not infringe the spirit of the 'Instructions,'" and in commenting on "Hearing and Seeing," he speaks of it as having encroached upon the side land for steps and areas. This seems contradictory, as he sanctions it in the two designs referred to.

Every one knows that where figured dimensions are given, they are to be adhered to, unless competitors are told to check them, of which nothing was said in the Instructions, and we all know that in a restricted site an extra width of 6ft. makes all the difference in planning, and in this case it was assumed that in fixing the dimensions the committee had some special reason for not giving, what may or may not be, the actual available frontage.

This was the view I took, and also seven other competitors. I therefore protested against the award, solely on the above grounds, and maintain that "Winged Heart" was disqualified, and that the premiums should have been awarded to the two best designs which had adhered to the Instructions.

It is to be regretted that the assessor did not take this view, as his decision cannot but shake the faith of competitors in the employment of an arbitrator.

With the conduct of the committee throughout the competition I have no word of complaint, but give them my thanks for their fair and straightforward action. A COMPETITOR.

THE ARCHITECTURAL ASSOCIATION.

SIR,—I have not had time to follow closely the nature of the various discussions which have led us to the present position, and which threatens our connection with the Architectural Association by doubling, without any special reason, our annual subscription. To a casual observer it is obvious that upon the roll-call of the Architectural Association there are innumerable names of architects of both position and extensive practice who have no ends to serve and no special benefit to derive by retaining membership of the Association; who practically see no return for the existing annual subscription of ten shillings and sixpence, and were it not for a pure and unalloyed love of architectural dilettantism, would cease to be members. The financial strain of actual practice is only sensibly and fully appreciated by those who are actually in practice; the strain of the collar and bit is an unknown quantity to the bystander. An architect in practice and a professional member of the institute can derive little or no benefit from membership of the juvenile institution in question; but, on the contrary, very considerable benefit can accrue to the Architectural Association by retaining on its list of members the many distinguished and honoured names it now posesses. The professional architect has an annual demand made upon his purse to the extent of from two to four guineas for his membership of the Royal Institute of British Architects, and other societies, from a variety of reasons or of motive he may feel compelled to join, make similar demands. In short, it becomes a matter of financial policy to see that some measurably adequate returns are made to justify these outgoings. The Association, apparently, for reasons yet unfathomed, appear to think otherwise.

I have not been yet made aware as to how far the resolutions affecting the doubling of the subscription have been carried; and I am anxious to be accurately informed on this point. But whatever views official members of the Association may foster with regard to the advantages accruing to members of the Association, I have no hesitation in saying that no such advantages accrue to architects in practice, and who are members, and that there is nothing whatever to justify their remaining members with a subscription increased to one guinea per annum. Personally, I do not attend more than once a year at any of the meetings of the Association, and innumerable other architects frequent the Association even less. Such being so, the idea of doubling the subscription appears ludicrous. I should be very sorry to see the association awake from its daydream like Samson, shorn of its locks and its strength in pursuance of its present suicidal policy; but, as a word of warning, I feel it incumbent to add that, if the subscription is raised as it is in some quarters intended, I, for one, should not hesitate to withdraw from membership of so august an assembly.—I am, &c.

CHAS. R. GUY HALL.

13, St. Alban's-road, Kensington.

A REAL BLACK DIAMOND!

SIR,—I think the following is too good to be lost to the profession. It is taken from a board to be seen on the L.B. and S.C.R. main line:—

H—— G——

"Architect, Builder, and Coal Merchant."

Comment is needless; but the idea of mixing up coals and plans is a novelty to me.—I am, &c.,

SPENCER W. GRANT.

Moorgate Station Buildings, 63, Finsbury-pavement, E.C., Sept 29.

THE LATE MR. SMALES.

SIR,—There are several notable errors in the obituary notice in your last of Mr. T. C. Smales, recently deceased in America. I presume the paragraph was copied from some Transatlantic paper.

He never was in the British army; he was articled on leaving school to his uncle, an architect practising in Kendal and London, and subsequently for some years served in the offices of architects in Bolton and Wrexham, and for two or more years with Mr. Arthur Vernon, of Wycombe. It reads very strange to learn that a few years ago he entered the offices of an architectural firm as student, after very considerable prior experience, and his talents and abilities in his profession were considerable.—I am, &c.,

D. BRADE.

22, Buckingham-street, Strand.

"THERE'S WORK FOR ALL TO DO."

SIR,—The Co-operative Builders I was speaking of were started nearly three years ago in the following manner: The contractor for a large building failed when it was about half completed; this led the architect for the work to consider whether it would not be possible to keep the men together and carry on the work without the intervention of a contractor. This, with the consent of the owner, who agreed to pay weekly according to the time-sheets and invoices for material, was done, and proved satisfactory in every way. The successful termination of this work encouraged the architect to have other work done in a similar manner, with the important addition that the men were to share in the profits, and be able to invest their savings in the business at which they were working.

The shares are £1 each, and no workman can share in the profits until he has worked 400 hours for the firm. An important feature in this business is the training of boys to fill up vacancies. I believe the rules as to co-operation have had to be modified: the control and authority of the foreman over the men and his power to discharge them must be maintained, while the architect has control over the foreman. The point which most pleases me in this scheme is the elimination of competition where there is a desire on the part of the employer and the architect for good work, there is not the least necessity for competition, as is shown by the successful working of the co-operative builders. When, as is customary in competition, the lowest tender is accepted, very careful supervision is required on the part of the architect to see that the work is properly carried out. He will be saved this trouble by working on the lines of the co-operative builders; he will also be able to alter the drawings freely as the work proceeds, and he will save his client the quantity surveyor's commission.

As capital accumulates, the employer would not be required to pay so often as once a week, but by this means business can be commenced with a very small capital. All accounts and time-sheets relative to the work are open to the employer's inspection; a percentage for working expenses and profit is charged at each payment. Only an approximate estimate need be given, but, of course, there is nothing to prevent a contract being entered into not to exceed a certain sum.—I am, &c., C. F. M.

SIR,—Your correspondent "Currente Calamo," strikes an entirely false note in his letter. An architect's work, it seems to me, consists in designing and carrying out building operations in the best manner, and in the interest of his client, and the moment he becomes a contracting party he is in reality a builder, and as an architect ceases to exist.—I am, &c.,

Sept. 30. PANSA.

ZINC IN CONTACT WITH BRICKWORK.

SIR,—In your issue of Sept. 12 is a paragraph in your "Office Table" quoted from a German paper, in which the writer states that in building the Berlin city market halls a portion of the zincwork which rested upon brick walls rapidly decayed, and suggested as a preventive the introduction of *roofing*-felt between the brickwork and the zinc.

There may be something peculiar in German bricks or mortar; but we have had a large experience in zincwork in England, and have never found any premature decay in the turns-up or flashings against brickwork.

As to the introduction of roofing-felt under zinc, your readers should be cautioned against the recommendation. We were called in to report on the defects of a large flat, not laid under our superintendence, under the zinc of which *roofing*-felt had been laid over the boarding of the flat. No other cause of the decay of the zinc could be found than that the acids of the tar-felt had acted chemically on the zinc, and pitted it all over with small holes. No doubt hair-felt, not tar roofing-felt, would have been

harmless, if unnecessary; but *roofing*-felt is always worked up with coarse tar, and should for this purpose be avoided.—We are, &c.,

A. and C. Harston.

15, Leadenhall-street, London, E.C., Sept. 25.

ORDNANCE RULE.

Sir,—The use of Ordnance Maps has now become so general that it would be a great boon if the mathematical instrument makers made a pocket rule, on the inside bevelled edges of which were one inch and six inches to a mile, and the $\frac{1}{500}$ and $\frac{1}{2500}$ scales.

This arrangement would occupy one side of the rule, and the other could be utilised by the most commonly-used scales—viz., $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$, and one inch.

Should chain scales be needed, they could be placed on the flat part of the rule, or on the edge at the back of the bevelled one.

The great need, however, is the handy reference to the "Ordnance scales" on the pocket rule.—I am, &c.,

James Jerman, Fellow R.I.B.A.

5, Bedford-circus, Exeter, Sept. 29.

CLAYBURY ASYLUM.

Sir,—In your issue of Sept. 26, in the note on Claybury Asylum entrance-gates, you state that the asylum is being built by Mr. Lovatt; this is incorrect. The asylum buildings are being built by Mr. E. Gabbutt, of Liverpool, the foundations having been put in by Mr. H. Lovatt, of Wolverhampton.—I am, &c.

Claybury, Sept. 30. H. R. Bishop.

Intercommunication.

QUESTIONS.

[10394.]—**Solid Wood Floors.**—I have heard of ordinary flooring boards being nailed to coke breeze concrete as a cheap substitute for solid block flooring. Can anyone say from experience whether there is a risk of rot setting-in by water penetrating the joints and getting underneath when floor is washed, &c.? Has this ever affected solid block flooring too?—Learner.

[10395.]—**Parquetry Corridors and the Building Acts.**—In some industrial dwellings in the metropolis it is proposed to lay the corridors with concrete, and to lay on this boarding which will in turn carry a parquet flooring. The district surveyor objects to this as an infringement of the Metropolitan Building Act of 1855, Section 22, which provides that in every dwelling of such character "the floors of the lobbies, corridors, passages, and landings, and also the flights of stairs shall be of stone or other fireproof material, and carried by supports of a fireproof material." Can parquetry on concrete be regarded as "fireproof" within the meaning of the Act, or must the surface be of tiles or concrete? I omitted to state that in the centre of this concrete of passages are chases which will receive iron pipes for heating the buildings.—Jeremiah.

[10396.]—**Day-work in the Profession.**—How many hours are reckoned to the day by the profession, and can any of your readers state what is considered a day in attending a Court of Law?—Doubtful.

[10397.]—**Quantities.** — In case of a proprietor demanding a copy of quantities on architect sending in final statement for work carried out, can he legally force the architect to produce one?—Resistant.

REPLIES.

[10333.]—**Reredos and Rood Screen.**—Answering one of your querists, I might mention there are two very fine modern screens to be seen in Brighton: one a recent erection in the old parish church of St. Nicholas, designed in a Flowing Decorated style, with a handsome cross or rood; the other a rood-beam and cross in St. Martin's church. The reredos in the latter church is an exceedingly fine one in three tiers, richly canopied at the top. The east window is placed high. The pulpit has a very elegantly-carved canopy rising to a considerable height. The arcades are of brick. The whole of the chancel is harmoniously fitted and in a good style. In the Church of St. Peter, Leigham Court-road, Streatham, is to be seen also a very light and well-designed metal screen and floriated cross over. A reredos should properly belong to, and grow out of, the altar, and for this reason I think it best to confine it in width to that extent in small churches. In larger churches the reredos may be widened by side bays carried up from the ground, these side bays projecting beyond the altar on either side. This arrangement is the one adopted at St. Martin's Church.—G. H. G.

[10382.]—**Fireproof Floors.**—I notice in your issue of last week that Mr. Potter gives some details concerning the combination of concrete with iron. It is, however, an ascertained fact that this combination has serious faults. Captain Shaw has given orders to his men not to enter any building on fire where concrete is used in conjunction with iron, because of the liability of the concrete to part company with the iron and fall down in masses. This tendency has been experimentally proved by Mr. W. H. Stanger, C.E., whose report came into my hands some time ago, and which I inclose for the perusal of your correspondent. It shows that in a furnace worked up to 2,000° the best quality concrete, applied as a protective coating to iron girders, began to crumble away in 53 minutes. Doulton-Peto tiles, under the same conditions, lasted over 4 hours; but slag-wool (which is, to a great extent, an air-harbouring body) resisted the heat for over 7 hours until the fire was raked out, at which time the iron girders showed no deflection.—James Christie.

[10374.]—**Stoppage of Work.**—I scarcely think "G. H. G." has gone far enough in stating that the contractor can only charge for work and labour actually done when the works are stopped, as I believe he has a further reasonable claim for profit that would be likely to accrue were the work carried through, for on the principle that it takes two to make a bargain, one party to it cannot break the same without the consent of the other, and compensation allowed. This also applies to the architect's commission.—Tolop.

[10381.]—**Roof—Graphic Solution.**—The load rests on a king-post truss at three points—at the foot of each principal rafter, at the centre or purlin, and at the ridge. If we assume that $\frac{1}{2}$ W is supported at the centre or purlin point, and a $\frac{1}{4}$ W at the foot of rafter, and also at ridge, we have the resultant force at the foot $\frac{3}{4}$ W upwards, since the upward vertical pressure of the wall has to be added. This distribution is one of those found in treatises. It being assumed that the pressure on middle prop is $\frac{1}{2}$ W, that at the extremities of rafter $\frac{1}{4}$ W each, the rafter being supposed to be jointed in the middle, and therefore the weight of each half of rafter is equally divided between its extremities But, of course, any distribution at certain points is more or less arbitrary.—G. H. G.

[10382.]—**Altar Rail.**—I must thank "H. W." for his reply, which is suggestive of what may be done. I have seen several chancels, but they vary to so great an extent in the number of steps, width of footpace, and other details, that no rule can be deduced. I will certainly visit the church he names. The chancel is that of a country church, and is about 19ft. by 40ft. According to "H. W.," the altar-rail should be about 12ft. from top step—this distance, I presume, supposes a passage behind altar. The taste of the clergyman is, as he says, exceedingly self-assertive; but if there was a common rule for a given-sized church, he could not exercise his opinion.—A. H.

[10384.]—**Wood Block Floor.**—I should prefer pitch, or some bituminous composition, to lay the blocks on; no smell need be feared. I should recommend "Trenwith" to apply to Mr. Roger L. Lowe, whose wood block flooring is one of the best. The blocks are fastened to a concrete bed by a patented composition, which checks dry-rot and prevents dampness.—G. H. G.

[10387.]—**Windows.**—I do not think J. W. Simpson has a remedy against his neighbour for slightly enlarging his windows, provided the windows are practically coincident with the old one, for it has been ruled that a window cannot be obstructed if the obstruction interferes with an existing right to light. The case of "Aynsley v. Glover" applies to such a case.—G. H. G.

[10389.]—**Drainage.**—It is usual to provide both an inlet and outlet in connection with the main inspection manhole at the disconnecting trap, for the ventilation of the manhole and the drain. The outlet may be either at the high end of the drain, coming into the manhole, or it may be off the manhole. If a soil-pipe delivers into the high end of the drain, it may be made to serve as the ventilating pipe for the drain; but in many cases some plumbers and sanitary engineers prefer to trap the soil-pipe at its foot, and provide a separate ventilating pipe for the drain. I prefer to do so in my own practice as far as possible. 2. Gully-traps might be used for rain-water pipes leading into a rainwater tank, where they are intended to catch leaves, soot, and sand, and prevent such passing into the tank.—W. P. Buchan.

[10390.]—**Pointed Architecture.**—It has been suggested with some reason, that the requirements of vaulting, as in the case of narrow vaults intersecting circular vaults with level ridges, necessitated the pointed arch (see Fergusson's "Handbook.") As to the origin of the pointed form, the Assyrians used the pointed arch, and we know the Etrurians and Pelasgi used it in their tombs. In the south of France the pointed arch was used for vaults, because it allowed the covering of roof to be laid immediately upon the vault, as in the church at Carcassone—there was less fitting-in necessary. In the construction of domes with pendentives, the pointed form was also adopted in the latter, as avoiding the weakness of circular arches.—G. H. G.

[10393.]—**Wood Block Flooring.**—A wood block floor would answer very well for a public market hall; it can be laid to gradients for draining, and can be made impervious. For concerts and lectures the wood paving would be better than asphalte or brick. "C. W. S." would do well to apply to any of the makers of floors of this description. For his other particulars, R. L. Lowe, W. Duffy, and the Westminster Patent Flooring Company are well-known makers of wood block floors.—G. H. G.

At the Court House, Stockport, Mr. Arnold Taylor, an inspector of the Local Government Board, held an inquiry on Friday relating to an application by the corporation of Stockport to borrow £15,560 for the construction of new streets and bridges, £9,000 for works of street improvement, and £5,500 for the erection of stables. The recently-appointed borough surveyor (Mr. Atkinson) and the late borough surveyor (Mr. A. M. Fowler) gave evidence as to the plans.

On Saturday evening, at St. Michael's Church, Maidstone, the reredos erected to the memory of the late Mr. F. Scudamore was unveiled. Sir Arthur Blomfield, the original architect of the church, designed the reredos, which has been carried out by Messrs. A. N. Pryer and Co., of West Borough. The decorative work has been executed by Messrs. Heaton, Butler, and Baynes, of Garrick-street, London.

Broseley parish church was reopened last week after the erection of choir-stalls, new heating apparatus, and a new vestry, and the reconstruction of the organ, the latter work being carried out by Messrs. Nicholson, of Worcester.

WATER SUPPLY AND SANITARY MATTERS.

Blyth.—After a delay covering many years, the old Slake, which forms the boundary between Cowpen and Blyth, is being covered in. The Slake is now really a small tributary of the River Blyth, originally flat, low-lying land, covered at each recurring tide by a shallow stream of water. A portion of the ground on which the lower part of Cowpen Quay is built has been reclaimed from the Slake, and now only a tidal stream of some 30ft. broad has been left. This stream it is which it is now proposed to inclose within a culvert, and so leave the land open for the erection of dwelling houses, &c. The contract has been let to Mr. J. Carrick, of Durham, and the work is now commenced. The culvert for 1,141ft. of its length will have an internal diameter of 5ft., while the higher portion, extending 495ft., will have an inside measurement of 3ft. by 2ft.

Newcastle-under-Lyme.—On Tuesday, the 23rd Sept., a public inquiry was held at the Town-hall, Newcastle-under-Lyme, by Mr. Codrington, one of the inspectors of the Local Government Board, respecting an application for powers to borrow £8,500 for permanent works, consisting of main sewers, irrigation works extension, and various public improvements. Mr. Jas. Pattison, borough surveyor, explained the plans and the nature of the work proposed to be done. There were one or two minor objections by representatives of the Ratepayers' Association. The inquiry, which was a lengthy business, lasted from 10.30 a.m. till 5.30 in the evening. On the following day the inspector visited the sewage works, and the sites of various other works proposed to be carried out.

CHIPS.

The current number of *A. A. Notes* gives publicity to the rumour that Mr. Norman Shaw, R.A., intends to retire from active work almost at once.

As we anticipated last week, when noticing the proposed practical retirement of Mr. Lyster, the engineer to the Liverpool Docks Board, that body have agreed to the scheme under which the salary of Mr. G. F. Lyster, as engineer, will be reduced from £4,500 to £3,000 per annum, that of his son, Mr. G. A. Lyster, being increased from £500 to £1,500 a year, Mr. Le Mesurier, chief assistant to the engineer, receiving an advance from £850 to £1,000.

A working men's Conservative club is being built at Thorverton, and will be opened in November. Mr. Allen, of Exeter, is the architect, and Mr. Westcott, the builder.

On Sunday the new post and telegraph office, which has been erected at Queengate, Inverness, at a cost of over £14,000, was formally opened for business.

Cradley Church has been seriously injured by mining operations, and Mr. J. M. Gething, architect, of Kidderminster, has been called in to report thereon. It is found necessary to rebuild vestries and make other alterations.

The Congregational Church, Grafton-square, Clapham, has just been reopened after repairs and decorative works, which have been executed by Messrs. Pitman and Son, of Newgate-street, under the superintendence of Messrs. Searle and Hayes, the architects.

A Goliath over-head travelling crane, with a capability for lifting 20-ton blocks of stone or marble a height of 25ft. clear and carrying them to any part of the work, was tested at Mr. Harry Hems's studios at Exeter on Friday. The work has been carried out by Mr. Benjamin Johnson, Mill-lane Works, Bramley, near Leeds. Amongst other commissions at home and abroad, Mr. Harry Hems has just had the sculpture for the new Municipal Buildings at Bombay intrusted to him. These public offices are being erected from the designs of Mr. F. W. Stevens, F.R.I.B.A., by Messrs. Warden and Co., contractors. Much of the sculpture will be of colossal size, notably an emblematic female figure of India upwards of 12ft. high.

Mr. W. A. Shade, the American painter, who has resided in Rome for the last ten years, died at Lucerne on Friday night. Mr. Shade studied at Düsseldorf, Munich, Paris, and Rome, and was an idealist. One of his pictures, "First Love," was bought by the Berlin National Gallery; another, "The Power of Love," by the Empress Frederick. He also painted a series of family portraits for Prince Wiel. "The Flight in Egypt" is his chief work.

The committee engaged in erecting a monument to Dr. Parry, the late Bishop of Dover, met on Monday at Mr. Forsyth's studio to inspect the clay model of the recumbent effigy of the late bishop, about to be erected in marble in the nave of Canterbury Cathedral. The further details of the altar-tomb, on which the effigy is to rest, were left to be arranged by a sub-committee.

Our Office Table.

The *conversazione* to be given this (Friday) evening at the Town Hall, Westminster, to inaugurate the forty-fourth session of the Architectural Association, promises to be an unusually successful gathering of its class. The programme is an attractive one, and includes a reception by the President, Mr. Leonard Stokes, in the large hall, to be converted for the occasion into a drawing-room, and lit by electricity; selections of music by the Coldstream Guards; illustrations and demonstrations of hypnotism by Dr. George André, of the Physiological Institute of France; and the exhibits will consist of prize drawings of the session, the Oxfordshire Excursion photographs, water-colours and other sketches on loan, and specimens of the arts and crafts allied to architecture; while rumours are being floated by members of the committee that the refreshment and cloak-room arrangements will be "better than usual."

The coming session of the Association promises to be one of great importance to that body, as the report of the Committee on the future of that body, so fully discussed last session, comes up for further consideration at the meetings of the 31st inst. and Nov. 14th. The syllabus of papers to be read includes the following subjects:—"Opaque Glass," by Mr. Powell; "Wood and Stone Carving," by Messrs. Pomeroy, Stephens, and Frith; "Renaissance Art," by Mr. J. M. Brydon; "Marble Mosaic," by Messrs. Horsley and Spence; "Home-like Houses," by Mr. Ernest Newton; "Notes by the Travelling Student," by Mr. Percy Smith; and others by Messrs. Basil Champneys, Prior, and Scott Morton.

The seventh session of the Society of Architects will be opened on Tuesday, November 11th, when the President, Mr. Robert Walker, of Cork, will deliver his inaugural address at the Society's room, St. James's Hall, Piccadilly. The succeeding meetings will be held on Tuesday evenings, November 25th, December 9th, January 13th and 27th, 1891; February 10th and 24th, March 10th and 24th, April 14th, May 12th, and June 23rd, the last being the annual general meeting. An excellent and attractive syllabus is, we hear, in course of preparation.

Mr. G. A. T. Middleton is about to give a series of twelve lectures in preparation for the R.I.B.A. examinations, commencing on Thursday week, the 15th inst., each being about two hours in length. Those on the "History of Architecture" and the "Development of Ornament" will be illustrated by lantern views. On November 18th Mr. Middleton delivers an address at the Alderley Edge Art Club, Manchester; on the 27th of that month he will speak at Kidderminster on "The Homes of our Forefathers"; on December 1st before the Birmingham and Midland Institute, on "Ancient History Written in Stone"; and on January 8th he will give a lecture before the Cardiff Naturalists' Society on "English History Written in Stone."

The manager of the Ecclesiastical Art Exhibition, which is held every year concurrently with the Church Congress, and was opened at Hull on Monday, has succeeded in bringing together a very remarkable collection of objects in the loan collection, which includes nearly 600 exhibits. Church plate is represented by communion vessels from Holy Trinity and St. Mary's, Hull; St. Mary's, Beverley; Preston-in-Holderness; Burton Agnes; St. Michael-le-Belfrey, York; Swine; Guisborough; Howden; Bugthorpe; Pontefract; and Middleton. Several private owners have also contributed ancient examples from their collections. Local ecclesiology is well represented by a number of drawings, engravings, and books, having reference to the churches and monastic remains of the neighbourhood. Some fine specimens of early printed books, a few of which are also of interest on account of their bindings, are also included. Embroidery, both ancient and modern, is well represented in the exhibits of the East Grinstead School of Embroidery, the school in connection with St. Stephen's Orphanage, York, and the specimens lent by various private owners. Mr. H. E. Franks and Mr. M. C. Peck lend a collection of rubbings of monumental brasses, and Messrs. Smith and Brodrick, architects, of Hull, exhibit views of buildings carried out by their firm.

The Worshipful Company of Plumbers met at the City Guildhall on Monday to swear in their officers for the ensuing year—viz., Mr. W. H. Bishop, master, Mr. Charles Hudson, warden, and Mr. Philip Wilkinson, renter warden. Sir Philip Magnus referred to the large increase in the number of students attending the plumbing classes in connection with the City and Guilds Institute, stating that 569 students had presented themselves at the last examination held by the institute. He said the institute welcomed the graded scheme formulated by the company for the training of plumbers, commencing at the time of their apprenticeship and providing for examinations at three stages, preliminary, intermediate, and final, the last entitling successful candidates to enrolment under the rules of the National Registration of Qualified Plumbers.

A deputation from the Plumstead District Board of Works waited on the London County Council on Tuesday to ask them to increase the sum they are willing to give towards the proposed purchase of Bostall Wood, as an addition to Bostall Heath, already under the charge of the latter body, as an open space. The wood consists chiefly of pines, covering a hill of 60 acres, presenting a picturesque appearance. Sir Julian Goldsmid, M.P., who holds the property in trust, is willing to part with it to the County Council for £200 an acre, and has refused to accept a larger sum from the builders, who are already laying out streets close to the spot, and are ready to cover the ground with houses. The Parks and Open Spaces Committee have decided, however, to come to a conclusion to offer £150 an acre for the land, the locality to contribute a fair proportion of the cost. The owner, in virtue of his trust, cannot reduce his demand, and under the deadlock thus caused the negotiations may, it is feared by the residents in the locality, fall through.

A vein of ricolite and green onyx is being quarried in Western Gran County, New Mexico, and has been tried in the new Alhambra Theatre at Chicago. The vein is said to be 50ft. wide and over a mile in length, and the stone is got in large blocks. The colours are dark green, cream, pink, and salmon, and also striped and mottled; in fact it is said to contain some of the "lost colours" in stone, while its toughness enables it to be carved. Blocks of the new onyx will be used in the construction of the new Mexico Exhibition pavilion at the forthcoming World's Fair at Chicago, when its decorative and commercial values can be tested.

The annual report of the Pearl Life Assurance Company, presented at the twenty-sixth annual general meeting, held September 26th, states that 370,851 policies were issued during the past twelve months, representing a new annual premium income of £154,999 1s. 8½d. The total income for the past financial year amounted to £272,707 0s. 2d., and exceeded that of the previous year by £19,771 2s. 5½d., being an increase of more than 40 per cent. over that of the previous year. A dividend of 10 per cent. has been recommended and paid.

Mr. J. E. Hodgson, R.A., has been elected president of the next annual congress of the National Association for the Advancement of Art and its Application to Industry, which will be held at Birmingham from the 4th to the 8th of November next.

The chapel of St. Clare's Convent, Pantasaph, has lately received a gift of the 14 Stations of the Cross which have been recently erected. The wall spaces between the nave lancet windows have been selected for the niches in which the sculptured groups of the Stations have been placed. The material used for the niches and the sculpture is a soft-coloured stone, and the groups are carved in high relief. The Stations were executed by Mr. Boulton, of Cheltenham, from the designs of Mr. Edmund Kirby, of Liverpool.

A new branch library, in the parish of Battersea, was opened on Tuesday night by Mr. J. S. Gilliat, M.P. The central library stands on Lavender-hill, and the two branches are at Lammas Hall and in Lurline-gardens. The former branch contains 5,000 volumes, and the new one in Lurline-gardens, Victoria-road, opens with 4,200 books. On Wednesday evening the Public Library for Rotherhithe was inaugurated by the Right Hon. Sir John Lubbock, M.P., while the new Clerkenwell Library will be opened on Saturday in next week, the 11th inst. The last-named building, which was designed by Messrs. Karslake and Mortimer, was illustrated by us on May 17, 1889.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Engineers. "Sewer Ventilation," by W. Santo Crimp. 7.30 p.m.
Liverpool Architectural Society. Opening Address by the President, T. Mellard Reade, F.S.A. 7 p.m.
Glasgow Architectural Association. "The Middle Period of Greek Architecture," by Henry Mitchell. 8 p.m.

National Registration of Plumbers.—Plumbers Registered since 1st September, 1890.

LONDON JOURNEYMAN.

Plenty, E. W., 44, Hazelwood-road, St. James-street, Walthamstow.

PROVINCIAL MASTERS.

Fisher, C., 21, Market-place, Loughborough.
Hope, G., 15, Salisbury-place, Edinburgh, N.B.
Hunter, H., 11, Farndale-terrace, Thornton-street, West Hartlepool.
Mason, J. A., 1, Strathern-villas, St. Saviour's-hill, Leicester.
Pallett, W., 58, Oxenden-street, Leicester.
Snuggs, E. A., 26, Sheet-street, Windsor.
Thornton, C., Mill-street, Oakham.

PROVINCIAL JOURNEYMEN.

Bramham, J., 3, Warehouse-hill, Call-lane, Leeds.
Curson, J. W., Wellington-terrace, Ber-street, Gates, Norwich.
Gordon, T. McG., 21, Victoria-street, Galashiels, N.B.
Lester, C. J., 2, Millfield-place, Blackpool, Cork.
Longfellow, T., 27, South Terrace-cottages, Headingley, Leeds.
Nickalls, J., 28, Pavilion-road, Foord, Folkestone.
O'Brien, M., 100, Friar-street, Cork.
Rutledge, P., Fermoy, co. Cork.
Speirs, J., 32, Albert-place, Galashiels, N.B.

CHIPS.

The great scheme of church extension inaugurated by the Bishop of Peterborough in 1875 is now practically completed. Four new parishes have been created, and four new churches erected. The consecration of the last of the latter—St. Paul's—took place yesterday (Thursday), when the Bishop preached.

The remains of Archbishop Tenison's throne, to which public attention has recently been directed by Mr. G. Cavendish Bentinck, M.P., are being put together under the direction of the Dean and Chapter of Canterbury. It is stated that the throne, when completed, will be re-erected in the Cathedral Library.

A memorial has been placed in the churchyard at Cove, near Tiverton, to the late rector, the Rev. William Knight. It takes the form of a Cornish cross, being a *fac simile* of the fragmentary Celtic cross at St. Columb Major. It is made of Hopton Wood stone, and is surrounded by a curb of grey Dartmoor granite. It is the work of Mr. Harry Hems, of Exeter.

A memorial stone of a new Wesleyan chapel was laid at Twerton, near Bath, on Tuesday. The chapel will be built of Twerton lias, with Bath stone dressings, will seat 375 persons, and will cost, with schoolroom in basement, £2,400.

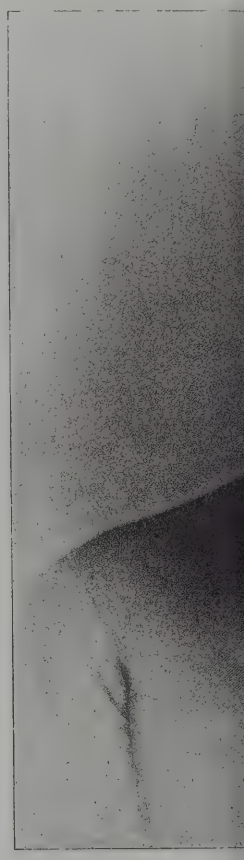
Several improvements are about to be made at Cradley Church, which has fallen into a bad state of repair, partly in consequence of mining operations in the neighbourhood. Choir stalls will be provided, and a new choir vestry built, and the ventilation improved. Mr. J. M. Gething is the architect.

At the annual meeting of the Tylers and Bricklayers' Company, held on Monday evening, the following officers were elected for the ensuing year:—Master, George Edward Tanner; upper warden, Samuel Sansom; renter warden, Ellis Marsland, M.S.A.

A new Goldsmiths' Institute has been erected at Lewisham, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilators.

Additions are being made to the infirmary at Warrington, including the provision of a top-lighted operation theatre, and the building of a lift from the ground floor to others, and a new staircase. Mr. Beckett, of Hartford, is the contractor.

Holloway's Pills.—The Great Need.—The blood is the life, and on its purity depends our health, if not our existence. These Pills thoroughly cleanse this vital fluid from all contaminations, and strengthen and invigorate the whole system, healthily stimulate sluggish organs, and establish order of circulation and secretion throughout every part of the body.



BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1866.

FRIDAY, OCTOBER 10, 1890.

WHITEFIELD MEMORIAL CHAPEL COMPETITION.

LAST week we gave an abstract of Professor T. Roger Smith's report on this competition, which describes the leading features of each of the ten designs. The remarkable conclusion of that report, as contained in the last paragraph, was so contrary to what we had expected after reading the comments on the designs, that we concluded the assessor must have had some good reasons for rejecting so unceremoniously all the plans he had pronounced good and of artistic design for four others of much less merit. Our inspection of the designs has certainly failed to reveal any such reasons. The ground assigned for the assessor's astonishing conclusion is that as it is virtually impossible to erect buildings for the amount named, £15,000, therefore he had to select a design not upon its merits, but the one which he thinks is most economical. We must confess this seems to us a rather curious and illogical conclusion to draw, after speaking of three of the designs—"Lux Mundi," "Forward," and "Taxis"—in the highest terms and as remarkable for artistic merit. Why should designs of architectural merit be set aside for those confessedly of a lower order of merit for the sake of economy?

The sum named by the committee is quite insufficient, no doubt, as some of the competitors hinted at the commencement; but the inadequacy of the amount was the fault of the committee, and should not be made the ground for setting aside the best designs. An architectural assessor's duty is to weigh the merits of the designs, and certainly to award the first prize to that design which commends itself to his mind with a reasonable regard to economy. If it is impossible to erect buildings giving the amount of accommodation required with the necessary elegance, dignity, and convenience for the amount named, the assessor is justified in acting upon this opinion and select one that appears to fulfil these desiderata. There is a further consideration which some of our correspondents have pointed out—namely, that the design to which the first premium has been given exceeds by 6ft. the frontage to Tottenham Court-road or that shown by figures on the plan issued to competitors (102ft.), or about 670ft. superficial more in area. No doubt the extra 6ft. would be a valuable addition, and would have allowed other competitors to improve the hall; but as the printed instruction was decisive on this point, those competitors who complied with it should at least have fair play accorded them. On what ground then, we ask, does Professor Smith favour this excess of frontage in the case of 'Winged Heart" when "Lux Mundi," which is acknowledged to be of great merit, does not exceed the 102ft.? While we are astonished at the decision on the grounds above stated, we still more wonder after an inspection of the design awarded the first premium. "Winged Heart" (by F. Boreham) is florid in its style and details, and wanting in some of the external characteristics of buildings of this class. The front elevation rather strongly put us in mind of a commercial building; the front towards Tottenham Court-road especially. We freely admit there is much that is good in the plan. The chapel in the rear is rectangular, about 94ft. by 68ft., the axis north and south. Out of the corners rectangular staircases are taken, leaving a recess on the north side for a corridor behind the pulpit, and another recess on the south side which is fitted with seats. These are arranged in four rectangular blocks with three passages. The accommodation on the ground floor is 930 seats, in the gallery 585, and an addition of 50 in the choir, making a total of 1,565 sittings. The gallery plan shows a semicircular gallery at the south end, with the organ at the north end over the platform. Two areas on the east side separate the chapel from Toplady Hall and afford light; between these areas there is a central corridor of good width, giving access to the chapel through the ground floor from Tottenham Court-road. The hall is a rectangle, 101ft. by 51ft., the ground floor being occupied by classrooms on the left side of the corridor, and by a church parlour on the right-hand side, in front of these being six offices towards the main road; the upper floor of hall has a gallery on three sides. The basement is devoted to the general school room and infant school under the chapel and stores. The approaches to the hall are by wide staircases. The interior is illustrated by an ink perspective, which shows a clerestory, a spandrel roof carried on iron pillars and arches, lean-to aisle roofs of open timber principals, and ceiled between. Exteriorly red brick and stone in dressings are shown, the style being a kind of round-arched Italian. The square pinnacles carried up between window bays are extravagant features, and the fenestration looks crowded; a bold circular entrance in the Tottenham Court-road is the only visible feature in front which leads one to imagine the chapel behind. The steep hipped roof is broken by the pinnacles, and two ventilators on the ridge over the hall. The south elevation includes the gabled end of the chapel, which has a large wheel window flanked by square turrets. There are good points in the plan: the staircases and approaches are ample and the lighting good, and the author shows means of ventilation in the roofs of the two main buildings. The author's estimate is £15,000, a certainly low figure.

"Lux Mundi," which receives the second premium, is a masterly design in its conception and details. Mr. J. M. Brydon, the author, has grouped his main blocks in such a manner that while each building emphasises its purpose, they combine to form a composition marked by much dignity and refinement. The drawings are the most artistic; nothing can be nicer than the interior view, looking across the chapel beneath the dome. The main blocks are connected by the staircases; the chapel, about 86ft. long by 73ft. wide, has its two eastern corners canted off, and the blocks of circular seats are arranged radially to the rostrum or platform in the centre of the west side, there being four passages converging to the pulpit, with the vestry behind. The gallery plan is semicircular and extends round the three sides upon columns of good proportions standing on pedestals. These columns are arranged hexagonally, carrying arches and a domical ceiling of the same form with a clerestory arrangement. The dome is also pierced by openings. A choir gallery and organs on each side are divided by a screen from the interior, making a very pleasing feature. The hall block is traversed by a wide corridor to the chapel; on one side are placed the secretary's rooms, and on the other the church parlour, the front having four offices. The hall over measures 99ft. by 45ft., and has a platform at the south end. The form of the chapel and the spacing of the columns are such as to allow everyone to see and hear the minister, and to offer the least obstruction, a condition to which Nonconformists attach the greatest value. "Lux Mundi" has certainly solved this part of the problem; the lighting is ample, the seating arranged upon the most economical plan, and the requirements fairly met. The style, in red brick and stone or terracotta, is a Late English Renaissance, very suitable and divested of all unnecessary details, and the author puts his estimate at within 10 per cent. of the amount fixed.

"Taxis" (by Mr. Jas. Cubitt, in conjunction with his former pupil, Mr. Littlewood) is another very clever and picturesque design in its plan and exterior treatment. The drawings are artistically executed in light tinting, and display a pleasing handling of Flemish Gothic, though perhaps the front elevation towards Tottenham Court-road is scarcely imposing enough. The plan of chapel, which is exceedingly clever, is an irregular octagon, the east and west sides being slightly recessed; the western end has the platform and pulpit, with organ behind. The total diameter this way is 92ft., and the width across 88ft. Within this octagon, six columns, arranged at the angles of a regular hexagon, carry the gallery, the sides of which, instead of being straight, are curved outwards or towards the outer walls, and producing a ground plan like a sexfoil, and having a diameter of 68ft. The seats follow the curves. The six columns carry six Tudor Pointed arches, and a clerestory with a groined ceiling above. The author has adopted the "Hall type" of plan, with the best results. Staircases at each angle of the chapel and a passage round gallery are shown. The seating below is ingeniously contrived to reduce to a minimum obstruction of the columns, the seats are arranged in three blocks with two radial passages from the platform and a surrounding passage. The floor slopes up at the back a few inches. The front block has the arrangements well studied: there is a large, well-lighted schoolroom below, three offices, a church parlour, and classrooms in ground floor on each side, and a wide corridor entrance, and above a hall the whole length of front. The tower which springs from the junction of the two blocks on the south side is picturesque, and with nice outline and details. Red brick and stone are the materials. The accommodation set down is 1,100 on ground floor, and 442 on gallery.

"Forward" is a well-thought-out design, perhaps too Town Hall like in its front elevation, but nevertheless dignified in a kind of modern Romanesque of brick and terra-cotta; the front has corner square turrets, a high roof and flèche in the centre, the windows are round headed, and there is a bold, deeply recessed archway in centre, which gives access to the chapel. The latter is an oblong, 100ft. by 56ft., placed north and south, the platform recess in the centre on west side, and the seats arranged amphitheatre wise with radial passages. This arrangement brings the front of the gallery rather near the preacher, and we think is better adapted for a medical lecture theatre. The other rooms, the lobby entrance to chapel, are convenient. The hall has the same arrangement of side platform. Much less satisfactory is the interior, as shown by the sepia perspective; the details are "thin," there is a flat panelled ceiling and clerestory to chapel, and the nearness of platform spoils the effect.

We can only briefly notice the other designs. "Lux" is clever; the interior perspective is nicely drawn, but the exterior has a rather warehouse type, being entirely of red brickwork with small openings; the irregular plan of chapel is more ingenious than effective. "Arcanus" shows a better arranged plan of chapel, 93ft. by 63ft., the pulpit platform being on the long axis of rectangle, some distance in front of the end wall, with seats planned between radial passages. The Italian exterior is of the Municipal character, with corner tower. The ceiling is flat and coved.

"Red Star" is essentially chapel-like, with the usual amphitheatre-like plan, 81ft. by 78ft., with platform at west end, the details somewhat bizarre. It is singular

that the author should have exceeded the limits of frontage and taken up the whole width of ground for his building, and still more remarkable that the assessor has thought fit to sanction this infringement, as he has done in the case of "Winged Heart." "Hearing and Seeing" has the rectangular plan of chapel with recess for platform, and the author has only partially, we think, met the requirements. "Wisdom, Strength, and Beauty" is in Italian, with domical chapel, and excessive in its features. "Spero" also is costly and pretentious; the domes and towers are numerous, the chapel is square, surmounted by a large dome with semi-circular seating; the square hall has corner staircases, carried up by crowned cupolas; and the front towards Tottenham Court-road is of four stories.

We cannot think Professor Roger Smith's award justifies his own convictions, nor the claims of those whose designs he admits have merits of a higher order. The principles which the assessor in his report has well laid down, and which we had presumed had influenced his decision, have been set on one side in favour of a design which, whatever may be its merits—and we do not underrate them—cannot compete with at least two of those which he acknowledges are "remarkable for artistic merit." Many correspondents express their surprise at a decision which so completely contradicts their idea of principle of selection, one design having been selected from four of the economical class, and the second from one of the three artistic designs. The instructions stated that the award of the premiums would be left in the assessor's hands, but they made no promise as to which design they would accept for building. Perhaps even now it is not too late to hope for a revision.

SPECIFIED MATERIALS AND WORKMANSHIP.

ONE of the prosaic duties of the architect is that of knowing the markets, current quotations, and inventions connected with building. Fine art in the abstract is a pleasant theme for those who can look at architecture from the outside, to discuss at congresses and social gatherings, theorise about at professional societies, and talk over at home; but it does not constitute practical architecture. A man who can advise on building matters must be an expert in materials, manufactures, and appliances, for it is at least nowadays more than half good architecture to know what materials should be used, and how they should be introduced. Quite a symposium of thought and skill in art might be made out of goods and materials supplied in contracts which included so many of the industries of the the present day. Nearly all of the applications of science to art have taken one form or another of concrete embodiment, and these are now enlisted into the service of building and construction. The difficulty is to know which is the best material or the best appliance for a particular use, for until the professional architect or engineer decides in his own mind as to the proper conditions, there is the mischief of specifying materials and goods at random, because they happen to be in the market and in general request. The fashion for employing a certain material, or the general run upon a certain article, appears to dictate its use without a knowledge of its real advantages. Thus, to take clay wares, some time ago there was a great demand for pressed bricks and for perforated bricks; the former were suitable for wet situations, but their smooth and half-glassy surface was disappointing where brick effect was desired; the perforated bricks were made from heavy clays, and they were pierced with a number of small holes throughout their thickness to reduce the weight; but it was soon found the perforations made them useless for cutting, and a considerable waste was caused. Then there is a difficulty in cutting gault bricks, although they are exceedingly hard and durable, and suitable for some kinds of building. In specifying terracotta, it has been the custom to place too much reliance on the market, and to assume that anything can be turned out under existing conditions of manufacture equal to stone. Disappointment has been the result. The shrinkage, the expansion of the cement concrete filling in, the twisting and warping of the material after baking are accidents which the contractor cannot be made answerable for, especially when the designs have been made upon expectations founded on stone work. The architect's design is transferred to the modeller; but the actual casting is spoilt by unskilled hands in the after processes and firing. All the skill is expended in making and fitting the moulds, which is but the preliminary step, and may be spoiled by unequal shrinkage, trimming, and after-manipulation. So that in intricate designs the architect is disappointed at the result—the warped lines, the rough arrises. Recent improvements have removed these difficulties and risks, so that in specifying large quantities of this material the architect would do well to require that manufacture which gives him the highest result.

So in the manufacture and supply of cast iron. It is too much the custom to select patterns and castings that have had a run without inquiry whether they really fulfil the requirements. The temptation of the contractor is to use what he finds ready to his hands; he hints that it will delay the work if he works to a new design, and that the cost will be more. The architect in practice is well aware of these representations, but is unfortunately often inclined to give way to them, forgetful that by acquiescing in the substitution of inferior goods he is compromising his taste and the real value of his services. Extra trouble and cost, or want of appreciation on the part of a client, are no excuses for agreeing to something that is discordant with the design or inappropriate. Suppose it is a number of cast-iron pillars and spandrels to support, say, a gallery round a hall. The contractor may persuade the architect to select a certain stock pattern. The pillars are fixed, but their proportions or design of capital and bracket are out of key with the interior, and nothing can be done to alter it; they remain a sad reproach upon the architect's taste. Or let us imagine a series of pendent or lamp brackets in a church that have been selected to save a few pounds. They for ever mar the church by their vulgarity or discordance; far better would it have been to have agreed to a much simpler and less obtrusive pattern. The extra cost of a new pattern would make a comparatively small addition to the cost of each column, while the harmony of the design would not have been destroyed. The multiplication of the same pattern is often made an excuse for substituting a less expensive article, generally because the contractor gets a discount from the manufacturer, and nets a profit upon the order. Sometimes the desire to quote a price under a normal sum may induce the contractor to supply a stock pattern. Hence the absolute importance of making detailed drawings and specifications for ironwork of an architectural character. There are now great temptations to introduce something inferior. In these days, when manufactures have been substituted for handicrafts, it is more necessary to call the attention of the architect to the importance of detail drawings for all iron and metal work, wood work, modelling, and the like. The machine-made goods are the products of repetition, and repetition is therefore the prevailing sin of the contractor. The Arts and Crafts Exhibition is a protest against the machine-multiplied design, and an attempt to revive the English traditions of handicrafts, and those who feel any desire to improve workmanship should pay the exhibition now open a visit. We shall be told that the old traditional handicraft cannot now take the place of manufacture; perhaps not in its true traditional form, but it may awaken designers and producers to the danger of mechanical repetition, and set them to work on more rational lines, to learn the true principles and methods of applied design. We are now concerned with the ordinary "goods" and "materials" used in building, such things as bricks, floors, iron-work, joiners' fittings, sanitary fittings. The ordinary specification simply provides for these things, it does not define what class of manufacture they are to be, except, perhaps, that they are to be the "best" or "approved," terms which may mean nothing unless the architect takes the trouble to obtain the right thing, or himself designs, or selects from the manufacturer the particular article. Means of making known to the trades connected with building the qualities and merits of artistic workmanship and design, of drawing attention to the right models, are not what they ought to be, or might be made, if we except exhibitions of a select character of goods designed and executed by artists. Not knowing the ideas of architects, manufacturers are contented to work in the old groove and to reproduce for the sake of profit. Designer, craftsman, and contractor must be brought more closely together before a standard of quality or of merit can be recognised; they must be placed on the same level, discard the mere "fashionable" or "archæological," and endeavour to realise that their interests, though not identical, are certainly not contradictory.

The one serious obstacle to reconciliation between the designer and contractor is the requirement of price. How, for example, is quality of skill to be guaranteed in such an ordinary competition as the construction of so many yards of "glazed socketed pipe sewers, or of brick manholes, and settling tanks," or for the laying of "so many yards of sanitary pipes," to quote an advertisement, if the lowest tender is to be accepted unconditionally. The plans, specifications, and forms of tender, if rigidly adhered to, may mean a considerable out-of-pocket transaction, or if they are not complied with the competition becomes a mere farce. The only desirable way is to make a private estimate, and to accept the tender which comes fairly within a moderate percentage of it; but it is manifesty more satisfactory to invite a schedule for laying per yard in such a case, as it would be easier to see whether a fair or remunerative sum has been put down. When the price is for a large quantity of work in the lump, it is less possible to insure the specification being carried out. In architectural tendering there is even more opportunity of breaking away from the conditions than in work of a plain mechanical sort. When the architect can introduce a form or mode of tendering that will give the contractor some interest in employing skilled hands and artistic products, an improvement will be made.

ARTS AND CRAFTS EXHIBITION.

A LARGE and, on the whole, successful exhibition of arts and crafts is opened at the New Gallery, Regent-street. Commencing our examination in the south gallery, we notice a large cartoon and photographs for sgraffito in Clane Church, county Kildare, designed and executed by Heywood Sumner, representing "The Baptism," very effective in line and characteristic of the material. Next to it John Scarratt Rigby has a design

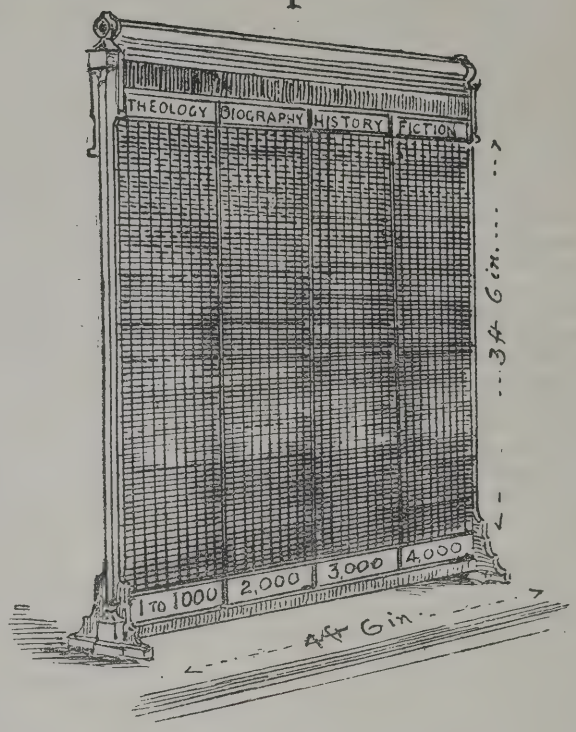
for block-printed cotton velvet in three or four colours. The ground is green and the flowers are well distributed over it; the stems conventionally arranged to form a repeating pattern. The fine series of cartoons by Morris and Co. which occupy a large space on the walls show a design (perhaps enlarged) by E. Burne Jones, A.R.A., for a window at Jesus College, Cambridge, in which the artist represents the Hierarchy. It is needless to say the conception of the nine figures comprising angels, archangels, cherubim, seraphim, thrones, dominions, &c., is full of that spiritual and symbolical meaning which Mr. Burne Jones can impart. The figures are designed with exceeding grace, the countenances are of the ideal angelic type we meet with in this artist's work, the draperies vigorously drawn in black chalk. The central figure of a seraph with censer, for example, is a noble study of a decorative figure subject. The window has been executed by Messrs. Morris and Co., who also show a very beautiful design in chalk, by the same artist, for a window at Gilsborough, Northampton, "Lazarus and Mary"; another window illustrates "Rachael and Jacob." The cartoon for Lanercost Abbey, "The Annunciation to the Shepherds," also executed by this firm, is another of E. Burne Jones's designs. A bold "filling" in two colours, red and yellow, is shown by George C. Haité, an exceedingly elegant adaptation for wall surface. Another pleasing wall paper cartoon in tempera is shown by Walter Crane in two cartoons. The subject "Corona Vitæ" is a clever idea worked out with considerable skill and fancy. The design is emblematic of a "full and ample life," the winged lions and other devices cleverly introduced. It is shown tdeated as an embossed leather paper, and also in the flat. An ornamented overlap leaf design by Lewis F. Day, printed in transparent lacquers on a gold ground with other treatments of the same, both in rich flocks and distemper colours. Various examples of flat treatments of chintz and other papers, printed in ordinary distemper colours and in transparent colours, from designs by Miss Mary Gemmell, Messrs. A. F. Brophy, B. and F. Gast, C. F. A. Voysey, Edmund Sedding, and J. Rigby. In another gallery Jeffrey and Co. show an embossed, lacquered, and gilt leather paper with the design (377) and a frieze on distemper, also a wall-paper painted in distemper colours and gilt on which the design is introduced.

Another large contributor in this branch of art is Selwyn Image, whose excellent little essay in the catalogue "On Designing Embroidery" may be read with profit. We notice particularly a design in charcoal and chalk for a painted glass window (24) for the Church of St. Michael and All Angels, Watford, Herts, and another for a window executed in grisaille (25). A large cartoon in charcoal, for a fresco in the Manchester Town-hall, is hung at the end of this gallery, and represents "The Baptism of Eadwine," by Ford Madox Brown, a very appropriate subject, and ably handled by the artist, who depicts the Northumbrian King being baptised. The composition is well arranged, the king is seen standing in a font, surrounded by the bishop and wise men, the rite of baptism being administered by the method known as affusion. The Kyrle Society send a very appropriate design for decoration of Working Men's Club at Vauxhall, the frieze of which is bold, and in nice colour, with a dado band. G. Woolliscroft Rhead's designs for majolica roundels, being emblems of the Evangelists for St. George's Church, Newcastle-on-Tyne (19); James Powell and Son's mosaic panel, "The Blessed Virgin Mary," designed by Miss Harrison; Lewis F. Day's faïence vase designs (55) and design by T. M. Rooke for a ceiling, "The Seven Stars and Signs of the Zodiac," may be named. John D. Sedding's plaster model of centre of an altar, modelled by Conrad Dressler (75) is a nice treatment. In the west gallery we have various embroideries and fabrics. Thomas Wardle's collection of printed silks, satins, plush, woollen and linen cloths in permanent colours, some of them designed, others reproduced from ancient fabrics, are noticeable. Very rich designs and colours we notice in some cotton velvets and printed silks (108). A design for an Irish national banner, embroidered in silks on hand-worked ground, designed by Walter Crane and executed by Una Taylor, is effective. The artist has cleverly arranged the Celtic cross and sun's rays which form the principal features; the four quarters of the banner contain shields of the four provinces. Mary Augusta Smith shows a very cleverly-worked and chaste wall-hanging of the Four Elements, designed by Heywood Sumner, worked in yellow and gold thread on cream-coloured cloth or serge. The Royal School of Needlework sends several good examples—one, a quilt worked on linen in crewels, designed by W. Morris, executed by B. Pike (132). The fireplace by Wilson and Pomeroy is rather heavy; but the modelled frieze is telling and effective. A handsome red stole (187), embroidered on red silk damask, designed by Aymer Vallance, and executed by K. Delano-Osborne; and an embroidered silk cushion, executed by Isabel Rogers, from an old Chinese design (186), and a case of embroidery sent by Morris and Co., together with the altar-cloth of needlework worked in silk and gold (235) designed by Selwyn Image, are creditable specimens of embroideries, designed on correct principles, in which the decoration of the material is not lost sight of in the mere device worked. The works exhibited by many lady artists, such as Miss May Morris's curtain, "The Fruit Tree," embroidered on blue linen, show a right appreciation of the art of arranging lines and masses on surfaces according to the purpose intended. Even much of what we see in modern embroidery is too delicate and minute, and the work and effect are therefore lost. In this gallery is a chimneypiece in giallo and verd anticed marbles executed by Farmer and Brindley, and designed by W. R. Lethaby.

The North Gallery contains one or two nice panels in gesso, bronzed for friezes, designed by Walter Crane, and executed and modelled by himself, Harold Weekes, and the late Osmund Weekes (283-287). The subjects are appropriate to libraries. The Anaglypta Co. show some very nice examples of their relief decoration. Gillow and Co., Howard and Sons, the Guild and School of Handicraft, Reginald T. Blomfield, Morris and Co., Collinson and Lock have many examples of well-designed and executed furniture. The walnut and boxwood marquetrie sideboard (340), designed by G. J. S. Lock, and the cabinet-work, by B. C. Jewell and Spurgeon; the rosewood and ivory tables, shaped as in (345), are exceedingly elegant specimens of craftsmanship. Jeffrey and Co. exhibit several beautiful and appropriate wall-papers, many of them designed by W. Crane and Lewis F. Day (376-395), and we notice particularly here a well-designed and carved litany desk, designed by Reginald T. Blomfield, and the woodwork and carving being by W. Aumonier, with brasswork panels. Messrs. Maw and Co. send a unique case of vases in lustre ware (416), designed by W. Crane. In the entrance-hall the altar of alabaster, lapis-lazuli, and repoussé metal, designed by J. D. Sedding and executed by T. Stirling Lee and A. G. Walker (422) makes an imposing feature. The painted wood credence table for Memorial Church, Greenwich, designed by A. H. Skipworth and executed by R. Godbold (425), altar cross in hammered gilding metal, set with rock crystal, designed by Mrs. H. Rawnsley, of the Keswick School of Industrial Arts (426); Strode and Co.'s excellent newel and panel in wrought iron, designed by W. Amor Fenn; the exhibits of the Coalbrookdale Co. (453), and the beautiful and very elegant opal glass set in hammered iron in the form of pendants, brackets, table glass by J. Powell and Sons (502); a good specimen of heraldic work in marble mosaic by Mainzer and Kempthorne (479) are all we have space to notice. A few drawings of ecclesiastical work, and a variety of other designs and specimens of craftsmanship are seen in the balcony.

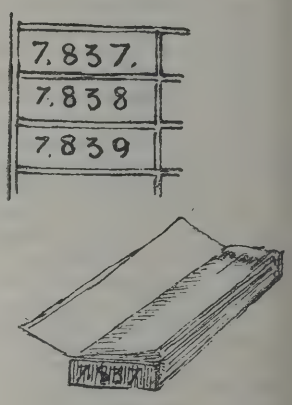
FREE PUBLIC LIBRARIES.—V.

THE meeting of the Library Association of the United Kingdom, at Reading, the week before last, which brought together from all parts of the country a large number of librarians and officials of free public libraries, comes opportunely in discussing the details of libraries. The useful remarks on ventilation, heating, and lighting of libraries by Mr. W. H. Greenhough, the librarian of the Free Public Library, Reading, we shall give when we refer to this part of our subject.



Dr. Thompson, the president, referred to some very instructive facts in connection with the spread of the library movement. The adoption of the Act at first was slow, yet about 200 towns in the kingdom had adopted the Act in the course of forty years. Statistics, he went on to say, proved "that the increase had been one of arithmetical progression, and for every ten libraries added this year, there would be twenty in the next, and so on until the demand was satisfied." The geographical aspect of the movement is suggestive. Dr. Thompson showed that the great centre of the movement lay in the central counties, and if we imagined a band drawn across the country extending from southern Lancashire and Yorkshire on the north to Warwickshire and Northamptonshire on the south, the free library towns were within this zone. Within these limits are the great manufacturing towns. The Metropolis is another great and independent centre. Every week we record the opening of new libraries. On Tuesday last Mr. D. R. Plunket, M.P., opened a new public library at Battersea, and Sir John Lubbock, M.P., performed a similar ceremony at Rotherhithe, while the Lord Mayor opens the new Clerkenwell Free Library on Saturday in next week. In referring to literature, Dr. Thompson observed that the vigilance of the librarian would have to be exercised in the selection of prose fiction, which is exceedingly prolific. Happily the three-volume novel is not so commonly read as it used to be; but the question of storage-room for books of this description is one of the questions with which the librarian is called upon to deal. Compilations of treatises on history, theology, philosophy, and science are growing year by year; book-makers are more numerous than authors who have something to say or teach; therefore the discrimination necessary in selecting such books for a reference library requires no small amount of study and labour.

Every librarian has his own ideas of selection and classification. The principal consideration is to secure for each library a fairly complete and representative collection of the literature of the day, not to give an undue prominence to any one branch. The editions to select are rather those that are clearly printed and not too large, and the single-volume editions of Tennyson, Thackeray, George Eliot, Carlyle, and other writers are more suitable for lending than the several-volume and more costly editions. In works of fiction especially we strongly recommend economy on this point. The three-volume novel is an incumbrance and wasteful of space. One volume



novels and biographies, if of any standard value, can be obtained, but if not, they are dear at any price. This rule need not be extended to more important branches of literature. Such works as Darwin, Spencer, Tyndall, and other writers on science, and those of Ruskin, Arnold, Newman, Martineau on art and theology, as excellent in literary style, must be obtained if a library is to represent the higher lights of literature, in lieu of works not very popular, or not obtainable in one-volume editions. Generally, it may be well to say that the great authors in history, philosophy, science, theology, and the fine arts should be selected from good editions, and the higher kind of poetry and prose fiction should be selected with not too parsimonious a hand, as these branches of literature should form the nucleus of every good library.

To facilitate order and classification various means have been employed, and to some of these we allude. We have already spoken briefly of the counter and indicator, and now refer in more detail to the Cotgreave indicator, which has been adopted by a considerable number of free libraries after an examination of other plans of registering. At Leeds, Nottingham, Stockport, and a score of other leading institutions we find this form of indicator in use. Mr. A. Cotgreave, the inventor, the present chief librarian of the Guille-Allè's Library, Guernsey, possessed experience of the requirements of librarians and borrowers, and after some thought has perfected an indicator which is simple in construction, easy and saving of time to the borrower, can be at once scanned by the librarian, who at a glance can see the time any book has been kept, who the borrower is, how many books he has had, and find other particulars that are necessary to be known by the custodian. One feature of the Cotgreave is that it occupies little space on the counter. As already described, it consists of an iron frame fitted with as many thousand zinc shelves as there are books to be recorded. Each shelf has a little metallic cased ledger numbered alike at both ends, but coloured blue at one end and red the other. When a borrower requires a book he seeks its number in the catalogue, and then looks at the indicator, where the numbers are arranged in regular order. The number found, the colour at once reveals the fact whether the book is in or out. Thus if the blue end of the little case is visible the book can be had, but if the red end is out, then it has been borrowed. To find the titles and authors of any of the numbers, a catalogue key numbered like the indicator is framed and placed by it. We give a sketch (Fig. 1) of the Cotgreave indicator for 4,000 volumes. Each indicator occupies about 5ft. in length of the counter, and they can be placed with intervals of about 3ft. along the counters if there is length enough, or they can be placed close together on each side of the opening for borrowers. As a rest for books is useful in front of the indicators, they should be set about 9in. or so from the outer edge of the counter. One of the decided merits of this indicator is that the borrowers themselves can be made to check the accuracy of the registration. In issuing books, no entries have to be made, the only thing required being to insert the borrower's ticket and draw back the number in the indicator. In discovering outstanding borrowers, the indicator has been found of great use. Fig. 2 represents, to a larger size, the metal shelves and the small metal-cased ledger which is inserted on each shelf, numbered at each end. Each book is ruled and headed for borrower's name, number, date of issue. By using a date slide, the numbers can be covered altogether when a book is out. Other uses for checking the issue of books, &c., may be made of the indicator; but for further details we refer our readers to the inventor and librarian of the Guille-Allès Library, Guernsey.

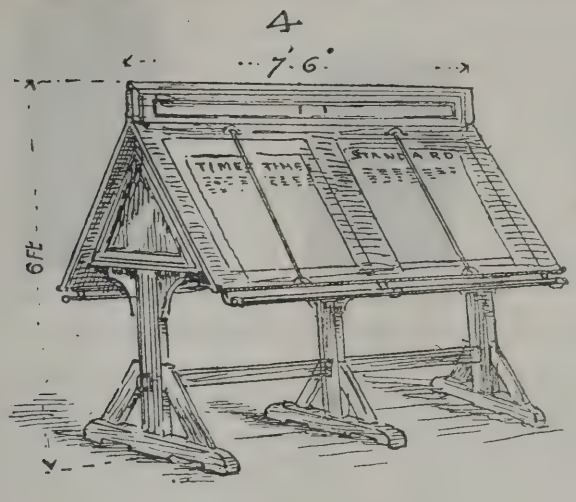
2



An improved newspaper and periodical rack has been introduced by Mr. Cotgreave, the inventor of the indicator already described, which rack is now largely in request. The number of serial publications issued weekly and monthly is now so formidable that librarians find a difficulty in finding room for them, and in keeping them clean and in order. These are usually placed on the tables, and become disarranged by readers, and it is often difficult to find the paper required, or to know whether it is in use. The Cotgreave rack occupies little space, and is about 6ft. square for 200 periodicals. It is a wooden frame, fitted on both sides with diagonal shelves, like louvre boards, with a clear space inside between the edges of shelves, so that any size of paper can be inserted slanting, and without folding, its own heading or title being left visible. By means of a spring clip the paper is held in its place, and can be removed at pleasure. The papers are arranged in alphabetical order, so that any reader can immediately find the one he wants and withdraw it from the rack without touching the clip, which acts automatically, and has only to be pulled back when reinserting the paper. If not properly fixed it falls through the rack, and immediately draws the attention of the reader. The papers by this means are kept clean and orderly, and the absence of any one can be at once noticed. (See sketch 3.) By a recent improvement the numbers of a journal for several weeks can be placed together in the rack, so that any back number can be removed without disturbing the others. This form of rack may stand on the floor, or be placed on a table or counter, or against a wall, whichever is most convenient.

3

We called attention in our last article to the newspaper stand, and showed how its length should be determined. The sketch we give, Fig. 4, represents the construction of the ordinary stand. The length being determined by the unit of a newspaper opened, and the number for which the stand is intended, it only remains to give it a convenient height for readers standing. From 5ft. 6in. to 6ft. is a good height, so that the eye may be on a level with the apex of the sloping desks, which may be inclined at a good angle for reading. Some of those we have seen have an angle of 60°, or the slopes and base form an equilateral triangle. The base of desk may be about 3ft. from the floor level; the space for each newspaper about 3ft. 9in. On the horizontal piece that runs along the top the names of the news-

papers may be printed. A brass bar, about ⅜in. diameter, hinged at the top and locked to a plate at the bottom, should be provided, to pass over the middle of the paper to secure it to the desk. Along the bottom of the desk on each side a thicker brass bar is fixed as a guard. Stained and varnished yellow pine is a suitable material for these stands. They may be placed to stand at right angles between the windows, one end close to the wall; or, if the width of the news-room is narrow, half-stands may be provided with only one slope, placed lengthwise against the wall, a plan that has been followed at the Norwood Library; but, of course, the shape and dimensions of the room will determine their position. A very good arrangement of desks and tables is that at the Reading Free Library, to which we shall refer in our next article.

THE ART CONGRESS IN BIRMINGHAM.

THE preliminary programme is now being issued of the third annual Congress of the National Association for the Advancement of Art and its Application to Industry, which is to be held in Birmingham, under the presidency of Mr. J. E. Hodgson, R.A., from November 4 to November 8. The meetings of the sections, presidential address, and other work of the Congress will be carried on in three different buildings—viz, the Mason Science College, the Midland Institute, and the Council House. The inaugural addresses of the presidents of sections will be delivered in the large lecture theatre of the Midland Institute at the opening of the morning meetings at 11 a.m. The president's inaugural address will be delivered in the same building on the Tuesday evening.

The order of proceedings is as follows:—

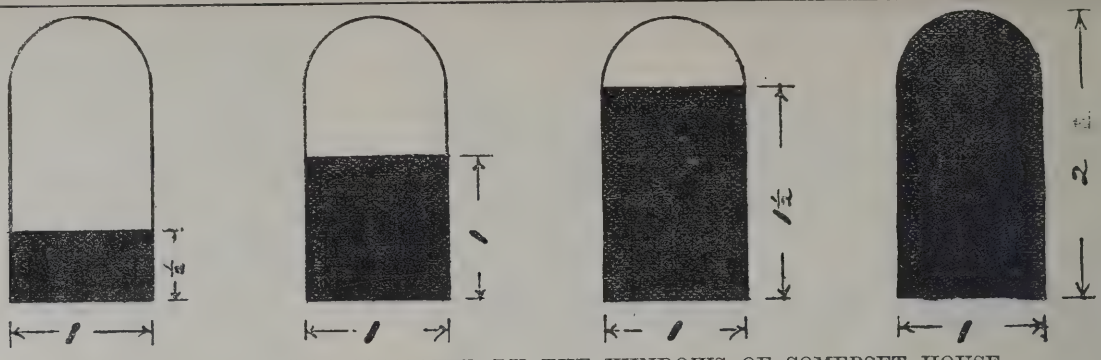
Tuesday, November 4.—10 a.m., meeting of council, No. 1 Committee Room, Council House; 11 a.m., Mr. P. H. Rathbone, presidential address in Section E, Mr. J. Thackray Bunce on "Encouragement of Art by Municipalities," Mr. T. Stirling Lee on "Municipalities in their Relation to Art Schools"; 2 p.m. (combined meeting of Sections B and C), Mr. Roscoe Mullins on "Sculpture as Internal Decoration," Mr. Ralph Nevill on "The Importance of Field Study for Architectural Decoration;" 2 p.m. (combined meeting of Sections A and D), Mr. Selwyn Image on "Colour in Relation to Internal Decoration," Mr. W. E. F. Britten (not fixed); 8 p.m., President's inaugural address, Midland Institute.

Wednesday, November 5.—11 a.m., Mr. T. G. Jackson, presidential address in Section C, followed by an architectural paper; 2 p.m. (Section A), papers by Mr. John Brett, A.R.A., on "Education in Art," Mr. Stanhope Forbes (not fixed), and Mr. W. J. Wainwright, A.R.W.S., on "Some Remarks on the English School of Water-colour Painting"; 2 p.m. (combined meeting of Sections B, C, D, E), Mr. Heywood Summer on "Advertisements," Mr. Bidlake on "Architectural Drawing," and Mr. Ablett on "The Drawing Society"; 8 p.m., reception of the Mayor (Alderman Clayton) at the Council House.

Thursday, November 6.—11 a.m., Mr. A. H. Mackmurdo, presidential address in Section D, and Mr. Alfred Gilbert, A.R.A., on "Metal Work"; 2 p.m., Mr. Henry Holiday on "The Figure in Design," Mr. J. W. Tonks on "Art as Applied to Jewelry and Personal Ornament"; 2 p.m. (combined meeting of Sections A, B, C, E), Mr. James Orrock, R.I., on "A Gallery of British Art"; 4 p.m., reception by Birmingham Royal Society of Artists, Newstreet.

Friday, November 7.—11 a.m., Mr. G. Simonds' presidential address in Section B, Mr. E. Onslow Ford, A.R.A., on "The Modern Education of Sculptors," M. B. Creswick (modelling master Birmingham Municipal School of Art) on "The Relation of Sculpture to Architecture"; 2 p.m. (Section E), Mr. William Kenrick, M.P., on "Technical Education as Applied to Art Industry," Mr. Ashbee "How can we foster Art at our Polytechnics?"; 2 p.m. (combined meeting of Sections A, B, C, D), Mr. Aston Webb on "The Education of Architects," Mr. F. G. Jackson (master of design Birmingham Municipal School of Art) on "Art Education in relation to Industry"; 8 p.m. reception by local committee at Edgbaston Assembly Rooms.

Saturday, November 8.—11 a.m., Mr. W. B. Richmond, A.R.A., president of Section A, followed by the general meeting. There will be three evening lectures for working men, at 8 p.m., on Wednesday, Thursday, and Friday evenings, in the large lecture theatre of the Midland Institute. They will be by Mr. Starkie Gardner on "Metal Work," Mr. J. E. Hodgson, R.A., on "Art Books, and How to Read Them," and on "Glass" (lecturer not yet fixed).



ARCHITECTURE: THE PLEASURE DERIVED FROM ITS STUDY.

THE inaugural address to the Class of Architecture and Construction at King's College, London, was delivered on Friday evening by Professor Banister Fletcher, F.R.I.B.A., J.P., D.L., who took as his subject the pleasure to be derived from the Study of architecture. In illustration of his definition of the term "Architecture" as a useful as well as a fine art, an enlarged elevation of the river front of Greenwich Hospital was exhibited side by side with one of the same front deprived of all superfluous features. In the latter case the plain walling, with the window openings and the parapet constituted good building, but not architecture. A simpler contrast between a bare and well-clothed French structure served to emphasise the point. Reversing the method of illustration the lecturer continued:—

Let us take a plain building with a straight front, with plain window openings and parapet, or eaves-gutter, and the cheapest form of substantial roof, the queen or king post. Now how can we make this mere building into architecture? Well, let us break up the front thus:—Recess slightly the central portion, and instead of the roof being hipped at each end, let us place gables at each end, and roof them with high-pitched roofs, and at once we get away from mere building and have a commencement of architectural treatment. Let us continue the treatment with the central portion, and you will admit that the one gives you more pleasure than the other. The outlay of thus turning mere building into architecture need not be expensive. It may be necessary in this commercial age that it should be so; certainly in the examples just given it may be done without much expense, and without any that is not remunerative. Some think that architecture means elaborate decorations, carving, and ornament, and even that well-known author, Mr. Fergusson, in his analysis of architecture, appears to lay too much stress on ornamentation when he says, "Architecture is nothing more or less than the art of ornamental and ornamented construction." It recalls to my mind a building, the ground floor of which was Grecian, the first floor Roman, the second floor Italian, and the roof and turret Gothic—all built without the slightest regard one for the other. It was certainly ornamented construction; but one does not wish to see another example built. Now, bear in mind that mere ornamental building cannot satisfy the taste. There must be proportion, without which no building can please, and this is the next division of my subject. All-important in architecture is proportion. Let me give you an illustration from Somerset House (see next page). First note the doorway, the height only half the width; how at once (although the height may be sufficient for all practical purposes) the proportion, I trust, strikes you as decidedly bad. Next, let me remove a further portion of our illustration, and you will see we get the square opening—the width and the height are the same—an improvement on the first, and yet I venture to hope you will still say bad proportion. Next, let me remove another piece of my model, and we get what will appeal to your eyes as fairly proportioned—the height being one-third in excess of the width. Now add a semi-circular arch (which I do by removing another piece of the model), and I think you will agree the proportion of this doorway is perfect. As I have mentioned, this example of proportion is from Somerset House, which was built from the design of that able architect Sir William Chambers. Before leaving this part of the subject, I should like to call your attention to a method of dealing with openings where you cannot increase the height, as we have just done in my model. We have a plain, ordinary country cottage, with (as usual) low ceilinged rooms. The small, almost square, windows cannot be heightened for the reason mentioned—viz., the low pitch of the rooms. The client says he cannot afford to rebuild, and yet wants some slight architectural character given, so as to redeem the cottage from looking like a labourer's cottage. Well, instead of heightening, make the windows wider, and the comparison will show what a difference is made. It gives some character at once. Let me summarise what we have then as the result with regard to proportion. 1. A building without proportion is utterly, hopelessly bad. 2. A building, no matter how simple, if in proportion, is good and pleasing. 3. A building in good proportion and with ornamented construction is to be desired, and will give much pleasure. 4. No amount of ornament or even ornamented construction is of any avail in producing a pleasing effect without proportion. Proportion, then, is the very *life blood* of architecture. To test whether designs would look well in execution, it has been suggested to wash the perspective all over with a dark tint of Indian ink, so that only the outline would be left (like, in fact, it would be seen in a London November fog), the opinion being that if the design then looked well, it was certain to be a success. This treatment would show that the many excellent persons, as the late Mr. Barry said, who seem to consider that any structure may be made ornamental by plastering it with so-called ornaments, as we cover a twelfthcake with sweetmeats, are thoroughly wrong. The key-note to the method of designing I ought to mention, for we must have some system, is—

"Consider what you undertake,
And analyse it well;
And ever work from whole to part—
Grand principle of master art
That makes that work to tell."

I trust I have made clear to you what architecture means. I next propose to point out the advantages you possess in its pursuit. Firstly, when you have acquired the true principles of the art, you have them always. Unlike science, the principles are eternal. The students of science must be ever learning the new developments, the new discoveries. That which they

PROPORTION, AS ILLUSTRATED BY THE WINDOWS OF SOMERSET HOUSE.

know as facts to-day may to-morrow become exploded theories. Nothing is fixed; nothing certain to remain as it is. Science then means change—that which is learnt to-day may have to be unlearnt to-morrow. On the contrary, art and architecture change not. Once learn the true principles of beauty, and they are learned for all time. In confirmation, I mention the marvellous fact that, with all our progress, we have never excelled—never equalled—the glorious works of Greece and Rome. So much for the advantage of once learnt. Secondly, you can always study your subject—at least, the external portion—without any payment, by day, and sometimes by night. Thirdly, when on vacation tours you have an additional source of delight. To those of you who are not architects the value of a knowledge, however slight, of the history of architecture cannot be overrated. Its use comes before us at every turn, whether in England or abroad. We cannot obtain half the enjoyment out of our vacation when travelling, unless we can inform ourselves of the different styles and at what date certain buildings which we visit were erected; unless, in fact, we can dissect our building, as the medical man his subject in the operating-room, and place, as nearly as possible, each part of our building to its correct date. The history of England, then, is, in a great measure, the history of English architecture written in stone, and our time-worn cathedrals and ancient churches offer attractions not to be disregarded by even the most hasty traveller; but, believe me, these attractions are increased a thousand-fold when one can trace each successive phase of the building of these cathedrals, when, by difference of outline, detail, and ornament, we can tell to an inch how much was done by this period, or where that period commenced, and in no building can these different epochs be better traced than in our own Canterbury Cathedral, or Westminster Abbey. The study, then, of the history of architecture may be looked at as a good commercial speculation, if from no higher point, and should form part of the education of every educated man, if he wishes to enjoy to the full the intellectual storehouses of the countries and buildings he visits. The time, we hope, will not be far distant when the history of architecture will be taught as a higher subject in the Board schools of London. The late E. M. Barry observed:—"Surrounding the cultivated minorities is a vast constituency—a nation of workers, of hewers of wood and drawers of water. To these is denied the enjoyment of pictures and statuary, excepting so far as these may be provided by special private liberality, or by the stinted efforts of an Exchequer ever grudging where art is concerned. A noble building, however, such as a grand cathedral, is in their midst. It cannot be hidden. It is a possession in which all have their share, and it is difficult to over-estimate the educational effect of architecture in such cases. Our art (architecture) is therefore a natural teacher, and even in these days may help to prepare the soil for the reception of that artistic seed, the importance of which I hope and believe is being gradually, if too slowly, recognised by those who regard the commercial prospects of our country with anxiety. I promised to explain the difficult term *beauty*. To show how stable are the canons of our art, I can find no better description than that given in the writings of Plotinus (born in Egypt A.D. 205). He says, combating the theory that proportion alone will insure beauty: 'If we are to fall in with this theory, we are committed to the assertion that only what is matter of composition and nothing that is simple is beautiful; but unless individual parts have beauty, the beauty of a composition will be derived from the proportion established among ugly elements. But simple things are beautiful. Colours by themselves have beauty, so has the simple light of the sun—what, then, of gold? What of starlight! What of sounds? And we know that in a song which is beautiful as a whole each note is beautiful singly." Further, concluding, he says: "Surely then there must be a beauty which is superadded to proportion, and the beauty of proportion itself must be dependent on something beyond." The conclusion to be drawn is: Proportion there must be, but the individual parts must have individual attention. As I believe we now all understand what architecture means (by the bye, a charming description of architecture was that given by Madame de Stael, who called it *frozen music*), I next have to explain the leading characteristics of the different styles. First, considering the origin of all architecture. The original dwellings of man are divided into three classes by Gwilt: the cave of the hunter and fisher, the tent of the shepherd, and the hut of the agriculturist. Having shown many illustrations of the three classes, Professor Fletcher continued:—Nearly all the cave excavations in Egypt are tombs. In India they are formed as dwellings, temples, and monasteries. In Asia Minor the caves are in many examples decorated with a façade of the Ionic or other types. Passing on to the Egyptian architecture. The Egyptians were pre-eminently a building race, and our knowledge of their entire history is due to the records they have left in and on stone. Their Pyramids were erected 3,000 to 3,500 years before Christ. It has been well said the monuments of Egypt give life and reality to their whole history. It is impossible for any educated man capable of judging of the value of evidence to wander among the pyramids and tombs of Memphis, the temples of Thebes, or the vast structure erected by the Ptolemies or Cæsars, and not to feel that he has before him a chapter of history more authentic than we possess of any nation at all approaching it in antiquity, and a picture of men and manners more vivid and more ample than remains to us of any other people who have passed away. Next in antiquity is the Assyrian, which dates from 1341 B.C. to 332 B.C. The form of building is of the heavy, massive type, relieved with glazed tiles and bricks. I give two examples—Nineveh, and fishing pavilion taken from the sculpture at Khorsabad. This exhibits all the parts of an Assyrian order with its entablature. The period is more than 1,000 years later than the Pyramids. The great charm in Grecian architecture is the refinement of line, as exemplified in the Parthenon, about 400 years B.C. It is considered that Grecian architecture in this building reached its highest perfection and beauty. In sculpture also we find a great advance. The conventional figure of the Egyptian and Assyrian period is gone, and we have work unrivalled in any country and in any age—sculpture of which the poet has said—

"And the dead marble leaped to life, a god."

Pause a moment to think that some 2,000 years ago perfection was attained—at least, the work is still the admiration of the world. And it adds to our wonder if we recollect that all these glorious works were accomplished in the short space of 150 years. The language of Mr. Fergusson may give excessive praise in speaking of the Parthenon, yet we may venture to agree with him. It is undoubtedly the most beautiful building in the world. It is true it has neither the dimensions nor the wondrous expression of power and eternity inherent in Egyptian temples, nor has it the variety or poetry of the Gothic cathedral; but for intellectual beauty, for perfection of proportion, for beauty of detail, and for exquisite perception of the highest and most recondite principles of art ever applied to architecture, it stands utterly and entirely alone and unrivalled—the glory of Greece, and a reproach to the rest of the world. We pass now to the pleasure to be derived from a very different character of art. Roman architecture was not matured like the Grecian in peace, but in war and conquest. Its architecture displayed greatness in the mass, grandeur in the conception, and an expression of power whilst it lost, but is deficient in the refinement and grace of the Grecian. The next style, the Romanesque; a modification of the Classical Roman forms, to adapt Classical forms to Christian purposes. In Italy and the South of France the Romanesque continued to be practised till the 6th or 7th century. In Constantinople and the eastern portion of Europe it developed into the Byzantine. In Western Europe, architecture, on the dissolution of the Roman Empire, seems lost for a time. And history next brings us to Romanesque architecture, invented and used by the Western barbarians who overthrew the Roman Empire. In England we know the Romanesque style by the name of Norman. Having briefly referred to the progress and development of the Gothic styles, elucidated by many illustrations, the lecturer added: I have long thought that a lack of idealism is the great defect of the present day. We work—and rightly too—for material improvement, betterment of social conditions, &c., but surely at the same time we ought to work for something else. Might not that something else be to endeavour to make the city we live in the most pleasing—aye, even the most beautiful in the world. You to whom I am speaking must in time become the governors of the policy that must help forward or mar this ideal. Try, then, to get rid of the present too often stated condition of building. Most people say, I want a certain quantity of space covered in and certain showy ornament, and it must all be done at such a sum. Do you imagine that that was the way they built the glorious buildings, the mere illustrations of which have, I hope, given us so much pleasure to-night. Again, in competition, too often the showy, meretricious designs carry off the prize, and are built. Why, then, is this? It is because the study of architecture is neglected, and it is certain that not until the public take to its study (and appreciate, as they are sure then to do, all its pleasures) will it insist that pleasure shall meet its eye in every new building, and not in buildings only, but in the planning of the streets, avenues, and open spaces. Then indeed shall we advance with rapid and successful strides. I trust that I have proved my subject, and, if so, the natural question arises, where you will study. To show you the desire there is that you should have increased opportunities here, I may mention the day courses are now so arranged that in the three years a complete study of the subject is given, and if properly followed should enable the students to pass the R.I.B.A. examinations. To the students at the evening classes, now first opened by the Council in conjunction with the Worshipful Company of Carpenters, is offered the advantage that after the lecture the demonstrator will take a constructional drawing class. Thus the explanations given by me as to trusses and roofs, and the other subjects connected with the lectures, will be impressed on the mind by this graphic work. In addition to the diagrams belonging to this college, I have my large collection, the labour of many years, and only last Saturday I went by invitation to see the collection of a friend, who

told me he intended to cease lecturing, and thought it a pity his large collection should remain unused, and I have arranged to purchase all his diagrams, photographs, and drawings, numbering some 336. Further, I have been purchasing casts of the best work of all time; some of these are now on their way by sea from Italy. The Council of King's College have allotted me a special room, and therein, and in the corridor adjoining, all these will be placed. The casts of Egyptian, Greek, Roman, Gothic, and Renaissance examples will be arranged on the walls, following their sequence of style, on the lines of the celebrated museum of comparative sculpture founded by the late Viollet-le Duc in the Trocadéro at Paris. There are over 120 specimens of architectural features which will be invaluable to the student attending the lectures, as he will have before him, if not the building itself, at least as much as we can give him of its contents. In addition, the Building Construction Museum contains materials which will be handed round during the lectures, and which will enable the student to acquire what is so necessary—a practical acquaintance with the look and touch of the materials themselves, so as to be able to distinguish between good and bad, and enable him to know what to condemn and what to pass in making the inspection of any building of which he may be the architect in after days Arrangements are now pending to have additional classes of design. There are classes of geology, applied mechanics, chemistry in relation to building materials, all under able professors, so that within these walls the student has now the opportunity of pursuing a complete and systematic course of architectural study. Let me take this opportunity of tendering my best thanks for the generous assistance I have received from the various manufacturers. In addition, owing to the liberality of the Worshipful Company of Carpenters, the students will have the advantage of a technical reference and lending library, and the use of Models, and they have built (through "Harbens Gift") a wood-carving school, working in conjunction with the Council of this college. All these advantges are open to day students, and also to the evening students. The Carpenters' Company also gives certificates, prizes, and medals. It is to me a great pleasure that in preparing my syllabus I have had the great advantage of the assistance of Mr. Arthur Cates, who also proposes to give prizes. I trust I have said sufficient to indicate to you how much pleasure you may derive from a study of architecture; with what added pleasure you will look at buildings when you have mastered the principle of the art; and, while deriving pleasure yourselves, you will also feel you are helping forward our country to take its proper—the foremost—position in the art world.]

SEWER VENTILATION.

At a meeting of the Society of Engineers, held at the Town Hall, Westminster, on Monday evening, a paper was read by Mr. W. Santo Crimp, M.Inst.C.E., F.G.S., on "Sewer Ventilation."

The author first pointed out that much had been written with regard to sewer ventilation, but that few experiments had been made, and as a result methods had been suggested that would almost certainly result in failure. It had, for instance, been constantly assumed that the movements of sewer-air were almost entirely due to temperature, an assumption which the author found did not subsist upon a satisfactory basis. He then referred to the experiments of Miller, Beetz, Miquel, Carnelly, and Holdane, which were made more especially with a view to ascertaining the number of micro-organisms present in sewer-air, relatively to those in the atmosphere. In the result it was found that sewer-air contained fewer; but the author pointed out that their nature might probably differ widely. With regard to the excess of carbonic acid generally found in sewers, the author suggested that it was probably largely due to the mingling of the ground-air with the sewer-air in cases where sewers were not air-tight. Referring to other gases found in sewers, he pointed out that these gases were in themselves incapable of producing fevers of the zymotic type, and argued that such fevers, when caused by sewer-air, were due to the germs of disease present in the sewer-air, and suggested that it was undesirable to set up rapid air currents in sewers, in the absence of which these germs would fall back into the sewage from which they arose. Dividing sewers into two classes—namely, those into which men could not enter, and the larger ones in which they were frequently employed, he suggested that the smaller ones should simply be provided with vents, carried high over head, and sufficient in number to prevent the house traps being forced; although a properly drained house should be proof against the most severe test. The large sewers, of course, had to be very fully ventilated—at any rate whilst men were employed in them. The author then proceeded to a consideration of the forces causing movements of sewer-air, and presented an epitome of the experiments made by him at Wimbledon during the year 1888. The experiments were carried on continuously throughout the year, and were made on sewers of all sizes up to 4ft. by 2ft. 8in. One pipe sewer, constructed in a hilly road, was continuously experimented upon, whilst tests were constantly made on others, including also surface-water sewers when these were free from water. In the result, the author found that the only currents measurable by an anemometer were those produced by the wind, and that the direction of the sewer-air currents varied with that of the wind, being sometimes uphill and as frequently downhill. The amount of movement of the sewer-air was also in accordance with the velocity of wind. Having regard to the facts, he suggested that in the ventilation of sewers the fullest advantage should be taken of the wind as a motive power, and that it should be deflected into the sewers, or made to induce out-currents, as may be found desirable.

THE ARCHITECTURAL ASSOCIATION CONVERSAZIONE.

The most brilliant and successful of the series of annual *conversazioni* by which the Architectural Association has inaugurated the year's sessional work was that which came off on Friday evening at the Town Hall, Westminster. The A.A. entertainments committee, with Mr. Arthur W. Earle as chief director, induced about a score of the leading art manufacturers to unite in lending materials and labour sufficient to transform the large hall for the evening into a sumptuously furnished drawing-room, thickly carpeted, amply provided with sofas, rout seats, tables, cabinets, and even pictures, and with walls artistically draped with tapestries, silks, chintzes, and papers, with a profusion of flowers and other foliage, plants, chrysanthemums, while another firm, Messrs. Rashleigh, Phipps, and Dawson, with the assistance of the Westminster Electric Supply Corporation, provided an abundant and equally distributed lighting by incandescent lamps. Throughout the week an army of over 120 workmen had been employed in fitting up the hall under Mr. Earle's direction, and the result was a charming *coup d'œil*. Pains had also been taken by the committee to avoid the blunders in the refreshment and cloakroom arrangements that had marred the enjoyment of the evening in some former years, the result being that socially, as well as artistically, the conversazione was a success. Invitations had been more liberally dispensed than heretofore, and there was a numerous gathering of the younger members of the profession and lady friends. A feature of the evening's entertainment was the illustration of hypnotism, given in the council chamber with the aid of a well-coached "subject," by Dr. George André, described as a professor of l'Institute Psychologique de France.

A carpeted and covered corridor, in which were shown hangings by Messrs. F. B. Goodyear and Co., led from the entrance into the large hall, and directly facing this was a lofty pavilion, under which the president, Mr. Leonard Stokes, held a reception. This pavilion or baldacchino, which was surrounded by palms, ferns, and autumnal flowers, was well draped with hangings in folds and festoons, and contained, beside the presidential chair and table, a bookcase and well-furnished cabinet. The arrangement of this central feature had been entrusted to Messrs. Gregory and Co., of Regent-street, who also displayed, in the bay immediately behind the pavilion, some cabinets covered with inlaid grotesque flowing ornament of Late Renaissance character. Passing to the right, the first bay was arranged by Messrs. Felix and Wayman, of New Bond-street, with crimson and heavily-gilded furniture of the Louis Quatorze period. The stage, which was occupied for the evening by the band of the Coldstream Guards, had been furnished in excellent taste by Messrs. C. Hindley and Sons, of Oxford-street; and in the bay next it on the left Messrs. Graham and Biddle, also of Oxford-street, showed china in walnut and ebony cabinets. Messrs. Collinson and Lock, of Oxford-street, showed some well-finished cabinets and other furniture, and Messrs. Gillow and Son had a similar display. Near and over the refreshment stall Messrs. Jeffrey and Co., of Essex-road, Islington, exhibited a selection of new patterns in their well-known papers, including a bold frieze paper in Free Classic style, designed by Mr. Hampton W. Pratt, and representing the "Four Winds"; an effective ceiling by Mr. Lewis F. Day, printed in five colours; a large peony treatment of frieze and grapes, designed by Messrs. B. and F. Gast, the colouring in soft tones of blues and greys; a chrysanthemum frieze by Miss Mary Gemmell, and other examples by Mr. A. F. Brophy. Messrs. William Morris and Co. showed some new patterns in papers and hangings, in which their characteristic tertiary colours were predominant. In the gallery, Messrs. C. Hindley and Sons had hung the greater part of the walls with chintzes and carpets; Mr. Thomas Wardle, of Leek, exhibited a very large frame containing choice examples of brocades, silks, velvets, cretonnes, and challets; Messrs. Pitman and Son, Newgate-street, displayed a selection of wall-paper, carpets, and some decorative work; Messrs. D'Oyley and Co., Oxford-street, also showed hangings, and near the stage were arranged specimens of Fisher's muraline duro-textile embossed tapestry, and other patent wall hangings; Messrs. Rottmann, Strome, and Co. exhibited papers and other Japanese work; Messrs. William Woollams and Co., some of their hand-made leather and other wall-papers; Mr. Freeman his pyro-granite; and Messrs. T. Bontor and Co., Dockerell and Co., Fisher and Co., and Hayward and Son were also represented by examples of the arts and crafts connected with architecture.

In the suite of rooms on the first floor were hung the premiated work executed last session in the various classes, and the awards were made of the prizes in accordance with the following list:

A.A. Travelling Studentship.—Percy D. Smith; 2nd, Sydney Tugwell.
A.A. Medal.—William Pywell.
Essay Prize.—H. G. Gamble.
Architectural Union Company's Prize.—1st, W. Wonnacott; 2nd, not awarded.
A.A. Sketchbook Title-page.—Victor T. Jones.
Cates Prize.—F. M. Simpson.
Lectures on History of Architecture.—1st, A. T. Walmsley; 2nd and 3rd, S. W. Cranfield, J. W. Hall, and W. B. Hopkins (æq.); hon. mention, C. Waymouth, J. Murray, and C. J. Shaw.
Lectures on Construction.—1st, A. T. Walmsley; 2nd and 3rd, Victor T. Jones and G. H. M. Trew (æq.)
Elementary Class of Design.—Section I. 1st, C. Orlando Law; 2nd, H. C. Lander; hon. mention, F. G. Hicks. Section II. 1st, Kotaro-Sakurai; 2nd, H. C. Lander.
Elementary Class of Construction.—1st, H. C. Lander; 2nd, W. B. Hopkins.
Elementary Class of Ornament and Colour Decoration.—1st, C. Orlando Law; 2nd, H. G. Lidstone; hon. mention, F. Gould Wills and A. T. Griffith. Class Prize, F. R. Gould Wills.
Class of Design.—1st, E. E. Fetch; 2nd, Alfred Cox; 3rd, J. Hutchings.
Class of Ornament and Colour Decoration.—1st, F. G. Christmas. Time sketch, 1st, F. G. Christmas. Note.—J. L. de Beaupré was placed first, but was disqualified, owing to his having received this prize last year.
Class of Construction.—1st, H. J. Leaning; 2nd, J. W. Hall; 3rd, E. Penfold.
Advanced Class of Construction.—Not awarded.
Lectures on Quantity Surveying.—1st, J. Murray; 2nd, H. Ermrich; 3rd, not awarded.

In these rooms were also shown a number of water-colour drawings by Messrs. H. L. Florence, A. H. Hart, A. Hemmings, H. V. Lanchester, Francis Masey, Walter Millard, G. H. Fellowes-Prynne, Edgar R. Selby, R. Phené Spiers, Aston Webb, and R. Needham Wilson, and also the Excursion photographs taken by Mr. J. L. Robinson, A.R.H.A., in Oxfordshire last August.

The foundation stones of a new Congregational chapel were laid on Wednesday week at Howdon, near Willington Quay station. The building will be of local freestone, Perpendicular in style, and will be seated in pitch-pine with open benches. The internal dimensions are 60ft. by 36ft. Mr. W. Hope, of North Shields, is the architect, and Messrs. Smelt and Robson, of Heaton, Newcastle, are the contractors.

THE JUNIOR CONSTITUTIONAL CLUB. — CONTEMPORARY BRITISH BUILDERS AND CONTRACTORS.—A SHEET OF OLD CHURCHES IN GLOUCESTERSHIRE, ETC.—A MUSIC ROOM AND WINTER GARDEN. — LITTLE MORETON HALL, CHESHIRE.—CANOPIED CHIMNEYPIECES, BY W. WALKER AND SONS.

Our Illustrations.

JUNIOR CONSTITUTIONAL CLUB, PICCADILLY.

This important addition to the leading club-houses of London is now in course of erection, from the designs of Col. R. W. Edis, F.S.A., who was the architect also of the Constitutional Club in Northumberland-avenue, erected a few years since. The façade of the present building, which will overlook the Green Park, is to be faced entirely with pure white Norwegian marble, relieved by dark marble columns and Red Shap granite sparingly introduced. The front will be constructed entirely of Portland stone. The ashlaring, of marble, will be supplied from Mr. Anker's quarries at Ofoten fjord. Messrs. Bywaters are the general contractors. The plans which we print show the interior arrangements, one great feature of which is the unusual prominence given to the smoking and morning room on the ground floor. The staircase is all of marble, with arcades and detached columns. The reception room faces the entrance. The dining rooms are splendid apartments, with the service accommodation well situated in the centre of the building. The drawing given was shown at this year's Royal Academy.

CONTEMPORARY BRITISH BUILDERS.

(See description on p. 522.)

ST. NICHOLAS CHURCH, GLOUCESTER.

The church of St. Nicholas is Early Perpendicular of a very interesting type, and is one of the most elegant buildings in the city. Owing to its being crowded round with houses, the spire is not seen to the best advantage; yet it makes a charming group, if looked at from either up or down the street. The 18th-century restorers endeavoured to improve the light inside by adding dormer windows in the roof, which give a bad effect both inside and out. The spire at this time was giving way at the top, and part of it was taken down and a lead roof and stone parapet substituted, as seen in the sketch, an alteration, however, which does not at all detract from its beauty.—E. G. D.

GREAT WASHBOURNE CHURCH, WORCESTERSHIRE.

A good example of the saddle-back tower common in this district, obtained by carrying up the eastern gable of the nave and building a tower of timber and plaster on the chancel roof. There is a peculiar Perpendicular window at the west end.—E. G. D.

CHIPPING NORTON CHURCH, OXON.

An interesting church of various dates, with hexagonal vaulted porch. The windows in the upper and lower part are not level on either side, thus giving a somewhat irregular appearance.—E. G. D.

MUSIC ROOM AND WINTER GARDEN, HAMPTON, MIDDLESEX, FOR MR. C. J. STUTFIELD.

These buildings have lately been erected at Grove House, Hampton, from the designs and under the superintendence of Messrs. J. T. Wimperis and Arber, and are now in course of decoration. Advantage was taken of the levels of the ground to form a gallery leading from the drawing room with a flight of marble steps down to the music-room level. The plan of the room is a parallelogram with the centre formed into an octagon, the eight detached columns carrying a circular dome. The pendentives being corbelled over, these eight columnsare connected by arches with corresponding columns against the wall. The walls are lined with a dado of old Spanish tiles, and the upper part with modelled plastering. The floor is in marble, marking the octagon in the design, and the whole has been specially modelled and worked out from the best Moorish examples. The work has been carried out by Mr. Frederick Anstey, of Alpha-road, St. John's Wood. There are some fine examples of old Cairene work in the gallery-front and in the window-screens overlooking the garden. A splendid mosque lamp will hang in the centre of the dome.

LITTLE MORETON HALL, CHESHIRE.

These two photographic views are by Mr. Richard Keene, of Derby, the well-known artistic photographer, and they form part of a series of studies of this rich and famous old Cheshire mansion which he exhibited at the last exhibition of photographs held at the Crystal Palace. We described them at the time, and now give these examples in further illustration of the building from which they were taken. Almost every part of the fabric was included in Mr. Keene's set of details. The view of the main entrance into the courtyard from the bridge is one of the most pleasing and effective. The two specimens given to-day show first the chimney-piece in the room over the porch, and the second print illustrates the doorway to the Hall itself. A complete set of measured drawings of Little Moreton Hall, drawn by Mr. J. Strong, will be found in the last volume of the "Abbey Square Sketch-book," so ably conducted by Mr. John Douglas, of Chester. Other views of the house were given in the Building News at the following dates: June 25, 1880; July 25, 1881; May 27, 1883; May 11 and 25, June 8, and December 17, 1886.

CANOPIED CHIMNEY-PIECES.

The fireplace, being as it is the centre of attraction in our chilly climate for seven or eight months in the year, naturally commends itself to the attention of the interior decorators as being a suitable point upon which to direct their energies. Much of late years has been done to make the chimney-piece a feature in the room. Twenty years ago, uncouth and horribly cold-looking Sicilian marble jambs and mantels reigned supreme. Now, ingenuity has been taxed to its utmost to produce artistic effect in wood, from the simplest work in painted pine, to the finest rosewood elaborated with inlay, carved work, and bevelled mirrors. But chimney-pieces, like all mundane things, have their fashion. Sometimes tile-decoration is in vogue, then mirrors, multiplicity of shelves, or superabundance of cupboards, brackets and shelves for china, and other ornaments—all in turn have their ascendency. The chimney-pieces which we illustrate this week are from the show-rooms of Messrs. Wm. Walker and Sons, of Bunhill-row, and they show what seems to be the tendency of to-day—viz., the use of the canopy, more or less ornamental. For halls, billiard-rooms, and even dining-rooms, perhaps, this is an improvement on many of the flimsy over-mantels, with their overdone baluster-work. Our sheet shows some five designs, which speak for themselves.

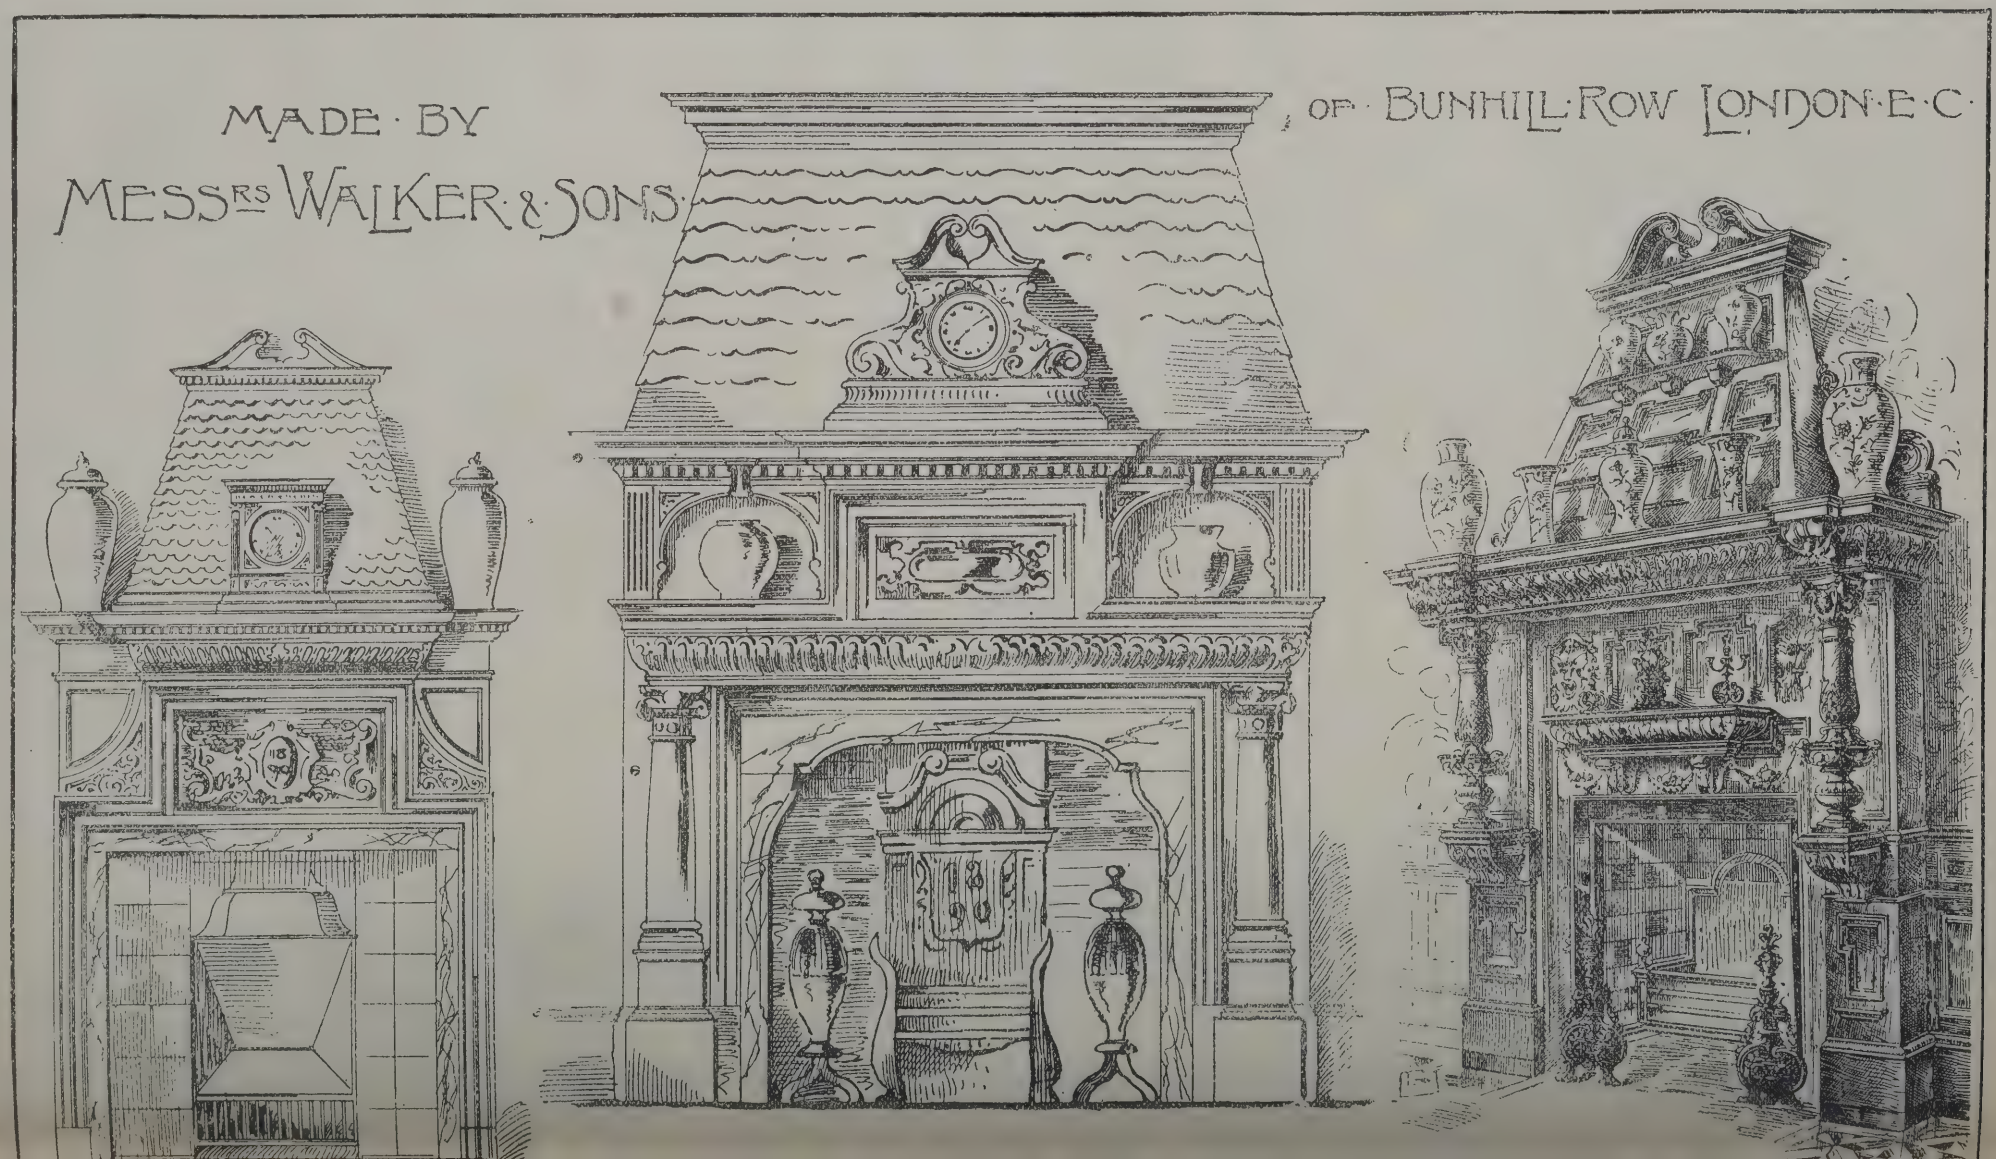
As the stonework of the tower and spire at the Cemetery Chapels, Brighton, has for some time past been a matter of anxiety to the Brighton Burial Board, they ordered a scaffolding to be erected, and their chairman, Mr. Arthur Loader, architect, carefully examined the condition of the fabric from apex to base, and laid before the board the result, with recommendations for prudently rendering the fabric secure and partial reconstruction. This the board unanimously adopted, and forthwith ordered Mr. J. T. Chappell, builder, of London and Brighton, to execute the work.

COMPETITIONS.

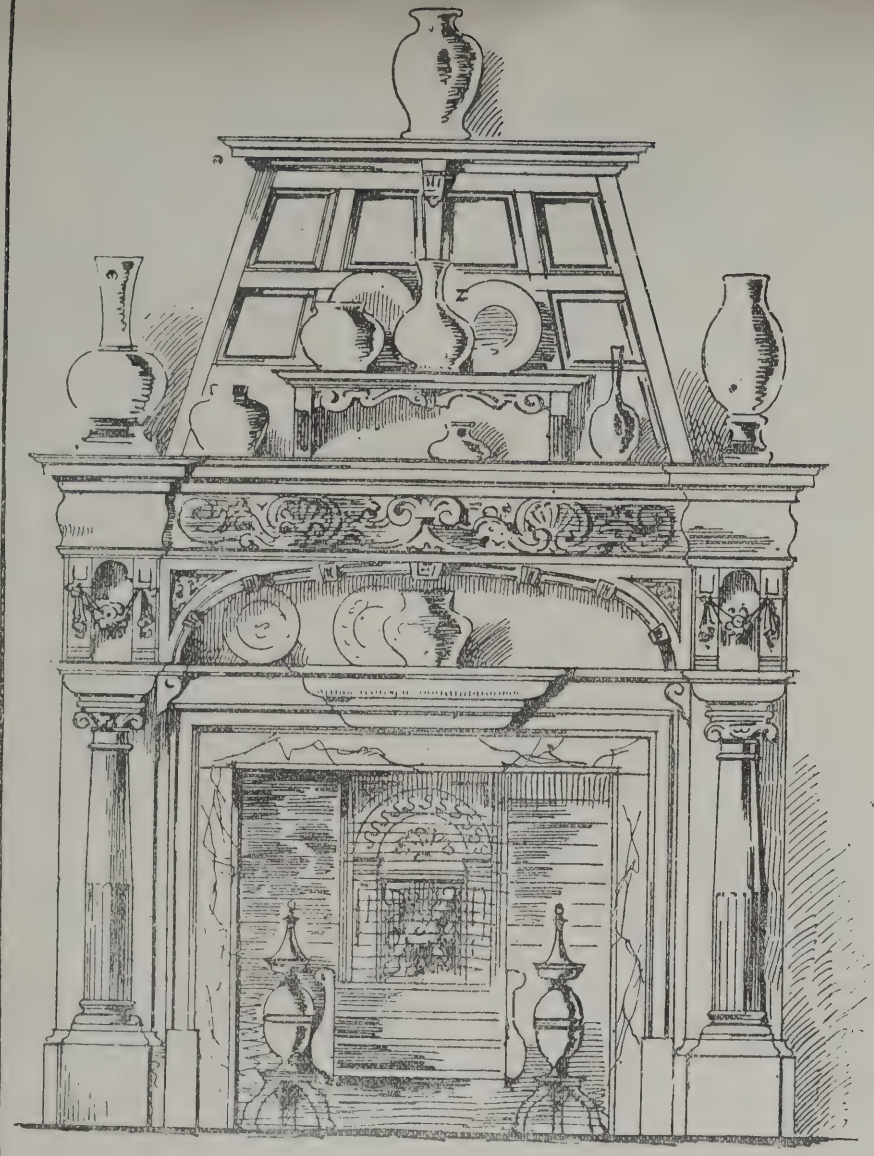
Bensham, Gateshead.—A limited competition has just taken place for plans for the extension of the Lady Vernon Schools at Bensham, and the managers have selected the design submitted by Mr. Stephen Piper, M.S.A., Neville-chambers, 42, Westgate-road, Newcastle-on-Tyne. The principal features of the selected design are a left-hand light to all classrooms, provision for clearing each classroom without disturbing any other, a mezzanine floor for hats and cloaks, the head mistress's room with conveniences, and book-store being placed on first floor, and a covered playground obtained by utilising the fall in site. The new wing will provide for 400 scholars, raising the total accommodation to 1,100, and will be commenced very shortly.

The Tate Intermediate Schools for Wales.—The report of Mr. Ewan Christian, who was selected to make the award of premiums under Mr. Henry Tate's gift for the best designs for intermediate schools in Wales, has just been published. Four premiums of twenty guineas each were offered, and fourteen designs were sent in. Of these Mr. Christian has selected seven for detailed comment, from among which he has awarded the premiums to the designs sent in by the following architects:—Messrs. Phillips and Holdgate, Cardiff; Messrs. Baker and Hughes, London; Mr. T. E. Pryce, London; and Mr. Robert Grierson, of Bangor. Designs for both dual and single schools were sent in by all the architects named except Mr. Pryce, whose plan was that of a single school. Mr. W. Cadwaladr Davis, the secretary of the committee appointed to administer Mr. Tate's gift, has sent lithographic copies of these designs to all the members and clerks of the various joint committees in North and South Wales.

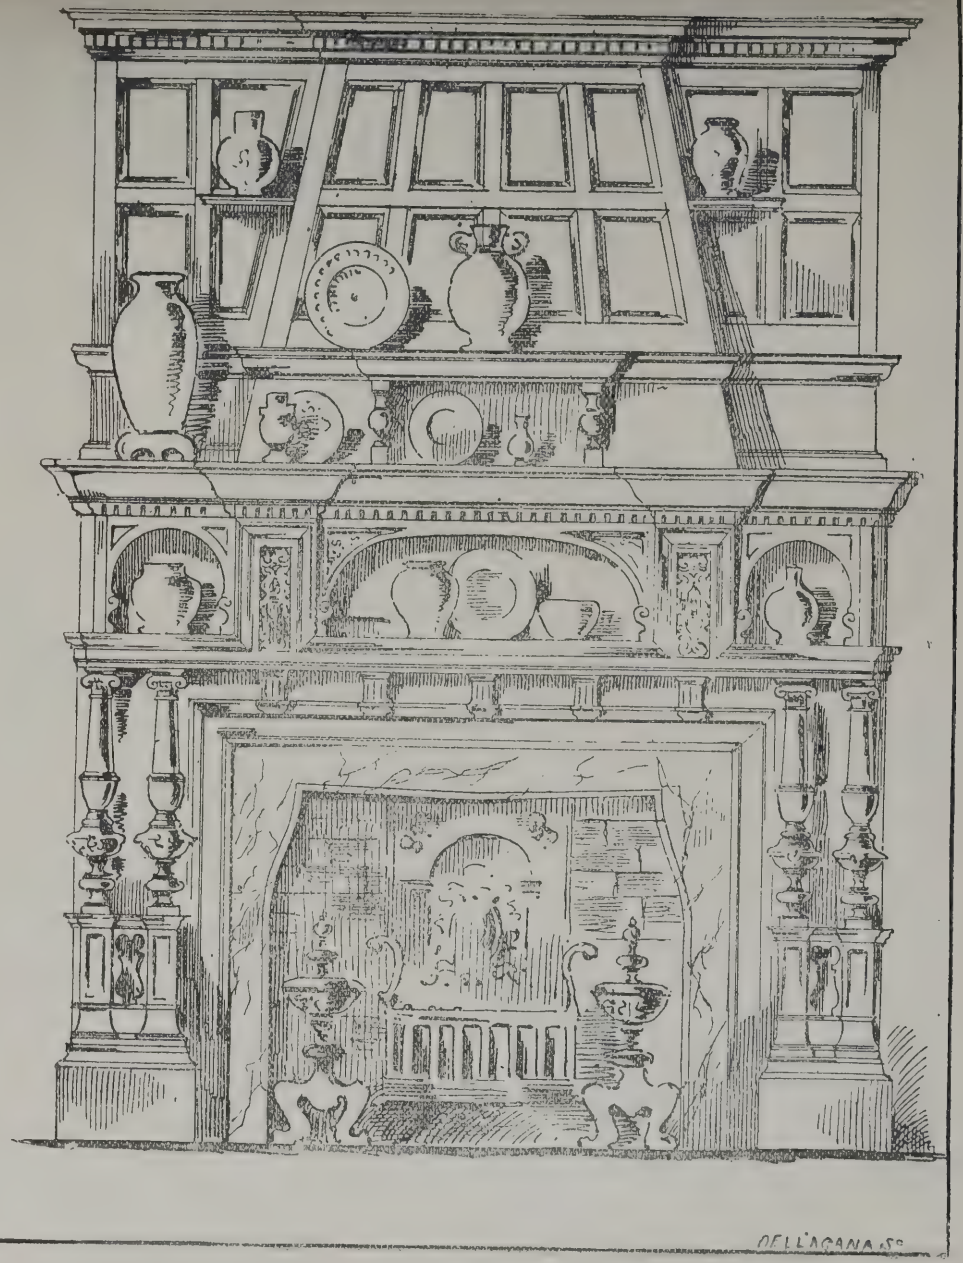
Willesden Cemetery Competition.—The Willesden Burial Board, at an adjourned meeting last week, after consultation with Mr. Charles H. Worley, the architect of the successful plan for laying out and building upon the new burial-ground, came to an agreement about the scheme, and directed Mr. Worley to proceed at once with the work of preparing the specifications and working drawings. The site of the chapels in the centre of the ground was considered, but in the end the members concurred in Mr. Worley's opinion that it would not be advisable to alter the site to any considerable extent, and no motion was made. Other points were considered, and eventually it was resolved that the site of the lodge should be changed from the approach road to the N.E. angle facing Cobbold-road, and that the mortuary be placed in the shrubbery towards the north-west end of the cemetery.



CHIPS.



Ex-Bailie Gentle, one of the leading builders and quarrymasters in Dundee, and a prominent member of the town council of that city, died on Sunday after an illness of three months. He was the originator of the scheme for extending the Esplanade, and his last public work was the preparation of a report for the introduction of the cable system of tramways into Dundee. He had been fourteen years in the town council, and was in his forty-seventh year.



At the Cheadle County Court on Saturday, Annie Wearing sued Messrs. Stephen Seale and Co., quarry proprietors, of Hollington, for £179, damages for the death of her husband, Francis Wearing, who was killed, with a fellow-workman, whilst blasting at the defendants' quarry on May 9 last. Judge Jordan held that the defendants' manager had been guilty of gross negligence in allowing the men to work in a dangerous place, and he assessed the damages at £150. He declined to stay execution pending appeal.

The excavations at Rhamnus, in Attica, on the site of the famous Temple of Nemesis, have resulted in the discovery of important fragments of the statue of Nemesis by Phidias, of which some portions were already in the possession of the British Museum; a colossal statue of Themis intact, the work of Cheristratus, of Rhamnus; and a life-size statue of a priestess of Nemesis, with an inscription on the pedestal assigning it to the second century before the Christian era.

New co-operative stores have been erected at Finsbury Park, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

WAYSIDE NOTES.

ENCROACHMENTS on the ground outside the stipulated limits of a competition site, if not rigorously opposed by assessors, are an unfailing source of indignation among competitors, and very rightly, since, were such digressions allowed to pass unchallenged, the greatest injustice would be done to every competitor strictly complying with the conditions of the competition. It does not require very keen perception to recognise the injury done. All right-minded persons will be easily able to realise that, on an increased superficial area, it becomes a vastly less difficult task to afford the required accommodation; and, other conditions being equal, the architect with the larger space of ground at his disposal can produce the most effective design. At the same time, in criticising the action of Professor Roger Smith, the assessor in the Whitefield Tabernacle Competition, it is necessary to refrain from immediately coming to any conclusion as to the fairness or unfairness of his line of action. A little consideration should be shown. The professor, according to the report of the competition, states, so far as I can make out, that there was some error in the plan submitted to competitors, it not giving accurately the actual dimensions of the site. Here is, so to speak, "a nice point of law." The preparer of the plan to go with the instructions has apparently fallen into a regrettable error. If such be really the case, who is to suffer for it? Are the promoters to lose a good design because its author, by an exhibition of greater cautiousness, failed to comply with the apochryphal plan of site, or are the competitors to feel that they have been unjustly treated in that they were supplied with a plan which, true or false, should be binding in its dimensions? The questions seem more than ordinarily vexing. All that appears certain is that, as with the Six Hundred, someone has "blundered."

The point concerning the supposed discrepancy between the plan of site and the actual allotted ground should first be examined and settled. If the plan proves correct, the author of "Winged Heart" and others are at fault. They should be out of court; there is no questioning the fact. If, as stated by the assessor, the error exists, a verdict is less easily given with serenity of conscience. One thing occurs to me, and that is that if a certain minority of the competitors discovered the error, it would only have been acting in a frank and open manner to have communicated with the promoters of the competition, who would have drawn the attention of the whole number of competitors to the mistake in the plan, and have re-surveyed the site. Having discovered that an error of this sort had been made, it is not a very noble action to go on working in fancied advantage over the other competitors. Had this been the case, one would declare that the secretly enlightened competitors should be ignored and their designs thrown out. On the other hand, if it be that no despicable advantage has been taken by any competitor, and that others have been too negligent and easy-going to get matters put right or to ascertain facts and check dimensions for themselves, I should say that the extra-site people have it, and that the awards as made by Professor Roger Smith only require seconding by the profession.

The age is getting so prosaic and matter-of-fact, and every in and out of the world, even in its oddest nooks, ransacked by tourists, that one despairs of any discovery of an archæological nature, over and above broken urns and coins and pottery-ware—generally, by the way, self-explanatory—that may not be referable, within a few hours of its announcement, by some learned specialist to its proper class and order, numbered, labelled, and docketed in a manner that straightway knocks out what little of poetic mystery that it may at first sight have appeared to possess. Soon, the globe will be known, not to say "done" by thousands, in every nook and cranny of its four quarters, as well as its *fifth*—Romney Marsh, as I was given to understand, once upon a time. The slopes of the Andes, and the peaks of the Himalayas are losing their fascination through modern research; and the water-logged forests of the Amazonian tributaries are not what they formerly were. Even the once inaccessible precipices of Roraima have, I believe, been scaled by some more ingenious globe-trotters, and the dark mystery of an inland island, cut off from civilisation by thousands of feet of sheer, natural wall, has vanished before the glassy clearness of fact and reality. Darkest Africa is indexed, and procurable for 25 per cent. discount for cash. The "Nile season, 1890-91" is advertised with "through bookings" (!) to the Second Cataract, and fast sailing luxuriantly fitted steamers! "Whirr, whirr, all by wheels; whiz, whiz, all by steam." "Luxor and Karnak Hotels now open." Shade of Sesostris! The Wild East is on view at Earl's Court; the Wild West has gone—both the sham and reality, the Red Indian in top hat and patent leathers being an accomplished fact. Travelling in the once "Great Lone Land" is as easy as in Pall Mall; and I have heard of schemes for a railway through the comparatively small tract of land, labelled on maps "unexplored," on the Australian continent, where in a few years the last survivor of the bearded black fellows will commit suicide with his own boomerang.

I did hope when, on Tuesday last, I read the *Times* correspondent's account of his journey to Zinbabye ruins whilst with the British South Africa Company's camp on the Mashonaland Plateau, that for once we had something entirely novel and fresh in the way of a discovery of primitive architecture. Interesting, however, as are these ruins, I find that their brand newness must be of a qualified description. It appears that the ruins, the existence of which were known by hearsay, were long sought for and discovered by Mauch, the German traveller, and that, moreover, from his verbal descriptions, Baines in his "Goldfields of South-East Africa" has ventured an illustration. Nevertheless, mystery, profoundly deep, surrounds these remarkable ruins of the handiwork of a vanished race.

The Zanbabye ruins consist of a series of walls and circular buildings "of small granite blocks, about twice the size of an ordinary brick, beautifully hewn and dressed, laid in perfectly even courses, and put together without the use of a single atom of either mortar or cement." They lie at the edge of the Mashonaland Plateau, at the base of a precipitous "kopje," inhabited by one of the Mashona tribes, under a chief called Moghabi. The first feature to be noticed on approaching the kopje, says the *Times* correspondent, is the existence of an outer wall, about 4ft. high, running, so far as could be judged amid the dense jungle-like undergrowth, round the entire kopje. This wall was indeed traced for half a mile, beyond which the accumulation of vegetable growths prevented further exploration. Next are traces of an inner wall, difficult to follow for a similar reason; then "amid a perfect labyrinth of remains of small circular buildings—a mighty maze, but not apparently without some plan," south-west of the kopje, and about 300 yards from its base, is the main feature of these strange ruins—a high wall of circular shape, from 30ft. to 35ft. high, forming a complete inclosure of an area 80 yards in diameter. This wall is about 10ft. in thickness at the base, and tapers to about 7ft. or 8ft. at the top; and it is this feature the masonry of which is as above described—viz., built in small blocks of granite, about twice the size of an ordinary brick, beautifully wrought, and laid without a cementing medium of any kind whatever. A gap in the wall allows of entry into the building or inclosure, apparently a roughly-formed hole, but on closer examination, evidently, says the writer, "a well-defined, narrow entrance, as shown clearly by the rounded-off corners."

Here we have the general exterior aspect of the Zinbabye ruins. Inside the building, or inclosure, above described, containing dense undergrowth and quantities of trees hundreds of years old, and thus rendered difficult of examination, are traces of a further series of circular, or elliptical, walls, and close to the entrance stands a "conical-shaped tower, or turret, 35ft. in height and 18ft. in diameter at the base, built of the same granite blocks and consisting of solid masonry." A noteworthy feature of the inclosure is that "on the south-east front of the wall, and 20ft. from the base, runs a double-zigzag scroll, one-third of the distance round, composed of the same sized granite blocks, placed in diagonal positions." On the "kopje" itself, too, and on the hill-side, are numerous traces of remains of a similar character, circular buildings wedged in between boulders of rock, walled terraces, at least nine in number, and built on the very summit of the kopje—which commands a panorama probably unrivalled in African scenery—is "an enormous mass of granite blocks, to be used apparently as a fort, and which, owing to the complete absence of disintegrating forces in that climate, is in a nearly perfect state of preservation."

In spite, therefore, of Mauch and Baines, we have here room for much speculation as to the origin, purposes, and date of these mysterious ruins at Zinbabye, on the verge of the Mashonaland Plateau, in South-East Africa. The Portuguese have suggested that they are the remains of the city and palace of the Queen of Sheba, "in the land of Ophir"; but one might, perhaps, with slightly less propriety suggest that they were the summer residence of the heir-apparent of old Darkest Africa. Ancient Portuguese records refer repeatedly, it is said, to a people in South-East Africa, established long before their own arrival and working the gold mines. Major Erskine, writing to the *Times*, contemporary with its account of the ruins, suggests also that they were erected by an ancient people for the protection of rich gold mines. But there remains a wide field for research in connection with the ruins, so wonderfully interesting in these know-everything days. GOTH.

CHIPS.

The Metropolitan Public Gardens Association, 83, Lancaster-gate, W., has offered £100 to each of twenty metropolitan vestries and district boards, to be expended in planting plane trees in suitable public thoroughfares in each district, on condition that the local authorities agree to maintain the trees when planted, replacing such as may die.

At Rubery Hill Asylum a committee of the city council of Birmingham are proceeding with the provision of improved accommodation for nurses and for patients who require separate sleeping-rooms, which has been approved by the Commissioners in Lunacy. The contract is in the hands of Messrs. Barnsley and Sons, whose tender of £2,616 was the lowest one.

The foundation stone of the first school to be erected by the School Board for Benwell, near Newcastle, was laid in Delaval-lane, Benwell, on Wednesday. Mr. J. W. Thompson, of Pilgrim-street, Newcastle-on-Tyne, is the architect, and the contract has been let to Messrs. T. and W. Common, of Horsley, for £4,630. The school will accommodate 638 children.

A scheme is on foot at Chicago to build a play-house, modelled upon Messrs. Dodgson and Unsworth's plans of the Shakespeare Memorial Theatre at Stratford-on-Avon, including the memorial hall, the latter to contain a collection of relics, curiosities, souvenirs, books, engravings commemorative of the poet and his works.

St. Peter's Episcopal Church, Lathom-place, Edinburgh, was opened on Sunday after internal decoration of the chancel and the filling of the fine lancet windows in the apse with stained glass. The works have been carried out by Messrs. George Dobie and Son, of Edinburgh.

The Grantham board of guardians adopted at their last meeting plans for a new workhouse prepared by Mr. Valentine Green, recently selected in competition. The plans have been reduced, so that the accommodation will be for 200 instead of 262 inmates, as originally proposed. It has been decided to carry out the work in Ancaster stone in lieu of brick, at an estimated additional cost of £500, the roofing to be of Broseley tiles.

Mr. W. M. G. Singer, of Paignton, has accepted the design of Messrs. E. Appleton and Son, architects, Torquay, submitted in a limited competition, for new farmhouse and buildings at Blagdon, near Paignton, Devon.

A mission home for the Sisters of St. Raphael is about to be built at Knowle, near Bristol, from plans by Mr. John D. Sedding, of London. It is at present proposed to expend about £5,000 in providing accommodation for 50 children and 14 sisters, leaving the refectory, chapel, and other adjuncts to be built hereafter.

Johnston Church, Pembrokeshire, which is undoubtedly one of the most interesting churches in the diocese of St. David's, is so far dilapidated that it requires very careful repair. Messrs. Kempson and Fowler, of Llandaff, have been intrusted with the work, and, under their direction, the strictest conservative repairs are to be carried out.

A new post-office is about to be built in Aire-street, Goole, together with an arcade of shops adjoining, extending by the side of the office from North-street into Victoria-street. Mr. H. B. Thorpe, of Goole, is the architect.

CONTEMPORARY BRITISH BUILDERS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THIS is the fourth double-page plate issued in this series of portraits of representative firms. The first on the sheet is Mr. George Adamson, the senior member of the firm of T. H. Adamson and Sons, of Chiswick, Putney, and Ealing. The foundation of this firm was laid early in this century by the grandfather of the present members, who was a builder at Chiswick. He was succeeded by his son, the late Mr. Thomas Henry Adamson, sen., who, about 38 years ago, took his four sons into partnership. The eldest, unfortunately, met his death in the year 1878 by falling from a ladder at the North London Collegiate Schools. The subject of our illustration, Mr. George Adamson, was apprenticed in 1845 to Mr. Henry Poole, of Westminster, where he gained considerable experience in all kinds of masonry. The other members of the firm are Mr. William James Adamson and Mr. Frank Adamson. The following are some of the principal works carried out by this firm:—St. Andrew's Church, Surbiton; St. Olave's Church, Mile End; Christ Church and Vicarage, Epsom; St. Jude's Church, Peckham; St. Mark's Church, Marylebone-road; Holy Innocents' Church, Hornsey; and the schools at Mortlake under Sir A. Blomfield, A.R.A.; All Saints' Church, Putney, and the Interior Royal Military Chapel, Wellington Barracks, under the late Mr. G. E. Street, R.A.; Emanuel Church, West Dulwich, and the North London Collegiate Schools under Mr. E. C. Robins, F.S.A.; Trinity Church, Streatham, Messrs. George and Peto architects; St. Michael's Parish Hall, Bedford Park, Mr. Maurice B. Adams architect; Christ Church, Hendon, and Westminster Training School and Home for Nurses, Mr. S. Salter architect; St. Peter's Church, Hoxton; Presbyterian Church, Brockley; Wesleyan Church, Hammersmith; tower and spire St. Jude's Church, Kensington, Mr. H. Godwin architect; St. Dunstan's Church and Vicarage, East Acton, for the Goldsmiths' Company, the late Mr. Hesketh architect; All Saints' Church, South Acton, Messrs. Adams and Kelly architects; Congregational Church and Parsonage, and Isolation Hospital, Ealing; Congregational and Baptist Chapels, East Hill, Wandsworth; Corn Exchange, Mark-lane, and chapel and almshouses at Lee for the Merchant Taylors' Company, the late Mr. E. I'Anson architect; warehouses and offices in Budge-row; mansions at Petersfield and Eastbourne, and several houses at Bexley, under Mr. R. W. Edis; United Westminster Schools and United Westminster Almshouses, the late Mr. R. Arntz architect; The Friary, Windsor; several mansions in Wimbledon Park and at Wimbledon; Schools of St. Barnabas and St. Philip, Kensington; warehouses for Messrs. J. Allan, sen., and Co., and for the General Iron Foundry Co., Upper Thames-street; vestry hall and offices, St. George's, Bloomsbury, and schools, Little Russell-street, Mr. J. Peacock architect; buildings for the London and the Thames Rowing Clubs, Putney; house, Sutton-court, Chiswick, for Mr. W. Emerson, architect; warehouses and shops, Hammersmith, for Mr. W. N. Froy; houses at Wimbledon Common, Elstree, and Hampstead, and houses and studios Bedford Park, Mr. E. J. May architect; Eyot Villa and two houses, Chiswick Mall, for Mr. J. I. Thornycroft, Messrs. J. and J. Belcher architects; St. Peter's Presbytery, Palace-street, Pimlico, Mr. Bentley architect; house for Mr. Lloyd, Delahay-street, Westminster, Messrs. Isaacs and Florence architects; house at Sheen, Mr. T. Collcutt architect; No. 3, Upper Berkeley-street; Gunnersbury House, Hounslow; the vestry hall, Chiswick; dairy, Blackheath, for Express Dairy Company; warehouses and offices in Charing Cross-road for Messrs. Hinks and Son; the Gallions Hotel and Buffet at the Royal Albert Docks; Church of St. Michael and All Angels, Walthamstow, the late Mr. J. M. Bignell architect; and the new Parish Church of St. Alban, Teddington, Mr. W. Niven architect; also the alabaster and marble reredoses at St. Andrew's Church, Surbiton; St. James's Church, Derby; St. Stephen's Church, Gloucester-road, and St. John's Church, Putney. Mr. Adamson's portrait is the work of Mr. W. Wright, of Cheapside.

Mr. H. T. Ashby is the senior partner of the firm of Ashby Bros., of Goulston-street, Aldgate, E. The firm was established in 1818 in Bishopsgate-street by the late Richard Ashby (uncle of the present family). Mr. H. T. Ashby is a "Cockney" born in St. Mary Axe, 1835. He was educated at the City of London School, and began business in the office and workshops as apprentice in 1857. He practised as a quantity surveyor for some years before becoming partner in the firm. Their works and business are chiefly in London. A few of the buildings erected by them are the City Bank, Finch-lane; Chartered and Mercantile Bank of India, London, and China, Broad-street; Bank of New South Wales, Broad-street; National Bank of New Zealand, Broad-street; Bank of British Columbia, Lombard-street; Dimsdale's Bank, Cornhill; Hambro's Bank, Broad-street; Royal Bank of Scotland, Bishopsgate-street; Leadenhall House; Central Telegraph Station, Threadneedle-street; Messrs. Caldecott's warehouses, Cheapside; Messrs. I. and R. Morley's warehouses, Milk-street and Wood-street; many of the new houses in Cheapside. The above are only some of the buildings they have erected. The portrait given is from the studio of Messrs. Boning and Small, Baker-street, W.

Mr. William Brass is the proprietor of the firm of William Brass and Son, builders, Old-street, St. Luke's, &c. Among the works executed in the past may be mentioned the General Post Office (corner of Newgate-street); Savings' Bank Offices, Queen Victoria-street; Eastern District Post-office, Whitechapel-road; St. Dunstan's College, Catford; Hanwell Schools; Essex County Lunatic Asylum, Brentwood; Royal Chest Hospital, City-road; Great Northern Central Hospital; museum, Bartholomew's Hospital; University College (new wing); Baliol College, Oxford; Memorial Chapel for Prince Imperial, Chislehurst; Carpenters' Hall; Cutlers' Hall; Haberdashers' Hall and adjoining warehouses for Messrs. Tapling; Alliance Bank, Southwark; National Provincial Bank, Baker-street; Manchester Hotel; New University Club, St. James-street; Civil Service Stores, Queen Victoria-street; Dashwood House, Old Broad-street; Bon Marché, Brixton; Economic Life Assurance Buildings, New Bridge-street; premises, Aldersgate-street, Messrs. Maw, Son, and Thompson; premises, Farringdon-street, Messrs. Marcus Ward and Co.; fruit sale rooms, Monument-yard; extensive business premises, Bayswater, for Mr. Whiteley. At the present time the firm are carrying out fortifications at Sheerness for the War Department; the triennial contract for works and repairs to public buildings throughout the London district; and substructure for the New General Post-office, St. Martin's-le Grand, under H. M. Office of Works; also contracts for the London County Council and Corporation of the City of London, and banking premises, Threadneedle-street and Old Broad-street. Mr. Brass's photograph was taken at Brighton by Messrs. E. Hawkins and Co.

Mr. R. C. Foster, of Rugby, was born in 1849, and educated for the architectural profession at King's College, and South Kensington, and under Mr. Arthur Evers, of Gt. Marlborough-street, exhibited in the architectural room of the Academy in 1877 and 1878. Leaving architectural work, he became a contractor in 1876, and carried out several contracts for the Great Northern Railway and others. In 1879 he joined W. Sidney Dicksee (a brother of Frank Dicksee, A.R.A.) in succeeding, under the title of Foster and Dicksee, Mr. John Bromwich, of Rugby, a well-known building contractor, who had carried out many works under Mr. Salvin, Sir M. D. Wyatt, and other leading architects. Their town works in progress are as follows: New Bankruptcy Offices, Carey-street, S.W. (£50,000), for H.M. First Commissioner of Works, Mr. John Taylor, architect; town house, 20, James-street, S.W. (£10,000), for Mr. E. Heinemann, Mr. Reginald J. Blomfield, M.A., architect; South London Art Gallery, Camberwell (£5,000), Mr. Godfrey Pinkerton, architect. Works carried out in town: Block of chambers, Park-lane, W. (£14,000), for Sir Julian Goldsmid, Bart, M.P., Mr. Alfred Waterhouse, R.A., architect; town house, Pont-street, S.W. (£12,000), for Sir Kenneth Matheson, Bart., Mr. C. W. Stephens, architect; town house, Cadogan-square, S.W. (£7,000), for Mr. H. L. Arbuthnot, Mr. Edwin T. Hall, F.R.I.B.A., architect; 49, 51, and 53, Pont street, and 22 and 24, Cadogan-square, S.W. (about £4,500 each) for Mr. S. Prince and others, Mr. Edwin J. Hall, F.R.I.B.A., architect; foundations, Sion College, Sir Arthur Blomfield, architect; 52a, Berkeley-square, and additions to 52, Mr. M. E. Macartney, architect; Parochial Hall, Brixton, Mr. Edwin T. Hall, F.R.I.B.A., architect; additions to St. Saviour's Church, Chelsea, Rev. E. Geldart and Mr. J. R. Vining, architects; 30 and 32, Pont-street, S.W. (about £5,000 each), Mr. C. W. Stephens, architect; thirty-two large houses, two shops, and four sets of stables at Beech Hill-park, Hadley Wood, N. (about £50,000 or £60,000 in all), for Mr. Charles Jack, Mr. J. Hall, architect; artisans' dwellings, Whitechapel, for Messrs. Carter and Sons; additions to business premises, for Messrs. Burroughes and Watts. Their country works in progress are: Mansion, Hatchford Park, Cobham (£15,000), for Mr. W. Chinnery, Mr. Rowland Plumbe, F.R.I.B.A., architect; large house, Colwyn Bay (£8,000), for Miss Gregory, Mr. Gerald C. Horsley, architect; large house, Barnsdale, Oakham (£3,000), for Capt. the Hon. C. W. FitzWilliam, Mr. E. J. May, F.R.I.B.A., architect. Works in country: Restoration of Stanford Hall, for the Rt. Hon. Lord Braye (£20,000); school chapel, Shrewsbury (£8,000), Sir Arthur Blomfield, architect; large additions to mansion and new chapel, Newnham Paddox, Warwickshire (£50,000), for the Earl of Denbigh, Mr. Thos. Wyatt, architect; rebuilding Blackmore Park, Upton-on-Severn (£18,000), for Mr. J. V. Hornyhold, Mr. David Brandon, architect; additions to Shandon Court, Kent (£7,000), for Major Fletcher Lutwidge, Mr. M. E. Macartney, architect; additions to Southlands, Kent, for Mr. J. Leedham White, Mr. M. E. Macartney, architect; additions to Speldhurst, Kent, for Mr. J. Pierson, Mr. M. E. Macartney, architect; mansion, Watergate House, Hants (£14,000), for Mr. R. Christy, Mr. A. Waterhouse, R.A., architect; mansion, Rosehill, Henley-on-Thames, for Mr. H. Micklem, Messrs. Ernest George and Peto, architects; mansion, Trescawen, Anglesey, (£18,000), for Capt. Pritchard Rayner, Mr. R. G. Thomas, architect; house, Kent Hatch, Edenbridge (£5,500), for Mr. F. Scorer, Mr. M. E. Macartney, architect; mansion, Burton Lazars, Melton Mowbray (£14,000), for Capt. Ashton, Mr. R. W. Johnson, architect, and various other public and private contracts. Mr. Foster's likeness was produced by the camera of Mr. Thos. Fall, of 10, Baker-street, W.

Mr. John T. Chappell, of London and Brighton, whose portrait we give this week, commenced business at Brighton and Steyning some thirty years since, removing about ten years subsequently to London to his present extensive works and offices, Thames Bank Wharf, Grosvenor-road, and 149, Lupus-street, Pimlico. The following is a list of some of the principal works carried out by him:—Baron Grant's mansion at Kensington (recently pulled down); London and County Bank, Oxford-street branch; London and Westminster Bank, Brompton branch; Cannon-street Buildings, Cannon-street, E.C.; National Hospital, Queen-square, for Epilepsy and Paralysis (Albany Memorial); New Offices, Eastcheap, for Sir H. Peek, Bart; Sion College, Victoria Embankment; Schools for the Royal Commissioners of the Patriotic Fund at Wandsworth; St. Mary's Church, Whitechapel, E.; Townshend Schools, Rochester-row, Westminster; Warehouses, Falcon-street, City; Camberwell Workhouse; Kensington Workhouse; Small Pox Hospital, Fulham; additions to Marylebone Workhouse; Museum Mansion (residential flats, &c., Great Russell-street, Bloomsbury); Ship and Turtle Tavern, Leadenhall-street, City; City Police Station, Cloak-lane; Church in the Mall, Notting-hill Gate; shops and offices, Ludgate-hill; City of London College, Moorfields; new wing to Chest Hospital, Victoria Park; Fitzallan Chambers, Arundel-street, Strand; Hove Townhall and public buildings; various extensive works on the West Brighton Estate; third County Lunatic Asylum for Middlesex, at Banstead, Surrey; third County Lunatic Asylum for Surrey, at Cane Hill, near Coulsdon, Surrey; Imbecile Asylum, and additions thereto, at Caterham, Surrey, for Metropolitan Asylums Board; Municipal Buildings, Reading; additions Surrey County Lunatic Asylum, Brookwood; Convent of the Sacred Heart, Brighton; Goldstone Reservoir, Brighton; St. Mathew's Church, Kemp Town, Brighton; gas-holder tank, Black Rock, Brighton; Surrey Houses, Arundel-street, Strand; Croxley Paper Mills, near Watford; Brighton and Hove Dispensary; dwellings at Gainsford-street, Horselydown; stabling at Chelsea, for the London Improved Cab Com-

pany; at Walham Green, for the London Road Car Company, Limited; and at Conway-street, Hove, for the Brighton Omnibus Company; offices at Mark-lane and Great Tower-street, for the Metropolitan and Metropolitan District Joint Committee; brewery stores at Brixton; new premises at Douglass-place, Bayswater, for Mr. Whiteley; additional cellarage at Tottenham for the Lager Beer Brewery Company; bank at Worthing for the London and County Banking Company; schools at New Cross for Haberdashers' Company; mansions at Cheyne Walk, Chelsea; Museum Mansions, Great Russell-street, Bloomsbury. Mr. Chappell has also just completed the rebuilding of Colonel North's mansion at Avery-hill, Eltham. We understand he is now commencing the building of the New General Post Office (North), St. Martin's-le-Grand; dwellings at Marlboro'-road, Chelsea, for Guinness' trustees, and has numerous other important contracts in hand. Mr. Fall, of Baker-street, is the artist responsible for the portrait reproduced herewith.

Mr. H. H. Bartlett is the senior member of the firm of Perry and Co., Tredegar Works, Bow. The principal works on which they have been engaged during the last fifty years would take too long a list for our space, so we only give a few of the leading ones:—Dramatic College, Metropolitan Asylums buildings at Fulham, Shoreditch Town-hall, Shoreditch Workhouse, St. Thomas's Hospital, Burlington House, Prince's Mansions, Victoria-street; Queen's Mansions, Victoria-street; Bethnal Green Museum, City Carlton Club; extension of South Kensington Museum, various hospitals, town-halls, and public buildings; all the several buildings and palaces for the Government repairs, building the Houses of Parliament, &c.; new station buildings at Waterloo; the various railway widenings and stations on the S.W. Railway system; new piers and railways in different parts of England; large buildings in Cairo, Egypt; dock works; hotels—some of the largest in London; very numerous works under the War Department, also some under the Admiralty; banks in the City and at Charing Cross; and at present they have in hand all the buildings of the People's Palace, new Tower Bridge; large block, Albany Buildings, Victoria-street; new station, renewal of bridges, and widening of the line at Vauxhall and Nine Elms; new wing at the London Hospital; new Seamen's Hospital; sewage works for the West Ham Corporation; Avenue Hotel, Kensington-gardens; and works at Farringdon Market, besides various ordinary buildings, bridges, &c. Mr. Bartlett's photograph is by Mr. Deneulain, of the Strand.

[In the sixth line from the bottom of page 248 of our issue of 22nd August last, it was stated that Mr. King Church purchased the Cakemore Estate in 1884, whereas it should have been stated that the purchase was made in 1874.]

NOTES ON BUILDING PRICES.—XI.

By John Leaning.

DRAINS.

AGRICULTURAL drain is sometimes laid where there is reason to anticipate damage to the foundations of a building from the surface water. When a large area, several acres for instance, is dealt with, it is customary to value it by the acre for labour and material (see "Drainage of Lands, Towns, and Buildings"—Dempsey). The tables of cost would be more valuable to the estimator if they included the time spent upon the various labours. The date at which tables were produced is rarely given, and the gradual rise in wages which has taken place within a few years renders many of them useless. Ganerally, the work dealt with by the builder, or building surveyor, consists of a few lines of pipes, which are better measured and valued in the same manner as for stoneware drains, but per *yard* run, in accordance with custom, instead of per *foot*, and, including digging, filling-in, and ramming; the size of pipe used is now seldom less than 2in. bore. The cost of 2in. pipes in 15in. lengths, delivered in London, is 35s. per thousand = 1,250ft. = 417 yards lineal nearly. A common price paid for them in the field is 30s. per thousand; the weight, about 29cwt. They are laid dry, the joints just abutting, by a fairly intelligent labourer. In valuing agricultural drains, the cost of the digging per cubic yard must first be settled in accordance with the nature of the soil, on the principle before described, and 20 per cent. added to that price for the extra trouble and comparatively small quantities. A trench 18in. wide can be excavated to a depth of 2ft.; but beyond that depth the width would be 24in.

The value of 2in. agricultural drain, and digging 2ft. average depth, and filling-in and ramming, would be as follows: Digging, per cubic yard, $4\frac{1}{2}$d. + 20 per cent., $\frac{3}{4}$d. + filling and ramming, $5\frac{3}{4}$d. = 11d.

	2in. pipes, per yard	1d.
3·0	Laying, per yard	$\frac{1}{4}$
1·6	Digging, &c., $\frac{1}{3}$rd yard..	$3\frac{3}{4}$
2·0	cube, at 11d. ..	
—9·0		—
	Cost per yard	5

The builder putting in small quantity of agricultural drains would do his work in the usual fashion of drain trenches. Large quantities would be put in with the well-known draining tools, spades of various widths and unusual depths, 13in. to 18in. being used, so as to produce a trench only 3in. wide at bottom. A trench 12in. wide at top, 3in. at bottom, and about 3ft. deep may be produced by one cut from each of three different sizes of spades.

The price of glazed stoneware drains *in London* is regulated by an agreement amongst the vendors, by which the published list always shows the same prices, but the trade discount varies. The list, as published by the merchants, is to be found in the current price books. The merchants will deliver within four or five miles without extra charge if a cart-load is ordered.

Drain-pipes are usually carried by the London merchants in a one-horse van, of size specially adapted to the purpose, 9ft. by 4ft. 9in. by 2ft., of capacity as follows:—4in. pipes, 200; 6in. pipes, 120; 9in. pipes, 55; 12in. pipes, 35; 15in. pipes, 22; 18in. pipes, 18.

The average one-horse van is about 9ft. by 4ft. by 2ft., and will carry about 2 tons. A knowledge of the size of vehicles is useful to the estimator, as he can the more readily reckon the cost of carriage, and he will find it to his advantage to note the quantities of materials carried under various conditions, the sizes of the vans or carts, and the number of horses, the number of men occupied on loading and unloading, and the time spent upon such work.

The trade catalogues of the large manufacturers, such as the Bristol Waggon Works Company, contain much useful information as to sizes, carrying power, and price of carts, vans, waggons, &c.

The present trade discounts off list prices of town-made pipes are: 6in. and under, 45 per cent; 9in., 40 per cent.; 12in., 35 per cent.; 15in. and 18in., 30 per cent. For country-made pipes, 5 per cent. more than these, and for very large quantities $7\frac{1}{2}$ per cent. more. As the country-made pipes are much more frequently used than any other, whatever may be proposed to the contrary, the examples and the following list are based upon the discount for country pipes:—

Prices of pipes delivered free in London after deducting trade discount:—

Bore of pipe	50 per cent. 2in.		3in.		4in.		6in.		45 per cent. 9in.		40 per cent. 12in.		35 per cent. 15in.		18in.		
	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	
Straight pipes	0	$1\frac{3}{4}$	0	$2\frac{1}{4}$	0	3	0	4	0	$7\frac{3}{4}$	1	$1\frac{1}{4}$	1	$11\frac{1}{2}$	2	$7\frac{1}{4}$	per foot.
Bends	0	6	0	$7\frac{1}{2}$	0	$10\frac{1}{2}$	1	$1\frac{1}{2}$	1	11	3	$3\frac{1}{2}$	5	10	7	$9\frac{1}{2}$	each.
Single junctions and taper pipes, 2ft. long, charged in list as 4ft. straight pipes	0	7	0	9	1	0	1	4	2	$6\frac{3}{4}$	4	$4\frac{3}{4}$	7	$9\frac{1}{2}$	10	$4\frac{3}{4}$	each.
Double junctions, 2ft. long, charged as 6ft. of straight pipe	0	$10\frac{1}{2}$	1	$1\frac{1}{2}$	1	6	2	0	3	$10\frac{1}{4}$	6	$7\frac{1}{4}$	11	$8\frac{1}{2}$	15	$7\frac{1}{4}$	each.
Siphon traps long	1	0	1	3	1	9	3	0	5	6	9	0					
S and P traps	0	9	0	$10\frac{1}{2}$	1	0	3	0	5	6							

Large quantities may be bought of the Midland manufacturers at from $7\frac{1}{2}$ to 10 per cent. below the above rates, carriage paid to a London station, or to a country station of equal distance from the manufactory; but this involves carting by the purchaser. Approximate number of pipes to a ton:—

	2in.	3in.	4in.	6in.	9in.	12in.	15in.	18in.
Pipes	285	200	150	90	42	27	18	14
Siphons and gullies		203	150	68	33	25		
S traps		224	124	62				
P traps		320	203	80				

Tested pipes cost generally 20 per cent. more than the foregoing rates, and each length is marked T. For the Stanford jointed pipes the trade discount is 10 per cent. off the published list. The trade discount off gully traps and flap traps is the same as for 12in. pipes (40), stoneware closet pans, same as for 18in. pipes (30). The customary measurement and valuation of drain pipes is per foot run, including digging, filling-in, and ramming, up to 3 or 4ft. deep, it may generally be assumed that no strutting or planking will be necessary, beyond that depth it is often necessary. The extent of it will depend upon the nature of the ground. It is rarely the case that the poling boards require to be close together; they may *generally* be from 4in. to 6in. apart. In the neighbourhood of London, the digging, filling-in, and ramming for drain trenches is often priced at 1d. per foot run for each foot in depth.

A bricklayer and labourer will lay and joint and cement in aday of 10 hours.

		Per ft. Constant	A bushel of cement and sand will joint.
4in. pipes	100ft. = $1\frac{1}{2}$d. .. ·010 ..		150ft.
6in. ,,	66ft. = $2\frac{1}{4}$d. .. ·015 ..		100ft.
9in. ,,	44ft. = $3\frac{1}{4}$d. .. ·022 ..		65ft.
12in. ,,	33ft. = $4\frac{1}{2}$d. .. ·030 ..		50ft.
15in. ,,	26ft. = $5\frac{3}{4}$d. .. ·038 ..		40ft.
18in. ,,	22ft. = $6\frac{3}{4}$d. .. ·045 ..		32ft.

The labourer's constant attendance is necessary to hand the material, and assist in the adjustment of the pipes.

A few examples will illustrate the method of valuing drains.

Example 1.—4in. drain jointed in cement and the joints puddled around with clay and 4ft. excavation.

1.0
2.0
4.0

		s.	d.
—3.0 = $\frac{8}{27}$	cube yard, dig, fill, and ram, at 11d., as before		$3\frac{1}{4}$
	4in. drain, per ft. run		3
	Laying $1\frac{1}{2}$d., cement $\frac{1}{4}$d., and clay $\frac{1}{4}$d.		2
	Cost per foot		$8\frac{1}{4}$

Example 2.—6in. drain as before, and 8ft. excavation.

1.0
2.0
8.0

		s.	d.
—16.0	cube digging, about $\frac{3}{4}$d. for each ft. in depth, or $\frac{6}{27}$, at 11d.		$6\frac{1}{2}$
	6in. drain. per ft. run		4
	Laying $2\frac{1}{4}$d., cement $\frac{1}{4}$d., clay $\frac{1}{4}$d.		$2\frac{3}{4}$
1.0			
2.0			
6.0			
—12.0 = $\frac{1}{2}\frac{2}{7}$	of a cubic yard, throwing out only, at $2\frac{3}{4}$d. the lower 6ft. of earth.		$1\frac{1}{4}$
	Staging (boards laid on the poles, or struts of the strutting and planking) about 5ft. by 2ft.—say		1
	The real value is the labour of fixing and removal, plus $7\frac{1}{2}$ per cent. per annum on the original cost of the planking.		
	Cost per foot	1	$3\frac{1}{2}$

The strutting and planting, if necessary, would be valued as hereafter described.

The valuation of bends, junctions, taper pieces, &c., is in accordance with the usual method of measurement, "Extra for" as the length of bend varies, some being 2ft. long, and some less; an average length reasonably applicable to all cases may be taken as 1ft. 6in.

The value of extra for bends is as follows:—There is no extra cost on the jointing or laying.

Extra for 4in. bend.	d.
Cost price of 4in. bend	$10\frac{1}{2}$
Deduct 1ft. 6in. of 4in. pipe	$4\frac{1}{2}$
	6

Junctions are of equal length to the pipe upon which they are extra. There is no extra cost on the jointing or laying. Siphon traps of the S and P

type would be equal in length when laid to 18in. of pipe, the longer shape 24in., and the fixing equal to that of junctions. The long siphon traps, the Weaver type, would be equal in length to 2ft. 6in. of pipe, valued as follows :—

	s.	d.
Cost price of 4in. siphon	1	9
Deduct 2ft. 6in. of 4in. pipe	0	7½
	1	2½
Extr labour laying.....	0	2
	1	4½

The smaller works, which usually appear in a bill of quantities for drains, can only be dealt with by resolving them into their elements. The basis of valuation would be the normal value of the larger quantities. The modification of the price per yard cube of concrete or foot of brick-work, as the case may be, would be an increase by a purely arbitrary percentage dependent upon experience, and it should be remembered that, as the particular article increases in number, so the percentage should decrease. Traps or gullies, which are generally bedded in concrete, would be valued in some such way as follows :—

No. 22.—Doulton's (Lambeth) (Fig. 13*b*) yard gully with cast-iron grating bedded in and including cement concrete 18in. by 15in. and digging and connecting with drain.

					s.	d.

2		2		make good drain-pipe to ½ brick-work in cement.

Slopes.—Formerly the surveyor would, in the measurement of trench-digging make a certain allowance for sloping sides to trenches. This practice is obsolete. When the sides of a trench will not stand vertically without support, strutting and planking is always allowed for.

Strutting and Planking.—The excavator's items of a bill of quantities or a schedule are often described to include strutting and planking in some such form as follows :—"Digging straight or curved on plan, except for wells, drains, or pipes, including levelling bottom of trenches or forming same to proper falls, as may be ordered; cutting steps, providing, fixing, and removing shoring, close-planking and strutting where required, not exceeding 6ft. in depth." The character and extent of strutting and planking varies greatly with the nature of the soil and the state of the weather. The sides of an excavation in loose sand may require the planks close together and supported by many struts. In clay soil the planks might be a foot apart, and in places would require none. As a familiar instance, a trench 6ft. deep and 4ft. wide in stiff clay would generally have 1in. or 1½in. vertical boards about 7in. or 9in. wide and about 4ft. long, 12in. apart, one 9in. by 3in. waling piece on each side of trench, and one row of struts about 5ft. apart, generally short pieces of scaffold-pole. Arrangements of poling and planking of trenches are illustrated in Seddon's "Builders' Work" and Hurst's "Tredgold's Carpentry." If strutting and planking is left in its place, as in some cases of underpinning where it is impossible to withdraw it, the cost of the wood plus the fixing and profit is the proper price, if new material is used; if old material, about a third the price of new is a customary rate. Strutting and planking to trenches is usually described as follows :—

24ft. run. Strutting and planking to sides of trenches 4ft. wide and 6ft. deep, one side measured for two; a common contract price for this would be 1s. per foot run. The poling boards would be "ends," as they are called, which may be purchased at the timber sales or the wood imported as firewood and sold at the firewood dealers at about £6 per fathom of 6ft. by 6ft. by 6ft = 216c.ft. These ends may be selected of any thickness and of all varieties of length from 3ft. to 6ft. at the same price per fathom. The cartage for four one horse loads per fathom would also be added, say, 12s., total, £6 12s., or about $\frac{7}{8}$d. per foot superficial for 1½in. The waling pieces, 9in.. by 3in. would cost about 2½d. per foot run. The poles would be scaffold poles, cut to lengths, cost about 1¼d. per foot, including the cutting. The valuation of the above item would be as follows :—

				£	s.	d.
2/24	0					
6	0					
288	0	1½in. boarding delivered at 7s. 4d. per square		1	1	1½
2/2/24	0					
96	0	9in. by 3in. waling piece, 2½d. per foot		1	0	0
2/10/ 3	9					
75	0	Struts 3ft. apart, 1¼d. per foot		0	7	9¾
				2	8	11¼
Interest on capital at 5 per cent. p.a.						
Depreciation at 2½ per cent. p.a.						
Say, one month in use at 7½ per cent. p.a. on £2 8s. 11¼d. = 3s. 8d. ÷ 12					0	4
288ft. fixing and removal at 2s. 6d. per square					2	2½
Cartage to yard one load at					3	0
Divide by 144ft. (one face for two)..					5	6½
Cost per foot superficial about					0	0½
Feet in depth						6
Cost per foot run.....					0	3

Strutting and planking to an excavation like a basement would be described by its superficial area. Taking as an example an area 40ft. by 40ft., and 6ft. deep, a calculation on the same principles would produce the following results :—

				£	s.	d.
160	0					
6	0					
960	0	1½in. poling boards as before, at 7s. 4d. per square		3	10	4¾
2/160	0					
320	0	9in. by 3in. waling pieces at 2½d.		3	6	8
4/9/ 4	0	144	0	9 × 3 sole pieces for struts (5ft. apart) (=27·0 cube) 2½d.	1	10	0
4/9/ 3	6						
	4½						
	3	11	10	Fir struts.			
4/9/ 6	6						
	5						
	4	32	6	Ditto.			
		44	4	At 1s. 6d.	3	6	6
					11	13	6¾
Say one month at 7½ per cent. per annum on £11 13s. 6¾d. = 17s. 7d. ÷ 12 =					0	1	5¾
Waste 5 per cent. on £3 6s. 6d.					0	3	4
960ft. fixing and removing planking, at 2s. 6d. per square					1	4	0
71⅓ft. labour and nails fixing struts, at 4d.					1	3	9
Cartage to yard, two loads, 3s.					0	6	0
Divided by 960ft.					2	18	6¾
Cost. per foot superficial ..						¾d.	

It is rarely the case that more than the foregoing is required. When the earth requires more support than this affords, 3in. planks are used instead of poling boards, sometimes shod with iron, and driven like piles. When still more security is required, square piles are used. The valuation of such work presupposes a knowledge of civil engineering, and is beyond the scope of these Notes.

The section "Quantities and Costs" of the Index of the *Transactions* of the Institute of Civil Engineers contains a number of references as to cost of coffer dams, piling, concrete in large masses, and similar works. The method of valuation of piling depends upon the mode of measurement, for which see Leaning's "Quantity Surveying."

(*To be continued.*)

CHIPS.

The building of a new bridge over the river Avon has just been completed near Bristol, by which it is intended to connect St. George with Brislington. The bridge, which has been built entirely of steel, has a span of 125ft., its breadth being 30ft. It consists of two bow spring lattice girders, each weighing 33 tons, and the floor of the structure is composed of Lindsey's patent troughing, Mr. Lindsey himself being the designing engineer. Messrs. Lysaght and Co., whose works adjoin the site, were the contractors.

Foundation stones of a new Wesleyan chapel were laid at Beverley on Thursday, the 2nd inst. The building is being erected from designs by Messrs. Morley and Woodhouse, of Bradford and Bolton, is Italian in style, and will cost £4,000. The chief contractors are Messrs. G. and R. Pape, of Beverley.

A public drinking fountain erected in the Ropery Meadow at Ilfracombe was presented to the town on Friday. It has been erected by Mr. J. P. Huxstable, of that town.

The Bishop of Carlisle consecrated on Thursday, the 2nd inst., the new Church of St. Mary, Cumrew, near Carlisle, which has been built on the site of the old church. The new building is designed in the Early English style. Mr. G. D. Oliver, of Carlisle, is the architect.

The new Roman Catholic School Church in Seaforth-vale, Seaforth, was opened by Dr. O'Reilly, Bishop of Liverpool, on Sunday. It is of brick, and is capable of sitting 300 persons. The building was erected from the designs of Messrs. Sinnott, Sinnott, and Powell, of Liverpool, by the contractor, Mr. G. E. Mulholland, of Great Crosby, and Mr. R. I. J. Irwin was the clerk of the works.

A new organ was opened in Christ Church, Yeovil, on Sunday. It has been built by Messrs. Vowles, of Bristol, and cost £260.

A new screen and choir-stalls were used for the first time in All Saints', Hull, last week. The new fittings, which have been carved by Messrs. Elwell and Son, of Beverley, from designs by Mr. Temple L. Moore, of London, are of wainscot oak, richly carved. The low screen is composed of tracery panels in deep relief, with moulded uprights between, decorated with carved pateras. The top rail is carved with vine foliage, and has an inscription on a scroll. The stalls are 12ft. long, having tracery panels terminating in a canopy with pendent tracery, and a cresting.

On Friday Mr. S. J. Smith, C.E., held an inquiry at New Swindon regarding an application made by the local board to the Local Government Board for sanction to borrow £22,860 for the purpose of buying a recreation ground for the town. Some opposition was raised on the ground that the site was too far from the town. The clerk to the board explained that the site was the most available one that could be obtained, and the price, £88 per acre, a moderate one.

Mr. Herbert Gribble's Armada Memorial on Plymouth Hoe will be unveiled on Wednesday week, the 21st inst., by the Duke of Edinburgh.

A memorial-stone was laid on Saturday last at the new mission schools of the Methodist New Connexion, Alexandra-road, Ashton-under-Lyne. The contractor is Mr. John Robinson, and the amount of the contract £1,228. Mr. J. H. Burton is the architect.

Building Intelligence.

Aberystwith.—The new parish church was consecrated on Tuesday week. It is English Decorated in style, and consists of a chancel 44ft. by 25ft.; an organ chamber and morning chapel, each 25ft. long and 18ft. wide; a nave with side aisles, of a total width of 72ft. and 61ft. long (intended eventually to be 100ft. long); two vestries, and north and south porches. The principal feature of the chancel consists of a five-light east window, 15ft. wide and 25ft. high over all, with tracery, and filled with painted glass. The subject is the "Ascension of our Lord," together with St. Michael and All Angels, to whom the church is dedicated. This window was designed and executed by Mr. Alfred O. Hemming, of 47, Margaret street, Cavendish-square, W. Under the window is a reredos in Ancaster stone, by Mr. Boulton, of Cheltenham. In the morning chapel is a three-light east window, filled with painted glass by Mr. A. O. Hemming, the subject being "The Crucifixion." The architects are Messrs. Nicholson and Son, of Hereford; the contractor was Mr. Thomas Price, of Hay; and Mr. John Evans, of Aberystwith, acted as clerk of works. The stone carving throughout is by Mr. Boulton, of Cheltenham, and the oak carving by Mr. Geflouski, of Bath. The church and site have cost about £8,000 altogether.

Edinburgh.—The Edinburgh Central Meat Market Company's premises in Ponton-street were formally opened on Friday. Adjoining the Western Dispensary, the market, which is built of brick, with facings of Corncockle stone, measures 80ft. by 80ft. The side walls are 18ft. high. The quantity of meat which can be stored is 110 bullocks, 220 quarters, 450 sheep, and 200 cuts of meat. The cranes, which occupy the space on each side of the main passage, are provided with movable hooks, while the conduct of business is further facilitated by a couple of automatic "travellers." The total cost of ground and buildings is about £4,500. The contractors were Messrs. James Duncan and Son, Grove-street; and the architect Mr. W. H. Grey, George-street, Edinburgh.

Faulkland, Somerset.—The formal opening of Turner's Tower took place on Friday week. The tower, which is situated about half a mile on the Radstock side of the village, and which has taken over two years in construction, is square, rising to a height of 200ft. from the foundation to the top of the spire, being built of native stone until the building reaches the height of 136ft. above the ground. The remainder is composed of wood, which is fastened to the masonry by bolts. The woodwork is divided into two sections, the first being 12ft. square, surrounded by a balcony, the other section being 7ft. square, surmounted by a balcony, each balcony being surrounded with pitch-pine railing. On the top of the smaller balcony is a spire, which rises some 20ft. higher. The tower is ascended from the inside by means of a spiral oak staircase, which is well lighted. Adjoining the tower is a room 50ft. by 15ft., which is known as the ball-room. Underneath are refreshment rooms, offices, caretaker's rooms, and lavatories. The buildings have been erected at a cost of £4,000. The architect and builder was Mr. J. Willcox, of Perry Hill. The masonry work was carried out under the foremanship of Mr. T. Cottle, of Freshford, Wilts. The views from the tower are most extensive, extending over parts of Wilts, Dorset, Gloucester, Somerset, Berks, and the hills of Wales.

Helperby.—About 18 months ago building operations commenced in the alterations and extensive additions to Helperby Hall, Yorkshire, for Mr. James Coates. The work is now completed. The building is in the Queen Anne style, and the addition on the ground floor consists of entrance hall, 28ft. by 20ft. At each side of the entrance lobby are alcoves with groined ceilings. The walls in hall are panelled in wood to a height of 7ft. 6in., and finished with a moulded impost. The works have been carried out from plans, &c., prepared by Mr. Charles E. Sayer, A.R.I.B.A., of 17, Soho-square, London. New stables and coach-houses are in course of erection, and are expected to be completed in a few months. Messrs. R. Leadley and Son are the contractors for the joiners' and carpenters' work, and the plumbing, plastering, and painting; Mr. E. Moorey, of Helperby, for the bricklayers' work; and Mr. R. Airton, of Harrogate, for the stonework. Mr. Jno. Hindmarch has acted as clerk of the works throughout. He was also clerk of works for the town hall and municipal buildings at Middlesbrough previous to commencing the above works.

Paddock Wood, Maidstone.—On Tuesday week the Archbishop of Canterbury visited Paddock Wood for the purpose of reopening the little parish-church of St. Andrew's, which has just undergone restoration. The work was entrusted to Mr. Martin, of Horsmonden, at a cost of £320. The flooring has been entirely renewed. A bed of concrete has been laid, upon which oak joists were laid on coigns on which the new floor rests. The match-boarding round the body of the church has been removed, and the walls plastered with a light-tinted stucco, while three new pointed windows have been let in on each side of the nave and filled with cathedral-tinted glass. The interstices in the open timber roof have been filled in with plaster. The heating apparatus has been extended, and a more powerful boiler laid down. The external stone work has been pointed, and defects in the tiled roof made good, while two windows have been placed in the porch, and a water table laid round the walls to carry off the surface water. Within the chancel the sanctuary within the rail has been raised and paved with encaustic tiles extending from a stone step.

CHIPS.

The parish church of Yarwell is about to be restored, at a cost of £800, from plans by Mr. J. C. Traylen.

The widow of the late Mr. J. T. Burgess, F.S.A., who was formerly a well-known contributor to this journal, has been appointed custodian and librarian of the Old Town Hall, Leicester.

An Amsterdam architect is restoring the small house at Zaandam, in Holland, which Peter the Great inhabited in 1692 for the purpose of learning the trade of a shipwright, and which is now the property of the Russian Government.

The Wesleyan Chapel at Little Sutton, near Rock Ferry, is being enlarged by the adition of transepts, a new front entrance porch, minister's vestry, two classrooms, a new schoolroom, vestibule, cellars for heating apparatus, &c. This will involve an outlay of £1,500. The architect is Mr. W. Allen, Sunbridge Chambers, Bradford-street. The contract is let to Messrs. Raffle and Campbell, Liverpool. The memorial stones have been laid this week.

A monument has been placed in the parish church of Tregaminion in memory of the late William Rashleigh, of Menavilly, M.P. for Fowey in the Unreformed Parliament. The monument is of white English alabaster, and of Jacobean character. It consists of a large shield of Elizabethan character, surrounded by drapery festoons, amongst which are sculptured the heads and wings of cherubs. Above the subscription is an ornamental shield, on which occur the arms of the Rashleighs. This memorial has been carried out by Mr. Harry Hems, Exeter.

Mr. George Barnard, landscape artist, who died last week, aged 83, was well-known for his water-colour pictures of Alpine scenery, and was one of the earliest members of the Alpine Club. He was drawing master at Rugby School for a great many years, and the author of many works of considerable utility to the student—"Foliage and Foreground Drawing," "Landscape Painting in Water-colours," "Drawing from Nature," and "Large Studies of Trees."

The Bishop of Chester visited Bramwell on Saturday afternoon for the purpose of consecrating the new mission church of St. Michael and All Angels. The new building is situated at the extreme end of the parish of St. Thomas, Stockport. The cost has been about £1,000, and the building will be used as a school. It has been built in the old "black-and-white" style peculiar to rural architecture in Cheshire.

The town council of Cheltenham adopted on Monday, after a long discussion, a report and scheme by Mr. Hall, the recently appointed borough surveyor, for preventing the disastrous floodings in the lower part of the town by deepening the bed and enlarging the waterway of the river Chelt, at an estimated cost of £3,551 5s.

The Lord Mayor will lay the foundation-stone of the new Fruit and Vegetable Market in Farringdon-street, about to be erected, on Wednesday week, the 22nd inst., from plans prepared in the City Architect's Office.

Workmen are engaged this week in pegging off the new line of light railway from Downpatrick to Ardglass. The making of the line will be commenced forthwith.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

J. W. (The load per foot we gave in the article referred to applies practically to the weight of the material of which the floor is composed, plus the moving load. The ordinary movable load on it would be very small. For a crowd of persons covering the floor 70lb. per foot has been considered sufficient; but this condition seldom exists in ordinary dwellings. The figures we give are for ordinary dead and moving weights on floors. For crowded floors the weight should be about 150 to 200lb. per square foot, as we state in the article. Hurst's 1½cwt. is intended to apply to crowds or warehouse floors, which is close to what we give.)—Mac. (There are various offices in connection with which such appointments are made—Her Majesty's Office of Works, the Woods and Forests, the various military and dockyard offices, and many departments of the Civil Service. It is impossible to answer specifically, but the most likely chance for you is to apply to the Civil Service Commissioners, Cannon-row, Westminster, for particulars of approaching examinations).

Correspondence.

WHITEFIELD CHAPEL COMPETITION.

To the Editor of the Building News.

Sir,—I shall be glad if you will kindly allow me to contradict the statement in "A Competitor's" letter in last week's Building News.

If he will refer to Professor Smith's report again he will find that it is "Red Cross" and not "Lux Mundi" that exceeds the space shown on the site-plan issued with the instructions. At the same time he is right in principle, that all designs which exceed the limits of the site should be disqualified. This has come to be so generally understood that one is astonished that Professor Smith did not act on it. Competitors have nothing to do with whether the site-plan is correct or not—they have got to work to it, as there may be many reasons for the dimensions shown thereon.

All rules have exceptions, however, and had "Winged Heart" been unquestionably the best design one might willingly be disposed for art's sake to overlook any little discrepancies of that kind; but, on the contrary, any one who has

studied the designs and knows what he is looking at must admit that it has been fairly beaten on its merits, and seems to have been placed mainly owing to its supposed cheapness.

In his report Mr. Smith tells the committee what everybody has known all along, that it is "virtually impossible" to erect the buildings for the sum named in their instructions, and yet he has not the courage of his opinion to place the best design first, and leave the impossible money condition to be solved hereafter.

What hope is there for architecture as a fine art from such an award as his? Personally, I willingly make my acknowledgments for the high terms in which he speaks of "Lux Mundi"; but what is the good of all that to art, when it is put aside in favour of the cheap and commonplace? We have a right to look for a higher ideal than the encouragement of this kind of thing from a Professor of Architecture.—I am, &c., J. M. Brydon.

5, Cambridge-place, Regent's Park, N.W.
October 6.

Sir,—Referring to the criticisms of "A Competitor" in your last week's issue, allow me to say that I consider them sufficiently answered by Professor Roger Smith in his able report.—I am, &c., F. Boreham.

75, Finsbury-pavement, London, E.C., Oct. 7.

Sir,—After inspecting the drawings submitted in this competition, I can indorse the letter published last week by a competitor in every particular, except that instead of "Winged Heart" and "Lux Mundi" having occupied 6ft. more frontage than the plan of site issued to competitors shows, it is "*Winged Heart*" and "*Red Cross*" who show this encroachment in their plans upon the figured dimensions. This should be stated in fairness to "Lux Mundi," who, in common with the other eight competitors out of the ten, kept within the building line shown on the plan of site issued to competitors.

We, of course, assumed that this plan and the figures thereon were correct, and as there are no buildings, but unoccupied land, on either side of the site, we had no other data to refer to than the figured plans. This is no trifle in the report of the assessor to which we take exception, as you will readily see when I state clearly the actual facts. The body of the site is figured on the plan issued to competitors as 147ft. 6in. in depth, by 102ft. in width of frontage towards Tottenham Court-road. Both "Winged Heart," the first premiated design, and "Red Cross" show their buildings covering 108ft. frontage, or 6ft. more than the others, which, in a frontage of 102ft., represents an addition of one seventeenth in area to the whole site. I maintain that such a departure from the instructions should absolutely exclude these two designs from being premiated or adopted; if not, where is the use of a professional assessor? As any one acquainted with the difficulties of planning such complicated buildings in a very restricted area, which the assessor says "is only just large enough for the purpose; in fact, should there be any difficulty about securing unobstructed light over the adjoining land, it is not large enough," must know that 6ft. frontage by 147ft. 6in., or 885 superficial feet added to the site without authority gives a most unfair advantage over the other competitors. Again, I maintain that the assessor's report is inconsistent in excusing "Red Cross" and "Winged Heart," and giving the latter the first premium, when he points out as disqualifications that "Hearing and Seeing" "seems to encroach on adjoining land with steps and areas," and of "Spero," that "access is obtained on the south, and projecting steps are shown there. These and an access at the north from Whitefield-street appear to be outside the boundary of the building line shown on the plan. Its general arrangements no doubt are good, but they would be much curtailed if the projections were cut off within the boundary line."

"Hearing and Seeing" and "Spero" do, it is true, show steps and areas as described above; but surely they were justified in doing so, as one of the clauses in instructions runs thus:—"The portion coloured pink on block-plan represents the site to be occupied by new buildings, the whole area of which may be covered. The vacant ground on N. and S. sides may be deemed available for approaches to side entrances; but is not to be built upon." Even if steps are considered as buildings, these steps and areas would only occupy a very small portion indeed of the area allowed by the assessor to be actually covered by buildings in the designs of "Red Cross" and "Winged Heart" without any disqualification. In the face of this, I cannot accept the report as consistent or fair to those who have kept to the dimensions of site-plans and have written to the committee to that effect.—I am, &c.,

Another Competitor.

THE HOUSING OF THE WORKING-CLASSES ACT, 1890.

Sir,—An observant reader throughout of the clauses of the "Housing of the Working Classes Act, 1890," may note that not once does the word "architect" occur, and it is much to be regretted that no provision has been made with the view of compelling the public (whether complainants or proprietors of insanitary or dilapidated buildings) to employ suitable architects to confirm complaints or superintend such works as may be directed to be executed under the provisions of this valuable Act.

It is probable that many cases of severe hardship will occur by reason of the enforcement of the various clauses; yet it is quite beyond doubt that the result will greatly benefit the community generally, for if in any district four or more householders "living in or near to any street complain in writing to the medical officer of health of that district that any dwelling-house in or near that street is in a condition so dangerous or injurious to health as to be unfit for human habitation, he is required forthwith to inspect the same and to transmit to the local authority the complaint."

Neighbours' quarrels, and circumstances of a kindred nature, will sometimes lead up to unnecessary complaints being given, and it is in my opinion most certainly to be regretted that the clause should appear in this form, especially if it be remembered that, according to the Act, the absence of any such complaint will not excuse the medical officer concerned from inspecting any dwelling-house, and making a representation thereon to the local authority. Further than this, I consider that some protection against frivolous complaints might have been secured had there existed a clause insisting that all complaints should be backed by a member of the Royal Institute of Architects in addition to the four householders mentioned.

It is, I consider, further to be deplored that, in the initiative measure, the necessity for architectural aid is entirely ignored by the Act. The matters will be very much in the hands of the medical officer from the outset, and this, although the Act deals with dilapidated, as well as with otherwise insanitary buildings and areas; as the matter stands, building works will be entered upon without the aid of an architect (by reason of a supposed economy), and the compulsory employment of an architect in the case of proposed closing orders or subsequent works would have been a useful feature of the Act.

The Act fully provides for the legal enforcement of its clauses by all local authorities and county councils, and in case of necessity there is an appeal to the Local Government Board. Every local authority must cause to be made from time to time inspection of their district with a view to ascertain whether any dwelling-house therein is in a state so dangerous or injurious to health as to be unfit for human habitation, and power is given to forthwith take proceedings against the owner or occupier for closing the dwelling house, and any such proceedings may be taken for the express purpose of causing the dwelling-house to be closed, whether it be occupied or not, and upon such proceedings the court of summary jurisdiction may impose a penalty not exceeding twenty pounds, and make a closing order.

If, after a closing order has been made, the local authority should be of opinion that the dwelling-house has not been rendered fit for human habitation, and that the necessary steps are not being taken with all due diligence to render it so fit, and that the continuance of any building, being or being part of the dwelling-house, is dangerous or injurious to the health of the public, or of the inhabitants of the neighbouring dwelling-houses, then the local authority will order the *demolition* of the building.

In Part IV. Clause 75, the following occurs: "In any contract made after the 14th day of August, 1885, for letting for habitation by persons of the working classes a house or part of a house, there shall be implied a condition that the house is, at the commencement of the holding, in all respects fit for human habitation."

This retrospective clause, if thoroughly acted upon in connection with the rest of the Act, would probably clear the way to an extraordinary amount of work for builders throughout the country.—Yours faithfully,

George H. Bibby, F.R.I.B.A.

7th October, 1890.

"THERE'S WORK FOR ALL TO DO."

Sir,—As the architect referred to by "C. F. M." in your issues of the 19th September and October 3rd, and so crushingly criticised in your leader, I ask to be allowed to explain my views on the question of co-operation as applied to the profession or trade of building.

Looking at the whole subject broadly, the essential conditions for producing a thoroughly satisfactory building are, 1st, good designing; 2nd, sound workmanship; and 3rd, fair prices to both employer and employed. The first we will assume, but, given a good design, the next step is to get it carried out faithfully and honestly. To do this, it is first necessary to eliminate as far as possible all temptations to "scamp" the work. For the sake of argument we will assume that the architect is a man of honour, whose only aim is to do his duty to his employer. There are, of course, scamps in every profession, and no doubt it is perfectly easy for the architectural blackleg to cheat either on the usual or any other system. It is purely a question of personal character. The client will naturally intrust his work to a man in whose honour he has confidence, and must, like everyone else, suffer if he should happen to be disappointed. But, assuming this first point, there is no doubt but that the architect-builder has a far better chance of seeing his work honestly and faithfully carried out when the different craftsmen are engaged by him, and are under his direct control; nor will they do their work with less zeal when they find that, so far from being goaded into dishonest or indifferent workmanship by the eager avidity of the contractor to snatch an exorbitant profit or prevent a loss consequent upon his tender being below what honest work could be possibly done for, they are in every way encouraged to put forth their best efforts.

Nor would their zeal diminish when treated as co-operators with the architect in the work on which they are engaged, and when they share beyond their wages in the profits of their labour.

After all, it is only reverting to the ancient system. The old work was done in this way—the architect was the head, the men the hands of one and the same body, and no one was allowed to interfere with their direct co-operation. Hence much of the charm of the old work.

My reason for seceding from the Co-operative Builders was that I found, after practical experience, that I should be better able to carry out my views without being at the mercy of a committee.

I have, therefore, founded another scheme, known as "Hubbard's Profit-sharing Building Business," in which the interest of the men is maintained by an undertaking into which I have entered with them to equitably distribute one-half of the net profits of the business amongst them. The men are not shareholders, nor have they the rights or liabilities of partnership; but they are in every way encouraged to save and add to their profits, so that they may enjoy at the close of their lives the legitimate profits of their life's labour.

I inclose a copy of the rules, and am, &c.,

George Hubbard.

Sir,—In answer to "Pansa," I beg to say that it is the bricklayers and the carpenters who are the builders; the contractor is nothing but the profit-taker and sweater. Thomas Brassey very clearly shows this (though unintentionally) in a paper, "Co-operative Production," contributed to the *Contemporary Review*, Vol. XXIV.

Besides the saving to the employer, mentioned by "C. F. M.," by the direct association of the architect with the workmen, he is saved the contractor's profit, while such a comparatively small saving as the clerk of works' salary need not be mentioned. I quite see also, under this system, the great saving of trouble to the architect. He knows the men he has to deal with, while in general practice he never knows what duffer or scamp he may get hold of.

For those of your readers who have not an opportunity of referring to the volume (published in 1874) mentioned, I may say that the

"co-operation" Mr. Brassey speaks of for certain railway works was not co-operation at all. He says (page 223): "The whole of these works were executed by sub-contract. Some of the sub-contractors would take contracts for work costing in the total £15,000 to £20,000, and employing from 150 to 200 men. Frequently the sub-contractor would again let his work to the navvies at so much a yard."

Mr. Brassey says further: "When the work was organised in the manner described, the function of the principal contractor was rather that of a practical engineer superintending the execution of the works by a number of smaller contractors." And this is the point. I maintain that it was the work of the engineer himself to superintend the execution of the works.—I am, &c., CURRENTE CALAMO.

ASSOCIATION OF MUNICIPAL SANITARY ENGINEERS AND SURVEYORS.

SIR,—My attention has been called to a report of the proceedings of this association at Edinburgh in your issue of the 3rd inst., in which you have seriously misquoted what I said in the discussion which followed Mr. Cooper's paper. In your report, I am supposed to have said that the Liverpool Corporation were endeavouring to sell the blocks of artisans' dwellings they have erected, as they had failed in their requirements; whereas what I did say was that the corporation were now endeavouring to sell the land from which the "rookeries" had been cleared at a very low price, in order to induce persons to build suitable dwellings for the poor upon it.

The artisans' dwellings erected by the Corporation of Liverpool are models of their kind, and I am quite sure you will correct the misrepresentation contained in your last issue.—I am, &c.,

H. PERCY BOULNOIS, M.Inst.C.E.,
City Engineer, Liverpool, Oct. 6.

ZINC IN CONTACT WITH BRICKWORK.

SIR,—Allow me to corroborate the statement in Messrs. A. and C. Harston's letter (in your issue of Oct. 3), respecting the effect alleged to be produced in zinc through its contact with brickwork, as in the case of flashings, &c. I can speak from a practical experience of 30 years, and I have never found that zinc has suffered in any way from such contact. In fact, generally, when stripping a roof, I have found the flashings the best preserved. A strip of felt between, as suggested by your German contemporary, except, perhaps, where the flat brickwork is to be covered, and that merely to secure a level surface, I hold to be useless. Careful pointing with cement to secure perfect dryness is, in my opinion, all that is necessary.—I am, &c.,

J. S. RAINER.
(Pro Holden and Co.)

The Bishop of St. Alban's has just consecrated the new church of St. Thomas, West Ham. The church was designed by Mr. J. Oldrid Scott, and consists of a nave and one aisle, and seats 500 people. It was illustrated in our issue of Nov. 13, 1885.

The new infirmary at Hurstpierpoint College, built from the designs of Messrs. Carpenter and Ingelow, was opened on Thursday, the 2nd inst. The cost has been about £1,200.

At Monday's meeting of the Yeovil Corporation, a letter was read from Mr. R. Vining relinquishing the office he had held for 30 years as borough surveyor, and thanking the council for appointing him as consulting surveyor, at a salary of £100 a year for five years. He promised to do all he possibly could to assist the new surveyor, who commenced his duties on the 1st inst.

Mr. Ebenezer Timmins, engineer and ironfounder, of Mill House, Runcorn, died at his residence on Sunday at the age of 67 years. He was engineer to the Runcorn Waterworks, and had acquired a reputation throughout the kingdom as a sinker of wells.

The terms of an agreement for the erection by the Great North of Scotland Company of a new passenger station at Rosemount Viaduct, and a turntable on the north side of Union Bridge, were adopted by the Town Council of Aberdeen on Monday. The new station will consist of a building two stories in height, and be erected between Rosemount Viaduct and the Woolmanhill Tunnel. The price paid by the railway company for the land is £1,252 14s. 9d., and the work has to be completed by 1st January, 1892.

Intercommunication.

QUESTIONS.

[10398.]—**St. Giles' Cathedral, Edinburgh.**—Will one of our Northern readers send a sketch of the recently-discovered window in St. Giles', Edinburgh, as it is evidently one of the few Perpendicular details in Scotland; also if Burn, in his restoration, copied in the present traceries at all what he found pre-existing?—OS HUMERUS.

[10399.]—**Setting Kitcheners.**—What are the requirements necessary in setting a kitchener? Cannot a pipe be carried up from boiler to heat a coil over, or is it necessary to have a special boiler for this purpose? Shall be glad with information.—THOMAS.

[10400.]—**Weather Bar.**—Which is the best form of a weather bar for casement to a school-room subject to driving rains, and how should it be fixed?—SURREY.

[10401.]—**Church Decoration.**—Any suggestions on decorating a small church now simply plastered will be received with thanks. There is a chancel divided from nave by an arch, an open-timbered roof, one end gallery. The scheme must be inexpensive, and consist mainly of toning the walls; relieving by appropriate stencilling, or otherwise, the chancel; and putting a dado round the nave. —M. A.

[10402.]—**R.I.B.A. Exam.**—Will Mr. G. A. T. Middleton, or some other reader, let me know the following:—In the Preliminary Exam. for the above I note that drawings are to be sent, with certificate, for exemption from the exam. I saw Mr. Middleton's answer some time since respecting freehand drawing. What would be a good subject for geometrical drawing, as I am anxious to know?—X. Y. Z.

[10403.]—**Strength of Pipes.**—What is the rule for pipes which have to convey water at a considerable pressure? An easy rule would oblige.—L.

[10404.]—**Rise of Water in Basement.**—Can anything be done to prevent a basement room being flooded after a heavy rainfall? The soil is clay. Cannot the wood floor be substituted by an asphalte or cement surface? Answers will be gladly received.—A TENANT.

[10405.]—**Levelling.**—Are there any improvements in instruments for levelling, and which is the best level for ordinary purposes?—SURVEYING STUDENT.

[10406.]—**Sash Fastening.**—I want to specify a really good fastener. Is there not a special kind for houses of a superior make that will not easily get clogged up? The springs of the ordinary fastener are a great objection, as they are continually getting loose, and are readily broken.—A. Z.

[10407.]—**R.I.B.A. Exam.**—Will some of your readers kindly give me some information under the following circumstances?—Twelve months ago I entered for the Preliminary Exam., in ignorance of the restriction that two years have to elapse between each successive exam., which means at least four years before I can enter for the final, as I have been relegated in the Preliminary for one subject—viz., French—and as I am now old enough to take the final, I should like to know if I can do so without taking the Preliminary over again and then waiting the stated time for the intermediate and final.—ANXIOUS.

[10408.]—**Party Fence Wall.**—It is proposed to take down a portion of a garden division wall (within the radius of the Metropolitan Building Act) and rebuild in the same position to a greater height, to form a side of a proposed building. Must a party-wall notice be served on adjoining owner, or can the work be done if he objects? If some experienced readers will kindly say what can be legally done, it will greatly oblige.—DOUBTFUL.

REPLIES.

[10394.]—**Solid Wood Floors.**—I should certainly recommend flooring boards to be nailed to fillets fixed in the coke breeze concrete, so that there may be an air-space between the latter and the flooring boards, as in W. Lindsay's method. The "Acme Board Flooring Co." has a layer of cement under the boards, which are laid on some composition. For solid and durable floors, the solid wood block is certainly to be preferred, as no moisture can then find its way under the wood.—G. H. G.

The bust of Eugène Delacroix, the painter, by M. Dalou, was unveiled in the Luxembourg Gardens, at Paris, on Sunday.

The Rev. Trevor Owen, Vicar of Trevor, is conducting a series of excavations at the Cistercian Abbey of Valle Crucis, near Llangollen. Whilst excavating along the north of the ruin, Mr. Owen has recovered the tombstone of a Knight Templar, beneath which were a few decayed bones. In completing the excavations along the west front of the abbey, the base of a spiral staircase was also discovered. Many pieces of molten lead, iron, charred wood, and stone have been discovered, demonstrating that the original abbey was destroyed by fire.

The Birmingham City Council decided on Wednesday to consult Mr. James Mansergh, C.E., with reference to the desirability of seeking Parliamentary powers for an extension of the water supply. It happens that the firm of Lawson and Mansergh, of which he was a member, were associated with Sir Robert Rawlinson, C.B., in the inquiry he made in 1871, under instructions from the town council, on the whole subject of the water supply of Birmingham. Extensive alterations and additions have, it was also reported, been carried out at the Aston pumping-station at a cost of £5,000, under the direction of Mr. Gray, the water engineer to the corporation.

LEGAL INTELLIGENCE.

RE W. L. KELLAWAY.—Under the failure of William Lemon Kellaway, White Lion-street, and Penton-grove, Pentonville, builder and contractor, a statement of affairs has been furnished, showing total liabilities £32,944, of which £29,532 are fully secured, and £3,148 expected to rank, with assets estimated to realise £676, after providing for preferential payments. The debtor commenced business in 1881 with about £500 capital, his contracts consisting principally of the erection of artisans' dwellings. He attributes his failure to his inability to realise or obtain further advances on mortgage property in Duffering-street, St. Luke's, and to losses on contracts.—The debtor has intimated that it is not his intention to make a proposal.

CHIPS.

The widening of the quay at Weymouth, which has been in progress for the past two years, is now almost completed, and the plant and machinery are being removed. The contract has been carried out by Mr. Saunders.

The town council of Halifax have invited competitive plans from architects practising in the borough for new baths to be erected on the Woodside Estate.

Mr. H. H. H. Horsley, the oldest artist in the Midlands, died on Friday last at the age of 84. Mr. Horsley was the senior member of the Royal Birmingham Society of Artists, having been elected to that body in 1833, and having remained a member ever since. He practised his art—first as a portrait painter and later as a landscape painter—with much assiduity during the long period above mentioned, and it is a striking testimony to his vigour that the present exhibition of the Birmingham Society of Artists contains some of his pictures.

The organ in the parish church of Winchcombe, which was built in 1782 and enlarged in 1844, has just been reconstructed and received further additions, the present works having been carried out by Messrs. Bishop and Son, of Marylebone-road, N.W. Side-wings, matching the old work, have also been added to the case. The reopening took place on Wednesday week.

The civil action for damages by Messrs. Monk and Newell, contractors, against the Corporation of Liverpool in connection with the Mersey aqueduct crossing, adds to the gravity of the position of the Vyrnwy scheme. The damages claimed amount to £28,000, and the case will probably be heard before Christmas in the Court of Queen's Bench, London. A counter-claim by the Corporation will probably be made, but it is stated that this does not nearly amount to the sum above named.

Owing to the increase in the population of the parish of St. Botolph, Lincoln, an additional church is to be built. Plans have already been prepared by Mr. William Scorer, architect, of Lincoln, the church being designed to accommodate 487 worshippers. The cost is estimated at £2,876.

The Bovril Company, Bath-street, City-road, were summoned to the Clerkenwell Police-court on Friday, for having caused a sky sign to be erected above their premises in such a manner as to be a source of danger to the public. Evidence was given that the letter B projected over the thoroughfare, and that the sign was 152ft. above the pavement. For the defence, Mr. George Sage, the constructor of the sign, said special precautions had been taken, and there was no danger. The magistrate imposed a fine of forty shillings. Notice of appeal was given.

A new studio will be opened at King's College on Monday next, the 13th inst., under the auspices of the Worshipful Company of Carpenters, for wood-carving classes. Particulars may be had of the clerk to the company, Carpenters' Hall.

On the opening day of Professor Banister Fletcher's Classes in Architecture at King's College, 102 students attended—a gratifying commencement of the new courses. The third-year students do not commence work till to-day (Friday.)

The necessary funds for purchasing the fields proposed to be added to Peckham Rye—£50,925, having been obtained, it is expected that the extension will be opened early next year by the County Council. A final £5,000 is, however, required to extinguish the leaseholds of certain houses that disfigure the ground, and the freeholds of which have been purchased.

The soundings made by French engineers on this side the English Channel in connection with the proposed Channel Bridge are now completed. The results of the survey are reported to be less satisfactory than was hoped, the floor of the Channel between Folkestone and the Varne being somewhat unfavourable to the project. Another route is, therefore, contemplated, probably between the nearest land points—namely, Cape Grisnez and Dover.

Our Office Table.

Mr. Alfred Waterhouse, R.A., in an article jointly contributed by him with Mr. H. Lawson, M.P., to the *New Review* on "Street Improvements in London," repeats his suggestion advocating the creation of a council of taste nominated by the Government to look after new streets and buildings in the metropolis. He writes: "Such a council has been in existence in Paris for upwards of two centuries, and has done its work effectively and at little cost to the public, which has thus had the advantage of the very best advice on matters of public taste from men whose fitness for the task, ability, character, and impartiality are unimpeachable, and who consider this office of the highest distinction and honour. Such a tribunal might report its recommendations to the County Council or the Board of Works, and if the representations were received with the attention they would deserve, they would not only save us from much annoyance and humiliation which, as a people of taste, we are now subjected to, but would conduce greatly by well-timed advice to the beauty and attraction of the metropolis."

"The Architecture of the Renaissance in England" is the title of a book about to be issued in six parts by Mr. B. T. Batsford, in illustration of a series of historic mansions and other buildings erected in this country between years 1560 and 1630, with descriptive letterpress notes by Mr. J. A. Gotch, F.R.I.B.A., assisted by Mr. W. Talbot Brown, A.R.I.B.A.. The programme includes Hardwick Hall, Hatfield; Kirby, Blickling, Cobham, Burghley, and other large houses as well as less important ones, such as Ragdale, Humbleton, Condover, Brereton, Lilford, and others. The illustrations will be chiefly photo-lithographic or "Lichtdruck" reproductions of photographs taken for the work under the direction of the authors, who have drawn besides some twenty plates of measured drawings, making in all about 124 plates for the entire book. Small sketches will be interspersed with the text. The first part is announced to appear this month.

One of the features of Newcastle-on-Tyne is the absence of direct means of communication between the chief points in the city and the roundabout and inconvenient routes that have consequently to be traversed between the chief points. Mr. J. J. Lish, of that city, past-president of the Society of Architects, has devised a scheme of street improvement which appears to remedy this evil, and to provide excellent sites for business premises at an outlay not unreasonably great when the advantages to be secured thereby are considered. Mr. Lish's scheme of improvement has as its leading feature an almost straight line of thoroughfare running east and west from Heaton to Elswick-road, with a branch off to Stanhope-street. He suggests as a site for the projected new Town-hall, a triangular central position facing the broad Haymarket, just where Percy-street and a proposed extension of Grange-street diverge from that leading thoroughfare, while behind it in Percy-street, and separated from the town hall by a short street, would be the new Assize Courts. Under an alternative scheme, the town hall is placed one block further south, facing Grey's Monument in Blackett-street and Grainger-street; but if the suggested improvements were carried out, the Haymarket site would become the natural centre of the city, and therefore the preferable position for its municipal buildings.

A committee of the town council of Birmingham reported on Thursday to that body that they have expended the sum of £2,000 in commencing a collection of water-colour drawings in the belief that a nucleus will speedily be supplemented by gifts and bequests. The works purchased with this sum were:—A water-colour drawing, by Walter J. Langley, R.I., of "A Fisherman's Widow"; "A Cumberland Lake Scene," by J. B. Pyne; a water-colour drawing, by J. Henry Henshall, R.W.S., "In Wonderland"; a water-colour landscape drawing, by Thomas Collier, R.I.; and a water-colour drawing by R. P. Bonnington. They have also bought some examples of Indian textile fabrics, antique lace, and ironwork. The amount expended by the committee to date is £12,083 7s. 3d., making, with £2,500 appropriated to unexecuted commissions, a total of £14,583 7s. 3d., of which sum £6,448 5s. has been devoted to the purchase of paintings, and £8,135 2s. 3d. to industrial art.

A special committee of the Glasgow Town Council appointed to fill the vacancy caused by the recent death of Mr. John Carrick, the Glasgow master of works, has recommended that the office be divided, and that Mr. John Whyte be appointed master of works, assessor to the Dean of Guild Court, and superintendent of streets and sewers, and that Mr. A. B. M'Donald be appointed burgh surveyor and engineer, and head of the architectural department, both gentlemen having been for some time in the employment of the corporation. All architectural work of an important character is to be in future given to outside architects.

The death is announced, in his 88th year, of Mr. Henry Courtney Selous, for years an exhibitor at the Royal Academy. He was a student at the Academy School, gained the silver medal for drawing from life when very young, and painted and exhibited his first picture at the age of 14. Before he was 20 he took two gold and two silver medals from the Society of Arts, and was elected a member of the New York Academy. He was principal painter of Barker's, afterwards Burford's, panoramas for 35 years, during which time he gained prizes in numerous competitions for original drawings. His best-known works were his two large pictures of Jerusalem, Ancient and Modern, and a painting of the opening of the Great Exhibition of 1851, which is now in the South Kensington Museum. His fresco of Alfred the Great at the Law Institute in Chancery-lane has been described as the only modern example of genuine fresco.

The annual meeting of the Association of Sanitary Inspectors of Great Britain was held on Saturday evening in Carpenters' Hall, London Wall; Mr. Hugh Alexander (chairman of council) presiding. In the annual report a warm tribute was paid to the memory of the late Sir Edwin Chadwick, K.C.B., ex-president of the association. During the past session of Parliament, it was said, there had been a continued block of business, excluding measures of sanitary reform recognised as necessary to make sanitary inspection more beneficial to the public health. The report called attention to the necessity for a statutory definition of the qualifications for sanitary inspectors, tenure of office, duties, and salaries, and declared that the conditions under which at present sanitary inspectors discharged their duties were inimical to the interests of public health. The report was adopted, and Mr. Alexander was re-elected chairman of the council.

A new board school in Ditchling-road, Brighton, erected at a cost of £13,250, was opened by the Mayor on Friday.

The Great Eastern Railway Company have presented the remains of the mansion of Sir Paul Pindar, which they are removing from Bishopsgate-street, under their terminus-widening scheme, to the South Kensington Museum.

The ceremony of laying the foundation stone of the new church of St. Augustine, Newland, Hull, was performed on Tuesday. The plans have been prepared by Mr. Gilbert Scott for a building in the Late Flamboyant style, with nave, and a single aisle, a wide one on the north side, to be built of brick, with stone facings. The estimated cost is £3,900.

Plans by Mr. Sydney Mitchell, of Edinburgh, for a nurses' home to be added to the Royal Infirmary of that city have, after considerable discussion between the Infirmary Committee and the Dean of Guild Court, been finally approved. Objections were raised by the Court that the new pavilion would tend to shut in the air coming to the Infirmary, but it was pointed out that the accommodation was urgently needed, and that as full provision for air and ventilation as possible has been made.

The Devon and Cornwall Banking Co.'s new branch premises at Dawlish, erected by Messrs. H. Webber and Co., contractors, Paignton, after designs by Mr. G. S. Bridgman, M.S.A., Torquay and Paignton, were opened on Monday. The bank occupies the site of an old beach house adjoining Brookdale-terrace, and as the new premises were by arrangement set back about 8ft. from the line of the old cottages at the bottom of Teignmouth-hill, the thoroughfare was opened up. The elevations are three stories high. The basement and ground floor front is of limestone, and the upper portion is of Chudleigh limestone, while the whole of the dressings and cornices are of Ham-hill stone.

MEETINGS FOR THE ENSUING WEEK.

Friday.—Architectural Association. Address by the President, Leonard Stokes. 7.30 p.m.

CHIPS.

At Stirling-road Wesleyan Chapel, Birmingham, on Tuesday, the new lecture-room, which has recently been erected from the designs of Mr. E. Harper, the architect of the adjoining chapel, was opened. The room is a structure of one story.

The Works Committee of Edinburgh Water Trust have unanimously agreed to appoint Mr. Mansergh, C.E., London, to act along with Messrs. Hill and Gale, engineers, in the remit recently made to them in reference to the question of procuring an additional water supply for the district.

The Royal Manchester Theatre in Irlam-road, Bootle, near Liverpool, was opened on Monday night. The builders were Messrs. H., J., and C. Pennington, of Liverpool.

The Lyceum in Bold-street, Liverpool, was re-opened on Thursday in last week, after extensive alterations and requirements, carried out by Messrs. Brown and Backhouse, from plans and under the superintendence of Mr. Robert Wylde, architect, of Lord-street, Liverpool.

Holloway's Ointment and Pills are never at fault in successfully disposing of skin diseases, scrofulous sores, and scorbutic affections. In all hereditary diseases these excellent remedies may be relied upon, and by their means the most delicate may become strong; the foulest blood may gradually be changed into the purest fluid.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

ELECTRIC LIGHTING.

COMPLETE INSTALLATIONS OR WIRING ONLY { ESTIMATES GIVEN.

STRODE & CO. 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. **LONDON**
New Branch Showrooms:—188, PICCADILLY, W.
Telephone No. 3958.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—

THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Birmingham.—For the building of a branch public library at Spring Hill, for the corporation:—
Sapcote and Sons (accepted) ... £4,222 0 0

Birmingham.—For the building of the Bloomsbury branch public library, for the corporation:—

AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1867.

FRIDAY, OCTOBER 17, 1890.

CONGREGATIONAL BUILDINGS.

PROBABLY the highest function of the art of architecture is that concerned with the design of buildings intended for religious worship. At least, the most typical examples of the art are those connected with the temples of Paganism and of Christianity. The noblest art has been found associated with the temple and the sepulchral monument. Though in these days the profession have to consider various forms of structure for purposes that did not exist in the earlier ages, yet the requirements of buildings for public worship and preaching still call into exercise skill of no mean order, and lead to the erection of structures that display the more prominent and persuasive qualities of art. An architect well equipped for his profession cannot now be content to know the history and growth of church-building in England, or how to satisfy the requirements of the opposite schools of thought in the Anglican church, congregations that prefer a traditional ritual or one of primitive simplicity; but he must be prepared to solve the more difficult problem of arranging buildings to suit various Nonconformist sects, in which a large congregation can be seated within hearing and sight of the preacher. Between these two modes of design a very essential difference is implied in mind and feeling. The traditional type, with its historic growth of forms, appeals to one class of architectural minds; the other is a problem for which precedents are few, hence it is more difficult and is only mastered by those who can resolutely set aside all previously conceived ideas. With the one the doctrinal idea of a building in which the Sacrament is prominent, involves the basilican type of church having a chancel or apse of large size to which everything else is subordinate: one that lends itself to picturesque arrangements, but is equally unsuited for a congregation whose main object is to hear a preacher and to partake in congregational singing. This unsuitability of the older type is seen more conspicuously in many of our cathedral churches, where a second pulpit is often set up westward of the choir-screen for the better hearing of large congregations which now frequent them. The long church with its triple division into avenues was the natural outcome of a liturgy in which processions form an important part of the service as in the Roman and Anglo-Catholic rituals; it is, indeed, this point of length, compared with breadth, which differentiates the two types of building. The distinction has at last been recognised, after a long period during which many Nonconformist buildings were erected to imitate the older church plan. Architects are now grasping the problem of how best to provide for large congregations in restricted areas. Considerable advances have been made of recent years; but there is still much room for improvement, especially in the direction of architecturalising the interior. Though ingenious plans have been adopted, not many architects have succeeded in giving them an external form. Amongst those who have laboured most successfully in giving a character to the architecture, we must mention Mr. Jas. Cubitt, whose able work on "Churches for Congregations" is well known to many of our readers. Since the publication of this work many very clever buildings have been erected, based on the Greek cross and the central-hall principles. The square and octagon forms combined have furnished some of the more important of these plans. Of the latter class are the polygonal churches and baptisteries, as those of St. Vitale, Ravenna, and St. Lorenzo, Milan—the former remarkable for the manner in which an octagon arcade is domed over with a surrounding aisle.

The plan of the congregational type of building has generally been a rectangle, with a recess at one end for the platform. Sometimes we see it broken by slight transepts, more for the sake of appearance, and often we find a tower added as a porch to the west end or on one side. The architects have sought refuge in imitation of the traditional church for external appearance, while contenting themselves with various expedients internally to assist the acoustics and to reduce the space occupied by pillars and arcades to the minimum. The endeavour has been to give an external church-like effect, while bringing the interior to the condition of a large preaching hall unimpeded by columns. This compromise, we know, is beset by difficulties; it has never been satisfactorily solved, for the sufficient reason that the avenue or arcaded church was the outgrowth of a plan arranged for a special purpose, and to make it perfect the arcade should be prominent and pronounced. On this rock early Nonconformist architects came to grief. Trying to avoid the arcade and its piers, the whole design became a subterfuge—a subversion of the original idea. Our readers know the various attempts made to retain the arcade, while endeavouring to reduce its substance to a minimum. Two ideas presented themselves, and these have been worked upon ever since: the first is to substitute iron for the stone pillar, the second to reduce the number of arches or bays. The result of this attenuation was to rob the interior of all character and meaning, and to produce a feeble and meagre imitation. The equal-armed cross has been tried with better success. The pillar difficulty was wholly or partly met; the transepts being short, have two roofs intersecting in the centre, the latter sometimes carried up as a dome or lantern. This plan enables the pulpit to command the whole congregation, especially if it is brought into the church in a line with two of the opposite transepts. Or a plain, square building having four piers within forming a cruciform arrangement of roof, gives a large unimpeded area, as the four corners taken out of the Greek cross plan are, in this plan, thrown into the church, a principle on which we have a few very ingenious and highly-effective interiors by Wren, notably in some City churches. St. Stephen's, Wallbrook, shows a rectangle of about 3 to 2, subdivided by columns carrying over half the area a dome with clerestory, a celebrated instance of roofing over a large area architecturally; though, curiously, it has been very little taken advantage of by architects who desire a large area. The Temple Church is a 13th-century example of a circular nave attached to a rectangular choir; the acoustical properties are excellent. One of the first experiments made in this direction in the construction of a church was at Harlesden in 1887. Mr. E. J. Tarver designed a church in which a large octagon, joined to a short rectangle at the west end, formed the plan. The octagonal part, which was covered in by intersecting roofs, forming internally an octagonal lantern with flèche over, was about 60ft. in diameter, and a small recess was made for the altar at the east end. The junction of octagon with a rectangle divided into nave and side aisles was not, however, a very happy expedient. The seats were arranged over the entire area of the octagon or in straight blocks. A more successful attempt was made at the Union Chapel, Islington, in which a square is converted into an octagon by four isolated piers arcaded above, the four other piers being engaged to the walls of recesses. The piers only obstruct about six sittings out of the whole 1,600. A lofty lantern roof, ingeniously contrived by the architect, Mr. Jas. Cubitt, crowns the octagonal area, the side aisles outside the octagon being roofed up to the octagonal arcading which carries the lantern. A view of this chapel we published on March 29th, 1878. The particular point of this design is that it is an attempt to produce an architectural treatment of a galleried central hall for preaching. Another well-known example of the octagonal plan is that of Christ Church, in the Westminster Bridge-road, designed for a large congregation under Mr. Newman Hall. Other instances of congregational churches planned on the central-hall principle, may be cited to show what has been done towards the solution of the problem. They all present us with a more rational basis for congregational worship than the "avenue" plan, while acoustically those we have mentioned have been found to give good results. The recent competition for the Whitefield Memorial Chapel, noticed by us last week, afforded architects another opportunity of displaying their invention in buildings of this character. We might have expected a distinct development of the problem, though only two of the designs indicate any satisfactory attempt to render a large congregational area architectural. It is singular to remark, as showing the still uncertain state of the architectural mind on the subject, and the tentative efforts made, that the larger number of competitors adopt the rectangle with the old arrangement of side aisles and recesses as in the case of the selected design. Other designs show the rectangle placed transversely to the axis of the platform, with seats semicircularly disposed round it—a plan well suited for a lecture theatre for a hospital, but not certainly one that can lend itself to any architectural effect either externally or internally. These very opposite principles of planning conclusively indicate the absence of any argeement as to the conditions of congregational church planning, and show that architects have still very imperfect ideas of acoustical arrangements. To instance the question of seating: the selected plan has the blocks of seats planned in straight rectangular lines, with three parallel passages on the old system; others have made the centre passages radiate towards the pulpit, with the seats as tangents to the radii of sight; a third class show the seats arranged in arcs of circles struck from the platform as a focus, and this arrangement has been adopted by those who have taken the lecture-theatre type. No doubt there is a scientific fitness in the circular seating plan, as the waves of sound are propagated in circles; but it does not follow that the circular arrangement is therefore better to assist the hearing, while on architectural grounds the rectilinear plan, as that first mentioned, is more in keeping with structural lines, and of course is less costly in construction. The question of the position of platform and pulpit is another point about which architects have very conflicting views. In some places we find the pulpit placed against a flat wall or in a recess; while in others it is advanced into the body of the church. To give an initial force to the voice and to confine it within a small space at first has led theorists to suggest a trumpet-shaped section to the building, which is contrary to the position assigned in the latter. Under a lofty roof, assistance is required by the aid of a sounding-board to prevent a too rapid transmission vertically of the waves of sound.

The gallery has always been the bugbear of the church architect. In some of the Rhenish churches the gallery has been treated in a sensible structural manner, and made to form a part of the fabric. At the fine church of St. Augustine, Kilburn, following these

models, it is formed in the thickness of the wall or arranged between internal buttresses, which are pierced by arches to form, below an aisle and above a gallery. Why should the Nonconformist architect restrict himself to that very miserable and intensely ugly arrangement of a sloping platform of seats resting on a few niggardly posts of iron? Why should he still desire the circular gallery front at the end opposite the pulpit, which looks to rest on nothing? These are questions which, however difficult they appear, owing to the necessity of gallery accommodation in town churches, are worthy of more attention and study. Of course, the main difficulty is the column obstacle again. A great deal can be accomplished by placing the galleries in recesses or transepts outside the central hall, or continuing them upwards to carry a clerestory. The arcade and clerestory are features that cannot be altogether ignored even on this system if an architectural interior is to be attained. In the beautiful little church given by Agincourt of Sta. Fosca, Torcello, we have a germ of what a congregational building may be where a dome springs from eight columns placed within a broken square with recesses on each side.

PROPORTION.

THE whole secret of design in architecture may be summed up in the terms Proportion and Expression, for the differences which mark off one style from another are those mainly derived from the form and proportion of the openings. Professor Banister Fletcher, in his opening address to students of architecture at King's College, very appropriately alluded to the subject of proportion, which he illustrated by taking the openings of Somerset House, and by showing by model the effect of first a doorway of half its width in height, next making it a square opening, then adding one third of the width to the height, and, lastly, making the height twice the width (see diagram, p. 498, *ante*). Though the low opening may be really high enough for a doorway, the mind naturally reverting to the human figure as a standard of proportion, or to the "fitness" of things, at once condemns the proportion as bad for a doorway. We sometimes, it is true, see wide entrances to the pits of theatres, drill halls, and warehouses; but they invariably look out of proportion—that is, they appear awkward and offensive to our sense of fitness. Even in some Queen Anne houses we have seen doors of about a square, which looks contrary to our standard, because we naturally recall to the mind the human proportions; though, as a matter of actual use, the wide opening may be an advantage in getting in or out large pieces of furniture. The manner of teaching proportion which the Professor adopted has the merit of ocularly demonstrating one of the essential principles of design, for there are many people who imagine that a few inches more or less in the width of a door or window make no difference whatever. The same disregard, or ignorance, of a pleasing proportion is seen in the planning or selection of rooms, as if it made no difference whether the room was square or oblong, and that furniture of a certain size and shape could be made to look equally as well in a square as an oblong room. The window, like the door, has its own pleasing proportion. We can widen a window, as Professor Banister Fletcher says, but we can easily spoil it by the operation, unless we take care to preserve the unit of proportion by sub-dividing the width by mullions, as in a Gothic window, or by bringing the eye to dwell on the proportion of one of the panes. But it is absolutely essential to preserve some unit or individual part in a wide window, or it would be quite as offensive as a wide doorway.

The lesson of proportion need not stop at windows and doorways: it can be applied not merely to plans of apartments and their heights, but to the art of composition itself. For example, Professor Fletcher might have shown that into his first illustration of breaking up a plain building front into parts, proportion enters. If, for example, we take a long, straight façade perfectly flat of blank wall, or with windows in it, equally distributed, we may have a proportion that offends by its length and monotony. But break it up by projecting or recessing certain parts, say the two extreme ends and a wide centre, and the proportion of the whole is greatly improved, for although not an inch of height has been added, the eye is arrested by the three individual parts into which the whole façade has been divided, and the extreme length, being broken by oblongs of the contrary direction, is rendered less fatiguing to the eye. By further dividing, or by making vertical lines, the proportions may be still more altered. The effect is mainly due to the fact that the eye attends to the smaller individual parts instead of to the whole. To take a concrete case, a continuous barrack front looks much longer than an equal length of houses forming a street of the same height, because each separate house, being an upright oblong, arrests the eye, and the number of stories forms a scale to its real height. In design, then, the value of proportion is in composing the individual parts or subdivisions by giving them the proper ratio of height to width, and so drawing the eye from the proportion of the whole mass to that of the individual parts. What better illustration of this can be found than in towers? We constantly hear people talk of the proportion: it is either said to be squat or too tall, referring unconsciously to a standard in their mind's eye, from which they cannot get away. Thus, for example, St. Paul's dome would look very squat after gazing at a tower and spire like that of Salisbury, and many towers would look too short after seeing the Boston example. The proper proportion of any particular tower can only be judged by the individual parts or stories of which it is composed. It may look exceedingly tall and disproportioned if the belfry windows are small, and a mere repetition in every stage, but by subdividing the height into stories of unequal height, and by making the openings narrow and small here, and large there, the proportions will be pronounced excellent. Therefore propertion is not a matter of mass only, though of course we have to see our buildings through dense fogs sometimes, when they ought to look pleasing, but is chiefly to be studied in the smaller parts of a design. Bad proportion in a window, a door, or a fireplace, will always be an eyesore in a room, however well proportioned it may be; the same want of pleasing ratio will spoil a wall-paper, the panelling of a door or dado, or any ornament, though the eye in the latter cases would have to be more educated. The ordinary sense of fitness in proportion is, however, pretty general; and, roughly speaking, we may say, that it exists among people almost as strongly as the sense of harmony or music. As a discordant note jars on the faculty of hearing so we find a glaring disproportion, or want of fitness, produces an unpleasant sensation on the mind.

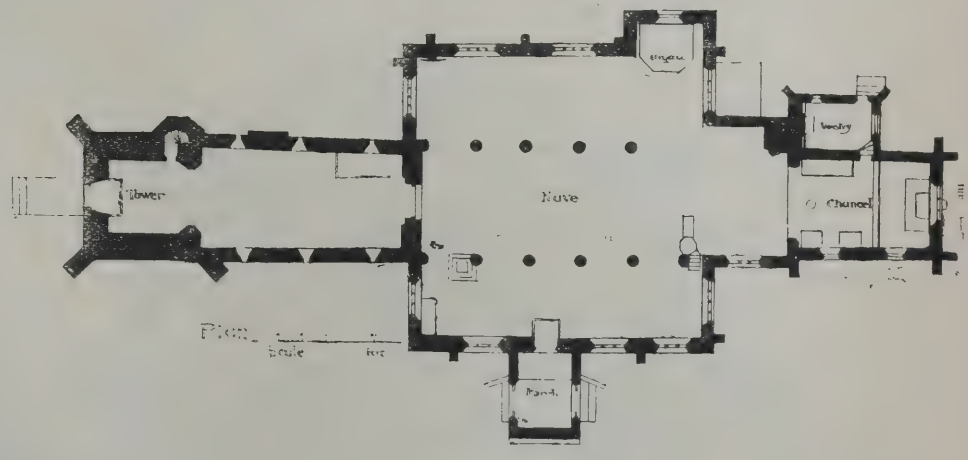
Proportion is, however, not confined to ratios and dimensions; we experience its influence in the right proportion of mass to detail, of plainness to ornament, and these are quite as necessary to learn by those who are studying artistic kinds of expression. The value of models or illustrations in the designs of carpets, wall-papers, decoration applied to furniture and metal-work is apparent. We often see patterns offensively obtrusive and distractive, owing to the want of quiet surfaces or a due intermixture of ground and pattern; furniture full of unrestful twists and turns, and carvings which distract rather than please; because the artist has not realised a sense of proportion between the plain parts and the ornament. These are things that can be taught by showing how much ornament can be placed on each part without overloading it, what surfaces or members should be plain, and which may be enriched. The whole question of ornament is one of "more or less." The amount of ornament on a surface must indeed be in inverse ratio to the height of relief. Thus every square quarter-inch on a Benares brass bowl may be occupied with incised ornament without offence to the eye, for the lines are narrow and the relief exceedingly low; but in repoussé work of massive relief in the same metal, anything beyond a simple device broadly treated is felt instinctively to be intolerably coarse. To teach applied design on rational principles, the student is in need not merely of examples in the art he is studying, but of demonstrations or models that will show him the most agreeable combinations. He should not be taught to copy furniture and decoration of various masters and styles, but be taught to realise for himself the due proportion between structure and forms of the plainest and most direct kind and the ornament that should accompany them. It is in these more extended ways we may learn the value of proportion in the arts of design, and not merely in regard to the heights and widths of openings, the proportions of columns and entablatures, and of apartments, which appear to be the only kinds of proportions that are recognised by the Classic revivalists.

STREET BRIDGES.

THE continual blocks that take place daily in our Metropolitan streets, partly owing to the relaying of roadways, and partly to the ever-increasing demands of public traffic, should compel our two leading authorities to devise a scheme for diminishing the delay and inconvenience caused thereby. In addition to road repairs, which are constant and necessary at one part or another of a busy thoroughfare, there is a further daily cause of block in proximity to the theatres and places of public entertainment. The Strand, for example, during certain hours of the day and night, is crowded to a dangerous degree by the vehicles which put down and take up the frequenters of these places of public resort. Sometimes the cabs and private carriages occupy a considerable space of the roadway, to the stoppage of ordinary traffic, both pedestrian and vehicular. A block of traffic, from whatever cause, is intensified by the difficulty experienced in crossing the road near the congestion. The pavements get crowded by persons who wish to cross, but find no opportunity of doing so, and the result is aggravated to an extent that calls for some immediate remedy. The Commissioners of Sewers have done something towards improving the City; but more might be done. We remember a suggestion was made to relieve the crowding near the Bank and Mansion House by forming subways between these points and the Royal Exchange. Why cannot this idea be utilised not merely there, but in other parts of the City, at the crossing of St. Martin's-le-Grand, Cheapside, and Newgate-street, of Victoria and Cannon streets, at the very crowded junction at King William-street, Cannon-street, and Gracechurch-street? No doubt in many of these places subways could not be formed without interfering with sewers, water and gas mains; but short lifts to subways passing below these substructures might be constructed. But why have not overhead crossings been attempted, which would be comparatively simple and inex-

pensive? These footway bridges could be constructed of light iron trussing, crossing at right angles to each road. At the junction in King William-street one bridge west of the Monument, crossing from the south side of Cannon-street to the angle of the block of houses, and thence across King William-street, would be sufficient. At the Bank a triangular or circular structure above the traffic, with stairs to each of the main streets which radiate from this point, might be formed. At Ludgate-hill a light footbridge is urgently needed, which could be placed next the railway viaduct. In addition to footbridges at main junctions, facilities for crossing ought to be provided at several points, as those opposite public buildings, so as to enable pedestrians to cross over. Charing Cross and the Strand are equally in need of these facilities. Of course, the principal difficulty is in providing for the approaches and stairs on either side, owing to the narrow-paved footways. For this purpose it might be necessary to acquire property and set back the house-fronts at the ends of the foot-bridge. The means of accomplishment are, however, small, compared with the advantages that would be insured in rendering our streets less crowded and more safe. Nor would it be difficult to obtain designs for structures of a kind that would be unobjectionable from an artistic point of view. We should have something better than the lattice girder foot-bridge of the railway station connecting opposite platforms. The chief danger to avert is the constantly recurring blocks on footways of streets crowded by vehicles. Timid ladies and children would prefer ascending a flight of steps to the risk of crossing, especially if they were in a hurry. The principal remedy is to prevent those temporary blocks which take place all day long in crowded thoroughfares, and for those who make the blocks—people who hesitate to cross the road of thoroughfares like Cheapside and the Strand—the plan suggested would afford a great relief.

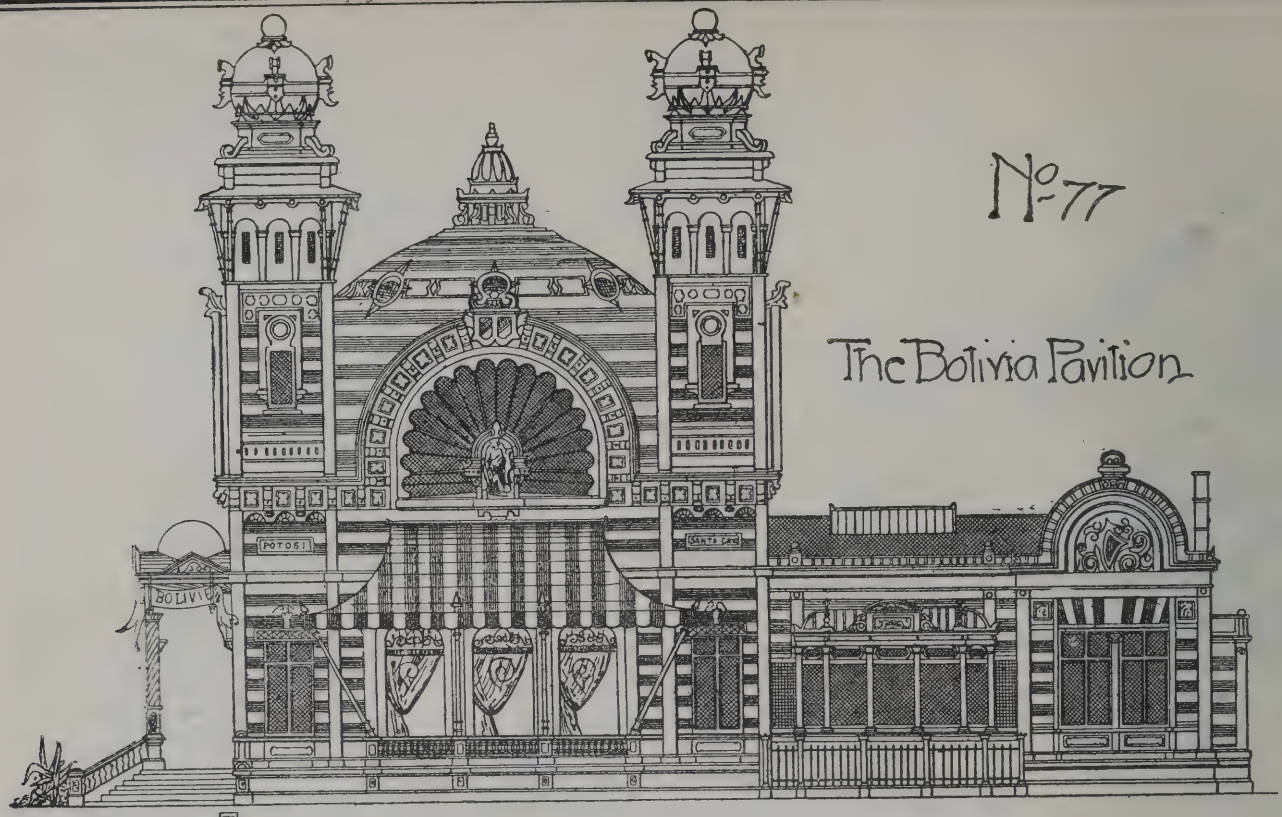
ST. WOOLOS CHURCH, NEWPORT.



THE parish church of St. Woolos, Newport, Mon., is regarded as the most ancient and interesting of any in the district. It is finely situated on the summit of Stow Hill, being itself a landmark, and commanding a most extensive view of the surrounding country and Bristol Channel. The tower is attributed to Jasper Tudor, Duke of Bedford, who also built the great tower of Llandaff Cathedral, which goes by his name. There is an exceedingly perfect Norman nave and fine archway between this and the chapel. Some interesting old effigies remain, and other fragments. The church was restored in 1855; but the detail is not of the best type, being hard and mechanical in feeling. Previous to this, many interesting features must have disappeared from time to time; but the church has fortunately escaped stucco.

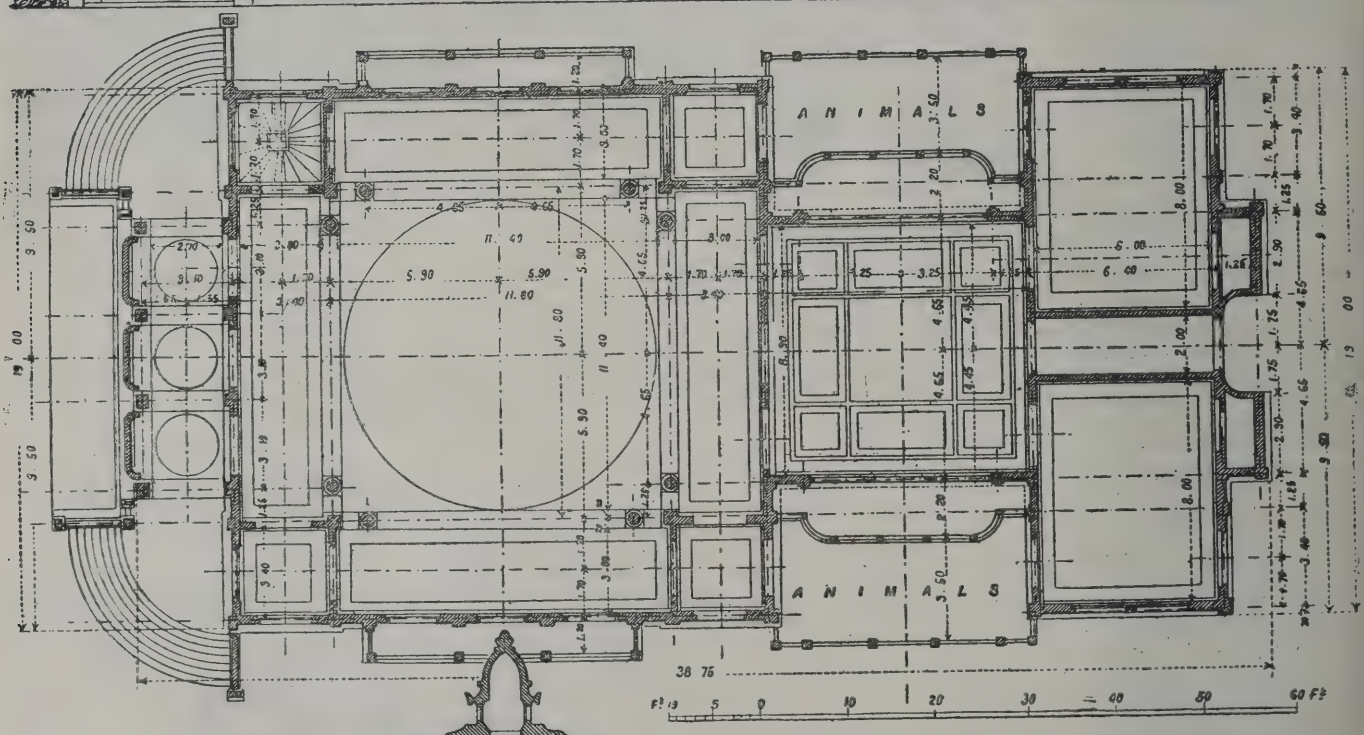
CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XVI.

By Banister Fletcher, Jun., A.R.I.B.A.

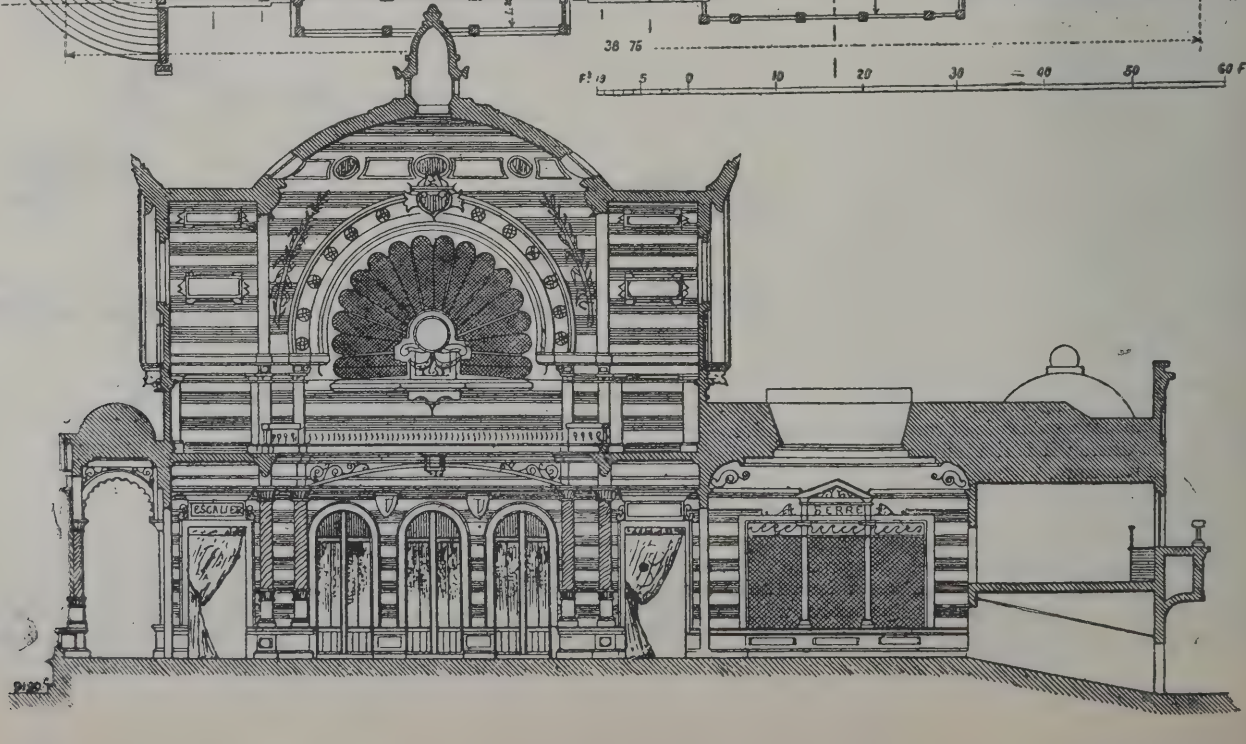


THE BOLIVIA PAVILION

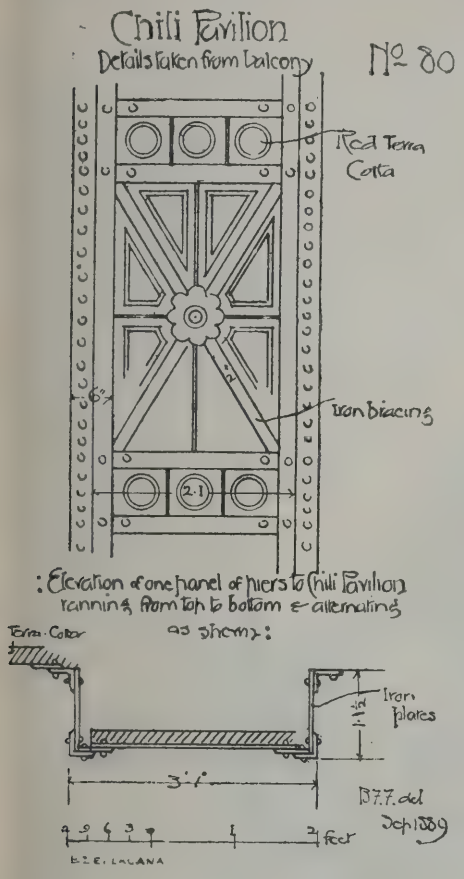
IS situated on the Champ de Mars next to that of Venezuela. The architect is M. Fonquian, and he having only a limited sum at his disposal,



had to be content with a wooden framework covered with plaster of Paris and painted externally in bands of chocolate and white.

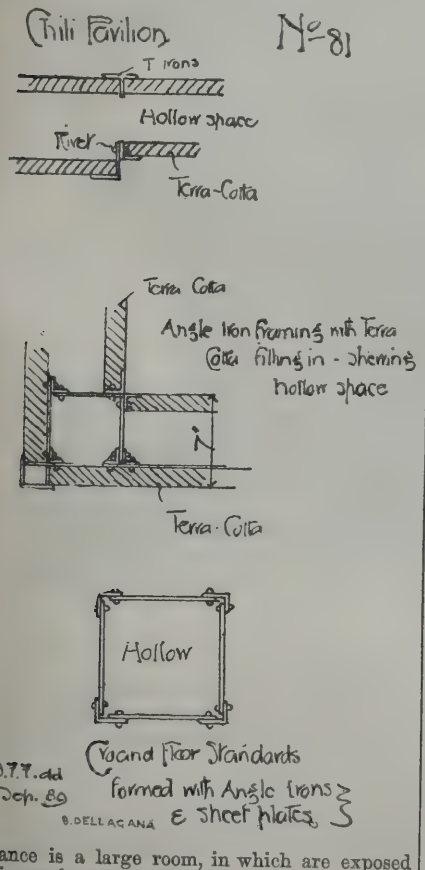


The architecture itself partakes after the modern Bolivian architecture (No. 77 from *Engineering*). The Pavilion is entered by eight quarter-



No. 77

The Bolivia Pavilion



circular steps leading to a central porch covered with three small domes supported by twisted columns. From this porch the central space under the dome is reached. (The dome is 40ft. in diameter.) An aisle 11ft. wide runs round

this space and at the junction of these aisles is a tower at each corner. Under the tower in the left-hand corner on entering is the staircase leading to first floor galleries. Opposite the

entrance is a large room, in which are exposed specimens from silver mines, and further on the right and left are two more rooms used for exhibits, between which there is an exit fitted up as a silver mine with silver ore.

The wooden framework is very ingeniously fitted together, but I was unable to get any drawings of it from the architect. There is no

construction shown inside, the walls being entirely hung with canvas, mostly yellow.

The hall is lighted by large semicircular-headed windows branching out from the dome itself, and there are also small circular windows in the dome itself.

The dome itself is covered with felt. There is no ironwork used in the construction of this building.

THE PAVILION OF ECUADOR,

At the foot of the southern pier of the Eiffel tower, is by M. Chedaim, a French architect (No. 78, from *Le Génie Civil*), and is the reproduction of one of the temples which the Incas dedicated to the sun. It is not a reproduction of any particular building, and has been compiled from different archæological books on the subject. The sculptures have been copied from the Trocadero Museum.

THE CHILI PAVILION.

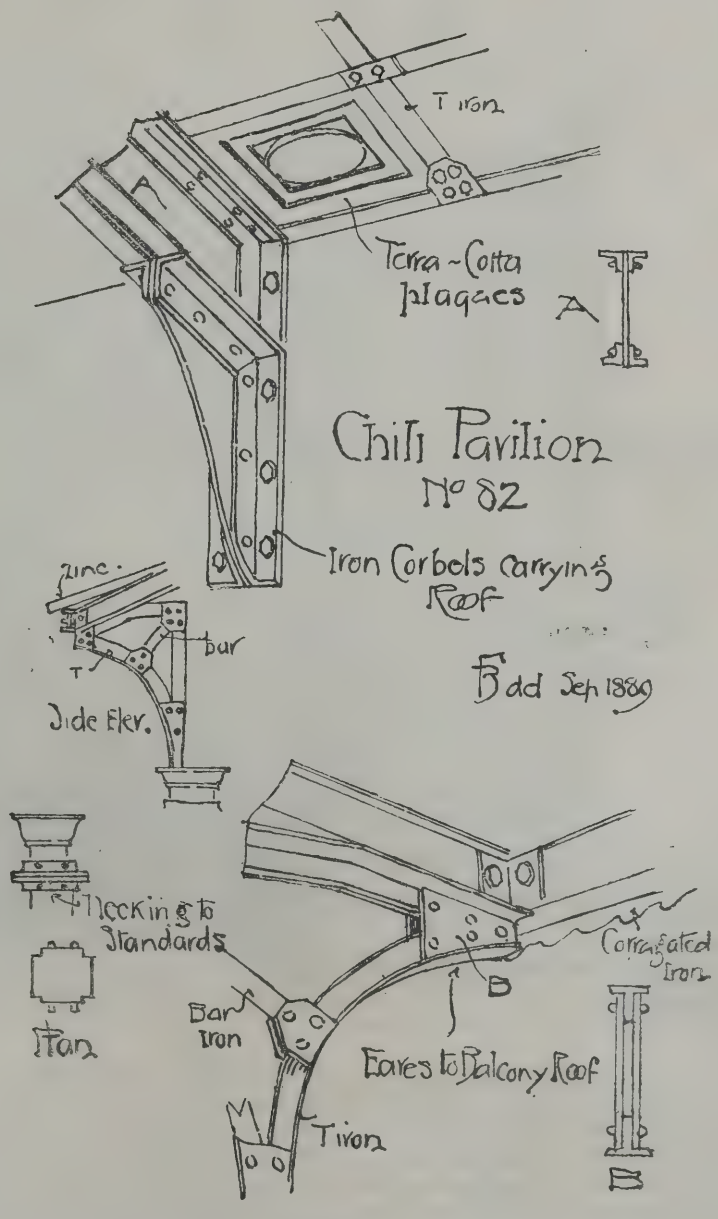
The Pavilion of Chili—the architect is M. Picq (No. 79, from *Le Génie Civil*)—occupies a space of about 82ft. × 65ft. 6in.

Before describing the building I propose giving roughly the particulars of the competition as an example of the manner in which designs were obtained for some of the buildings.

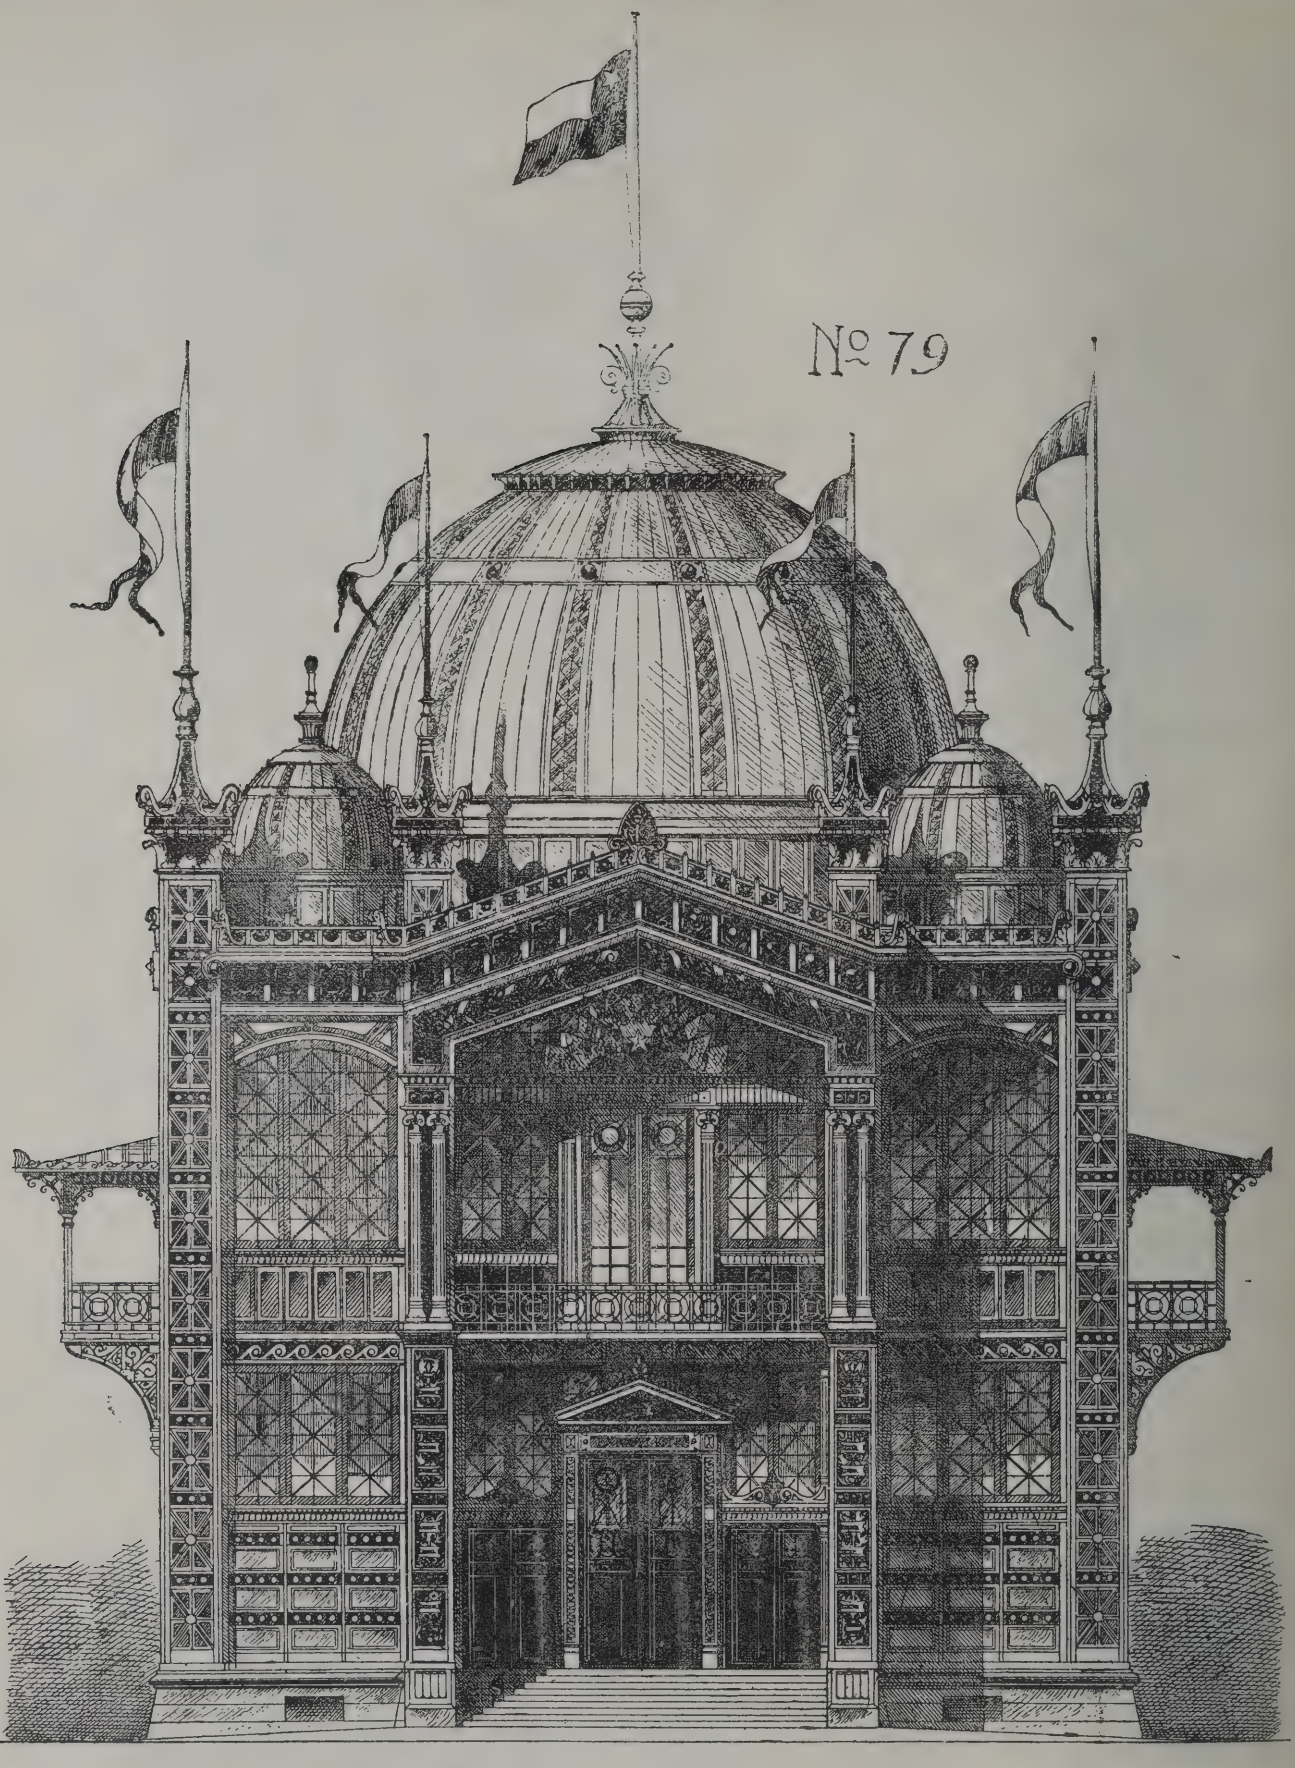
1.—Five weeks were allowed to send in designs.

2.—The building to be entirely original and founded on no style.

3.—The building to have two floors, with a central space open from bottom to top for light.



4.—To have an iron framework with terra-cotta, &c., filling in, the whole to be easily taken down and rebuilt in Chili.



5.—The building, having to be erected in Chili, had to be built to resist earthquakes.

6.—The cost was not to exceed £5,600, including erection, taking to pieces, removing and erecting in Chili, and remaking up the ground on which it stood in the exhibition, lent by the administration.

By reference to the two plates it will be seen to some extent how far this has been accomplished. The plan is very much like that of the Bolivian pavilion.

The building has a central dome, and around it, in the four angles formed by the inter-

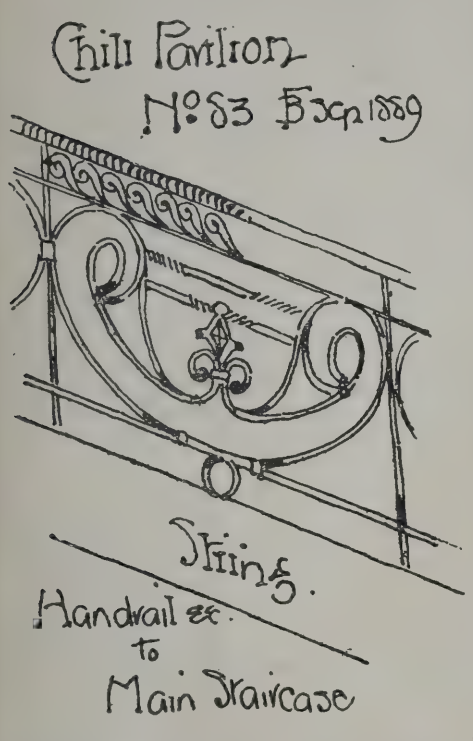
section of the aisles, four smaller ones; these five domes are covered with glass, and are surrounded by the ornamental caps placed on the top of the piers surrounding them. These piers are built with a framework of iron, and filled in with terra-cotta panels, the terra-cotta being arranged in patterns of different colours, which is very effective (see below).

The entrance leads direct into the aisles surrounding the central space. There are balconies (No. 82) on all sides at the first floor-level; on two of the sides these are held up by light iron cantilevers on the side of the entrance, and at the back the balconies are supported between the projecting piers.

The balconies are all in communication with the first-floor galleries.

Besides the ironwork which has been used as a decorative material, in the caps for instance, the materials principally used are terracotta, compressed concrete, bricks, tiles, squares of plaster Paris, "staff" for the moulded parts and wood, the latter material only being used, however, for flooring and the treads to the stairs.

The materials are in panels (see No. 80), so as to allow of their being easily taken down and removed to Chili.



The walls throughout are hollow, No. 81 having two faces of terracotta, which equalises the temperature in the building, and will therefore be distinctly useful in Chili.

I think that this pavilion shows in one of the best ways the application of ironwork and terra-cotta to architectural work. The ironwork internally is painted two shades of blue-grey, and the ceiling to the galleries are formed in light T irons and "staff" panels of good design.

The small angle domes, constructed externally

of coloured glass, have an inner dome constructed of T irons, painted grey-blue, and with plaster of Paris panels.

The staircase to first floor has wooden treads on iron strings and balusters (No. 83).

The terracotta panels are coloured, browns and reds entering largely into the exterior decoration.

LE PALAIS DES ENFANTS.

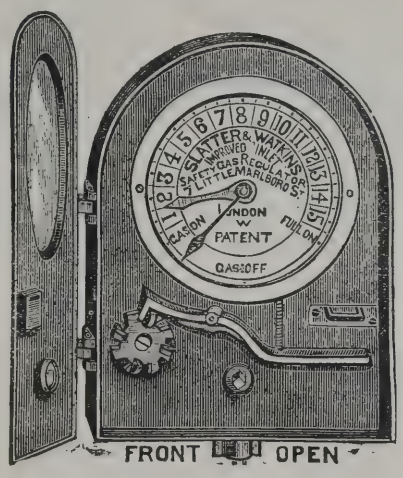
To the west of the Chili pavilion comes the Palais des Enfants. It is constructed in wood and plaster. There is nothing pleasing about it. At its four angles are four grotesque looking towers. It is appropriate in one sense, in that it looks like a gigantic doll's house.

THE NICARAGUA PAVILION

Is another exception to the list of iron buildings. The architect is M. Stephen Sauvestre, who was also the architect to the decorations and constructions on the different stages of the Eiffel tower.

It is 65ft. × 32ft. 6in., and is composed of a large central hall, and one on each side, which are covered with roofs of ogee form, and these are covered with tiles and bands of enamelled red tiles.

THE COSTA RICA PAVILION



Is a small building two stories in height, and having a central glass dome. It is composed of iron pilasters, which form the framing and filling-in of plaster. The ironwork is painted grey, and the plaster in between is painted a lighter grey, which gives it a light and graceful effect. The horizontal architraves, &c., are in ironwork.

BOOKS RECEIVED.

Ipswich, Past and Present.—This series of illustrations in platinotype of the chief buildings and natural scenery of Ipswich, published by Mr. W. Vick, of that town, is approaching completion. Parts 21 and 22, now before us, are fully equal in interest to the earlier issues, and include views of Holywells Mansion, the seat of the Cobbold family; the old ducking chair and stocks; an Italian figure that has done duty successively as Justice on the market cross and as Ceres on the Corn Exchange, and is now preserved in the local museum; Stoke Bridge, an iron structure of 1819, and the mills and maltings on either side; the White Hart Inn, a picturesque plaster and timber building surrounding a courtyard, removed in modern street improvements; and the High School for Girls, a Palladian edifice, decorated with good Ionic columns, built in 1809 as Assembly Rooms, and used from 1859-1878 as a School of Art. Two more numbers will complete Mr. Vick's work, which will increase in value as time goes on.

INLET SAFETY GAS REGULATOR.

THIS is a simple but useful invention by Messrs. Slatter and Watkins, enabling the head of a house or large establishment to check

and regulate the inlet of gas from the main before it enters the meter, and to prevent anyone turning on the gas fuller than necessary for the sufficient illumination of the building. This is done by means of a stud on the ordinary regulator wheel, which enters a slot on a spur wheel, which is called the "stop wheel." The shaded hand on the dial, shown in the cut, marks at what point the supply is to be checked; when the shaded hand is at that point the gas inlet cannot be turned on further than will bring the black indicator hand level with the "stop" hand. The stop action is worked by the rack wheel on the left below the dial, the dial-hand indicating the result of the movement. The door can, of course, be kept locked after setting the regulator, so as to prevent its being interfered with.

ONE-MAN EXHIBITION OF PHOTOGRAPHS.

THIS week, at the Camera Club, in Bedford-street, W.C., an exhibition of very fine photographs has been opened by this society, showing a series by Mr. Lyd Sawyer, whose work has often been noticed in these pages. His views on the Tyne round Newcastle, giving studies of old shipping and boats, or such subjects as "The Fish Quay, North Shields," best illustrate this artist's tastes and his successes. The view over the city of Durham above the mists we have already drawn attention to at the gathering in Pall Mall. We admire his photographs taken in the Castle Garth, Newcastle, very much. Their depth of tone and sympathetic handling well accord with the picturesque irregularity of these tumble-down old thoroughfares. "Waiting for the Boats" makes a good figure group; but his set-figure studies, such as "Love's Young Dream," are apt to be commonplace. "The Place Verte, Antwerp," and other Belgian pictures are admirable, and the collection on the whole is decidedly clever.

The death occurred on Friday of Mr. William Gibson, of the firm of Messrs. Chesshire, Gibson, Son, and Fowler, auctioneers and surveyors, of New-street, Birmingham. Mr. Gibson was one of the best-known men in his profession in the Midlands. He was articled to the firm of John Chesshire and Son. In 1851 he became a partner in the firm, in connection with which he acted as surveyor to the Colmore and Gillott estates, and was probably concerned in the transfer of a larger amount of valuable property in Birmingham than any other person. He was sixty-eight years of age.

A fortnight since the foundation stone was laid of the chapel at St. George's school, St. Alban's. Since the school was erected four years ago, there has been an effort on foot to obtain sufficient funds for the erection of a chapel, estimated to cost about £1,400. The architects are Messrs. Whitfield and Thomas, Cockspur-street, W., and the builder is Mr. Wade, of St. Neots, whose contract amounts to £1,387. The chapel, which will be Perpendicular in style, of brick with stone dressings, will be 60ft. by 23ft. It is intended to accommodate 150 persons. The altar will be raised seven steps above the nave. It is proposed to connect the chapel with the school by a cloister.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRADFORD HISTORICAL AND ANTIQUARIAN SOCIETY.—The annual meeting of the above society was held at the Alexandra Hotel, Horton-road, Bradford, Yorks, on Monday evening. After the tea, the president of the society, Mr. T. T. Empsall, occupied the chair, and called upon the hon. secretary, Mr. J. A. Clapham, to read the annual report. The society now numbers 224 members, and has a balance to its credit of £62 3s., besides copies of the "Bradford Antiquary" to the value of £207. Many valuable papers were given during the winter session, and the excursions during the summer had been much enjoyed. The report and balance sheet were adopted, thanks given to the retiring officers and council, those who had contributed papers, and to the Press for their accounts of the proceedings of the society, in which Messrs. John Lister, M.A., Wm. Thackray, Robt. Denly, Thos. Lord, Percival Ross, Wm. Suddards, and others took part.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The opening meeting of the coming session of the above society was held at the Montgomery Hall on Tuesday night, and there was a large attendance of members. Mr. F. Fowler, the President, in his address congratulated the members on keeping up their numbers, and on the fact that the society had a good balance to its credit. The main object of their society was to look after the interests of their profession and to stand by one another. He trusted they would all continue to take an interest in the well-being of the society, and do their best to enlarge its sphere of usefulness. A pleasant social evening was spent, and the proceedings terminated with a vote of thanks to the president.

CHIPS.

The new tower just added to Lymm parish church, Cheshire, was dedicated by the Bishop of Chester on Tuesday week. It is 100ft. in height, Perpendicular in style, and has cost £4,500.

Dr. Freshfield has just presented to the borough of Winchelsea the old town-hall, which passed out of the possession of the inhabitants many years ago. It is proposed to utilise the building for public purposes.

Messrs. Peter Spence and Sons, of the Manchester Alum Works, commenced on Tuesday their purification for a few days of the whole of the Salford sewage, which amounts to about ten million gallons per day, at the Corporation sewage works, Weaste.

The governors of the North Wales Asylum decided on Friday to institute a competition for plans for the enlargement of that building; a premium of £100 to be offered, and an architect to be appointed as assessor in the competition.

The first sod of the East-End Industrial Exhibition, to be opened at Glasgow next year, was cut on Saturday by the Lord Provost. A guarantee fund of £11,000 has been subscribed for the exhibition, which will be held in the Dennistoun district. Mr. D. V. Wyllie, of Glasgow, is the architect of the buildings, which will cover 6,500 square yards, in addition to some existing Reformatory premises, which will also be utilised.

On Wednesday week the opening of Gledholt Wesleyan Chapel, Huddersfield, took place. The new chapel is from the designs of Messrs. John Kirk and Sons, Huddersfield and Dewsbury, and has been erected at the corner of Blacker-road and New Hey-road. There is accommodation for 700 seat-holders on the ground floor and in the gallery. The style is Free Renaissance. An organ has been provided by Messrs. P. Conacher and Sons, Huddersfield. The total cost of the contracts, exclusive of the organ, is about £6,000.

St. Paul's Mission Room in Edward-street, Burton-on-Trent, a gift by Lord Burton, will be opened by the Bishop of Lichfield in a few weeks. The building is of red brick, with white bands externally, and stone facings, and the front has a gable, on which stands a plain cross. The main room is 59ft. by 27ft., 17ft. high, and there are also two class-rooms. The cost has been £900, and the work has been carried out by Mr. G. Hodges, builder, from plans prepared by Lord Burton's local architect, Mr. Reginald Churchill. His lordship and his father have erected in the parish the cathedral-looking church dedicated to St. Paul, a large brick edifice dedicated to St. Margaret, together with schoolrooms connected therewith; a vicarage for St. Paul's, the large block of buildings which include the Institute and the Liberal Club, and now the Edward-street Mission Room.

A HOUSE AT WEYBRIDGE.—YEW-TREE FARM HOUSE, WIMBOLDSLEY, CHESHIRE.—PROPOSED NEW CHURCH, LONG CLAWSON, LEICESTERSHIRE.—SKETCHES OF OLD TIMBER-WORK IN SALOP AND LEICESTER.—STAINED-GLASS WINDOWS IN AINTREE CHURCH, NEAR LIVERPOOL.—FURNITURE AT THE ARTS AND CRAFTS EXHIBITION.—TWO SKETCHES FROM CAMBBIDGE.

Our Illustrations.

HOUSE AT WEYBRIDGE.

This drawing was exhibited this year at the Royal Academy. The house is erected in a pine wood near Weybridge. The builders were Messrs. Maides and Harper, of Croydon. The roofs are covered with red tiles, the upper walls are hung with Wrotham tiles, and the lower walls are faced with red brick. The plan given with the view explains the internal arrangements. Mr. Ernest Newton, F.R.I.B.A., is the architect.

YEW-TREE FARMHOUSE, WIMBOLDSLEY, CHESHIRE.

The house, which has just been completed, is built of red bricks to the first-floor height, and has cavity-walls, the upper walls being half-timbered, filled in between the framing with bricks, and with cavity also between exterior and interior framing; the exterior face of brick between the framing is covered with Portland cement and then lime-whitened, the frame being painted a dark oak. The moulded bricks for stringcourses, plinths, and chimneys are specially made Ruabon red from the works of Mr. J. C. Edwards. The roofs are covered with Ruabon red tiles, with special-made hip and valley tiles, no lead valley being used. The floor of entrance is laid with 4in. square Ruabon red tiles, supported above cellar with iron girders filled in between with cement concrete. Internally, the walls of kitchen, passages, and what may be termed the working-rooms are lined with glazed bricks, the lower portion of a dark colour forming a dado, and the remainder up to ceiling height of white glazed bricks. Special attention has been given to the ventilation by means of fresh-air inlet-shafts, formed in the walls and carried immediately under the ceilings, and foul-air outlet-shafts separately in the chimney-shafts. All wood floors have also been provided with means for air circulating all round each joist and under the wood floors, and similar means have been adopted for ventilating the roof timbers. The outbuildings have been laid out and built on the most modern principles suitable to the class of farming in the district, and are placed in position for economy in working arrangements in connection with the house, and so that the farmer can see all work being done in the farmyard when in the living-room.

NEW CHURCH, LONG CLAWSON, LEICESTERSHIRE.

The existing church of St. Remigius, Long Clawson, being in a dilapidated and dangerous condition, and devoid of any architectural or archæological detail worth preserving, it has been decided to pull down the old church and erect a new one, as shown in our illustration. The old church has had north and south transepts as well as nave and chancel abutting up to its central tower, and in designing the new church the architect has adhered to the original architectural outline and grouping. The cost of the new church will be about £5,500, exclusive of taking down and rehanging the five bells, which is to be done by Messrs. Taylor and Son, of Loughborough. The new bell frame will be arranged so as to allow of three more bells being fixed at any future time. The external walling is to be rock-faced Coxbench stone, and internally fine hammer-dressed Coxbench ashlar, with fine Hollington stone for all external dressings, and arcade piers and main piers, arches and groining of tower, and Corsham Bath for all other internal dressings. The reredos will be of Caen stone. The seating throughout, vestry, screen, and organ-gallery front, will be in pitch pine, and also the whole of the roofing. The roof will be covered with best pressed Staffordshire tiles. Mr. John Howitt, of Nottingham, is the architect.

SKETCHES OF OLD TIMBER-WORK IN SALOP AND LEICESTER.

The accompanying sketches represent a type of timber construction once prevailing in Shrewsbury and neighbourhood, and of which a great many fine examples still remain. Few examples, however, can be found which have not been seriously disfigured by the introduction of modern barge-boards, sash-windows, and plate-glass. The general effect, although rich, is still somewhat crude, the timber framing being tarred or painted black, and the plaster filling whitewashed. The roofs are generally covered with tiles; window-bars and sashes painted white. Rakedale or "Ragdale" Hall was built by one of the Earls Ferrars about the year 1629, which date can be found in a panel over one of the bay windows. Although built in the 17th century, the detail is extremely simple and severe, the whole building depending for its effect on the large masses and proportions of its chimney stacks and bases, bay windows, roof outline, and a wealth of mellow colour. The whole building is constructed of a rich red sand brick, with stone dressings to the bay windows and chimney bases, *white* mortar, a slight introduction of timber-work, and rich "blueish-purple" slates. At the side of the house is a quaint little church, and in the churchyard a tall foliated Perpendicular cross. The house, now divided into two tenements, has suffered severely in the interior design and arrangement; but still there is remaining some good 17th-century woodwork, chimneypieces and panelling, unheeded and uncared for. An idea of the general grouping and design will be obtained by reference to two sketches by Mr. T. Langham, published in our plates for Oct. 22nd and Nov. 5th, 1875, respectively.

ARTS AND CRAFTS EXHIBITION: CARTOONS FROM AINTREE CHURCH.

Mr. Aldam Heaton has lately executed some beautiful windows for Aintree Church, near Liverpool, in the five lancets of the apsidal sanctuary there, the subjects being arranged in the following order:—St. Peter, Our Lady, The Christ, Dorcas, and St. John the Evangelist. To-day we reproduce three of the cartoons, drawn by Mr. E. Ingram Taylor, who exhibits his work this year in the Arts and Crafts Exhibition, opened last week. In the windows under each figure comes a grisaille picture of the event in the life of the figure represented above, e.g., "The Denial" under St. Peter, "The Annunciation" under the Virgin Mary, "The Institution" under the Crucifix, "Alms-giving" (i.e., distribution of clothes) under Dorcas, and "The Vision in Patmos" under St. John. The point specially worthy of note in the figure of Christ is that He is represented as a king in royal robes, *standing* with outstretched arms in front of the cross, "Reigning from the Tree," as it was called in the Greek-Christian philosophy; the nude and dying Christ not coming into use till Augustine's time and the influx of Roman sentiment.

FURNITURE AT THE NEW GALLERY.

The sketches published herewith portray a few of the more strikingly novel exhibits in the way of furniture now on view at the "Arts and Crafts" Exhibition. Very good is the Library Mantel Fitting by Messrs. Liberty and Co., and we regret that the names of the various craftsmen engaged in its design and execution do not appear in accordance with the general rule. The credit given to the worker, as well as the seller, is one of the objects of the Society, and should be insisted upon. The woodwork of the Chimney-piece is in dull-polished teak, the panels and cornice, &c., being enriched with intagalio decoration, the sinkings being coloured blue. The design is Egyptian in character, the details being adapted from ancient examples. The face of the fire-opening, sconces, curb, &c., are in copper, the repoussé work on the former being very nice. We have shown in our sketch the two Chairs *in situ*, which are in keeping with the character of the work. The mahogany Corner Cupboard, for which Messrs. Reginald G. Blomfield and John Finch are answerable, is a refined and well-made piece, and possesses the merit of originality. It is inlaid with snakewood and ebony. Original, too, is Mr. Lethaby's design of the little rosewood Table exhibited by Messrs. Marsh, Jones, and Cribb. It may be thought by many to be rather too original; but originality is just what we expect at the Arts and Crafts, and feel disappointed if we don't get it, and we have plenty of mediocrity and tameness at other exhibitions. The Arm-chair, carried out by Mr. J. Britnell from Mr. E. W. Gimson's design, is comfortable and picturesque, and we fancy received its inspiration from Oliver Goldsmith's chair at the South Kensington Museum. We gave a review of the Exhibition in our last week's issue.

TWO SKETCHES FROM CAMBRIDGE.

St. Peter's College, or Peterhouse, as it is commonly called, received its name from the Church of St. Peter, which was used as the collegiate chapel. This church fell down in 1350, and was replaced by the adjoining church, Little St. Mary, which also served the purpose of collegiate chapel until 1632, when the present building was opened (see illustration). The latter is a most curious illustration of the mixture of the Gothic and Classic styles; some of the parts seem most incongruous. The interior is chiefly noted for its stained glass, which is particularly fine.—The illustration of St. John's College is a view of the hall from the second quadrangle. This court was built in 1595 to 1620 by Ralph Simons. The subject of this sketch is a very good specimen of the Tudor style, showing scarcely a trace of Classical influence. The third court, part of which (the library) was finished in 1624, shows a marked decline, manifested in the rudeness and the inappropriateness of the details; though, with it all, there is a picturesque quaintness, which is extremely pleasing.

CHIPS.

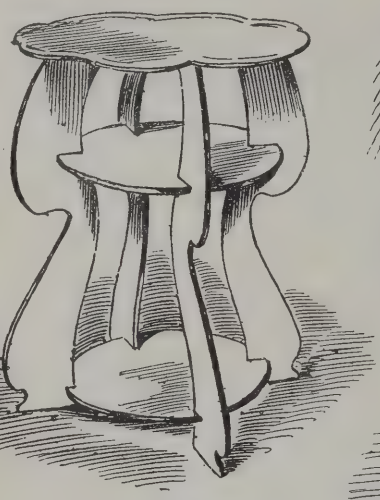
The designs of Messrs. W. L. Bernard, F.R.I.B.A., and R. M. Drake, of Bristol, have been selected in open competition for a new board school for 300 children, to be erected at Cadbury Heath for the Oldland School Board.

"Architectural Studies in France," by the late Rev. J. L. Petit, are shortly to be reissued in a reduced form by Messrs. George Bell and Sons, and the work is now in the hands of the binders. The original book was produced in 1854, with 200 woodcuts and anastatic process plates, partly the work of P. H. De la Motte. The bold style of drawing adopted in these sheets was unique at that time.

At the Hants Quarter Sessions on Monday, at Winchester, Lord Montagu presented, on behalf of the subscribers, a portrait of the chairman, Mr. Melville Portal, executed by Mr. A. Stuart Wortley, in recognition of his services to the county. The portrait was ordered to be hung in the room beside those of the Duke of Wellington, Lord Eversley, and Sir W. Heathcote.

Two windows in St. Mark's Church, Deptford, have been filled with stained glass as memorials, and were unveiled at the harvest festival last week. Mr. Taylor, of Berners-street, W., is the artist.

The Free Public Library in Skinner-street, Clerkenwell, was formally opened by the Lord Mayor and Sheriff on Friday last. The building has cost £6,500, and has been erected by Messrs. McCormick and Sons, from plans by Messrs. Kerslake and Mortimer, selected in competition.



Two oak doors have just been fixed in the High Altar Screen in St. Alban's Abbey, in place of the deal painted ones that were so long there, as part of the work carried out at the cost of Mr. H. Hucks Gibbs, of Aldenham House. The doors were designed by Sir Arthur W. Blomfield, A.R.A., who has superintended the restoration of the screen generally, and have been made by Mr. Harry Hems, of Exeter. On the side facing west, both doors exhibit rich tracery work, the sides towards the Saint's Chapel being plainer in character.

WAYSIDE NOTES.

SOONER or later old Vauxhall Bridge will have to be replaced by new, not, as the specification writer says, "of similar description," but of a totally different genus. The antiquated structure will not be removed just at present, since the London County Council is not in a mood to effect the improvement, much needed though it be. The Council have turned a deaf ear to the petition of the Lambeth Vestry, who prayed that the old bridge might be superseded by one of modern construction. The excuse urged is that other and more pressing Metropolitan improvements require prior consideration. This may be so: it doubtless is the case. At the same time, the day cannot be very far distant when the question of replacing the Vauxhall Bridge with a more convenient and substantial structure will be as pressing as any before the members of the Council. As a matter of fact, Mr. Osborn, the chairman of the Bridges Committee, while deprecating the idea of immediate construction, admitted that the present bridge was "narrow," that the gradients were "steep," and that "the piers offered some obstruction to the river." These, one would think, were serious defects, and such as would warrant early attention, even though the evil is of long standing. Mr. Osborn says that the bridge is a substantial structure, and likely to last many years, though at the same time it will be watched carefully as heretofore. This final statement is, perhaps, most to the point, and should reassure those who consider the life of Vauxhall Bridge worth but few years' purchase.

The question of "sky-signs" came before the Council at its meeting on Tuesday last, and from the opinions given and suggestions made, one may look forward to the possibility of the growth of these unhealthy fungi being promptly checked. They should surely be definable as "erections," and as such come within the scope of certain rules and regulations. Anyhow, the Building Act Committee have recommended that the Council's solicitor be instructed to take proceedings in a "test" case, and the recommendation has been agreed to by the Council. The result will be anxiously awaited by the artistic, as well as the common-sense portion of the community. It were a grand thing for London if the house-tops could be cleared of these nightmare objects, and their future erection entirely forbidden. If the County Council have not power under present statutes to make the clearance and restrain intending advertisers, *à la mode*, it might be possible, as Mr. Beechcroft suggested on Tuesday, to create new by-laws dealing exclusively with this threatened pestience. Not of much good would Mr. Waterhouse's artistic tribunal, or council of taste, to regulate the architecture of the Metropolitan thoroughfares—excellent though it is in theory—be whilst demoralised commercialism is rampant on ridge and parapet, the signs of the money-grabber crossing the blue vault of heaven by day, and mingling with those of the Zodiac by night.

Whether London is yet going to vastly increase in size and spread itself further and further into the country, or whether an awful Something is to destroy and humble our modern Babylon, it yet behoves those concerned to persevere in the good work of acquiring and preserving "open spaces." Although Bostal Heath is well without the boundaries of London proper, and, were the determining circle more regular, would be also without the pale of Greater London, the County Council are yet fully justified in expending money upon the acquisition of a tract of land thereon, or to next adjoining, known as Bostal Woods, and comprising a considerable company of sombre and sighing pines. A sum of £11,000, or, if the Plumstead District Board contribute a moiety of the cost, £5,500, is not by any means unreasonable for the 74 acres now available to the Council, who, by the bye, already have control of 55 acres of Bostal Heath. Whether or no the Council will purchase the additional ground yet remains a doubtful question, the recommendation of the Parks and Open Spaces Committee, pointing out the opportunity for acquiring the woods, having been postponed. For my own part, I hope it will see its way to act with promptness, and preserve a beautiful spot in north-west Kent from that undesirable and wholly unmerited end, defined by the newspaper letter - writer as "the encroachment of the speculative builder." Bostal Heath, as everyone knows, lies above Plumstead, over against the Essex shore of the river, which winds along in the green marshes below, its glistening reaches ever broken by the hastening steamers or slow-moving barges. Just one of those prospects I love does Bostal Heath afford—a bright, bracken-covered foreground, an expanse of emerald grass-lands, with a silvery, craft-laden waterway therein, and an undulating distance leading far away into a blue and uncertain haze. Yet but one quarter-turn, and we look over the London basin, with its vast concourse of houses and buildings, outflanked by a maze of tall chimneys, behind which, wreathed in dark, lurid clouds of drifting smoke, the winter's sun sinks red and fiery.

Of all the clumsy, barbarous-looking methods of going to work with the assistance of modern steam-power, I should say that the system of road-scarifying, as employed on the Embankment and elsewhere in the reparation of the surface of London streets, is most decidedly the most clumsy. It certainly affords one a little recreative amusement for a few minutes to watch operations; but there is something to me infinitely revolting and offending to the sense of the fitness of things in the spectacle of a powerful traction-engine groaning and snorting, swaying its vast weight backwards and forwards, and grinding to powder beneath its great wheels the granite chips in vain efforts to move the clumsy "scarifier," anchored, nose-deep, in the surface of the roadway. Such an exhibition of misapplied ingenuity has been a common object of the Embankment lately, and within the last few days visitors to the Royal Hotel, Blackfriars, have had extra special rehearsals, the slight incline in the roadway at that point of the Embankment having increased the frequency of the occasions where the engine becomes powerless to shift the "scarifier," though its driving-wheels are skidding and pulverising the stones beneath. That it does its work in the end—after much reversing of gear and jerking of the coupling chains—one cannot deny, seeing that one of these road-ploughs seems to keep four or five large steam-rollers busy reconsolidating the metalling. But the method of dragging up the old stones must surely strike others as barbarous, and expensive, too; for an engine subject to strains, such as I have witnessed on more than one occasion on the Embankment, cannot last long. I did hear that, owing to strikes and difficulties with the navvies, the old and common-sense (until a more scientific "scarifier" is forthcoming) method of hand-picking was abandoned some time back, and the present system employed. Unless an improvement on this comes along, I should say it is a pity that the road-makers cannot return to hand-labour. The method employed is offensive to every true mechanic, every attitude of true mechanism—especially of the steam-engine—such as dignity, ease, rhythm (best simplified, perhaps, by the Galloway engine, at the Crystal Palace) being absent, and in its place a display of brute force, soon brought to naught.

I did not think that the G.E.R. would do wrong with the old façade and ceiling of Sir Paul Pindar's house, and was scarcely surprised to learn that the company had offered them to the South Kensington folk. It remains to be seen what the museum authorities will do with these relics. There is not, if I remember correctly, a great amount of room for features of this sort in the architectural room, what with the cast of the famous Roman column, and the many other miscellaneous and interesting objects in view. Anyhow, it will be "standing room only," if not actually full inside. A façade may be regarded for practical purposes as being, like Euclid's superficies, a matter of length and breadth only; and in the same light may a ceiling be viewed. Consequently, if stowed upright in some gallery, and flat against the wall, no vast amount of space will be taken up in depth, at any rate. So, one fine day, when the museum trustees have taken over the mortal remains, so to speak, of Sir Paul's old home in Bishopsgate-street, we may find them comfortably lodged at South Kensington, having first been cleaned down and made respectable enough to receive visitors.

Further reflection on the issue of the Whitefield Tabernacle competition draws me more towards the view that, error or no error, the promoter's plan should have been the basis of operations, and that competitors exceeding the limits were throwing themselves out of court; and it would seem but just and fair that, if the promoters accepted a plan exceeding the stipulated dimensions, they should at least handsomely compensate any "placed" designs the authors of which have been handicapped by adhering to the smaller site. There seems to be no two views as to the question of the size of site, all declaiming against the encroachments made by the two competitors; and certainly if the award first made hold good, the assessor will have created a very bad precedent, and the Whitefield Tabernacle incident will become ill-famed in the annals of architectural competitions. One would gladly say little or nothing about a slight matter of opinion where an assessor's report is concerning, for the sake this, of the welfare of competitions generally; but in the present case, so far as one outside the competitions—such as myself—can judge, a vital principle is at stake. This being so, it would be wrong not to criticise the award made.

I am really glad that at last the Association has brought off a successful conversazione. To tell the truth, I did attend one of these evenings some years back, and ever since avoided them. As a result, perhaps, I missed Friday week's reception, which, according to accounts, was completely successful. Having thus overcome the difficulties in the way of making the conversazione a success, we may hope that future years will find no relapse to the old dulness, which, as some must admit, was, on occasions, oppressive.

A.A. Notes have come to hand, and a good number; not the least interesting of the contributions being the continuation of Street's lectures on architecture. "G. E. S." must have been in good form when he wrote this portion of his Academy discourses. Every sentence has something of great import to sketchers of architecture for architecture's sake—how different, alas, with Aitchisonian and other like utterances of these degenerate days. "The Coming Session" is not up to the style of the Editorial in the September issue, and moreover goes for Mr. A. B. Pite's opinions only just above the belt. Mr. Pite writes anent the proposed changes, and incidentally says something about a certain examination, wherewith I accord. It seems like an echo of my own views, and had we chanted the theme together before the assembled members of the A.A., no better conclusion can I imagine than a stepdance by Mr. Pite and myself—*pas de deux*, or "toe-and-heel" in full view of the audience. Mr. W. Millard writes on the architecture of Rhenish tributaries, and the writer of the "Notes" says no one can hold a candle to Mr. Norman Shaw in Domestic work, which should be gratifying to our great architect, and temporarily bad for the office-boys in some other studios where Domestic work is turned out.

GOTH.

The parish church of St. John, Marchwood, Hants, was re-opened last week after partial restoration. The organ has been removed to the north transept, having been enlarged to nearly double its original size by Messrs. Bishop and Son, of London. The chancel floor has been laid with encaustic tiles by Messrs. Carter and Co., of Poole. The work also includes the re-arrangement of the seats.

On Friday, Mr. Arnold Taylor, an inspector appointed by the Local Government Board, held an inquiry at Colne, Lancs, concerning an application made by the Local Board of that town for sanction to borrow £22,000 for the purpose of gasworks extension, and £2,000 for private street improvements. The application was unopposed, and evidence was given showing the remarkably rapid growth of Colne during recent years.

Mr. Abernethy, of London, has visited Clevedon, Somerset, and reported to the Local Board of Health on the condition of the pier. He found the pier head useless for passenger traffic. He proposed to extend the head on either side 50ft. by a new iron structure connecting the present one, and to construct a landing stage of timber. He found the approach in very good condition. Sir E. H. Elton stated that the directors would make a present of the pier to the town should the ratepayers elect to take it over, subject to a payment of £700 or £800 debt upon the pier, which originally cost £14,000. Mr. Abernethy was requested to prepare plans and estimates.

Building Intelligence.

Birmingham.—Plans, &c., have been prepared for a new Hebrew club, which building it is contemplated to erect in Holloway Head, in this city. This structure will be four stories in height, and will consist of caretaker's premises, wine cellars, refreshment bars, large and lofty assembly-room, billiard-room, card-rooms, and necessary lavatories, &c. The style adopted is a free treatment of English Gothic, ornamental brickwork, stone, terracotta, Minton's tiles, and other decorative features being introduced into the front elevation.—Some important villa residences are in course of erection, situated in the Mayfield-road, Moseley. The elevations are of an ornamental character, and Gothic in style, with moulded gables, dormer windows, porches, two-story stone bay windows, ornamental glass in lead lights, &c. The builder is Mr. George S. Spokes, of Sherlock-street, and the architect for the whole of the above buildings is Mr. John Statham Davis, of 53, Newhall-street, both of Birmingham.

Cambridge.—Through the munificence of Mrs. Lyne-Stephens, of Lynford Hall, Norfolk, a Roman Catholic church has been erected at Cambridge. The dedication took place last week, and the imposing opening ceremony was conducted on Wednesday. The edifice is situate at the Hyde-park corner of Hills-road, the main thoroughfare from the railway station, and, with its lofty spire of 215ft., is a prominent object for many miles. The cost of the structure has been £70,000. The edifice is called the Church of Our Lady and the English Martyrs, and will accommodate about 300 persons. The style is Early Decorated, and the materials Ancaster and Bath stone. There is an oak baldacchino over the high altar, and carving is profusely introduced both inside and outside the building. The stained-glass windows have been provided by Messrs. Hardman and Powell and Westlake and Co., whilst the organ has been erected by Messrs. Abbott and Smith, of Leeds. The architects were Messrs. Dunn and Hansom and Dunn, Newcastle-on-Tyne and Bristol, and the builders Messrs. Rattee and Kett, Cambridge. The carving has been executed by Mr. R. L. Boulton, of Cheltenham, and Mr. Ralph Hedley, of Newcastle. We illustrated the exterior in our issue of June 26, 1885, and the interior on May 30 of the present year.

Frongoch.—The Welsh Whisky Distillery, Frongoch, near Bala, North Wales, is the first whisky distillery in the Principality. The buildings comprise a malt-house, two malt kilns 36ft. by 36ft. each, and fitted up with the most modern drying floors and furnaces, the peat store, Excise officer's offices, manager's private and general offices, and directors' board-room, beautifully fitted up in mahogany and pitch-pine, with lavatory, w.c.'s, &c. The main entrance to the premises and inner courtyard is 20ft. wide, and fitted up with a pair of wrought-iron gates, with a small wicket gate in them, from the architect's designs. The whole of the works have been carried out from the designs, and under the supervision of, Mr. Walter W. Thomas, M.S.A., architect and surveyor, 25, Lord-street, Liverpool, with Mr. Edward Watkin as clerk of works; the contractor for buildings being Mr. Edmund Gabbutt, Liverpool; and for the plant and machinery, Messrs. John Miller and Co., engineers, Glasgow.

Glasgow.—At the Glasgow Dean of Guild Court last week a statement was submitted by Lord Dean of Guild Ure with reference to the building operations in Glasgow during the past year. During the twelve months ending at August, buildings and streets had been constructed which were valued at nearly £450,000. The number of dwelling-houses erected was 1,240, and their value was computed at £180,400; while 22 churches, halls, and schools were valued at £46,700; 162 warehouses, stores, and workshops, at £182,870; and the alterations and additions were estimated to be worth £17,790. Of the 1,252 dwelling-houses, 321 were of one apartment, 666 of two apartments, 190 of three, 57 of four, 17 of five, and only 1 of six.

Hull.—The foundation-stone of the Roman Catholic Church of St. Mary, Wilton-street, Holderness-road, was laid by the Bishop of Middlesbrough on Monday. The church will be Early English in style, and will consist of a nave 65ft. by 22ft., with north and south aisles 10ft. wide, and side chapels at the east end of them. The sanctuary has a circular apse. The nave is divided from the aisles by an arcade of four bays of moulded arches on stone columns, with shafts of blue Normanton stone. Above the arcade is a clerestory lighted by lancets. The roof-timbers will be of pitch pine divided into bays by principals resting on carved stone corbels. The nave floor will be laid with wood blocks in a herring-bone pattern. The sanctuary will be laid with encaustic tiles, and the steps to the predella of polished Sicilian marble. The two stone doorways in west front are under one recessed brick arch, in the centre of which is Our Lord crowned with thorns, and on either side spandrels of Early English foliage. Over this arch is a crocketed gable, in which is a carved niche for the Madonna and Child. It is proposed to fill the six sanctuary windows with stained glass by Messrs. A. O. Hemming and Co., of London, and the west end windows with grisaille glass, the rest plain cathedral tinted glass in quarries. The accommodation is for 500 adults, and the contract price £1,868 10s. It is being carried out from the designs of Messrs. Smith and Brodrick and Mr. Arthur Lowther, Hull. The contractors are Messrs. Colley and Levitt, bricklayers; Mr. George Scott, joiner; Mr. Peers, mason; and Mr. Beal, plumber.

Ipswich.—The Church of St. Michael, in Upper Orwell-street, commenced twelve years since, has just been completed by the addition to nave and transepts of a chancel, vestry, and organ chamber. The new work, which has cost £1,500, was consecrated last week. The style of the chancel is Early English, in harmony with the nave, but of a more elaborate character. The facings are of red brick, with Ancaster stone wall lining, finished with moulded capping at the level of the window sills. The inner arches to the windows and other details are in Bath stone. The chancel arch, which is of stone, and in height 33ft., has corbelled and clustered shafts and floriated capitals. There is a single arch between the chancel and organ chamber to north, similarly moulded, but different in detail. The organ chamber is divided from the transept by double-brick arches, with a central column in stone. The side windows are lancet-headed. The east window is Transitional in date. It consists of three main lights divided by mullions, with each main light again divided into three lights by minor mullions. The floor of the chancel is paved with Ancaster stone from the Lindley quarries, in three different shades. The roof is of single hammerbeam construction, and takes the form of a two-centred arch. The work has been executed from details supplied by Mr. E. F. Bisshopp by Mr. Thos. Thwaites, contractor. Mr. Harpham executed the stonemason's work, and also the stone-carving; and Messrs. John Groom and Son did the wood-carving.

Leamington.—New Board schools in Clapham-terrace have just been opened. The building is in the Gothic style, arranged upon the central hall principle—i.e., a large assembly hall, 80ft. by 30ft., for boys and girls, with an open roof and ironwork principals, and opening out of this are five class-rooms upon either side, accommodating each 60 boys and girls respectively. These class-rooms have a black parian cement dado above the wood dado, to serve, instead of using the ordinary blackboards, for object lessons; and the windows are glazed with tinted cathedral glass. The entrances, corridors, and lavatories are lined, to dado height, with white glazed bricks, with a capping of turquoise blue, and fitted with ranges of Finch's lavatory basins, with slate tops. The infants' department has also a large room, 45ft. by 25ft., finished, like the assembly hall, with open roof, but with a gallery at the north end and a five-light window. Opening out of this room are three class-rooms, accommodating 60 and 65 children each; a Kindergarten for 75 children; and a lavatory. The whole of the interior walls are lined with Kenilworth pressed bricks and left uncoloured. The latrines are lined with glazed bricks, paved with Walker's iron slag paving, and having an automatic siphon flushing-tank. The external elevation is of Kenilworth pressed bricks, relieved with red terracotta from Mr. J. Thompson's, of Northwich. The gables are half-timbered with a pair of enriched foliated panels in red terracotta, and filled in between the timbers with oblique lines of Maw's alternate red and black tiles. The roofs are covered throughout with Broseley tiles. The bell turret is framed in open timber-work, and is surmounted by a lead-covered spire, the apex of which is 65ft. high. The heating is effected by the low-pressure hot-water system by Messrs. Musgrave and Co., of Belfast. In the corridor immediately under the bell tower is a small panel, executed by Messrs. Maw and Co., with the following record:—"Erected 1889-1890. Fredc. Foster, M.S.A., architect; J. Fell, contractor." The clerk of the works was Mr. Edward Atkins, of Leamington. The cost has been £7,500, and the furnishing of the schools about £450.

London County Council.—At its meeting on Tuesday the Council passed a resolution authorising the purchase of Brockwell Park. A proposal of the Parks and Open Spaces Committee to acquire Bostal Woods, a pine forest of seventy acres, adjoining Bostal Heath, near Plumstead, was deferred for further consideration. The Council declined to carry out the suggestion of the Lambeth Vestry to reconstruct Vauxhall Bridge, not regarding the matter as urgent, although desirable. The Building Act Committee reported that their attention had been called to the erection of "sky signs" upon various premises in the Metropolis without license of the Council having been either applied for or obtained. As they considered the erection of sky signs most objectionable and dangerous, they recommended "That the solicitor be instructed to take the necessary proceedings in a test case, the particulars of which will be furnished by the superintending architect" (Mr. Blashill). Mr. Beechcroft thought the Council already had sufficient power to deal with these signs by drawing up the requisite by-laws, and moved that the matter be referred back to the Committee for that purpose. Colonel R. W. Edis, F.S.A., contended that the sky signs were just as much "erections" coming under the supervision of the Council as were iron and glass roofs projecting over the pavements, as to which the Council had undoubted rights. The amendment was negatived, and the recommendation of the Committee agreed to.

Northampton.—The consecration of St. Paul's Church, the fourth and last of those erected in the town under the Church Extension Scheme started in 1875, took place on Thursday, the 9th inst. The new church, the cost of which is about £5,000, and which will accommodate 600 persons, has been erected from plans by Mr. H. H. Holding, A.R.I.B.A., Northampton, also the architect of St. Mary's, Far Cotton, who has in the design kept to the fully-developed arrangement of nave, aisles, and chancel. The style is of the Middle Pointed period. The eastern ends of the nave-aisles are developed into quasi-transepts. There is no western door to the building, but there are north and south porches. There is a north aisle to the chancel, and on the south side of the chancel are vestries for the choir and clergy, and a lofty organ chamber. The main gables to the chancel and transepts have flanking turrets in stone; and a square bell-turret terminating in a spirelet and vane forms a central feature in the west front. The church has been built wholly of stone—inside and out—obtained within the county of Northampton, both with regard to the walling and wrought stonework. The walling stones were all obtained from pits at Kingsthorpe, and all the wrought stone came from Earl Winchilsea's quarries at Weldon, near Kettering. The nave is seated with chairs, and the choir stalls are of wainscot oak, with traceried fronts and carved ends. The carved pulpit is of Farley Down and York stone. The font is also of Farley Down stone, on Devonshire marble shafts, and with carved panels and bosses; it is designed to have a lofty wood cover. The contractor was Mr. J. T. Wingrove, of Talbot-road, Northampton, who has also executed the whole of the fittings, including the stalls, pulpit, and font. Mr. Reynolds, of Northampton, carried out the carving.

Peterborough.—After a restoration, which has been in progress for more than seven years, Peterborough Cathedral was reopened on Tuesday. The work of restoration was commenced in January, 1883, being necessitated by the dangerous condition of the central tower, which was found to be in a state of instability, owing to the failure of the north-east and south-east piers. This portion of the work was estimated to cost £13,000, while the total amount required for the complete restoration of the Cathedral was £55,000, and the appeals made to the country

have resulted in over £30,000 being subscribed. Mr. J. L. Pearson, R.A., was appointed the architect for the restoration, which has been carried out by Mr. John Thompson, of Peterborough. The central tower has been rebuilt, but the lofty angle turrets added by Dean Kipling were not reconstructed. In addition the pillars of the choir and the north and south transept roofs have been repaired, and both transepts have been underpinned. The other works done include the cleansing of the internal masonry of the nave, aisles, and western transepts, the placing of a cement floor in the triforium, and new bell-frames in the north-west tower. The total cost of these works has been £31,669 17s. 7d. That which has been done to the interior has been met by special donations. At a cost of £2,689 there have been provided fourteen stalls with richly carved wooden canopies, together with the flooring for the whole of the stall work for the two bays west of the central tower. The old Benedictine arrangements have been reverted to, and the choir stalls have been carried west, so as to include the first two bays of the nave. The stalls and pulpit have been carved by Mr. Nathaniel Hitch, of Vauxhall. The works on hand, or provided by special donations, comprise a choir, pulpit, Bishop's throne, and marble floor for choir, exclusive of aisles and transepts. Other works, urgently needed, which are estimated to cost £4,000, consist in making good the masonry of the north and south transepts, and in underpinning and repairing the north-east angle of the eastern chapel. It is also proposed, when funds are forthcoming, to complete the stalls with bookboards and seats, at a cost, with canopies, of £5,176, to rearrange the east end of the choir, and to reconstruct the organ in another position.

West Hartlepool.—The new church of St. Aidan was consecrated by the Bishop of Durham on Saturday. The church, which will have 615 sittings, will cost about £4,250, exclusive of the site and the tower and spire. The character of the fabric is Early English, and on plan comprises nave, aisles, and chancel, with organ chamber on the north, and choir and clergy vestries on the south side of the chancel. A tower with spire is to be built over the organ chamber at some future date. The nave arcade consists of five bays, with arches springing from circular piers; the clerestory above is lighted by a range of three-light windows. The west end is pierced by a large tracery window, with single lights on either side. The chancel is divided from the nave by a low parapet wall, with a moulded arch above springing from corbels. The east end is lighted by three lofty windows, with deeply splayed jambs and moulded arches. The chancel fittings are on a very complete scale; on either side are the canopied choir and priests' stalls, with the organ-case rising above on the north side. The pipes are decorated in colour; they are inclosed in a case with moulded cornices and cusped heads. The organ has been built by Messrs. Conacher and Co., of Huddersfield. The reredos is formed with high dossal hangings and side wings, all embroidered, together with the altar frontal. The walls of the sanctuary are draped in a similar way. The font consists of a massive circular bowl, resting upon a base with clustered shafts. The total length of the church is 118ft., and width 52ft. The whole of the internal fittings and roofs are of unvarnished pitch pine; the walls, both inside and out, are faced with red brick, with dressings of Whitby stone. The church is heated by a hot-water apparatus supplied by Messrs. Dinning and Cooke, of Newcastle. The contractors for the mason and bricklayers' work are Messrs. W. Scott and Son, of Sunderland, and for the carpenter and joiners' work Messrs. G. Clark and Co., of West Hartlepool. Mr. T. Adamson, of Sunderland, acted as clerk of the works. The church has been designed by Mr. J. H. Morton, F.R.I.B.A., of South Shields.

The post-office at Thirsk was reopened last week, after enlargement amounting to rebuilding. Mr. Westwick, of Thirsk, was the builder, and the fittings were carried out by Mr. Braithwaite, of Leeds, the contractor to H.M. Office of Works.

To-morrow (Saturday) afternoon, at 3.30, Sir Edward Clarke will open the public library given to the parish of Camberwell by Mr. George Livesey, the chairman of the South Metropolitan Gas Company. The building is situate in Old Kent-road, and has cost upwards of £6,000.

Engineering Notes.

New York.—A Bill to authorise the construction of a tunnel under New York Bay, connecting Staten Island and Long Island, has been introduced into Congress, the object of the tunnel being to give the trunk lines now centring on the Jersey shore a Brooklyn terminus. The tunnel would cross New York Bay at its narrowest point, and be about two and a half miles long, but the whole route of the new railway would be about six miles in length. The water in the bay is only 35ft. deep at its deepest part, and the formation nearly all the way is believed to be a hard soapstone, which is easily worked, but would not require much artificial support. The estimated cost of the work is about 1,250,000dol. per mile, or 6,000,000dol. in all.

CHIPS.

The last portion of the widening of Fenchurch-street will shortly be completed by the setting back of 171, 172, and 173 to the line of frontage of the London and South-Western Bank and 65, Gracechurch-street, in accordance with arrangements with the Commissioners of Sewers. The works are being executed by Mr. Nightingale, of Albert Embankment, under the superintendence of Mr. W. Seth Payne, of Bishopsgate-street Without.

The rural sanitary authority of Uttoxeter have decided to offer two premiums, of £30 and £20 respectively, for the best scheme for dealing with the water supply of the town.

Mr. Diggle, in his annual address to the London School Board, mentioned that last year the repairs to London Board schools cost £4,500, an increase on the previous year of £1,500, while during the current year £2,500 would need to be spent on a single school.

At the last meeting of the Tamworth town council, Mr. H. J. Clarson, surveyor to the Rural Sanitary Authority, was, after some opposition, appointed inspector of nuisances and surveyor of the borough, at a salary of £125 per annum. The grounds of the opposition were that it was desirable that the Corporation should have the entire services of a surveyor, and that difficulties might exist in the way of one person satisfactorily acting for the rural and urban authorities.

A statue of St. Mary the Virgin and Child has been placed in a niche in the south aisle of Marytavy Church, Devon. Mr. Harry Hems, of Exeter, was the sculptor.

The restoration of St. Michael's Church, Stone, Staffs, has just been completed by the increase of the peal of bells from six to eight. The additional bells were cast by Messrs. Taylor and Co., of Loughborough, and were first rung on Sunday.

The governors of the Birmingham General Hospital decided on Friday to erect new buildings on a more convenient site at a cost of considerably over £100,000.

The foundation-stone of the Coatbridge Technical School and West of Scotland Mining College—the first of the kind erected in Scotland by the aid of a grant from the Science and Art Department—was laid on Saturday with full Masonic honours by Sir Archibald Campbell, M.P.

The Bill which the Dover Harbour Board have decided to apply for to enable them to construct a deep-water harbour outside of the present docks will be an amendment upon powers obtained in 1882, and never acted upon. Covered docks will be constructed in deep water for several mail steamers. The area to be inclosed between the Admiralty Pier and the new eastern pier will be about 70 acres.

An illuminated address and a purse of £150 were presented on Saturday to Mr. John Gough, for the past fifteen years curator of the Birmingham Municipal School of Art, on his resigning that appointment.

The exhibition of the Royal Cambrian Academy at Plas Mawr, Conway, which will close on Monday week, the 27th inst., has been an unqualified success this year. It has been viewed by upwards of 10,000 visitors, and 56 pictures have been sold for £1,058 11s.

The Haberfield almshouses at Hotwells, Bristol, are now being completed. They have cost £10,000, and have been built in the Queen Anne style from designs by Messrs. Pope and Paul, by Mr. W. H. Cowlin, also of Bristol. Provision is made for twelve aged men and twelve aged women in a two-story terrace of houses 220ft. in length, and having gardens in front and rear.

A large warehouse has just been finished in Wellington, New Zealand, for Messrs. Sargood, Son, and Ewen, from the designs of Messrs. Sulman and Power, of Sydney, N.S.W. It covers an area of about 9,240ft. and is 45ft. high.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. K. and Co.—F. and B.—H. and E.—V. B. and Co.—S. B.—A. L. B.—R. B. and Son.—J. D.—J. E. and Co.—C. E. and S.—J. A. and S.—F. W. and Co.

J. E. S. (First query inserted. As to books, write B. T. Batsford, 52, High Holborn; he will recommend what you want, and in most cases at second-hand prices.)

Correspondence.

WHITEFIELD CHAPEL COMPETITION.

To the Editor of the Building News.

Sir,—The greatest importance should be attached to the questions raised in your journal on the above-named competition. Much money, time, and anxiety have been expended by the competitors on the faith of instructions issued to them, and although, personally, I have not the smallest concern in the result, I should like to be permitted to make a few general observations on this particular competition, which apply also, to my mind, to all competitions.

Prof. Roger Smith's report, judging from the extract which appeared in your issue of the 3rd inst., clearly shows that its author has insufficiently grasped the duties of an assessor. He informs us that his decision has been "based upon a compromise"; he very good-naturedly adds that he thinks "it fair to the competitors" to say that it is "virtually impossible" to erect satisfactory buildings for the stipulated sum of £15,000. He commits himself to the astounding remark as regards the design "Hearing and Seeing," that "the architects definitely estimate this building at £15,000; but I consider that in this design the desire for economy has led the designers to lower the quality, both of the exterior and of the interior, below that which so important an undertaking requires." He still further takes away one's breath by saying, with reference to "Red Cross," that, although the author of that design has extended the frontage beyond that laid down by the plan issued to competitors, the Professor considers that in so doing the architect has not infringed the "spirit" of the instructions issued; and, having so liberally

dealt with "Red Cross," he extends his consideration to "Winged Heart," who has also occupied more space than the plan issued to competitors shows. The Professor then pats "Wisdom, Strength, and Beauty" upon the back for having estimated the cost of their building at £20,000, and not putting it down at £15,000, and proceeds with a remark which, for an assessor, is, I think, unique: "I consider, however, that its costly nature, its departure from the programme, and other reasons, practically render it impossible to entertain it." Will Prof. Roger Smith honour me by permitting me to share the delight of his profound conclusion, based as it is upon such worthy and excellent reasons? I can only hope that the R.I.B.A. will have the above-quoted opinion emblazoned in letters of gold, to be held up to all future assessors as the embodiment of just conclusions for rejecting a competitive design.

Well, Sir, having given the committee a taste of his groundwork, the Professor gives them his advice. He awards the first prize to the gentleman who has "occupied more space next to Tottenham Court-road than the plan issued to competitors shows" (to quote the Professor's own words); and as regards cost, he informs his employers that "the author estimates the design at £15,000," but does not tell us whether or not he, as an assessor, checked that estimate in any way beyond the cubing process which he himself states is "not always very safe as a guide to the actual cost of any one building." Neither does he extend to "Winged Heart" that rebuke for putting the price at £15,000 which should follow the commendation he awards to "Wisdom, Strength, and Beauty" for not putting it down at £15,000.

All this is, to my mind, exceedingly unsatisfactory. I believe, in opposition to the views expressed in your leader of last week, and also in direct antagonism to those stated in Mr. J. M. Brydon's letter, also in last week's issue, that there is only one leading duty of an assessor, and that is, after selecting the designs to which he proposes to recommend that the prizes be given, to set himself strenuously to work to see that their authors have complied in the strictest possible way, in every particular, with the instructions issued, and the very essence of such compliance should be *cost*. It is not the duty of the assessor, as he did not fix the limit of cost, to concern himself further than to ascertain whether or not the design submitted can be executed for the stipulated sum. Does he not see that if this sum is to be movable, the man who moves it can furnish a far more taking building than he who has deprived his design of attractive features in order to keep his building within the specified amount? If Mr. Brydon chooses to enter a competition for a building, the stated limit of cost of which is inadequate, to his knowledge, he should so inform the committee, and retire on that ground, and not finish a design—beautiful though his design undoubtedly would be, which he knows cannot be carried out for the money in hand—in the hopes of catching an assessor asleep and carrying off the prize! He does but scant justice to his fellow competitors, and perhaps brings serious embarrassment to those who have to provide the funds. But if cost is the essence, as I say, of the instructions, what is to be said of the competitor who absolutely designs a building—so far as his only authority goes—which occupies a greater area than the building site affords? "Goth" ingeniously provides for the Professor a way out of the dilemma; but even if there is an error in the plan issued to competitors, which has not yet, I think, been demonstrated, what is that to the competitors? They have all received the same dimensions, and I presume that if the committee give the frontage to Tottenham Court-road as 102ft. they mean 102ft., not 108ft.! Why did not "Winged Heart" and "Red Cross" work on £20,000, and say that the committee meant £20,000, although they stated £15,000? A great deal more I could say on this serious matter for architects and for the public, but that you, Sir, will probably think I have occupied enough of your space, and I will therefore conclude by expressing the hope that the R.I.B.A. will seriously take this Whitefield Chapel Competition in hand; it is a subject pre-eminently worthy of its attention. It would, in so doing, fulfil one of its real functions—the furtherance of all that tends to raise to a high standard professional practice in every form. But if the Institute will not move in the matter, then I trust that the competitors will: that they will obtain counsel's opinion as to the legality of the award, and proceed as counsel may direct, and my guinea—as I am sure that of hundreds of others will be—is at the disposal of any committee who determines to test once for all in a court of law whether the conditions upon which architects enter upon a competition are or are not binding upon all parties, and whether a violation of those conditions by a committee renders it liable to actions for damages by all those who have been losers by the breach.—I am, &c.,

Wm. Woodward.

7, Duke-street, Adelphi, Oct. 14.

HOUSING OF THE WORKING CLASSES ACT, 1890.

Sir,—In my letter which appeared in your issue of last week, attention was directed to those clauses of the Act more especially relating to dilapidated and insanitary dwelling-houses, and to the provisions by means of which *four* or more *householders* may initiate legal proceedings against owners; but with regard to "unhealthy areas" the conditions are somewhat different: in these cases *twelve* or more of the *ratepayers* are requisite for the formal complaint (to the medical officer of health) that the narrowness, closeness, and bad arrangement, or the bad condition of the streets and houses, or groups of houses, within a district or area, or the want of light, air, ventilation, or proper conveniences, or any other sanitary defects, or one or more of such causes, are dangerous or injurious to the health of the inhabitants either of the buildings in that area or of the neighbouring buildings.

A recent confirmation of the necessity of at once applying the powers of the Housing of the Working Classes Act, 1890, is contained in a reference to the Local Board of Works (St. Saviour's) by a writer who puts the matter thus:—"I ask Mr. Sinclair why his Board have repeatedly refused, on the recommendation of their sanitary committee, supported by their medical officer of health, to appoint a second inspector of nuisances for their large district; their sanitary committee have reported to the Board that it is quite impossible for one inspector to do all that is required, and if a second is not appointed the house-to-house inspection must be neglected. Does this look as if the board have the sanitary state of the district, or their own interests, at heart? Mr. Sinclair is an able and enlightened man, and while kindly trying to shield his brother-vestrymen, is well aware that there are many places in his district as bad, or even worse, than the place described."

The Charity Organisation Society has reported several insanitary areas, and is bringing before the public authorities much valuable information tending to aid and confirm both householder and ratepayers in their representations concerning the conditions under which many are compelled to exist.

In the Greenwich Police-court yesterday, a property-owner was summoned for disobedience to an order of a magistrate to close four houses unfit for human habitation. The order was made so far back as in March last. The defendant was fined £20, with an alternative of two months' imprisonment, the magistrate saying that there was a law which hit landlords like the defendants: "He was the sort of man they wanted to catch—men who kept houses unfit for human habitation where poor people had to live, and where they contracted fevers."

Under the new Act, only three months will be allowed even for the demolition of unsanitary premises, a closing order must be obeyed after seven days, and no such delay as the foregoing would be permitted.—I am, &c.,

Oct. 15. George H. Bilby, F.R.I.B.A.

COPYING DRAWINGS TO A REDUCED SCALE.

Sir,—The following method of copying a drawing to a scale $\frac{1}{m}$th of the original scale by means of an easily-constructed geometrical diagram, suggested itself to me some years ago. Since then I have simplified the process, and I now offer it to your readers as one which may be found useful to mechanical and architectural draughtsmen—at any rate, in the absence of proportional compasses. Indeed, when m is less than 3, working with a diagram is at least as easy as working with the clumsy instrument just named, and the results are as accurate, supposing the diagram to be carefully constructed.

In Fig. 1, let A and B be fixed points in a piece of cardboard or thick drawing paper, and AP, BP, any two lines drawn from them and meeting in P. Then, if in all cases $AP = m \cdot BP$, the locus of P is a circle whose centre (T) is on AB produced.

To prove this, draw PN perpendicular to AB, or AB produced. Let $BN = x$, $NP = y$, and

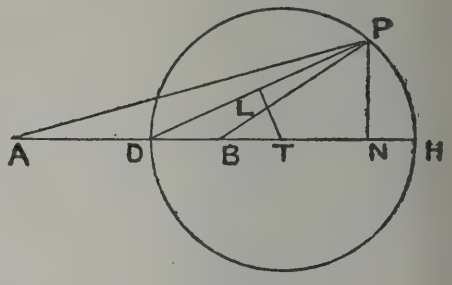

Fig. 1.

consider the length of AB (the *base*) as representing unity. Then—

$$y^2 + (x+1)^2 = m^2\,(y^2 + x^2)$$

from which we derive—

$$y^2 + \left(x - \frac{1}{m^2-1}\right)^2 = \frac{m^2}{(m^2-1)^2}.$$

This is the equation to a circle. $BT = \frac{1}{m^2-1}$, and the radius $TP = \frac{m}{m^2-1}$. By giving to m different values, we can calculate the corresponding values of BT and TP. Thus, if $m = \frac{\sqrt{3}}{\sqrt{2}}$, which is the ratio used in isometric projection, it will be found that $BT = 2$, and $TB = 2{\cdot}45$. If $m = \frac{3}{2}$, $BT = 0{\cdot}8$, and $TP = 1{\cdot}2$. If $m = 2$, $BT = 0{\cdot}33$, and $TP = 0{\cdot}67$, &c. The difference between the shortest length, AD, that can be taken on the original drawing and AH, the longest, decreases as we increase m, and it is easily shown that the range of the instrument, in its most simple form, is expressed by the formula—

$$AH = \frac{m+1}{m-1} \cdot AD.$$

In practice it is rarely necessary to calculate numerically the lengths BT and TP, for by a simple geometrical construction we are enabled to produce a diagram to any ratio m, given two lines whose lengths are in that ratio. Thus, suppose AB to be a suitable length for the base, and AP to equal $m \cdot BP$. Bisect the angle APB by the line PD. Then, since, by Euclid VI. 3.

$$AD : DB :: AP : BP$$
$$\therefore AD : DB :: m : 1,$$

which shows that PD is a chord of the required circle. Bisect PD in L, and draw LT perpendicular to PD. Evidently T, since it lies on both LT and AH, must be the centre, TP being the radius. Describe the circle, and the diagram is complete.

The mode of using the diagram requires little explanation. A length AP, from the original

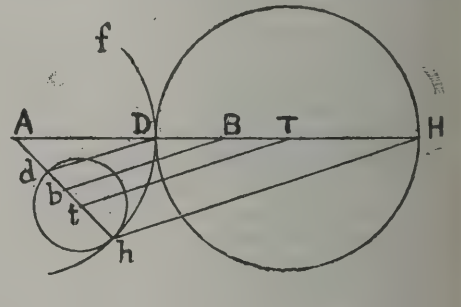

Fig. 2.

drawing, being set off with ordinary compasses from A, determines the position of the point P, and we take PB for the corresponding length in our copy. To prevent their being holed by compass points, A and B ought to be protected by horn centres.

For any measurement shorter than AD, when it cannot be taken indirectly (that is, as the difference between two longer measurements), a supplementary circle, constructed to a shorter base than AB, is required. In the diagram, Fig. 2, from A draw any line, Ah = AD, the shortest of the

measurements; join H h, and through T, B, and D draw lines parallel to H h, meeting A h in t, b, and d respectively. Then, A b is the new base, and t the centre of its circle, of which the radius is t d. Supposing A B to be of sufficient length, a third circle and base can be derived from the second, a fourth from the third, and so on; and it is easy to see—since the two circles in the figure are tangential to the arc f D h, described from A as a centre with the radius A D—that any measurement found on one circle cannot be found on any other, and therefore that no doubt need occur as to which base a measurement applies. When there are but two circles and bases, as in Fig. 2, since A h = A D, we have—

$$A D = \frac{m+1}{m-1} . A d,$$

and

$$A H = \frac{m+1}{m-1} . A D,$$

$$\therefore \quad A H = \left(\frac{m+1}{m-1}\right)^2 . A d.$$

In practice more than two circles are rarely required; but if we had n circles, and l and s were the greatest and least measurements within the range of the instruments, then—

$$l = \left(\frac{m+1}{m-1}\right)^n . s.$$

—I am, &c.,
Charing, Kent. J. R. C.

Intercommunication.

QUESTIONS.

[10409.]—**Drying Bricks.**—I shall be grateful if any of your numerous correspondents will give me the benefit of their experience as to the best and cheapest mode of drying machine-made wire-cut bricks made of strong clay previous to putting them into the kiln. Is the system of flues heated by means of coal or steam preferable? And what is the best means of constructing flues and floor, and what is the cost?—C. H.

[10410.]—**A Difficulty.**—I am the architect for a job of which my client is acting as clerk of works, and, being a builder's merchant, supplies most of the materials. On my last visit I was surprised and annoyed to find that the builder had set all the arches over window openings which have a 9in. soffit in two thicknesses, so there is now a joint to be seen all around the soffit 4½in. back from face of arch. As there is a good bit of work over, my client says he will not have them altered. Will any correspondent kindly suggest the best thing I can do under the circumstances? It has occurred to me that the soffit might be stuccoed.—Querist.

[10411.]—**A Builder in a Difficulty.**—Having lately started in the building trade, and being a joiner by profession, I have had a very fair run of work, and having good credit, was being well backed up by the trades connected; but in an unlucky moment I was tempted to take a lot of houses on the same ground as I was working on on another contract, and being so much engaged myself I left the estimating of this to my son, who was thoroughly up in it, and having got it, all went on swimmingly till we got nearly up to the first floor of joist, so as to get the stipulated first instalment; but having got a little more time on my own hands, I began to look over the estimate, and found a mistake of some £300, and being pressed a little for the month's accounts, I determined to go on and get the instalment before taking any steps; but having to stack the flooring, the merchant with whom I dealt had not a part of it in stock, but laid down all the rest, and on account of not having the agreement fulfilled to the letter, the owner refused to pay the balance of instalment then due, although opposite the deficiency in the floorings there was some £25 of extras in foundations, and I therefore had to shut shop, as they say, and he (the owner) now refuses to allow me anything—not even my scaffolding; and what I would like to know is if I have any remedy, or if any of your numerous readers know of a similar case, and how it was dealt with. I have a great many back numbers of Building News, and have searched them through, but cannot find anything like it, or rather report of anything like it. There is about £450 of work and material done, I have received £245, and the instalment was £350, as per agreement. By the way, I should mention that there is no clause in the agreement about the material being the property of the owner when laid on the ground, and I consider it very hard to give away all my labour, and tools as well besides, when I was so nearly up to the terms of the agreement—in fact about £15 worth of flooring would have made me fully entitled to it; but I preferred waiting till they had it in the place I was in the habit of dealing. Early advice from some of your numerous correspondents would much oblige.—Perplexed.

[10412.]—**Geometrical Problem.**—Can some reader, more skilled in mathematics than myself, give me the solution to the following problem in "Euclid," Book I. A B, A C are two straight lines, B and C given points in the same; B D is drawn perpendicular to A C, and D E perpendicular to A B; in like manner C F is drawn perpendicular to A B, and F G to A C. Show that E G is parallel to B C.—J. E. Smale.

[10413.]—**Lettering.**—In lettering stone or marble, where it is desirable to have the sunk letters filled in with black or red sealing-wax as more durable than painting same, and if for greater permanency, to have the dovetailed grooving run full with molten lead—what is the best way to bring the wax or lead to a smooth face with the stone or marble surface?—Tolop.

[10414.]—**Signing Contracts.**—Is it necessary that both employer and contractor sign the documents, or is it binding if the contractor's signature is put to it, and witnessed? When a contract is signed on behalf of a firm, is the signature of one member or a manager on their behalf sufficient, or should each member sign separately.—Teachable.

REPLIES.

[10366.]—**Enforcing Completion of Contract.**—I am disappointed no one has answered this question, as the matter is becoming grievous, all being at a standstill; the contractors, on the one hand, threatening that if the work is not measured off and a statement made by the architect, proceedings will be taken; the proprietor, on the other hand, saying he is prepared to pay balance when the work is completed by contractors, who resist, stating they will do no more, having, as they think, finished, the matters required being only trivial, and as their workshop is a considerable distance from the building, parties close at hand can do the little matters cheaper, and they are willing the amount should be debited at contract rate. The employer holds, however, that the contractors are bound to carry out their contract themselves, and as a question of right he is determined they shall do so, or he will not pay until forced. What course should the architect take in this case under the circumstances?—Perplexed.

[10382.]—**Altar Rail.**—It is worth something to know that the chancel "A. H." is concerned with is 19ft. by 40ft. In that space he can seat a choir of 30 with two priests, and have twelve steps to foot-pace, or fourteen if two may be projected towards nave; and perhaps a passage next the wall as well, nothing being pinched. In seating a narrow chancel it is desirable to bear in mind that 6ft. is not too much for men's and boys' benches, because in half-turning for creeds, &c., and walking in and out less than a foot is certainly insufficient. Place the chair in front of the table and turn round so as to walk between them, and it will give way so as to leave a space of 13in., and probably 14in. would be a safer width, even if the seats had to be pinched a little to compensate. Where there is lateral access to chancel, the position of altar rail hardly becomes an open question.—H. W.

[10392.]—**Okehampton.**—There are two churches at Okehampton. All Saints is the parish church; it stands on a bold eminence half a mile or so away from the town. The ruins of the old Norman castle, built by Baldwin de Briony—also called De Redvers and De Ripariis—the lord of two hundred manors, and in William the Conqueror's time the greatest landholder in Devon, are not far off. The castle crowns an abrupt wooded knoll close by the river Ockment. It also contained a chapel, of which remains still exist. The other church is St. James's Chapel-of-Ease, standing in the middle of the principal street. The church itself is modern (built 1862); but the Early Perpendicular tower, embattled and pinnacled, although all that is left of the original edifice, has interesting features. It is this that "J. E. P." asks a query upon in the Building News for Sept. 26th. Curiously, the parish church, like the chapel, only retains its original western 15th-century tower. The former edifice was consecrated by Bishop Bronescombe (c. 1257—91); but the body of the structure was totally destroyed by fire on the 13th of February, 1842, and soon after rebuilt from the designs of Mr. John Hayward, of Exeter. Not many years ago the solitary tower of St. James's, Okehampton (spelt variously Oakhampton, Ockington, Ockmentune, Ockmenton, &c.), served as a lateral support for a butcher's shop! The place was originally a chantry, but was afterwards given to the corporation by one of the Courtenays. It is now in the hands of the Charity Trustees. Risdon, in his "Survey of Devon" (he died A.D. 1640) thus refers to the two churches:—"Oakhampton was lately graced with a mayor, by the bounteous favour of King James the First—in which there is one chapel—the church standing somewhat remote, as if it were banished, without comfort or company." Dr. Oliver, D.D., a learned, painstaking local antiquary, in his "Ecclesiastical Antiquities of Devon" (1839) thus refers to Okehampton, but whether to the St. James's within the town, or the parish church without, is not clear. He writes:—"Okehampton.—On a tablet affixed to the south wall of the church—'Here under lyeth Thomasin Godolphin, the wife of Thomas Peter, Gentlem: who Dyed the ix of September, 1608.' On each side is a shield. That on the right Petre of Wiscombe and Godolphin, party per pale; that on the left Godolphin and Grenville, party per pale. Mrs. Petre kneels on a cushion before a desk with a book in her hand. Behind her, on the pavement, which is well engraved, kneel her three daughters. Beneath is the following inscription—

"She was to God and husbande trewe,
A mirror of all wyves to viewe;
The poor, the lame, sicke, and needy
She did releeve most liberally:
She lyved so good and Godlye life,
As never wronged man, maide, nor wife,
And made so good and Godlye ende
As none the same on earth may mend."

The Rev. F. C. Hingeston-Randolph, who has already reproduced the registers of several of the early Exeter Bishops—viz., Bronescombe (A.D. 1257-80); Quivil (A.D. 1280-91); Bytton (A.D. 1292-1307); Stafford (A.D. 1395-1419)—and is still engaged on the stupendous work, does not quote many references bearing upon the ecclesiastical history of Okehampton. There is, however, an entry in the Bp. Bronescombe Register: "Okehampton (Okemptone and Ochamtone MS.), vicars of: Adam occurs 6 April, 1267-36; Sir William de Winkelege, priest, was inst. 22nd February, 1277-8; patrons, the Prior and Convent of Cowick." And in Bishop Stafford's Register there is mention: "Okehampton (Okhampton MS.), Vicars of: Richard Yestbrook; on whose death was inst. 17th Dec., 1413; John Newecum, Chaplain. Patron: K. Henry VII. 154." And again, in the same Register: "Okehampton, Richard (Estebrok) V. Penitentiary in Deanery of Okehampton, i. 50; his will i. 321. John Newcombe V. ii. 292, Penitentiary i. 194, 207, 217, 231, 237. Okehampton and Cowick. Ordinacio concerning, by Bishop Stafford. The Bishop sets forth that between the Prior and Monks of the Parish Church of Okehampton (Okhampton alias Okementon) on the one part, and John Newcomb, Vicar, thereof, on the other part, grave differences had lately arisen, touching the repairs of the chancel and the provision of office books therein, and the said Prior, &c., by their proxy, John Hethfield, Chaplain, and the said Vicar in person had appeared before him at Clyst, 3 June, 1417, and had stated their case, the former alleging that by Bishop Briwere's Ordinacio, and by custom, the Vicar was liable, and the said vicar maintaining the contrary view. With the consent of both parties, the Bishop settled their differences thus: The said Vicar and his successors were to keep up both the chancel and the office books; and by way of compensation, it was agreed that in the case of any subsidy to be paid to the Vicar, and in the case of procurations, payable by him on account of Archiepiscopal and Episcopal visitations, the Prior, &c., should pay one entire moiety of the same. Also the Prior and Convent agree to remit 6s. 8d. per annum out of an annual pension of two marks, payable by them to the Vicar, reducing the said pension to 20s. per annum. This settlement the Bishop declares to be just and fair, and he confirmed the same accordingly." Bishop Briwere's Ordinacio, mentioned above, is quoted in full, granting to the Prior and Convent of Cowick the church of "Okementon," and the chapel in the castle there, with the consent of Courtenay (de consensu de Cortenay, veri patroni), reserving to the Vicar all the obventions of both the glebe (sanctuarium), and the court and buildings thereon, and the tithes, great and small, therefrom; save that the Convent was to enjoy the tithes, garbarum, both of the whole parish and of the tenants of the glebe, together with a suitable space adjoining the Vicar's Court, and a barn; with two silver marks yearly at Michaelmas. The vicar was to be liable for omnia onera debita et consueta Episcopalia, etiam Archidiaconalia, dictam ecclesiam et dictam capellam contingencia (these were the disputed words), and to provide for Divine Service daily in the said chapel. It was dated at Exeter, die Martis, in Easter week, 1239 The date of this Ordinacio was as given above at Clyst, &c. The Prior, &c, signed it on 7th June, in their chapter house; the vicar, at Clyst, on the same day ii. 292b, 293b.—Harry Hems.

[10402.]—**R.I.B.A. Exam.**—I should be inclined to interpret the words "Geometrical Drawing" somewhat liberally, and submit a measured drawing from a few panels in a 15th-century tomb, full size, or something similar. Probably a copied drawing of one of the stereotyped "Orders" would suffice; but I should advise, in preference, a measured section through the Parthenon entablature, obtained in the British Museum—Elgin Room—and drawn to ½ or ¼ full size.—G. A. T. Middleton.

[10403.]—**Strength of Pipes.**—For iron pipes cast vertically, where—

t = required thickness in inches.
d = diameter in inches.
n = head in feet divided by 33.
Formula, $t = (\cdot 0916\ n + \cdot 013)\ d + \cdot 32$.

Pipes should be tested to three times their working pressure, and to never less than 300ft. of head.—N. D.

[10404.]—**Rise of Water in Basement.**—Dig out clay round walls down to footings and return it well puddled, or render outside of brickwork with cement. Take up wood floor, and (having excavated deep enough, if necessary) lay down at least 6in. of good fine cement concrete, which should be rendered with neat cement all over before the concrete stiffens. Where concrete joins walls all round, take care to well clean and damp the brickwork and rake out joints. The wood floor can then be replaced, or the concrete floor may be made higher and tiled over.—N. D.

[10405.]—**Levelling.**—You should consult recent works on surveying and makers' catalogues. For general use, you would find a 14in., without compass, the handiest, and as to make, I prefer Stanley's Tribach Levels, which have several improvements.—M. D.

[10405.]—**Levelling.**—The side sights to Harling's levels are now and then of great advantage; but it may be generally said that any instrument by a good maker may be relied upon. Personally, I prefer four to three levelling screws, and one vertical hair to two; but these are only personal predilections, and are not shared by everyone. Test the definition of your lenses before purchasing.—G. A. T. Middleton.

[10406.]—**Sash Fastening.**—Has "A. Z." seen the screw fastener, which consists of an ornamental milled-headed screw, working in threaded sockets placed horizontally in the meeting bars? It looks well, when fixed, keeps windows from rattling, is easily worked by people with delicate fingers, and cannot well get out of order. I forget maker's name, but any ironmonger will tell you.—M. D.

[10407.]—**R.I.B.A. Exam.**—"Anxious" was unwise to enter for the Prelim. at all. He should have waited and presented himself for the Associates' Exam. next March. He ought now to lay his case fully before the Council, and ask to be allowed to attend in March, on submitting the usual probationary works; and his request can scarcely be rejected, as he will be able to comply with all the conditions. In the mean time, he should be working hard, attending either my lectures, those at King's or University Colleges, or those conducted by Mr. Farrow, reading by himself under guidance, making his probationary drawings, and, when possible, measuring and sketching from old works. No sudden cramming will get a man through the R.I.B.A. Exam. He must study thoroughly, and for a considerable period.—G. A. T. Middleton.

The Lord Mayor, accompanied by the Sheriffs of London and Middlesex, opened, on Tuesday, the new municipal hall and free library at Newcastle-under-Lyme. The building has been erected at a cost of £15,000, from designs by Messrs. Sugden and Son, Blood, and Snape. It includes a council chamber, a school of art, a public reading-room and library, and a large assembly-room.

The Mansfield Commissioners have lately purchased the undertaking of the Mansfield Water Company, which was promoting a provisional order for the purpose of obtaining powers to augment its supply. The Commissioners are now acting under the advice of their engineer, Mr. George Hodson, M.Inst.C.E., making trial borings on the site selected, which have already led to an abundant supply of pure water.

LEGAL INTELLIGENCE.

Re George Wall.—A first meeting was held before the Official Receiver on Friday. The debtor was a builder and contractor, carrying on business in Carlton-road, Kentish Town. His gross liabilities are returned at £25,360, of which £13,088 are unsecured, and the assets are estimated at £4,462. The London School Board make further claims for £13,000, which the debtor repudiates, and actions are pending in respect of the same. Mr. E. H. Collins, accountant, was appointed trustee of the estate, together with a committee of inspection, resolutions for bankruptcy being passed.

Ancient Lights and Crown Rights.—(The Mercers' Company v. Eames—Salaman v. Eames — Perry v. Eames.)—Applications were made before Mr. Justice Vaughan Williams on the 9th inst. to restain interference with ancient lights claimed by the Mercers' Company, as the freeholders, in respect of Gresham-buildings and Nos. 9 to 12, Basinghall-street, on the east side of the street. It appeared that the defendant was erecting buildings on the opposite side of the street, on the site of the old Bankruptcy Court, of a height of 14ft. higher than that of the old buildings, raising the height from 50ft. to 64ft. in a street only 25ft. wide. The defendant contended that, the Bankruptcy Court having been Crown property from the year 1820 to 1884, the plaintiffs could not claim any prescriptive rights against persons claiming under the Crown (2 and 3 William IV., c. 71, sections 2 and 3). The plaintiffs, on the other hand, maintained that the property had never vested in the Crown, but in trustees, and cited the provisions of the Act 1 and 2 George IV. section 115, under which the Bankruptcy Court was built, and sections 1, 2, and 3 of the Prescriptions Act, 2 and 3 William IV., c. 71. After considerable argument as to whether the property was ever really vested in the Crown or not, it was arranged that the motion should stand over till the second motion day of next sittings, the defendant undertaking to abide by any order the Court might then make with respect to pulling down any part of the buildings erected from this date, and which should, in the judgment of the Court, substantially obstruct the ancient lights of the plaintiff.

Sequel to a Builder's Bankruptcy.—At the Longton (Staffordshire) County Court, on Tuesday, the 14th inst., Mr. J. E. Moxon, solicitor, Hanley, brought an action against Mr. Wood, of the firm of Steele and Wood, earthenware manufacturers, Stoke-on-Trent, to recover from him the sum of £50, being £30 on account of the plainttff being wrongfully deprived of a mortar-mill, and £20 as damages. On April 19th Mr. Barlow, son of a builder at Stoke-on-Trent, called upon the plaintiff to borrow £25, saying that he was short of money with which to pay his firm's workpeople. Mr. Moxon refused the loan, but ultimately agreed to purchase from him a mortar mill for £25. On April 21st a summons was issued against Mr. Barlow, sen., for £17, by Messrs. Steele and Wood, and on the 23rd the case came before his Honour at the Longton County Court. On the same day, however, a bankruptcy petition was presented against Mr. Barlow, and so the County Court action was restrained until the conclusion of the bankruptcy proceedings. On May 14th, Barlow was adjudicated a bankrupt. The £25 which Mr. Moxon had paid for the mill went towards the bankrupt's estate. Whilst negotiating for the fixtures for the mill Mr. Moxon heard that the mill had been sold by auction on the instructions of Mr. Wood, the defendant. The latter paid £13, value of part of the mill, into Court, with a denial of responsibility in respect to the whole. Cross-examined, the plaintiff said he did not know the mill was incomplete when he bought it. A large portion of it ultimately came into the hands of the auctioneer, Mr. Wilde, who bought it from the Official Receiver. Mr. Wood admitted having sold one part of the mill by mistake, but contended that he was not liable for the conversion of the whole, as part of it had been sold by the Official Receiver to Wilde.—His Honour held that Mr. Wood, having authorised Wilde to sell part of the machine, rendered himself liable for the conversion of the whole, although he might have a claim against Wilde for a portion. His verdict must be for the plaintiff, for £30, with costs.

The iron opening bridge built at Goole, near the confluence of the Dutch River (cut by Sir C. Vermuyden), over the river Ouse, is now completed. The Manchester, Sheffield, and Lincolnshire Railway Company have built it in place of the old wooden structure that stood where it now stands. The cost of the bridge is £9,752.

A statue of Lessing, the literary Luther of the 18th century, was unveiled in the Thiergarten at Berlin on Tuesday. It is of marble on a granite pedestal, and was executed by Professor Otto Lessing, grand-nephew of the poet.

WATER SUPPLY AND SANITARY MATTERS.

Duffield Waterworks.—At the request of the Belper Rural Sanitary Authority, Mr. W. H. Radford, C.E., of Nottingham, has sent in alternative schemes for waterworks at Duffield, and they are now under consideration. In one scheme Mr. Radford proposes to take the water from the Hazlewood Spring, and store it in a service reservoir, and supply by gravitation, any future deficiency being made good by putting down the pumping station mentioned below. In the alternative scheme, Mr. Radford proposes to pump river water from alluvial deposit, after natural filtration through sand and gravel, the water being pumped into a summit reservoir to command the district.

CHIPS.

A meeting of the congregation of the Chapel Royal, Savoy, was held on Wednesday, for the purpose of taking steps to raise a memorial of the late chaplain. A letter was read from Mr. Burdett-Coutts, M.P., offering, on the part of the baroness, to take charge of the erection of a memorial over Mr. White's grave at Brompton, which proposal was accepted on the part of the family. An intimation was also received from Mr. Passmore Edwards of his willingness to found a permanent scholarship at King's College School for a Savoy chorister, or to erect a drinking fountain in the Savoy Precinct on the Embankment. The assistant chaplain (the Rev. W. J. Loftie, F.S.A.) wrote suggesting either such a scholarship or the erection of a choir-house. A representative committee was appointed.

Messrs. Samuel Trickett and Sons, of Victoria Stone Wharf, Millwall, E., desire us to state that, for the convenience of their customers, they have taken City offices at 119 and 120, London-wall, E.C., where in future all communications should be addressed to them.

The building trade in Australasia seems very dull. A circular lately issued to the members of one of the trade societies describes trade as being bad in all centres of population, excepting Wellington, N.Z., and Adelaide. Against these cities the word "moderate" is placed.

The Albert Hall in Shandwick-place, Edinburgh, will be reopened next week, having been entirely redecorated by Messrs. Macfarlane and Wallace, of that city.

Mr. John Newhouse, the head and organiser of the sanitary department of the Leeds town council, has tendered his resignation on account of advancing years. In 1865, while holding the position of police inspector, he was asked by the then mayor to organise a sanitary department; the only officials at that time who looked after the public health being an inspector of nuisances and a smoke inspector, with one clerk. He did so, dividing the borough into twelve sections, and appointing an inspector to each. This scheme worked satisfactorily, and the Local Government Board having issued an order that no police-officer should engage in sanitary work, Mr. Newhouse resigned his office in the police to take up the inspectorship of nuisances. The first medical officer of health was appointed in 1866, and, with the assistance of Mr. Newhouse, the sanitary department of Leeds has grown until it now numbers nineteen district inspectors, two meat inspectors, one smoke inspector and an assistant, one canal-boat inspector, and a dairies and cowsheds inspector.

A Bill was introduced into the Austrian Diet on Tuesday, authorising the creation of a Greater Vienna by enlarging the boundaries, so as to include a number of summer resorts and suburban villages. By this manner the area of the Austrian capital would be increased from 14,000 to 42,000 English acres, and the population from 700,000 to 1,300,000. Of this Greater Vienna only 10 per cent. is at present built on.

In the 1890 report of Mr. Arthur Bell, the engineer in charge of buildings for the Government of New Zealand, we see that £33,175 was spent on Government buildings during the last year. Education being one of the large functions undertaken by that Government, we are not surprised to see that £25,000 was spent on school buildings.

A mill-girls' institute is about to be built in Ancoats, Manchester, from plans prepared by Messrs. Darbyshire and Smith, of that city. The building will be Italian Renaissance in style, and will have a frontage three stories in height, faced with Ruabon red bricks and terracotta. The building will cover an area of 75ft. by 128ft., and will cost about £5,000.

The stone screen erected in Rochester Cathedral as a memorial to the late Dean Scott will be unveiled to-day (Friday). The carving has been executed by Mr. Nathaniel Hitch, of Vauxhall.

Sir Edgar Boehm has just been commissioned to execute a colossal statue of Lord Reay for Bombay.

Our Office Table.

"The Architectural Antiquities of the Isle of Wight," from the 11th to the 18th centuries, is the title of a folio about to be published by Mr. Percy G. Stone, F.R.I.B.A. It will be issued in four parts; the first of these will be apportioned to the East Medine, and the other to the West Medine. There will be over 100 full-page plates, including many measured drawings. The buildings to be represented comprise Quarr Abbey, all the best churches (some twenty-four in number), several brasses and sepulchral monuments, pulpits, panelling, metal-work, chimneypieces, and furniture, as well as views and plans of the manor houses of Arreton, Mottison, Woolverton, Stenbury, North Court, West Court, Yaverland, Sheat, Merston, Chale, Swainston, and Billingham; the Castles of Carisbrooke, Yarmouth, and Cowes. Mr. Stone will publish the work himself to subscribers.

Earl Derby has just presented to the Liverpool Free Museum a very valuable collection of prehistoric implements illustrating the stone and bronze periods of Europe and America. The series consists of 425 specimens, the general collection containing 378 examples, supplemented by 47 very fine neolithic Scandinavian weapons of marvellous workmanship. The palæolithic epoch contains specimens from Norfolk, Suffolk, Essex, &c., as well as specimens from Abbeville, the original locality described by M. Bourcher de Perthes, who discovered in Europe the great antiquity of these weapons and their association in the gravel pits with the remains of the extinct mammoth, woolly rhinoceros, and other prehistoric animals. The collection also contains flint implements from the surface gravels of Surrey, Newhaven, and other well-known English localities. It is, however, in the neolithic or later epoch specimens that the collection is especially rich. There are axes or wedges in polished flint from Denmark, with keen edges; gouges, scrapers, cores, and sacrificial knives or lances all in flint. The collection contains also Irish celts in basalt, a large series of flints in their original horn hafts from the Swiss lake dwellings, celts from France; a series of American wedges, some grooved, as well as flint arrow-heads from nearly every part of the world. The bronze period is also represented by swords, palstaves, knives, and a large series of pins and brooches from the lakes of Neuchâtel and Mörigen. The collection is now being prepared for exhibition by Mr. T. J. Moore, the curator of the Free Museum. The Rev. H. H. Higgins is to lecture upon it at the Philosophical Institute of Liverpool on Monday next.

One injustice to Scotland, against which lovers of art have hitherto ineffectually protested, is about to be remedied, the Board of Manufactures for Scotland having received a communication from Lord Lothian, Secretary for Scotland, announcing that the Government propose to give a grant of £1,000 a year for five years for the purchase of pictures for the Scottish National Gallery. Considering the liberality with which the London and Dublin Galleries have been treated, it is strange that hitherto not a penny for the purchase of pictures has been granted to Scotland, and in consequence many desirable works of art have passed out of the country which ought to have found a permanent home in the National Gallery at Edinburgh. The first £1,000 will be available after April next.

The superiority of Portland cement for anchoring iron bolts has been recently shown in some experiments in connection with the foundations in rock for an elevated railway. Sulphur, lead, and Portland cement were tried for the purpose, holes being drilled in the limestone rock 3½ft. deep, and about 1⅝in. in diameter. With sulphur the bolts showed a strength of 16,000 and 31,000lb.; with lead the results showed the same strength, but the cement gave the highest. Five out of six bolts broke without pulling out; one 1in. bolt began to yield at 26,000lb., but sustained the load a few seconds. A further series of experiments were undertaken to determine the strength per square inch of area. A plain 1in. bolt yielded at 20,000lb., a threaded bolt at 21,000lb. A threaded 2in. bolt yielded at 32,000lb., the strain being slowly applied. These tests go to prove that cement is more reliable and stronger than either lead or sulphur, and that the resistance is from 400lb. to 500lb. per

square inch of surface exposed. Cement also preserves the iron.

In a vigorous letter to the Watford *Observer*, Messrs. Webster and Cannon, of Aylesbury, protest against the recent conduct of the Watford School Board in passing over their tender for the new schools on the Common—although the lowest sent in, and recommended for acceptance by the architect, Mr. Ayres—on the ground that the work ought to be given to local men. They point out that they were put to considerable trouble and expense in tendering, and declare that to accept a tender £190 higher on such a ground is to further protection in its most obnoxious form at considerable cost to local ratepayers. They ask what Watford builders would think if they were so treated at Aylesbury, and show that in that town the contracts for the railway station, post-office, and bread factory were all given to outside firms, and, indeed, it is a common practice all over England. A parallel case appeared in our list of tenders a fortnight since in the action of the Coventry School Board, who, without objection being raised, accepted the tender of Mr. J. T. Wingrove, of Northampton, for their new schools.

By the will of the late Mr. Henry Lammin, who formerly resided at Newark, but who died in London in August, the Nottingham Castle Art Museum receives a valuable addition to its treasures, Mr. Lammin having bequeathed to the institution his collection of paintings and ceramic ware, the value of which is estimated at £4,000. The pictures (about fifty) include examples of Turner, Gainsborough, David Cox, Crome, Stark, Richard Wilson, and others. There are a few large canvases, but most are cabinet works. The decorative objects principally consist of Crown Derby ware and other ceramic works, such as those from Worcester and Swansea. The Crown Derby includes some splendid vases and sets.

On the 10th inst., Mr. John Grundy, of Duncan-terrace, Islington, N., and of Tyldesley, near Manchester, gave his annual entertainment to between 500 and 600 aged persons of both sexes, ranging between 60 and 90 years of age, belonging to Tyldesley and the neighbouring districts. After partaking of a substantial tea, an entertainment was provided for them by ladies and gentlemen friends of the host, interspersed with which were many speeches, not the least of which was that in which Mr. Grundy replied for the hearty manner in which the health of his wife and himself had been proposed. He expressed himself as being very delighted to see so many old neighbours and friends around him, and trusted that he might do so for many years to come at these annual reunions. Mrs. Grundy, he regretted to say, was unavoidably prevented from being present by unforeseen circumstances.

CHIPS.

The new church at Aldborough in the North Riding, built at the cost of the Dowager Duchess of Northumberland, was consecrated last week. It is Early English in style, is seated for 120 persons, and has been built from plans by Mr. W. T. Hicks, of Newcastle-on-Tyne, at a cost of £1,500. Messrs. Ivison and Brown were the contractors.

An oil painting of the late Duke of Buckingham and Chandos, which was on Tuesday presented to the county of Buckinghamshire by the magistrates, has been hung in the dining-hall at the Judges' Lodgings at Aylesbury.

Additions have been made to the head office of the National Provincial Bank of England, Birmingham, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

On Wednesday last a bazaar was opened at Wigan in aid of funds for building the new church of St. Mark, a portion of which is now in progress at a cost of £3,500. Messrs. Heaton and Ralph, of Wigan, are the architects.

The County Council for the West Riding resolved on Friday that a grant of £300 be made to the West Riding surveyor for bringing into force the Local Government Act, 1888, and for additional work in consequence thereof.

At a public meeting held at Dudley on Tuesday night, Mr. Thomas Chatfeild Clarke, F.R.I.B.A., was unanimously selected as the Liberal candidate. It will be recollected that Mr. Chatfeild Clarke unsuccessfully contested Hammersmith in 1885.

MEETINGS FOR THE ENSUING WEEK.

Tuesday.—Manchester Architectural Association. Inaugural *Conversazione* of Session. Athenæum Lecture Hall. 7.30 p.m.

FRIDAY, OCTOBER 24, 1890.

THE ARCHITECT'S POWER.

TO what an extent an architect, as general agent of his employer, may exceed his direct professional duties, is a question that has not been very clearly answered, nor is ever likely to be so. Many of the duties rendered by an architect in the course of his professional engagement are of an irregular kind; a hundred little matters may be done by him for which he does not receive any remuneration—such, for instance, as discussing points with his client which have already been settled by the contract, visiting manufacturers, in assisting to select fittings, and attendance upon various people. For these gratuitous services he may never receive a shilling, yet when he does anything connected with the contract which is a little beyond his primary duties, he lays himself open to misrepresentation or to a charge of exceeding his authority. How far, for example, he can go in ordering any deviations or extras, or in obtaining goods for the work, are rather delicate questions, which an architect should endeavour to answer for himself, and which will probably vary with circumstances. Clients are not alike: some may be inclined to give *carte blanche* to their adviser, to leave everything in his hands about which they themselves know little or nothing; others hardly like their architect to go out of their sight—certainly not to do anything without consulting them. We have heard of employers making themselves masters of the specifications, looking at all materials supplied, and seeing everything being done, even to the mixing of mortar and the laying of drains. Between these two extreme views of a client's duties it may indeed be hard to draw a line. An architect may decline to be subject to interference on the part of his employer, though whether he can refuse to accept anything which has been ordered contrary to his specification is rather questionable, and to raise the point will generally lead to unpleasant consequences.

The professional man, as agent of the employer, can bind him by acts within the scope of his employment. He can, for example, bind his employer to certain acts and orders which appertain to his employment as architect; he can order additions and deviations in carrying out the work, so long as they do not alter materially the contract or drawings and specification; he has an implied authority to retain a quantity surveyor under certain circumstances, or where tenders are required; and he has generally an authority to act in the interests of his client; but beyond these cases it is rather doubtful whether he has the legal power to bind his employer. The architect's power, so far, is independent of any special agreement; but the Courts appear to be jealous of extending the architect's authority under these circumstances; perhaps because they think that professional men are inclined to take upon themselves more than they are justly entitled to, and, no doubt, there may be an inclination to do so under some circumstances. But, of course, this power or authority of the professional man can be extended. The employer can sanction his architect to do whatever he may desire, and this power can be expressed in the contract. For example, it is usual to make a condition to the effect that the contractor is to make such additions, omissions, or variations as the architect may direct. This liberty of being able to order additions or variations may be attended with disadvantages, and sometimes not in the interests of the employer. In those cases where employers are inclined to be crotchety and vacillating, or disposed to object to necessary deviations, we think this kind of clause necessary, or, at every suggestion of the architect the employer may be inclined to demur. We now consider those cases in which no special agreement exists. All we gather from the opinions of the Courts prove there is an inclination to limit the authority of the architect, and to confine his acts and orders within the scope of his employment. One case, "Kimberley *v.* Dick," illustrates the view taken by the Court when the architect orders various additions and variations under the contract, reserves the power to decide what are additions and variations, and the payment the contractor should receive. One of the conditions of the architect's appointment was that the additions to the house were not to exceed a certain sum; but this stipulation was not made known to Kimberley, the plaintiff, who sent in a tender rather below the amount. The architect exercised the right under the contract to order additions and variations, and it was held *inter alia* that the architect was general agent for Dick in matters connected with the erection of the house; therefore, the plaintiff was not bound by the undisclosed condition between the architect and employer that the cost should not exceed the sum stipulated. From the decision, it appears that when any such stipulation between architect and employer is not made known to the contractor, the latter can assume that the architect can bind his employer by any order. Kimberley was not bound to the amount agreed to under these circumstances. He naturally thought that the architect could bind his employer to any sum that was necessary, and being no party to the agreement, it was ruled that he was not responsible for the increased outlay.

Those who contract ought to know, therefore, what the intentions of the employer are. In these cases, at least, every builder has a right to assume that the architect can pledge his employer's credit within the limits of his employment. When a contractor receives an order to do something not in the specification, he is justified in carrying the order into execution. Therefore, it is a matter for the architect to make himself sure of his position before giving orders to any considerable amount. He ought, as we have said, to know the limits of his authority as agent for his client, and if he has any doubt about this, he should receive special authority. We allude more particularly to those circumstances in which the architect, sometimes with the best of motives, gives an order to a manufacturer for goods or materials to a considerable amount. It may be again asked, What are the limits and the amount to which he may pledge his clients? No definite opinion has yet been given to decide this question. An architect may justifiably think that as he has the power to bind his employer to anything connected with the building, he is justified in ordering any material, like stone or particular fittings. The legal cases that have been settled throw very little light on the point. In one instance the architect ordered a quantity of stone for a church, pretending, so it was alleged, that he had authority from the committee to do so; the stone was supplied to the employers' account, but they refused to pay, and an action against them was dismissed. It was held that he was liable to the builder for their value, whether the representation was fraudulently or honestly made. The builder recovered also the costs of the action against the employer which failed from want of authority to bind him. All that this decision proves is that an architect cannot bind his employer if the latter turns round and denies his authority; but it in no way clears the doubtful ground. An architect may honestly believe he has a right to order and yet become liable to an action. The law in short interprets the order as implying an authority; but if this decision be carried to its logical conclusion, every order, however small, which an agent may think himself justified to make as within the scope of his employment, would be equally liable to be contradicted. However this may be, it is certain that an order given by an architect without a special authority is open to a very wrong interpretation, or as one lawyer has put it "a person professing to contract as agent for another, impliedly if not expressly, undertakes to or promises the person who enters into such contract, upon the faith of the professed agent being duly authorised that the authority which he professes to have does in point of fact exist." The less, therefore, a professional man enters into contracts of this sort the better, and, in short, the less he gives orders on his own authority the more likely he will be to avoid the complication and difficulties which arise from them.

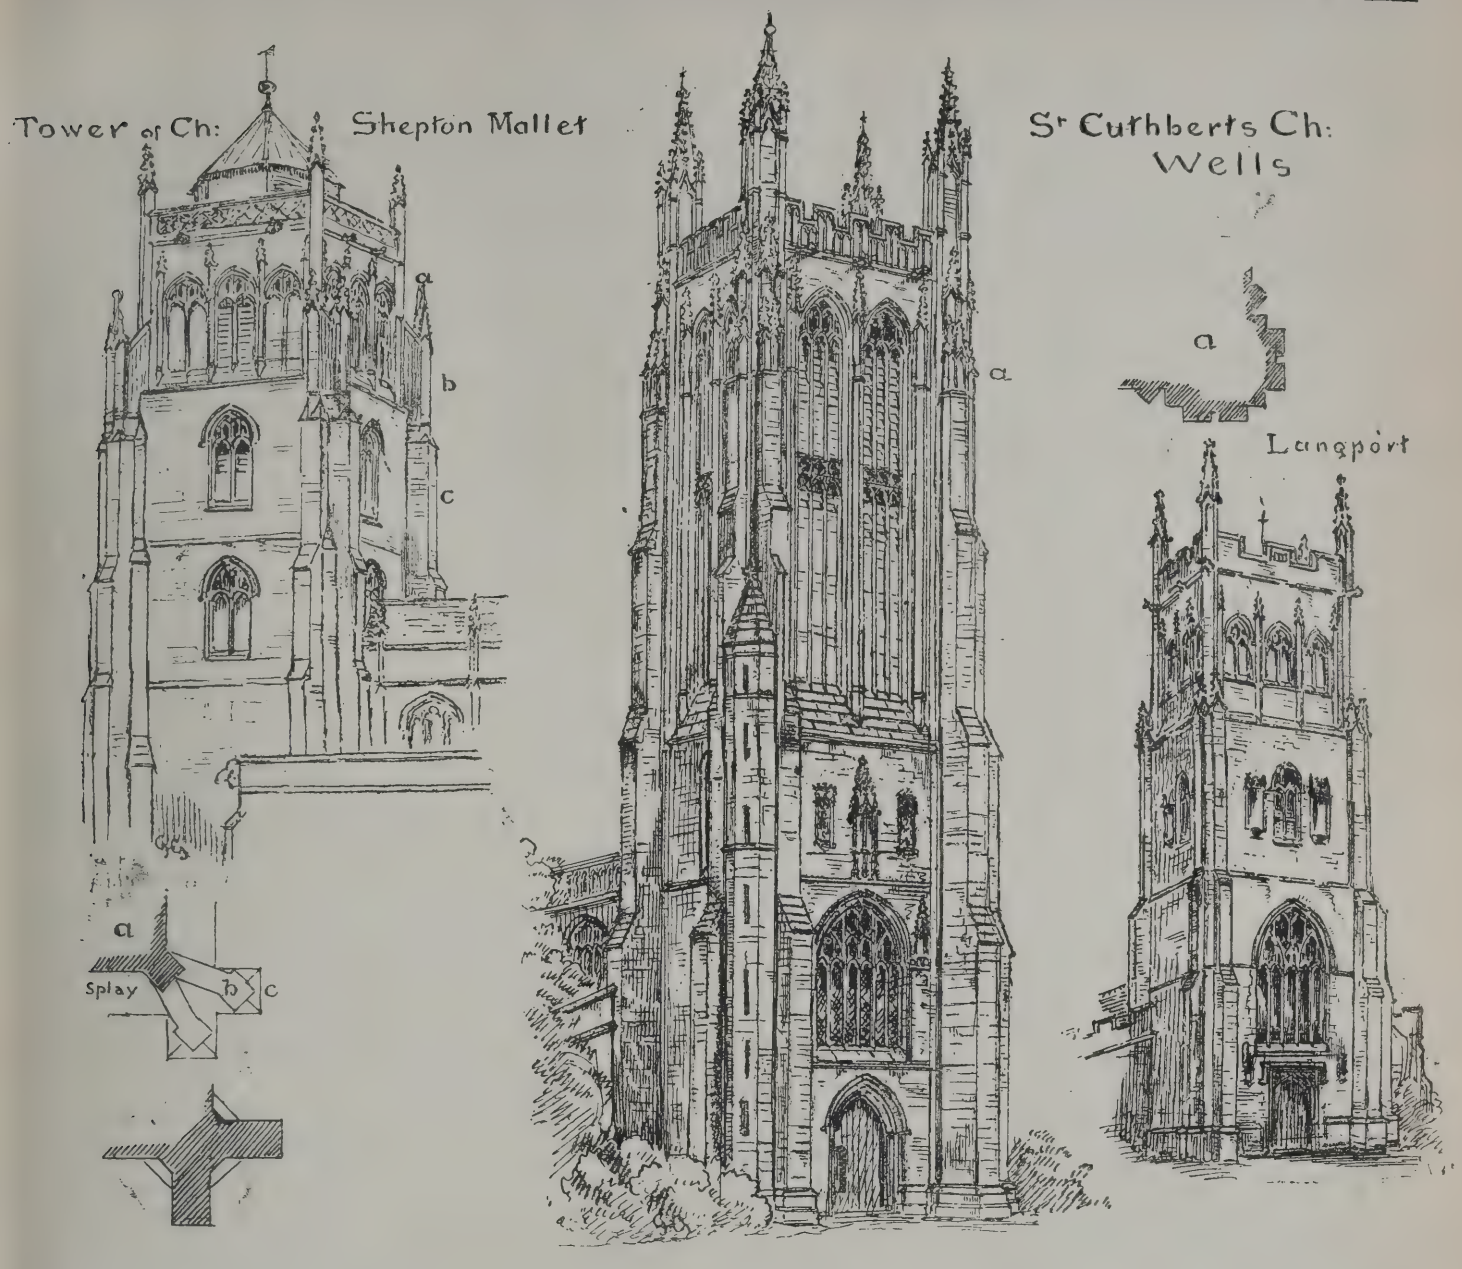
What acts and orders the architect has a right to consider to belong to his employment, or to his duties, is a matter of very much doubt, for we know that what one person has done, and can do without hesitation, another professional man has been held to be liable for. Thus, in one case, an architect was held to have no authority to direct the substitution of stone for a brick wall, in an action brought by the employer against the builder, who had been instructed by the architect; in another, when the contract gave power to the architect to vary the work, or to make "additions or omissions," and the contractor was instructed not to pile the foundations, it was held that this was a deviation, and not an addition or omission. The last decision appears, on the face of it, to be a very puerile one, as the word "omission," might have been intended to cover any work to the foundation that the engineer thought unnecessary to be done. The profession, with these decisions before them, cannot be too particular in defining the powers or authority they are supposed to possess as general agents. The ordering, for example, of material, such as stone or terra-cotta, ironwork, or any special fittings, unless with special sanction, does not bind the employer to pay for them. We occasionally hear of architects doing these things, and expecting their clients to raise no objection, or expecting to make some set-off to satisfy the contractor. In point of fact, they imagine they have the power, and make the person who enters into the contract believe so too. A more common exercise of authority is engaging a quantity surveyor. We know of men who, immediately they receive an order to prepare contract plans, appoint a surveyor without any authority to do so from the employer. No legal decision has confirmed the employment, unless some sort of implied authority has been given—such as that of obtaining tenders from builders; and even then the implied power must be reasonable. For example, it does not follow necessarily, because an architect has authority to prepare plans and specifications, and obtain tenders, that, therefore, he has authority to bind his employer to pay the percentage of the surveyor. Builders may agree to take out their own quantities, or join together to engage someone to do so. Custom alone can establish the rule. The legal decisions are not at all decisive. One judge has affirmed that, apart from actual contract, the employer should not pay for quantities. If we take a case of tenders, based on quantities that are too high to be accepted, it appears the more unreasonable to charge the employer with the cost of them. In this particular exercise of authority the professional man ought to have the concurrence of his client.

SHOULD RAIN-WATER BE ADMITTED TO SEWERS?

SOME few towns have succeeded moderately well in disposing of their sewage. The authorities have seen that they must make up their minds to spend a considerable sum of money in doing so, and get rid of the question which had been cropping up from time to time for many years, and they have done this, moreover, as a matter of great economy. But for every such town there are a score in which sewage difficulties of one sort or another are always arising, even at this day, when people might very reasonably suppose the difficulties had been got rid of. But that is far from being the case. It seems as if, in some cases, hardly anything will move the spirit of town councils and local boards—these especially—to come to a decision in the matter. The law is not complied with, but what of that? They prefer to run the risk of it being put in force, knowing well enough that those who might do so will not. It might be asked why the Local Government Board does not enforce the law everywhere? and the only answer would be the echo, Why? The County Councils might do something towards amending this state of things if they had the power, or, having it, were willing to see that sewage be no longer poured into rivers and streams until the best practical means have been adopted for its disposal. We shall see, perhaps, what they will do, by-and-by.

There are more fanciful difficulties than real ones in disposing of sewage. The real ones may be enumerated distinctly. One of them is as follows:—It lessens the difficulty of disposing of sewage to equalise the quantity arriving at the outfall day by day. This cannot be done exactly, because of the irregularity of rainfall, some of which, at least, must be admitted to the sewers; but a good deal may be done towards this end, and in some towns it is worth while to do it; in those, namely, where the contour of the ground is such that the distance to the river or a stream flowing into it is not great from any part of the town; and this is a very common thing. As the excessive quantity of sewage caused by heavy rainfalls cannot well be dealt with at the sewage outfall, separate drains to convey the excess directly to the rivers and streams are desirable. But here comes in the question of separate drainage, or the separate system of drainage, so called. That system, as first proposed, was impracticable. It was first advocated by one or two persons who knew little of the difficulties of town drainage, even as they existed then, and they have increased since. The system recommended has had other advocates too; but the difficulty of carrying it out in its entirety is almost, if not quite, insuperable. It consists in admitting to the sewers no rain-water at all, making it necessary, therefore, that a separate drain for the rainwater be laid to the back of every house, in cases where houses are drained singly; and, in consequence of many of the house-drains being laid through narrow passages there is not room enough for two drains. If we suppose such a thing as that a town were given us to build, as well as its drainage to construct, we might make the proper arrangements for draining it by a completely separate system of drains—one for the rainwater, and the other for the sewage; but even then we should have to contend with the misuse to which the rainwater drain would be put. There is, however, no difficulty in a modified system, whereby some portion of the rainfall is admitted to the sewers, and the bulk of it conveyed into the natural streams.

In laying down new sewers, many old culverts and watercourses, which have been from time to time covered in, are met with, and if these be restored, they may be made useful for the purpose; and where that is not practicable, new drains can be laid to convey the greater part of the rainwater to the natural streams.



It has been said that rainwater, falling upon the streets of towns, carries with it so much filth that it becomes as foul as any sewage, and therefore is not admissible into streams. The first rush of water from a street down the gulleys carries with it much dirt, especially from macadamised roads, and where the scavenging is neglected; but in a short time, and before the run of water has attained its greatest volume, it begins to run clear, and it is this greater portion of the clear rainwater which should be excluded from the sewers and turned into separate channels; but with due scavenging of the streets, all the rainwater from them may be diverted, leaving only that which comes from the backs of houses to go into the sewers. The due scavenging of the streets, to which we refer, is desirable in point of salubrity of the town, apart from the question of rivers and streams. As regards degree of pollution, which is important to be considered, the area of the town in relation to the volume of the river or stream into which a given volume of rainwater and sewage is discharged should be taken into account. It is much more injurious, for instance, in the upper and middle portions of a river than in the lower or estuary portion, where, not only is the volume of water much larger, but it contains already much débris of all sorts, so that it cannot be used for so many useful purposes as the clear water higher up the river. If domestic purposes be left altogether out of consideration, there yet remains the desirability of preserving river water clear for many other purposes. The filth of the streets, caused by a large amount of horse traffic, should therefore be treated as solid sewage in all towns above the estuary of the river.

On every acre of land built upon in a town the approximate number of 50 persons may be taken as an average, or twenty acres per thousand. Every tenth part of an inch in depth of rain produces 10 tons of water per acre, or 200 tons per thousand of the population. But in towns generally, perhaps, 25 persons per acre may be about the average, and the weight of water 400 tons per thousand of the population. We have only to consider how many tenths of an inch of rainfall in a year occur to find what a very large quantity of mere water has to be dealt with when the sewers convey the whole of the rain-water to the outfall of the sewers. Some deduction however, must be made for a portion of the rainfall which does not reach the sewers. A portion is evaporated, and another portion is absorbed by the ground and does not reach the sewers directly, though most of it probably does so eventually through the joints of the work, where no special provision is made to exclude it. The portions of the rainfall evaporated and absorbed by the ground cannot well be ascertained separately, but must be taken together. Observations made for the determination of the sizes of the sewers of the Metropolitan Main Drainage established the fact that the quantity of rain-water which flowed off by the sewers was in all cases less than that which fell on the ground, and it was concluded as a rule of averages that $\frac{1}{4}$in. of rainfall would not contribute more than $\frac{1}{8}$in. to the sewers, directly and immediately; nor a fall of $\frac{4}{10}$in. more than $\frac{1}{4}$in. These observations, however, do not show what depth of rain begins to contribute water to the sewers, nor do they show the proportion contributed of falls greater than $\frac{1}{10}$in. On the one hand we may suppose a fall of $\frac{1}{100}$in. would contribute none at all to the sewers, and, on the other, that a fall of 1in. would on many occasions nearly all run off directly into them. The depths stated above are for 24 hours; if they occur during one hour the relative quantities falling and running off the ground would be altered; more, probably, than $\frac{1}{8}$in. out of $\frac{1}{4}$in., and more than $\frac{1}{4}$in. out of $\frac{4}{10}$in., would flow directly into the sewers. Very little can be deducted for evaporation, for the convenience of street traffic does not allow of rainwater lying long upon the surface exposed to evaporating influence; and, in respect of absorption, nearly the whole surface is covered almost impenetrably on the closely built areas, so that on these portions of the town but little can be deducted on that account; but taking the whole drainage area, considerable portions will be included within the boundary, upon which a greater part of the rainfall is absorbed, and a correspondingly smaller portion reaches the sewers.

It is a great detriment to the disposal of sewage—whether that be its application to land or chemically in tanks—that any large quantity of road detritus should be carried down to the outfall, and where the roads are chiefly made and repaired with broken stone or "macadam," this of itself would be a sufficient reason for diverting heavy rainfalls. Their admission flushes the sewers, no doubt; but that is better done by means of sluices, which can be closed and opened at will. It is one of the necessary expenses of the disposal that not only excessive quantities of rainwater be prevented reaching the outfall, but that the solid ingredients of the sewage be prevented settling on the bottom of the sewers; and this means regular flushing. With sewers of the proper form and directions now almost universally adopted, this becomes possible with a moderate amount of labour. With the old form of sewers it was impossible without an excessive expenditure.

TYPICAL CHURCH TOWERS.—III.

REFERRING the reader to our last article, p. 389, for the peculiarities of the Somersetshire towers, we pass on to notice the fuller development of the style as exemplified in the very noble and dignified instance of St. Cuthbert's, Wells, which we now illustrate by a sketch. Strange to say, this tower has not received the attention bestowed on other structures of the class in the same county. The St. Cuthbert tower resembles in many important features the Evercreech and Wrington examples, both of which we have illustrated: first, in having three main stories; secondly, in the great height of the belfry stage and its windows; and, thirdly, in the general design of the angles and their buttresses. To examine the proportions, we find that the upper or belfry-stage of St. Cuthbert's, like that at Wrington, occupies about half, or rather more, of the whole height of the tower, which distinguishes it in a marked degree from every other class of towers. There is a majesty in this treatment: it at once draws attention to the great height of the structure, for the eye naturally takes the scale from the three lower stories in the west front, which can be gauged by reference to the church itself, and by the apparent height of the belfry windows, with their uninterrupted vertical lines of jambs and mullions. Looking up at the tower from below, the angle of vision subtended by the belfry can hardly be taken in at one glance; the only break in the vertical lines is the pierced transom in the tracery. If, instead of being in one story, there had been two separate ones with a marked stringcourse between, the tower would not have been half so imposing as it is, for the several stories would have suggested to the mind the ordinary division into stages, and the real height would not have been so perspicuously appreciated. The loftiness of the upper stage is a sort of *tour de force* which, by startling the eye, makes the impression of height. A number of smal stories scarcely produces the effect, becaus

they are more commonly met with, and unless the observer is close to the tower, and the scale is perceived, the repetition is not telling. Further, apparently, to increase the unexpected loftiness of the upper stage, the western front of the tower is divided below the sill of the great window into three parts by string-courses; in the lowermost is the western doorway, in the next story is a large Perpendicular window of six lights, and in the third stage are three canopied niches. These divisions at once give a scale to the rest of the tower. The gradation of the buttresses also, which divides the height into four main parts, is effective, and imparts a graceful outline to the whole mass.

Closer examination of the angle-buttresses show a decided refinement upon the Wrington tower. It will be noticed that while there is the same number of set-offs, and in much the same proportion, the engaged pinnacles (see plans *a*, *b*, and *c*) which adorn the upper stage of each buttress are arranged in a group of three—a centre one which terminates against the angle pier at about the level of parapet, and two lower and smaller ones at its base. The Wrington example has only one pinnacle engaged anglewise in centre of corner pier, and it terminates below the upper cornice or parapet. The triple pinnacle arrangement of St. Cuthbert's springs from a wider buttress, though in both the external buttresses are set a little within the outer angle of the tower, and the recessed upper story makes the angle-piers at each corner, which are carried up to form the corner turrets. At Wrington these angle piers are cut off by a stringcourse on a line with the parapet; but at St. Cuthbert's the stringcourse is omitted, and the face of each pier is carried up uninterruptedly into the turret. The advantage of the latter is evident: the angles of the tower form one continuous feature, and the turrets do not look as if they were after-additions. There is certainly more elegance and finish in the design accordingly of the corners, and the triple pinnacles engaged just below the parapet produce a tapering line which leads the eye from the outer buttresses to the turrets. There is one other difference to notice between these two examples. At Wrington the central pinnacle between the belfry windows is carried up through the parapet, and becomes an isolated pinnacle breaking the parapet; but at the tower of St. Cuthbert it is not carried through. The parapet of the former is composed of pierced trefoils alternately arranged between equilateral triangles; that of St. Cuthbert is panelled and battlemented as we find also at Chewton Mendip, St. Stephen's, Bristol, and other instances.

The horizontal lines so commonly seen in other towers are remarkable by their absence in this instance. They are here broken and discontinuous where they occur, so as to emphasise the vertical lines and height. The corner turrets, as we have seen, are not cut off by a stringcourse, but are carried up without a break from the piers, a peculiarity that we scarcely see anywhere else. In most other Somersetshire and Gloucestershire towers, the horizontal cornice line under the parapet is strongly marked, as we see at St. Mary's, Taunton; Huish Episcopi; Chewton Mendip; St. Stephen's, Bristol; and the central tower of Gloucester. In all of these, especially in the latter, the horizontal lines are emphasised. The idea of being added or put on afterwards is particularly strong in looking at the parapets and turrets of St. Mary's, Taunton, with its very elaborate battlemented parapet and panelled corner turrets. This idea is strengthened by the isolated pinnacles which stand out from each corner turret, and are carried on carved gargoyles. These detached pinnacles seriously destroy the graceful outline. The same arrangement of detached angle-pinnacles to the upper turrets is seen at Huish Episcopi, where the quatrefoiled and panelled parapet, broken by battlements, makes a very rich termination. Contrasting these upper crownings with those of the East Anglian types, when we refer to them we shall notice a very considerable difference, though in many of the latter towers the terminations or turrets have never been added.

St. Cuthbert's has a nobly-proportioned

plan of church with nave of six bays, opening into the western tower by a lofty archway, the lower story forming a baptistery, which is groined. There are side aisles with double transepts, each separated from the aisles by two arches, a deep chancel, and chantry chapels. The arcades are lofty, with clustered shafts, and the nave is covered by a rich flat Late Perpendicular roof of tie-beam type, with fine carvings of angels, and with pierced tracery filling-in. There is a richly carved pulpit, with grotesque carvings in the panels. The lower stage of buttresses to west front are enriched by gabled panels with trefoil arches on shafts, and by quatrefoils at the angles of buttress above.

The two other sketches we give illustrate a less ambitious class of towers. The tower of the picturesque church of Shepton Mallet, about five miles south-east of Wells, resembles in some of its features the towers of Banwell and Cheddar. The upper stage has the three windows, the centre one only pierced, with engaged pinnacles between; these resting on a deep weathered sill, which at the same time reduces the thickness of the walls and makes a set-off in the upper story. The peculiar angle arrangement of buttresses at the upper stage we give by a sketch plan. The principal point to remark is the way in which the outer pinnacles are connected to the angle-buttress of the belfry and the angle the connecting buttresses make. Externally the effect is most picturesque, and the whole design, with its low octagon pyramid or roof and angle-turret, is one worthy of study and adoption. The window tracery is similar to that at Cheddar. There is a fine old Perpendicular nave of six bays (covered by a very perfect wooden roof, with panels of varied design), restored aisles, and a low chancel. In the front of tower there is a large window of the usual Perpendicular type over doorway. The next stage has three canopied niches, a window over, with clock. The octagon turret and spirelet at N.E. corner is very much like that at Cheddar, the semi-octagon on the north side being joined to the buttress, and of the same projection. The walk from Shepton to Evercreech is about four miles, and a pleasant road.

The tower of Langport Church presents another characteristic example, in which the upper stage is set back a little from the lower walls, and has the triple windows and pinnacles, as at Banwell, Cheddar and Shepton Mallet. The angle buttresses to this stage spring from the weathering within the pinnacled heads of the lower buttresses. The proportions and the whole outline of tower are particularly pleasing. The canopied niches and window on the middle story are well grouped, and with the window and doorway of the lower story present the usual features of towers in this county.

THE ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the Association for the present session was held on Friday evening at 9, Conduit-street, the President, Mr. Leonard A. S. Stokes, in the chair. Messrs. P. E. Newton, J. M. Sharman, J. M. Cream, S. Reddy, C. A. Sharp, A. Harston, E. A. Toombs, and L. Gough were elected as members. A vote of thanks was passed to the Entertainment Committee, for their efforts in connection with the successful *conversazione* a fortnight previously, the names of Messrs. Burrell, Cresswell, and Earle being specially mentioned. A vote of thanks was also passed to the executors of Mr. E. C. Ayton-Lee, Messrs. Walter Lonsdale and C. Henman, for a donation of 27 books from Mr. Ayton-Lee's collection to the library. It was decided to adjourn the consideration of the report and balance-sheet for a fortnight.

THE INAUGURAL ADDRESS

was then delivered by the President, who in his opening remarks referred at length to the manner in which the Special Report on the Working of the Association presented last session had been "hung up" till this session, after having been adopted by the general body of members. Their present position was that they, as an Association, had passed a series of resolutions stating that certain changes in their methods, &c., were desirable, but had not as yet made any alterations in their rules. Mr. Stokes continued: Everyone in this Association is proud of his profession, and wishes to see it take its proper position before the world. Architecture is a fine art, and an architect an artist. Architecture is also essentially a useful art, and an architect a utilitarian. Architecture is, again, a constructive art, and an architect a constructor. Now a man may be born an artist, and unless he is endowed with artistic instincts he will never make an architect; but I doubt if many men are born utilitarians, or constructors; but, even if they are, technical education will develop their powers in the same way that artistic surroundings and sympathetic associations will stimulate an artistic temperament. From this we gather conclusively that an architect requires a special education or training, and the only point that there can be any difference of opinion upon is as to the amount and nature of such education or training. One form, and a certain amount of training, has hitherto been obtainable at this Association, and if you think it is the right form, and of proper quantity to meet the case, don't be persuaded to change; but if, on the other hand, you agree with your committee's report on education, and think the form capable of improvement and the quantity somewhat scanty, then why not go in for an improvement as proposed, at the expense even of old associations and traditions? The Association is not even now carried on in the way it was originally intended, and a body like ours cannot remain stationary. It must move with the times, otherwise it will be deserted. Here we might ask ourselves how it is that, with hardly an exception, all our classes show a falling off in popularity during last session, and for the matter of that during the last two or three sessions. Is it because the classes are not so good as they were? I think not, for they have been more ably conducted than ever; but perhaps it is that something more is now required than is supplied by our classes, something more in touch with the times and less haphazard than some of our instruction is. Personally I admire and agree with the originators of the mutual system, and I can conceive few things more interesting and instructive for men of a certain standing than meeting with their fellows on equal footing, and forming classes, where good-natured criticism and debate formed the method of gaining and imparting information. This, however, is almost a thing of the past, neither is it suited to the younger men, but it is to be hoped that what little remains of the old system will be jealously preserved. The great majority of our classes, however, are not worked on this principle. There is an art in imparting knowledge which is not possessed by everyone; but everyone who has that art should be encouraged in a substantial fashion to work in forwarding the cause of architectural education. There are some who think that the fees that were named in the Education Report as fair remuneration to the instructors and lecturers were quite inadequate for their purpose, and I am inclined to agree with them. At the same time, in the first place, these figures were only suggested as average amounts; and, in the second place, at first the supply of good teachers might be so small that high fees would be out of place, at any rate until the teachers had proved themselves efficient. If I am stating the case too strongly in favour of change, it is only because I cannot find arguments to produce on the other side. If the Association does not supply proper teaching, other societies must, and will. If they do, the Association must be prepared to go to the wall. At King's College already fresh life is apparent, and, together with the Carpenters' Company, great things are to be done. At Edinburgh the architects there have presented a memorial to Her Majesty's Commissioners for the Scotch Universities, asking for the establishment in the University of Edinburgh of a curriculum of architecture, in which they refer to the Architectural Association. Professor Roger Smith, in his opening lecture at University College the other day, called attention to our proposed curriculum, and while criticising some details, spoke not unfavourably of the scheme as a whole. The professional Press, too, has without exception spoken favourably of our proposals, devoting a considerable space to leading articles and reports of our meetings. On the other hand, we are told that we are tending too much towards an academic course, and that the individuality of our future members will be lost, and thus the glorious freedom of our national architecture impaired. I fail to see how a little more system in the training of our students will lessen their individuality. The present system of pupilage remains quite unaltered; in our proposed course all we ask for is that pupils and improvers may be allowed proper time to attend the classes at the Association. For this class of members we are anxious to establish a course of day classes, so as to relieve, as far as possible, pupils from any large amount of evening work. I fail to see that the curriculum is likely to absorb the individuality of our members, the scheme being so elastic that the individual tastes and tendencies of students will be encouraged and developed, and not compressed into one mould, as in some of the foreign schools. We are all agreed that a liberal education, if not absolutely necessary to an architect, will be found of the greatest help to ninety-nine out of every hundred. This is felt so strongly by some that they have already offered us the help of their purses—Mr. Florence offering us a hundred guineas to improve our library, and Mr. W. H. Seth-Smith a guarantee of fifty pounds a year for three years if we will start our new curriculum; and I have little doubt but that many others will come forward when they see that we really have made a beginning, or are, at least, determined to make one. The one point in our proposals of last year that I consider of the least real importance, is almost the only one which met with any serious opposition. I refer to the proposal to raise our annual subscription. I trust we shall be led by our common sense, and not by feeling, for the question is really a very simple matter of £ s. d. If you think certain changes in the working of the Association—e.g., the opening of the library in the daytime, and the employment of a paid assistant secretary—desirable, are you prepared to put your hands in your pockets and produce the necessary funds? If not, you cannot have them—i.e., unless you are ready to forego some of the other advantages you now enjoy, such as the conversazione, or soirée, or both. Another way out of the difficulty was proposed by Mr. Cole Adams—viz., that the subscription of all incoming members should be raised, that of existing members remaining as at present. I regret now that this suggestion was not adopted, as, with a little care, the money thus produced would prove enough for us to introduce what we want by degrees, instead of all at once, as was intended. It is not even now too late to adopt this course, which has some advantages, and I think it not improbable that this course may be laid before you, by your committee, when the proper time comes. Another point is, the proposal that we should vote by means of voting papers, and not by show of hands as hitherto, on subjects affecting the rules, &c., of this Association. At best it is a lazy way of voting; and the old-fashioned way of coming to the meeting and hearing the arguments on both sides of the question, and then holding up your hand either for or against it, is far more suited to our ways. I would suggest that we follow the example of the architects of Edinburgh, and memorialise someone. I am afraid it is no use our going to the University of London, as they probably would not listen to us, at any rate at present; therefore we had better go to the Institute and boldly ask it to either establish some course of architectural training itself, or to help us to amend and strengthen our methods so as to meet the requirements of the case. The Institute is practically pledged to do something more for *education* than it at present does; but if it will not help us, then we might summon a general conference af architects and get their support if possible, or at any rate hear what was to be said by them with regard to our proposed curriculum. The President referred at some length to the discussion on architectural education which took place at the conference of architects in 1887, quoting in detail from Mr. Cates, Professor George Aitchison, Babcock, and Roger Smith. Messrs. Arthur Hill, R. P. Spiers, A. Cates, Gotch, and Lawrence Booth, adding:—After all these papers, ten in number, each one advocating education, the meeting promptly passed four resolutions in favour of examination! It is hard to understand, but so it was. However, the time

has come when we all agree that something more than examination is necessary to insure the production of a creditable generation of architects. I am, you see, by no means alone in advocating a proper course of training for architects, nor in thinking that the Institute should bestir itself to provide, in some shape or another, such a course of training. I therefore once more press my suggestion that we should go boldly to the Institute, as it is the representative body of the profession, and ask the Council to either establish some course of architectural training itself, or help us to amend and strengthen our methods so as to meet the urgent requirements of the case.

Mr. John D. Sedding, in proposing a vote of thanks to the President for his address, remarked that he was entirely in accord with Mr. Stokes in his proposals for giving ample scope to young architects to avail themselves of the various educational agencies of the Association. It was to be regretted that it had been left to the younger men to provide the means of education for the profession. Development was the law of all life, and he felt that they must systematise their means of acquiring knowledge. He went further than many, and held that mere book-learning, or attendance at classes and lectures, in themselves were insufficient, and that to these should be added something of actual craft-knowledge. Architects, if they would properly support their claims to be considered artists, must consider the practice of some craft as an integral and necessary part of their training.

Professor Roger Smith seconded the motion, and said that if in his recent address at University College he had appeared to criticise the scheme for the improvement of the Association too critically, he was sorry. He regarded the proposal of the Special Committee as a whole as satisfactory, the weak point in that and the address to which they had listened being a tendency to look for material support from outside in carrying out the work. He would suggest that it would be well to endeavour to carry out part of their scheme the first year, and if it succeeded to undertake a second section, the third and last being reserved till they had tested the working of the proposals. He would strongly urge the younger men not to rely too much upon the assistance of the Institute, or any other body, but to act upon the maxim of great antiquity, "Heaven helps those who help themselves."

Mr. J. M. Brydon thought the Institute ought to help the Association in its new movement, and if a scheme which appeared to be reasonable were brought forward, he had no doubt the Institute would support it heartily. He, for one, cordially concurred in the proposals for the greater systematisation of education for young architects.

Mr. Reginald T. Blomfield drew a distinction between instruction and education, and said he feared architects did not, as a rule, follow up their studies in the same thorough way as did sculptors and painters. Architectural students ought to give greater attention, he thought, to the practice of figure drawing and modelling, and also to questions of professional practice.

Mr. Thomas Blashill and Mr. A. W. Earle also supported the vote of thanks, which was carried by acclamation, and briefly acknowledged by the President.

THE IMPERMEABLE BASEMENT OF THE NEW ADMIRALTY OFFICES.

A VERY important work in the rear of the Horse Guards is now being carried out by Mr. Webster, the well-known contractor for public works. It consists in the construction of the external basement walls of the new Admiralty Offices under the supervision of Messrs. Leeming and Leeming, the architects. The land springs are numerous and troublesome in this part of the ground, so much so that we know tubes of iron, perforated, were laid out beneath the surface of the Horse Guards Parade by the late Mr. Easton, C.E., for the purpose of draining the springs into the lake, from which the water is pumped to supply the Serpentine. Any plan, therefore, which did not grapple with this difficulty in sinking the foundations of the new buildings would have been decidedly defective. To give our readers an idea of the manner in which, by the adoption of Claridge's patent asphalte, the entire site has been rendered perfectly impervious to water, we may state that the whole area of the basement—a large rectangle measuring between 300ft. and 400ft. in length, and about 120ft. in width—has been excavated to a depth of about 25ft., and around this area a solid concrete retaining wall, constructed in thicknesses of from 16ft. at the bottom to 3ft. 6in. at the top, and slightly battered on the inside, has been built about 23ft. high. The bottom of this area and the footing of the concrete walls repose on the blue clay, which it is intended to cover with a bed of concrete 6ft. in thickness. Thus the walls and the bottom will form an immense tank, having an area left between it and the brick walls of the building. But the concrete walls would be useless without an impermeable application of asphalte. For this purpose, Claridge's Patent Asphalte Company have laid a damp-proof course through the entire thickness of the concrete walls, and have brought it up the outside to the ground level. Looking at the work from the outside of the walls, where they have been brought up from deep trenches, it resembles very much a huge ironclad vessel plated on the exterior. Instead of the usual mode of applying the asphalte in a liquid state to the walls, plates of Claridge's asphalte, ¾in. thick and about 2ft. by 1ft., prepared in a particular way, as hereafter described, are laid in cement, and pressed on the outer surface of the wall. These plates break joint. The edges of each plate, after they have become set, are bevelled, so as to form, in connection with the adjoining one, a ⋀-shaped joint, into which the liquid asphalte is worked, and makes a perfect and impervious joint. These plates of asphalte are prepared on tables, they are cut very truly at the edges, and the surface, which is imbedded on the cement walls, is made rough by means of brick chips the size of duck-shot, to insure suction. At all angles fillets of asphalte are put, and the whole work is being executed by the thoroughly skilful and workmanlike operatives of Claridge's Patent Asphalte Co. The building itself will be erected within this huge vessel of concrete and asphalte, and we may safely predict that it will be impossible for any water to enter. The extent of the surfaces covered are about 15,000ft. of damp-proof course and 30,000 vertical.

We have lately spoken of the absolute need there is to build submerged cases or tanks of concrete lined with asphalte of an undoubted quality in situations subject to land springs and underground moisture, and we have no hesitation in saying that the basement walls of every public or private building ought to be protected from periodical floods and over-charged sewers, by being built up within self-contained vessels of known impermeability, instead of being constructed in contact with damp soils. This system has also been advocated by Colonel Galton, R.E. To one or the other of these recommendations the adoption of asphalte at the Admiralty new buildings site may be due.

WOOD-BLOCK PAVEMENTS.

WOOD PAVING seems to have been favoured by metropolitan and local authorities, for it has now replaced a large number of the old macadam and asphalte pavements. In Paris and in American cities this sort of paving has been largely followed; in America, indeed, the experience has been rather unfavourable to wood on account of the imperfect methods of laying and want of care. Our London experience has been the most reliable. Taking a recent estimate of the length of the streets, it appears there are quite 2,000 miles, but of this total something may be struck off for new streets not adopted by local authorities. Macadam five years ago represented 573 miles, or about one-third of the aggregate length of carriageways. Flint and gravel was estimated at 798 miles, granite 280 miles, wood 53 miles, and asphalte 13 miles. During the last ten years nearly a million square yards of wood has been laid in London. From London Bridge to Chelsea wood paving may be observed; but there is evidently a very great difference in the wear of some systems, and the material adopted. The other day we saw a Lambeth thoroughfare Oakley-street, being paved with blocks of jarrah, a wood like mahogany in colour, hard and heavy, from Western Australia, and a very durable-looking pavement it seems. We shall watch with much interest the wear and maintenance of this new block. Baltic and Dantzic fir, pitch pine, elm, beech, have been tried, as well as blocks cut to different shapes. We believe hitherto the larger portion of the pavements has been laid with Swedish yellow deal, or red deal; but of course it would be impossible to say or to guarantee that the best Swedish or Baltic timber is put down after the blocks have been subjected to the "pickling" process. One authority has spoken well of Swedish yellow deal (Gothenburg's "Thirds"), if the blocks are cut from evenly-grained, well-seasoned, and sound deals; but, of course, in large contracts it is impossible to insure the constant supervision necessary for the rejection of inferior blocks. We are afraid that one or two good systems of laying have suffered from the employment of sappy and knotty blocks that have been allowed to be laid, and that the greatest enemies of the companies who lay pavements are those in their employ who allow inferior materials to be used. A harder and more durable wood is pitch pine; but its cost is greater. It has increased abrasive power, and is drier and cleaner than deal. Pavements of this description have been laid in the City and in Chelsea, and the annual vertical wear of the blocks is very small. Why should not, we ask, these harder blocks be used in streets of large traffic? Economy would be insured by the adoption in the first place of the hardest material.

Another point is treatment. We are not sure whether the "pickling" or dipping in creasote oil to which paving blocks are subjected is an advantage; indeed the experience of many leads them to the conclusion that the "preservative process," whatever it is, is a mere disguise, a means of putting inferior wood blocks into the market and of preventing detection. Many of the repaved portions of the London streets are laid without a joint or space between the blocks for wooden strips, and we think the plan desirable for some reasons. The foothold is largely connected with the jointing of the blocks. The cement joint is no doubt one of the better kinds, as it does not easily wear down below the wood surface, and it is hard and prevents the soakage of moisture just as much as the mastic joint, which appears to be of doubtful value in keeping the edges of the blocks from crushing or wear. Experience with the close-jointed wood-block paving may solve the problem.

RHIND LECTURES IN ARCHÆOLOGY.

IN the Lecture Hall of the National Portrait Gallery, Edinburgh, on Monday, Prof. Duns, D.D., F.R.S.E., delivered the first of the present year's series of the Rhind Lectures in connection with the Society of Antiquaries of Scotland. Sir Arthur Mitchell presided. Prof. Duns stated that the subject of the course of lectures, of which the present was introductory, was "Scottish Archæology and Natural Science," and that he would seek to give an exposition of the relations between them. Archæology should take rank alongside the sciences, notably that of geology, in respect that the pre-historical and remotely historical remains which it presented shed light on the probable history, social habits, industrial pursuits, intellectual attainments, and some of the moral characteristics of the early families of Scottish men. It had perhaps suffered from its isolation from all the contemporary branches of science. It would be foolish to try to divorce archæology from philosophy, and make it no more than a mere accumulation of bare facts; it was when observation allied itself to philosophy that bare information became vitalised into firm and established truth. Regarding geology, no efforts had been made to pursue it as a science in Scotland till towards the close of last century, though so early as the twelfth there had been certain superficial distinctions made as to various deposits of turf. For any serious exposition of physical geology or palæontology we must come down to 1785, when Hutton published his "Theory of the Earth," before we began the subject of Scottish geology. After this dawn came Charles Lyell, John Fleming, James Nichol, Charles M'Laren, and Hugh Miller—all, with perhaps the exception of Nichol, accomplished antiquarians as well as skilful geologists, and a band of men of whom Scotland might well be proud. Until a comparatively recent date the lists of tertiary rocks were regarded as marking the close of recent geological times. Some of the later deposits, however, had come to be characterised as geological under the term post-pliocene or quaternary. In general they might be called pre-historic and

recent, with the twofold classification geological and biological, and it was at this point that geology found footing in antiquarian research. In this domain of inquiry, too, would arise the question of the antiquity of man. So far as the first appearance of man in Scotland was concerned in its bearing as a question in anthropology, it was a question foreign to his present task, and he committed himself to no view as to man's origin. The quaternary deposits were classified into aqueous, glacial, igneous, and sub-aërial.

WATERWORKS REGULATIONS.

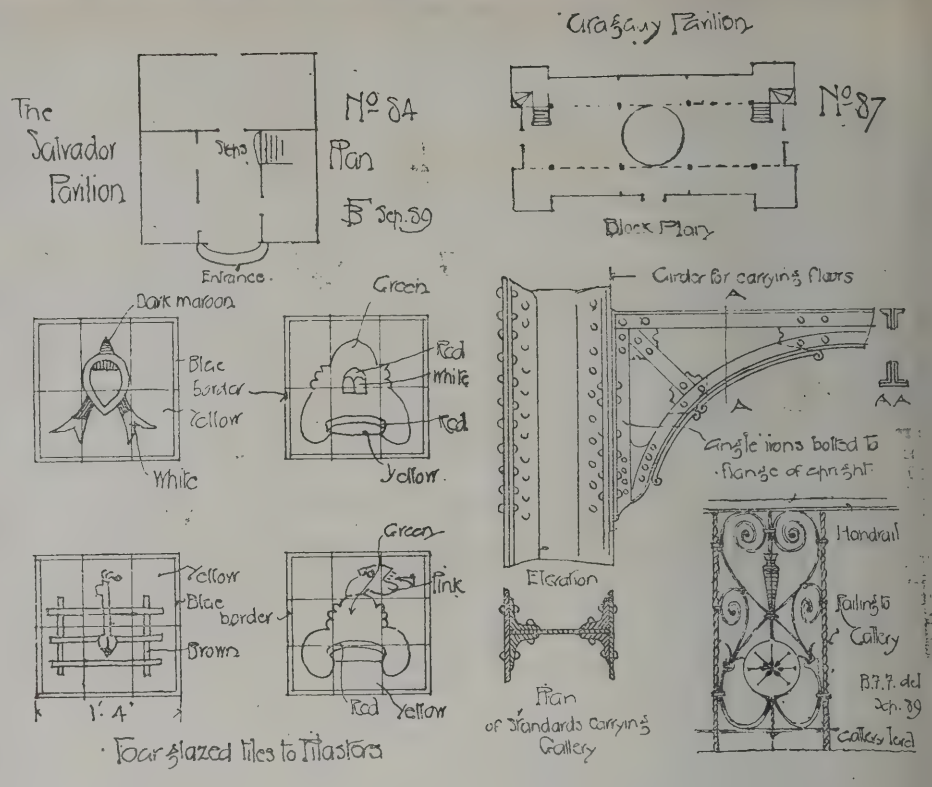
THE regulations of the Liverpool Corporation Waterworks form a good model for other works. With these rules the Corporation publish the names and addresses of such plumbers as they may approve of who undertake to do the work in compliance with the regulations, and the said plumbers are responsible to the Corporation for work they execute. All fittings are required to be tested and stamped by the authorised officer before being fixed, and fees are charged of 2d. for bib and stop taps, 3d. for ball taps, 6d. for closet cisterns and ball cocks. Standard fittings are exhibited in the stamping office, though any other fitting that is proved to be satisfactory may be stamped. Service pipes laid or fixed below ground are to be of lead, and the joints, whether above or below ground, are to be "wiped" joints. Service pipes underground are to be at least 2ft. 6in. below the surface. The diameters for lead service pipes are to be as follows:—For one house not exceeding £20 per annum rateable value, $\frac{3}{8}$in.; for house above £20, but not exceeding £70, or for six houses not exceeding £13 each, $\frac{1}{2}$in. diam.; for one house above £70, or fourteen houses not exceeding £13 each, $\frac{3}{4}$in. diam. Blocks of offices or houses on the same building, and belonging to the same person, are to have separate pipes and fittings. The following regulation is important: "Where two or more houses, of a rateable value exceeding £13 each, are supplied from one cistern, a leading pipe from the cistern must be laid in the back passage, and separate branches taken therefrom into each house." Certain minimum weights of pipes are given per lineal yard. If supplied from a cistern:—

$\frac{3}{8}$in.	diameter	4½lb. per yard.
$\frac{1}{2}$in.	,, ...	5lb. ,,
$\frac{3}{4}$in.	,, ...	8lb. ,,
1in.	,, ...	11lb. ,,
1¼in.	,, ...	13lb. ,,

Pipes under pressure from the main:

$\frac{3}{8}$in.	diameter	7lb. per yard.
$\frac{3}{4}$in.	,, ...	11lb. ,,
1in.	,, ...	15lb. ,,
1¼in.	,, ...	18lb. ,,

Every separate service pipe is required to have a stop cock-and box, which will be fixed outside the private premises at the expense of the Corporation. On the leading pipe from the main a tap is to be placed in each house, in order to draw water for culinary purposes, without passing through the cistern. Where there is a bath or hot-water apparatus the storage cistern must hold less than 50 gallons for each house, and in other cases it is not to be less than 25 gallons. Cisterns lined with lead are to have the latter not less than 5lb. to the foot. The other regulations require cisterns to be accessible, bricked round or otherwise, incased to prevent the action of frost. Several less immediate, but no less important, provisions are introduced respecting pans or basins of closets, baths, steam-boilers, hydrants, and steam-fittings, which ought to have the attention of the profession.



CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XVII.

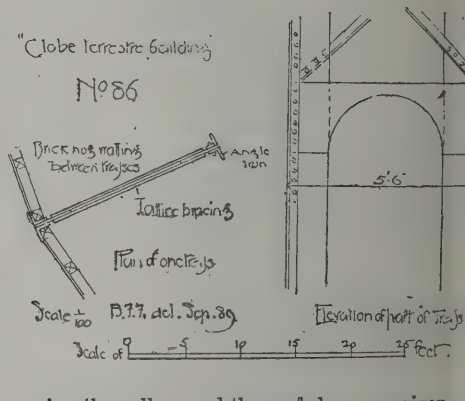
By Banister Fletcher, Jun., A.R.I.B.A.

THE SALVADOR PAVILION,

WHICH is situated next to Costa Rica, in front of the vestibule to the Palais des Arts Litéraux, is one of the striking buildings in the Exposition (not, however, using that word in its best sense) as far as decoration. About its architecture I know nothing, but a guide-book gives the following:—"Il est d'une architecture originale dont le double caractère arabe et espagnol donne une idée assez precise des constructions du pays." After seeing this building, all one can say is that if this is so, the Salvadorians are fond of colour, but colour of a very crude type. The exterior is composed of pilasters of glazed tiles, whose tints are principally yellow and blue (see No. 84), with architrave, &c., of the same material; this is repeated to the first floor. The intermediate filling-in the ground floor consists of horizontal stripes of blue and white glazed tiling. Between the pilasters on the first floor are panels of glazed tiling representing sea-scapes.

The walling of the building is of the pan-de-bois type (brick-nog partition) and plaster facing. It may be mentioned that the devices with which the tiles to the pilasters are ornamented are the signs of a dead language (Nohualt) of former conquerors of Central America, and M. Pector, the president of the committee of organisation of this country, had these reproduced.

THE "GLOBE TERRESTRE AU MILLIONEME."



The building which shelters this huge model of the earth $\frac{1}{1000000}$ full size, is the object of our study, although the model itself is well worthy of inspection.

The building is a duodecagon on plan (from *Le Génie Civil*, No. 85), is composed of six whole trusses or 12 half-trusses, which unite at the top in a ring composed of solid web and angle irons. The trusses themselves are of extremely light construction, formed of webs separated from each, and angle irons, between the trusses which rest on pile foundations is the walking way for the public, which is further increased by a balcony supported by brackets from the inside of the trusses; this walking way has a gradual slope from the bottom to the top to permit of the model being seen at all points. The back of the principals go up as shown and form a cornice and gutter. The three front bays are projected to the front to form the principal entrance, and contain on each side of entrance a flanking tower, one of which contains a staircase and the other a lift. The filling-in between the trusses is in "pan-de-bois," or brick-nog walling (see No. 86), and windows are introduced into these for the lighting. The trusses above the galleries are held together by horizontal purlins attached to the outer part of the truss. The staircase leading to the top immediately over the North Pole is held up by rods suspended from the principal purlin or ring, into which the principals are framed (see drawing). The whole is covered by a ventilating lantern.

The building is constructed on much the same principle as the "Panorama du tout Paris," by M. Yvon, architect.

URUGUAY PAVILION.

Proceeding along the Champ de Mars by the Avenue de Suffren, we come upon a less ambitious group of South American edifices, and firstly Uruguay (No. 87). The plan is simple, consisting of one large hall, with balcony at first-floor level, supported on lattice with arches riveted to the back of the main piers. There is a central dome in glass on four pillars, and a bay on each side, as sketched. The system of decoration to the columns is grey-blue, and the rivets are painted gold throughout. The dome is carried on a low pointed trellis-work arch, the spandrels being filled in with paintings on plaster. The ironwork is screwed together in large pieces, to take down at the end of the Exposition, and it is to be re-erected in Uruguay. The standards

carrying the gallery and the roof above are given above, as also a rough note of a very elegant railing to the gallery. Externally the iron framework is filled in with terracotta of a salmon colour, and the ironwork being painted grey-blue, the building has a light and graceful tone which is very agreeable. The small towers at each angle are carried up, and have glass cupolas over.

THE DOMINIQUE REPUBLIC

consists of a wooden framework filled in with brick-nogging and plastered, the studs showing, and occupies about 2,150sq.ft. These main wooden studs are painted grey with red chamfers. The plan consists of one large room. The building is tile-covered, and the gables have terracotta barge-boards, reminding one of the lodges at Hatfield.

The Town Council of Glasgow have instructed a special sub-committee to consider and arrange as to offering prizes for competitive designs for workmen's dwellings, these designs to be exhibited in the East End Industrial Exhibition along with models of the successful designs.

BERWICK LODGE, HENBURY, NEAR BRISTOL.—CHESTERFIELD HOUSE, GREAT TOWER-STREET.—CONTEMPORARY BRITISH SCULPTORS.—DURHAM CATHEDRAL FROM THE NORTH-WEST.—A BIT OF OLD NEWCASTLE.—IMPERIAL BUILDINGS, ST. MARY-STREET, CARDIFF. — SWEDISH FONTS.

Our Illustrations.

BERWICK LODGE, HENBURY, GLOUCESTERSHIRE.

This residence is beautifully situated, overlooking the river Severn, and commands a view towards the Bristol Channel. The present building is erected upon the site of an old house, and is surrounded by fine trees and shrubs. The materials used in construction are Cattybrook bricks with Bath-stone dressings. The internal fittings are of oak. Mr. John Hutchinson, of Nottingham, is the builder, assisted by Mr. Scull, of Bristol, for the plumbing, and Lewis and Sons, of Clifton, for the painting. The drawing was in this year's Royal Academy.

CHESTERFIELD HOUSE, GREAT TOWER-STREET, E.C.

These premises occupy a conspicuous position in this fine thoroughfare, and comprise an extensive and direct-lighted basement occupied as a restaurant, while the ground-floor is occupied by shops; first, second, third, and fourth floors by commercial offices; and the fifth floor by housekeeper's apartments. The various floors are served by one of Messrs. Waygood's hydraulic ram lifts. Constructional ironwork has been extensively used throughout the building; and wood block flooring has been used in the corridors as a noiseless paving. The ground story of the elevation is carried out in grey and red granite; the whole of the upper portion in Portland and Beer stones. The contractors were Messrs. Perry and Co., of Bow, and the architect Mr. Delissa Joseph, F.R.I.B.A., of 17 and 18, Basinghall-street, E.C.

CONTEMPORARY BRITISH SCULPTORS.

(See description on p. 594.)

DURHAM CATHEDRAL FROM THE NORTH-WEST.

The two artistic photographs which we reproduce to-day were shown this year at the Crystal Palace Photographic Exhibition by Messrs. Auty and Ruddock, of Front-street, Tynemouth, who have supplied the prints for our pages herewith. The first of these pictures represents the three towers of Durham Cathedral, the central one of which is 214ft. high, those at the west end being about 140ft. from the pavement. James Wyatt, the fashionable so-called "Gothic" architect of the last century, had the western towers in hand for about 20 years after 1775, when he put the fabric through a "chiselling process," no less than 3in. or 4in. of the surface being in some places removed, at a cost of no less than £30,000. The stonework thus taken away amounted to 1,100 tons weight. This precious "restoration" accounts for the absence of vigorous outline so marked in this cathedral since it was thus "done up." The great entrance to the church used to be at the west end; but as early as 1194 Bishop Pudsey erected the Galilee, since which time the north doorway has been the principal portal, with its rich and deeply-recessed Norman archways, in which Decorated-period ornaments were afterwards introduced. The comparatively modern battlemented parapets and pinnacles surmounting the western towers are said to have Italian details and mouldings. Most of the old Norman window openings are filled with mullions and tracery of a later period. The splendid position of the cathedral overlooking the town adds greatly, of course, to the importance of "Durham's massy fane." We gave two interior views of this church in the Building News for March 4, 1887, and August 3, 1888.

A BIT OF OLD NEWCASTLE.

This picturesque photograph represents the Castle Garth, at the head of Dog Loup, or Dog Leap Stairs, as it is now called. In the distance the crowning finial of the western tower of St. Nicholas most charmingly completes the picture. The word "Garth" as here used includes really all the castle precincts, and those who dwelt within its confines were as completely free from the jurisdiction of the mayor and burgesses as if they lived in the Orkney Islands. This was in the days of King James. In 1768 the Castle Garth was united to the parish of St. Nicholas; but the power of the trade companies was then rapidly declining, and the importance of the Garth as a refuge was passing away. The persecution to which the inhabitants were at one time subjected, and the privileges they enjoyed, despite the nearness of their adversaries, led to the establishment of a custom which, even sixty years ago, was not extinct. "Every stranger, immediately after opening a shop, is invited to a general meeting of all the dealers and chapmen within the precincts and liberties of the Castle at a public-house. Each individual pays sixpence, and the evening is spent in promoting good fellowship." Ruin has almost worked its full measure on many of the existing buildings in this part of the city, which, however, for that very reason, makes these remnants of the past all the more interesting. Inevitable progress and modern "improvement," before many years have gone, must lead to their removal, and therefore records, such as we give to-day, obtain more than a passing interest. We gave several drawings of Newcastle in the Building News for October 3 last, when reviewing "Vestiges of Old Newcastle and Gateshead," by Messrs. W. H. Knowles and J. R. Boyle, F.S.A., a book full of exceedingly curious and useful information.

IMPERIAL BUILDINGS, ST. MARY-STREET, CARDIFF.

This very large block of commercial premises is one of the most important additions, erected within recent years, to the street architecture of Cardiff. The basement is occupied entirely by a range of shops, and the central portion of the main building is devoted to an hotel, with offices and chambers in the other parts. The façade is in stone, with the oriels executed in timber, enriched with sgraffito plaster-work. The domes are covered with lead, and the principal roof is a flat behind the parapet. Messrs. Edwin Seward and Thomas, of Cardiff, are the architects from whose designs the buildings have been carried out.

SWEDISH FONTS.

In the historical collection of the Museum at Götoberg are a number of fonts rescued from old churches, and two casts of some which have been destroyed. They are interesting, not only for their own peculiarities, but because the history of them appears to be well known. For all the facts I am able to give I am indebted to Herr G. Housewitz, the curator of the Museum.—*Askim*, in Götebergs Vär, is from a church destroyed by lightning, when the font was much damaged. Total height 3ft.; width of bowl 2ft., height 1ft. 4in.—*Askums*, in Bahuslehn: The monsters and pedestal are extremely rough, and suggest an early date; but the ornament of the bowl seems not earlier than the 15th century. Total height 3ft.; width of bowl 2ft. 6in., height 11in.—*Finnekumla*, Vestergötland: A font of the 13th century. An inscription in Runic characters on the base is read, "Andrew made me." Total height 2ft. 11in.; width of bowl 2ft. 2in., height 11in.—*Karreby*, in Bahuslehn: This font belonged to an older church at Norrum by Oker, and the Runic inscription on it has been read by Professor Stephens, of Copenhagen, thus—"Rada sa er kaun, a mit Norkirkia, Lafrinzt gerthe i Okr"; or, "Guess me who can, nor church owns me, Laurence in Oker made me." This is a cast. Height 1ft. 2in.; width at top 1ft. 10in.—*Monstad*, Vestergötland: This is in two stones—the plinth of a grey stone, and the stem and bowl in a deep-red sandstone. The ornaments of peculiar crosses in alternate panels are deeply, but very roughly, cut in. No date is assigned to this. Total height 2ft. 6in.; width of bowl 2ft.—*Refvesjo*, in Vestergötland: This is a cast. The interlaced pattern on the base, which is deeply cut in, looks like 13th-century work; but the elegant scroll-work on the bowl seems later. Total height 2ft. 7in.; width of bowl 2ft. 2in.—*Risteröd*, near Undevalla: Said to be of the 14th century, but looks earlier. The bottom has been broken. The stone plinth appears to be the original one. Total height 2ft. 4in.; width of bowl 1ft. 10in., height 1ft. 5in.—*Skredswik*, in Bahuslehn: This curious font, assigned to the 13th century, is much broken, and the bowl held together by an iron band. The stem is trefoil-shaped, and in the plinth is a monster, and a trace of a human figure lying by its mouth. The arcade and figures on the bowl are in very low relief. Total height 3ft. 2in.; width of bowl 2ft. 3in., height 1ft. 4in. The square plinths showing in some of the sketches are only the wooden stands on which the fonts are placed for exhibition in the Museum.—J. Tavenor Perry.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Toronto Architectural Sketch Club.—The second annual meeting of this club, which is composed of architects, artists, draughtsmen, &c., was held on Monday, October the 6th, when the following officers were elected:—President, Mr. S. G. Curry; vice-president, Mr. A. H. Gregg; secretary, Mr. C. H. Acton Bond; treasurer, Mr. A. Clarence Barrett; directors, Messrs. H. W. Matthews, Henry Simpson, and W. R. Mead. The prospects for the season are very gratifying, and with the general enthusiasm of the members, success is pretty well assured.

CHIPS.

A new Metropolitan police-station is about to be built at Kilburn at a cost of £6,000. The contract has been taken by Mr. H. L. Holloway.

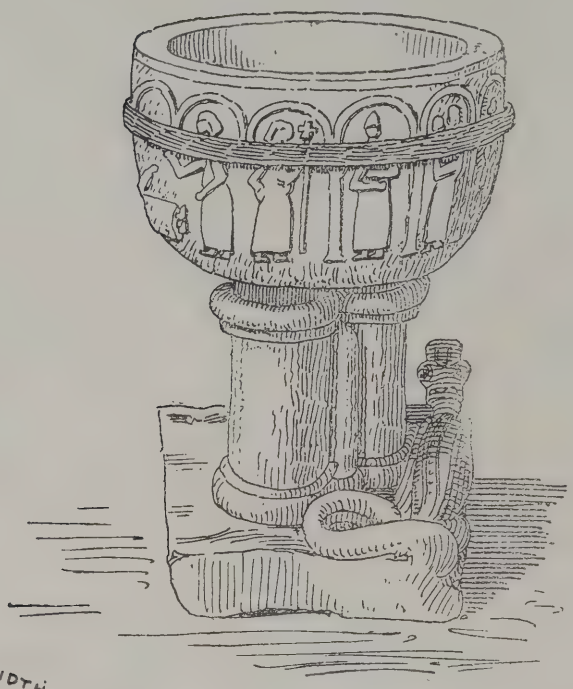
A large block of board schools is being commenced in the Woodbourn district, Sheffield, and will cost about £11,000. Messrs. Wightman and Wightman, of Sheffield, are the architects, and Mr. J. Morton, Lord-street, in the same town, the builder.

A new branch bank is being erected for the Birmingham and Midland Banking Company, in Kirkgate, Leeds, from designs by Mr. William Bakewell, of that town. The works are being carried out by local contractors.

At a meeting held at Salisbury last week it was decided to build a new district church on a site known as Weeping Cross Tree. The Bishop proposes that the church shall be built to seat 500 persons, at a cost of about £5,000.

A hospital is about to be built at Billericay, Essex, for the local sanitary authority of that district, and at a cost of £1,000. Mr. A. T. G. Woods, of Brentwood, is the architect, and Mr. A. Ansell, of Hatfield, Broad Oak, is the builder.

Memorial stones of an addition to the Printers' Almshouses at Woodgreen were laid on Saturday by the Baroness Burdett-Coutts and Mrs. W. H. Collingridge. The original portion of the houses was opened by Earl Stanhope in 1856, and consists of twelve suites of apartments. Two detached wings were added in 1871; but unoccupied spaces were accordingly left between the original block and the two wings, which are now to be filled up.



An inquiry was held at Carlisle on Monday and Tuesday of last week, before Mr. Thomas Codrington, M.I.C.E., an inspector from the Local Government Board, as to an application from the city council of Carlisle to the Cumberland County Council to have eleven roads within the city declared main roads. Mr. Howard Smith, the city surveyor, gave evidence for Carlisle, and his evidence was supported by several members of the corporation. For Cumberland the chief witness was Mr. G. J. Bell, county road and bridge surveyor, who declared he saw no reason why any thoroughfare within the city, however recently disturnpiked, should be maintained at the cost of the county generally.

WAYSIDE NOTES.

SUBURBAN residential life has never possessed any attraction for us. If not actually in the pure country, we would as soon be in the thick of London, in spite of fog and such like urban joys. Over and above other objections, certain suburbs appear particularly uninviting. I refer to such as, being in an undeveloped state, and not more definable as town or country than the hobbledehoy is to be described as man or boy, become the site of divers brick-making operations. Not that I object to bricks; as an architect I regard the modest lump of baked clay with a brotherly affection, and consider the ring of a bricklayer's trowel a species of music second only in point of cheeriness to the chirp of the cricket on the hearth. Neither do I consider the outlook over a brickfield utterly void of picturesque qualities. Indeed, there are brickfields wherein the artist may do worse than pitch his camp for an hour or two. The broken nature of the ground, the fantastic shapes of pugging mills, &c., the perspective of many receding, inclining troughs, added to the wealth of colour, harmoniously blended, in the new baked clamps, afford subjects for pencil and brush that will not be despised by the appreciative sketcher. "Early Morning in an Old Brickfield," I remember as a little woodcut in an art magazine some years back, possessing more than an average amount of true sentiment in its composition and chiaroscuro. In walks in pure country rich with autumnal colouring and effects I have turned aside to marvel at the tints in a clamp of bricks *in situ*, and thought what a vast gulf there is between such *brickwork* and the weary monotones of the architect's production. These things, say I, who should owe a grudge to the brickfield kind. Not so very long ago we were surveying in a working brickfield. On one side of our way was a quick-set, on the other a deep excavation half-full of clayey water; space available for walking, some 2ft. or less. Behold the ancient "Goth" one moment following the chain with measured tread, after the wont of the matter-of-fact surveyor—as though measuring the 360th part of the earth's circumference for important astronomical purposes—and the next waist-deep in a veritable Slough of Despond, and on a raw February afternoon! The survey stopped.

I owe no grudge. My objection to the brickfield is because it at times becomes decidedly offensive to the sense of smell. Other people's noses are no less sensitive, although, judging by the way in which some can live almost over a burning batch of bricks, one might be excused for thinking differently. But the bruised worm will turn. Wanting some more attractive topic, the editors of the *Times* and the *Standard*, if not those of other dailies, have opened their columns to the communications of parties suffering, either verily or in imagination, from the malodours of the brickfield. Letters from people residing in irreproachable suburbs, such as the various districts of Kensington, rave indignantly at the thought of the night-air that certain winds waft over the house-tops. "Sky-signs" have been let off mercifully compared with the brickfield. "Kensingtonian" awakens with "a sickening taste in the mouth, headache, and other unpleasant sensations," and miscellaneous correspondents have no less woe to relate. Now the complaints are doubtless warranted, but let the blame settle upon the right parties; for I believe it is a fact that stenches from a brickfield are chiefly referable to neglect and carelessness on the part of the operators therein rather than to the field, its earth, or the actual brick-making processes carried on. It is, I believe, the burning of refuse from the ashes, either carelessly left in them when used as fuel, or cremated as refuse, that causes abominable odours, a fact pointed out by Mr. James, L.C.C. for South Kensington, in the *Times*, which in due fairness to the operation of brick-burning should be more generally known. The burning decaying or inorganic refuse from dust-bins, when carried on at a low level, cannot be expected to be productive of odours so sweet as the "spicy breezes of Ceylon." Let this be stopped, as is proposed. Mr. James says that at Tuesday week's meeting of the County Council a by-law was made to this effect, and only needs the Local Government Board's assent to be put into operation. We shall then probably hear less of nuisances from brickfields, and people can turn their attention to those from sewer ventilators, which are really pestilential.

The "refuse destructor" comes in for its share of opprobrium with the brickfield. It is called "a new terror" by the *Standard* correspondents. The refuse destructor is not a new-fangled notion, though only recently has much attention been drawn to it. In theory, it is an admirable device, and in some places seems to have given great satisfaction. Thus, some days ago we learned that the Hastings authorities were delighted with the success of the one they erected. To it came bands of sanitary pilgrims from sixteen different places, eight of these delegates, we were told, having decided to adopt the plan of rubbish-cremating. The objections to its use in London are, apparently, (1) that it gives off obnoxious "asphyxiating" fumes, and (2) that in some cases the consignments of refuse continually being taken to the establishment are nauseating to near residents. A Haggerston correspondent's household "cannot open their windows without letting in a sickening, pervasive stench." A resident at Feltham views with pardonable dismay, day by day, "six or seven trucks of the offal of London fishmongers' and poulterers' shops, mixed with stable manure to disguise the other ingredients, standing alongside passenger platforms," while "the Railway Company propose making one grand depôt for the filth." Kensington, Earl's Court, and Notting-hill suffer nightly from "the burning of filthy refuse," and more careful followers of the correspondence will doubtless have seen many other dire complaints than these which I have casually observed.

The remedies are easy and simple, and must sooner or later be adopted. The furnaces of the destructors must be of a more scientific construction, so that the obnoxious gases are perfectly consumed, and the refuse must be taken to the depôts in specially constructed sealed vans, which are cause of offence neither to the eye nor nose. Properly arranged, a nuisance should be impossible, and thus a plan of getting rid of this "matter in the wrong place," excellent in theory, will be no less admirable in its practical working.

And why should not a municipal edict compel ordinary dust-carts to be of the construction suggested above—viz., covered in, and with well-fitting slides or lids? Here is a real nuisance rampant in the removal of dust and refuse in open vans on any day, particularly, however, when wind happens to be blowing, and more particularly when the van has been busy at some hotel or restaurant back door, wherefrom hath issued that appalling composition, the origin of the unspeakable foulness of which surpasses my understanding.

After all, I return to my pet "mutton," the sewer ventilator. There was a beauty near the entrance to the Military Exhibition, a sort of double-barrelled construction, its odour not belying its formidable appearance. And somewhere in the Strand at the end of Villiers-street, a few weeks back, was one nearly as objectionable. This, in an age of "sanitation."

The new Turner drawings at the National Gallery formed the subject of an interesting letter to the *Standard* of the 21st from Mr. Frederick Wedmore. It appears that something like a hundred drawings of the great master have suddenly appeared in the gallery, drawings that have never before been exhibited. Some are his earliest "paint-box" efforts, others in all the glory distinguishing the artist's latest styles. Mr. Wedmore says, of some of the earliest drawings, that they "display a very singular certainty in regard to architecture, and so suggest that Turner's treatment of building was not due merely to the fashion of the day, for topographical accuracy." These drawings should be full of interest to architects, especially any who hold views on Turner's architectural draughtsmanship similar to those expressed at times by myself in these columns. Turner's treatment of architecture in his youthful days is certainly not to be referred to outside influences, but to his own genius for delineating architecture. This was abundantly evidenced in the old water-colour drawings and in the unfinished pencil sketches so long in the basement at the National Gallery—a genius, however, which, as it also embraced landscape and other branches of drawing, may be said to have been certainly "a capacity for taking infinite pains." "Infinite pains" are indeed evidenced in the Turner water-colours more remarkable than in any artist's work of this nature, as may be seen by scanning the marvellous minuteness of the laborious colouring, the peculiar *technique* of which Mr. Ruskin has clearly demonstrated. To the architect this peculiar colouring is of less interest than the actual drawing in pencil of whole buildings and features. Anything showing the progress Turner made in the sketching of architecture will be of the highest interest, and it seems, from what our critic says, that something is to be learned in this way from the newly-exhibited works. Later than the primitive drawings above mentioned comes a representation of an old town gateway, which has "all the delicacy of an accomplished architectural work." Later still, though in Turner's youth, comes another drawing, a Norman crypt, in which the neutral and false—in a sense—tinting gives place to true colour, and this work was doubtless one of the steps to that beautiful representation of local colouring that culminated in the remarkable, though unfinished, castle gateway, well known to visitors to the old collection. Judging by what I read, Turner rapidly arrived at maturity, so to speak, as an architectural draughtsman—a distinct attribute of the true genius. But I shall hope to inspect these new works myself at the first opportunity, as, doubtless, will many other London architects.

Here's the difference between obscurity and fame. An unknown artist exaggerating colour would be condemned; his drawings would be "posters," and "highly coloured." Some of the drawings (actual sketches) in the new series, writes our critic, are "wrought in the sapphire blues, the topaz, and the garnet, in which Turner presented, in his advancing and most poetic years, not so much the daily facts about foreign heights and foreign cities as their aspect in his own enchanted dream."

GOTH.

CHIPS.

The Thomasson Park at Bolton, presented by Mr. J. P. Thomasson, ex-M.P. for the borough, at a cost of £20,000, will be opened to-day (Friday). Within the grounds of this new park there is a first-class library and museum, and one of the finest bathing ponds in the country. There are also lawn tennis grounds, bowling green, and gymnasium, as well as other adjuncts for a well-appointed park. £10,000 has been spent by the corporation in laying-out the grounds and adapting a mansion for a museum.

The fire which occurred in the Cathedral of Siena last week was happily restricted, by the brigade from Florence, to the cupola, the famous façade, by Giovanni Pisano, being preserved; but the damage done has been great. The vaulted interior of the cupola did not fall in; but the conflagration has destroyed the outside vaulting, its roofing of zinc and lead, and the gallery running round the cupola. The zinc and lead covering of the nave has also been destroyed, but the roof itself remains intact. The fire was caused, as usual, by carelessness on the part of the men engaged in repairing the roof of the dome. The following illustrations of this Duomo have appeared in our pages: West façade, Sept. 6, 1889; choir stalls, Jan. 1, 1886; ciborium and font, Feb. 5, 1886; bishop's seat, Sept. 17, 1886.

St. Luke's Church, Claremont, Newcastle-on-Tyne, was consecrated on Saturday. The style is Early English. The last window has been filled with stained glass representing the Crucifixion, carried out by Mr. Baguley, of Newcastle.

The annual dinner of the Carpenters' Company was held in the Company's hall at London-wall on Tuesday evening, Professor Banister Fletcher in the chair, when about 70 gentlemen were present. The toast of "The Examiners and Teachers of Technical Institutions," proposed by Mr. A. Preston, was responded to by Sir John Coode, president of the Institute of Civil Engineers, and Mr. T. F. Rider, president of the Builders' Institute.

The sixteenth session of the Manchester Architectural Association was opened on Tuesday evening by a conversazione, held in the Attendance Lecture Hall in that city, where a reception was held by the President, Mr. Thomas Chadwick, A.R.I.B.A., and the prizes were distributed. An exhibition of architectural and other drawings, photographs, and books, and of specimens of work, were on view.

New police-station and sessional courts have been erected at Stonehouse, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Bobert Boyle and Son's patent self-acting air-pump ventilator, and fresh air admitted by their improved air inlets.

CONTEMPORARY BRITISH SCULPTORS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

TO diversify our portrait series, we publish to-day our third sheet of sculptors, which forms the thirty-fourth double-page plate of photographs given in the BUILDING NEWS since the commencement of the present year. The first portrait in our present group is that of Mr. T. Brock, A.R.A., the sculptor of the bronze statue of Sir Bartle Frere, Bart., on the Thames Embankment, and "A Moment of Peril," the equestrian group now at South Kensington, which was purchased by the President and Council of the Royal Academy under the Chantrey Bequest in 1881. Among his other works we may name the following busts:—the late J. H. Foley, R.A.; the late W. S. Cookson; Jerome Murch, ex-mayor of Bath, 1879; the late Major-Gen. Boileau, R.E., F.R.S., for Kensington new Town Hall; Merthyr Guest; the Marchioness of Westminster; Sir Frederic Leighton, P.R.A., in bronze; and Henry Harben. Among his statues and groups we remember Richard Baxter, at Kidderminster; the Rathbone Memorial in Sefton Park, Liverpool; "The Snake Charmer"; equestrian statue of Viscount Gough, G.C.B., in 1878; "Our Boy" in marble; the statue of Robert Raikes, erected on the Thames Embankment; "Yonder He Goes," a bronze equestrian group exhibited in 1887; "The Genius of Poetry," last year; and Lord Angus, first colonel of the Cameronians, erected this summer in commemoration of the raising of the regiment. Mr. Brock has executed a great many medallions, such as that of Mrs. Boutcher, the late Peter Squire, and others. His statue of Sir Richard Temple, Bart., for the Town Hall, Bombay, is one of his chief works. He has also done numerous portraits, as, for instance, H. Rys, Chairman of the Merthyr Tydvil Board of Guardians; Rev. Samuel Harris Booth, President of the Baptist Union of Great Britain; the bust of Longfellow in Westminster Abbey; Capt. Hanham; the late Sir Erasmus Wilson in marble, for the Royal College of Surgeons, and another of this physician for the Infirmary at Margate; Mr. and Mrs. W. T. Lewis; the late Mr. Manelaus, of Cardiff, for his gallery in the Free Library there; Prof. John Marshall, F.R.S.; Sir Jervois Clarke Jervois, Bart.; and Isaac Pitman. Mr. Brock's photograph is from the studios of Messrs. Maull and Fox, of Piccadilly.

Mr. Albert Bruce Joy has always been a hard worker. In 1872 he exhibited a bust of Dr. Bruce Joy and some medallions of Miss E. Farrar; Rev. E. W. Farrar, now Archdeacon of Westminster; Joaquin Miller; and Miss Scott Siddons. Other portraits followed of Rev. Clayton Greene; Rev. Dr. Lloyd, Provost of Trinity College, Dublin; Miss Barton; and H. I. M. Napoleon III. At this time Mr. Joy's "Roman Boy" attracted attention. Sir Humphrey Davy was commissioned for the Royal Society, and Professor Max Müller was produced the same year. R. W. Raper, a medallion, and "The First Flight," executed in bronze, were shown at the Academy in 1876. The late Dr. Sellwyn was sculptured by Mr. Joy for the New Divinity Schools, Cambridge; the late John Laird, M.P., a bronze statue for Birkenhead, and the late Dr. Graves, for the Royal College of Physicians, Dublin; Canon Hamilton; the late Professor Malden, for University College; Mark Firth, for the University at Sheffield; John Stone, of Bath; Pratt's Medallion in Harrow School Chapel, and the statue of Chief Justice Whiteside in St. Patrick's Cathedral, Dublin. Other portraits included the President of the Royal Society, W. Spottiswoode; H.R.H. Prince Leopold; Hermann Vezin; Dr. Longstaff, for the Chemical Society; Dr. Harvey, for the Memorial on the Lees, Folkestone; and Viscountess Monck, in silver. "The Pets" was the title of a marble group. Mrs. Hickman furnished a medallion, and so did Miss Elspeth Campbell; H.S.H. Prince Herman de Salms-Braunfels, in bronze; the late Provost of Oriel College, Oxford; the late Lord Frederick Cavendish (statue); the Right Hon. W. E. Gladstone, M.P.; Mary Anderson; Rev. FitzHugh; Christopher Bushell, a statue for Liverpool; the Provost of Trinity College, Dublin; the Archbishop of Canterbury in 1885, Frank Griffin, F. H. Gillig, of New York; Percy Fitzgerald, the late Sir William Siemens, F.R.S.; the Marquis of Salisbury, K.G.; Earl Cairns, Prof. Stokes, M.P., P.R.S.; General Sir Frederick Roberts, Commander-in-Chief of India; and the late Lord Farnborough, which was exhibited in this year's Royal Academy. Mr. Bruce Joy's photograph was taken lately by Messrs. Done and Ball, of Baker-street.

Mr. Wm. Calder Marshall, R.A., was a pupil of Chantrey and Bailey. He was born in 1813. He first exhibited at the Royal Academy in 1835. He was elected A.R.A. in 1844, and R.A. in 1852. His taste has caused him to devote himself to poetic sculpture, and from the Art Union of London he has received many commissions. "The Broken Pitcher" and "Rebecca" were done in this way. "The First Whisper of Love" was chosen by the Art Union prizeholder of £300, and his "Dancing Girl Reposing," obtained the Art Union premiums of £500. "Sabrina" was well-known, having been produced in porcelain by Copeland. Mr. Marshall was one of the three sculptors employed in the Houses of Parliament, for which he executed the statues of Lord Clarendon and Lord Somers. He designed the statue of Sir Robert Peel at Manchester, and those of Jenner and Campbell. The first of these was in Trafalgar-square, but has been removed to Kensington-gardens. Mr. Marshall obtained the prize of £700 in 1857 for a national monument to the Duke of Wellington, and he executed part of a series of bassi-rilievi for the chapel in St. Paul's Cathedral. The statue of Crompton, the inventor of the spinning-wheel, was erected by Mr. Marshall at Bolton, Sir Geo. Gray at Cape Town, and Earl Derby. "Briseïs" was a group, and "Ruth" was a statue shown Mr. Marshall in 1872. "Wilder'd Fancies," "Tali Players," "The Prodigal Son," "Early Troubles," "Stepping Stones" (bronze), "Miranda," "Hermia and Helena," "Noonday Idleness," "The Last Days of Pompeii," "Sabrina thrown into the Severn" (a bronze group), "Achilles in the Styx," "Psyche," "Eve," "Debora," "Cordelia," "The Foolish Virgin," "The Old, Old Story," "Lilith leaving the Garden of Eden," "A Mermaid" (at this year's Academy), and "Noon," are among this sculptor's works. His portrait was taken by Messrs. Done and Ball, of Baker-street, W.

Mr. H. R. Pinker, formerly of Brighton, was engaged for some years in works of an architectural character, as at the Brighton Aquarium, where he carved the various caps and representations of fish, birds, and sea life. The figures in front of the "Palgrave," facing the Law Courts, are from his hand. His monumental works include the John Hunter Statue at Oxford University Library and the W.E. Forster Memorial, recently executed for the Thames Embankment in Temple-gardens. The monument to the late Prof. Fawcett at Salisbury was Mr. Pinker's work, and also the Britannia Statue for a Colonial work. His busts have been numerous, including the Rev. Chas. Calverley, the Prebendary of Wells, the Archbishop of Canterbury when Bishop of Truro, the Rev. E. C. Wickham, head master of Wellington College; the late H. S. I. Macnamara, Viscount Gage, Sir Wm. Yardley, the late Lord Chief Justice of Bombay, the late Earl of Ashburnham, the late Duke of Portland, Rev. Dr. Diamond, Prof. Rolleston, for Oxford University Museum; Sir Henry Acland, Bart., K.C.B, Professor Burdon Sanderson, Very Rev. Montague Brown, Dean of Lismore; the Dean of Christchurch, and W. S. Savory, F.R.S., President of the Royal College of Surgeons, exhibited this year at the Academy with the bust of Mr. F. W. Waller, M.A., Principal of St. Paul's School. The photograph given here is by Messrs. Elliott and Fry.

Mr. F. J. Williamson, of Esher, has executed a very varied and large number of works. His "Hypatia,"* in marble, at this year's Royal Academy, is one of his best productions. The following are some others of his essays:—"Baby Norman Lovegrove"; John and Archibald and Sir William Stirling Maxwell, Bart.; "Spring and Autumn"; Maria Hill; Dr. Priestley, of Birmingham; Count Münster; the Earl of Rosslyn; the memorial to the late Princess Charlotte, Claremont Palace; "Modesty," a group in marble, and "Miranda"; portraits of Prince Albert Victor of Wales, Prince George, Lord Loughborough and Hon. Fitzroy St. Clair Erskine; the Duke and Duchess of Albany; "Ferreting," a portrait group; Right Hon. and Mrs. Geo. Cubitt; the Princess Alice of Albany; Princess Beatrice; Lord Esher; Duke and Duchess of Connaught; Sister Dora, for Walsall; the Queen, Mrs. Kersey, the Rector of Bishopgate; and Robert Godlenton, of the Legislative Council of Capetown. The photograph of Mr. Williamson is by Messrs. Brown and Draycott, of Walsall.

Mr. John Rhind, one of the leading Scottish sculptors, born in Banff in 1828, was a pupil of the late Handyside Ritchie, A.R.S.A. Principal among the many public memorials which he has erected, may be mentioned that in memory of the Duke of Athole, at Dunkeld; Duchess of Sutherland, at Golspie; Earl of Dalhousie, at Brechin; Marquis of Tweedale, at Haddington; Sir John Forbes, at Lawrence Kirk; Memorial Fountain at Banff; the Dick Statue at Veterinary College, Edinburgh; and recumbent figures of the Earl of Kellie, at Alloa; and Countess of Wemyss, at Aberlady; the great Marquis of Montrose, in St. Giles's Cathedral, Edinburgh; and he has just completed a full-size model for colossal statue of the late Dr. Chambers for Edinburgh, the three last having been illustrated in our pages. He has executed the sculpture and decorative work on the following public buildings:—Corn Exchange, Leith; Fettes College, Bank of Scotland, Union Bank of Scotland, County Buildings, University Club, Stock Exchange, Museum of Science and Art, restoration of St. Giles's Cathedral, the Castle, all in Edinburgh; a large portion of the sculpture, and also a number of the statues on the Municipal Buildings, Greenock; Municipal Buildings, Glasgow; Gosford House, Loch Inch Castle, Dumfriesshire; Meikleour House, Forfarshire; Scott Monument, Edinburgh; Arniston House, Gorebridge; Army and Navy Hotel, London; Scottish Widows' Fund, Belfast; Free Libraries of Hawick and Dunfermline, Luiburn House, Midcalder. He has just recently completed the bulk of the sculpture work for the Edinburgh Electrical Exhibition Buildings, and among other works is at present engaged on a series of bas-relief figure panels for the interior decoration of the County Hall, Paisley. He has executed also many ideal works as well as a great many ideal portrait busts, many of which are placed in the public buildings in Edinburgh. The portrait was produced by Messrs. Rae and Sons, Banff.

* Illustrated in the BUILDING NEWS, June 20th.

SANITARY SPECIALITIES.

WE have received a new illustrated catalogue of the sanitary specialities of Messrs. Thos. Crapper and Co., of the Marlboro' Works, Marlborough-row, Chelsea. Among the valuable improvements in sanitary appliances we observe Messrs. Crapper and Co.'s "Improved Kenon" disconnecting trap, carrying out the suggestion by Professor Corfield, M.A., M.D. The chief objection against the ordinary disconnecting trap is that it is not easily accessible if placed in deep inspection chambers. The "Kenon" is supplied with a valve which can be opened from above to avoid the stoppage caused by sewage accumulation. By removing the manhole cover and raising the pull attached to the valve, the sewage can find free access into the sewer. By this arrangement the trap can be readily cleansed. These improved traps have an egg-shaped invert by which the passing of the sewage is quickened at the open end or channel. The traps are made of glazed stoneware, or can be glazed white inside, and cost for a 4in. size 9s., and for a 6in. 12s. 6d. If fitted with gunmetal valve, galvanised iron chain pull and bracket, and brass screw-cap, the cost is 31s. for a 4in., and 34s. 6d. for a 6in. drain. The shape of the trap, as improved, affords a quicker and more cleansing current. The "improved sanitary air-tight frames and covers" for drains and manholes are excellent, as the joint, which forms a kind of tongue and groove, is quite gas tight, and the covers can be ornamented by tiles to suit the paving. We also notice several other forms for channel pipes. The improved fresh-air mica inlet valves, the automatic flush-tanks, improved grease traps, the cast-iron lead traps for valve-closets, show several good points, such as the egg shaped conduit, and the same form is adapted to the gully-trap of glazed stoneware and grease traps. These have galvanised iron gratings or grids. Improved forms of valve-closets, like the "Elastic," where the overflow is kept clear; the "Ovington Wash-Down" with trap; water-waste preventers, baths, and lavatory fittings are illustrated.

COMPETITIONS.

St. Mary's, Islington, Public Baths and Wash-houses.—The following is an abstract of Professor Roger Smith's report in this competition. On Tuesday last the Commissioners confirmed their previous award, and appointed Mr. A. Hessell Tiltman, F.R.I.B.A., architect for the work. The second premium has been given to Mr. J. D. Mathews, F.R.I.B.A.; and the third prize to Mr. Robert J. Lovell, A.R.I.B.A. There were twelve sets of designs submitted in the competition for the proposed buildings in Caledonian-road, but there has been no exhibition of the designs. The three chosen plans will be on public view at the vestry hall, Upper-street, Islington, on and after Friday, November 7th next. Professor Smith says: "Making a selection from among these designs has been a more troublesome matter than usual, chiefly because the programme has not been a rigidly binding one; but each architect was left at liberty to vary and adapt his plans and design to what he may consider more suitable accommodation. It, of course, is extremely desirable in a set of public baths and wash houses that all the public accommodation should be on the ground floor; but the site is not large enough to permit this on the scale indicated in the instructions. In "Comme il Faut," the design placed first, the baths and public wash-houses and laundry are well separated—the swimming-baths being side by side on the southern half of the land, and the wash-house on the northern. The greater part of the warm baths are in two groups adjoining the two swimming-baths, and the women's warm baths are on the first-floor. The towel laundry is in the basement. This disposition gives as nearly as possible all the public accommodation on one floor; but in order to accomplish this, the architect has reduced the size of the swimming-bath. He has, however, kept it of good proportion. The first-class bath is 90ft. by 40ft.; the second-class one is 72ft. by 37ft. All the baths are well lighted and ventilated, and the general arrangement is, with one exception, very satisfactory. The defect in the design is that it contains three pay-boxes, which, it will be easily understood, increases the expense of working the establishment, though, as it does not appear to me difficult to do away with one of them, there is perhaps not quite so formidable an objection as it sounds. On the other hand, a good many details have been very carefully worked out, details which many of the other architects have omitted or not done so well. An example of this is the arrangement for providing a disinfecting chamber and small yard adjoining the public laundry and wash-house. The architectural treatment of the design, though not cheering, would be satisfactory, and probably more so than the rather heavily-coloured elevations indicate. A very carefully written and full report on the engineering questions accompanies the design, and shows a familiar acquaintance with bath work. Some provision for circulating the water in the swimming-bath is suggested in this report. The design is economical, and can, in my opinion, be carried out within the estimate." "Cleanliness" is the design awarded the second place. Mr. Smith says: "The author of this design has placed one swimming-bath (measuring 90ft. by 41ft.) to the north, and one measuring 85ft. by 42ft. at the south of the block. The towel laundry is behind the south bath. The central portion of the block contains the warm baths in the rear, all massed together in two groups, and well arranged, and the waiting-rooms and lobbies are in front. The public wash-house is on the first floor, boiler-house, &c., in basement. The simplicity and clearness with which the ground-plan is worked out deserves the highest praise, and taken alone, that plan is, in my judgment, superior to any other exhibited. The public wash-house and laundry, however, unfortunately covers a considerable part of the second-class swimming-bath, and seriously interferes with its success; nor is an upper floor as such quite free from objection for such a department. The required information is not full. The architectural treatment also is not vigorous or striking. The design, however, in addition to having the merit of being very simply arranged, and consequently easily supervised and worked, of giving swimming-baths almost of the exact sizes asked for, is undoubtedly very economical, and, could, I make no question, be built for the sum of £15,000 named in the instructions." "Soap and Water," the third premiated design, is thus described: "In this design the two baths are placed together, as they are in that of 'Practical.' One bath is 40ft. by 90ft., the other 40ft. by 72ft, with a recess intended for a boys' bath, bringing up the length to 90ft. The desired water dimensions are thus very nearly secured; but the platform is not carried all round the latter, and the dressing-boxes are in two stories. The public wash-house and laundry, extremely well arranged, occupies the north end of the block. The warm baths for men are on the ground floor; for women on an upper floor. There are two pay-offices. The superintendence and working of the building would be easy. The architectural treatment is on the whole satisfactory, though the exteriors are better than the interiors. The engineering details are thoroughly gone into. The basement, better lighted than many designs, is unnecessarily large, and the design in other respects not so economical as some; but many points of detail have been carefully considered, and the plan represents a group of buildings that would answer the purpose well." The report deals with all the designs in a similarly detailed manner. We have had serious complaints from the competitors because no one has been allowed to see any of the designs—not even the competitors.

CHIPS.

A new Congregational chapel at Heckmondwike, in the Spen Valley, was opened last week. It is Classic in style, and seats 1,000 persons on ground floor and gallery. The architect was Mr. Arthur A. Stott, of Heckmondwike, and the cost has been £10,000.

A Methodist New Connexion church and schools, to be dedicated to St. Paul, are being built in Melbourne-road, Leicester, from plans by Mr. A. H. Goodall, of Nottingham. Messrs. J. Mason and Sons, of Leicester, have taken the contract at £3,750.

At a meeting of the executive committee of the Royal Naval Exhibition held on Saturday, Mr. Wilson Bennison, architect and surveyor to the Royal Agricultural Society, was appointed architect.

The University galleries at Oxford, which have been for some time undergoing the processes of enlargement and rearrangement, were on Friday reopened. The structure has been enlarged by the addition of several well-lighted rooms, to which the collections of classical antiquity, notably the Arundel marbles, have been removed. To these have been added a collection of casts of the most important remains of Greek art, including the most modern discoveries. These have been systematically arranged, commencing with the archaic period, and form an educational series of a very complete character. At the same time, the Turner drawings have been made more accessible, and arranged upon screens, as also the Raphael drawings, which have gone through a process of careful cleaning and remounting. The Dome collection of engravings—a brilliant series of Rembrandts, Vandykes, and Albert Durers—has also been transferred by the Curators of the Bodleian to the Galleries.

On Thursday afternoon, the 16th inst., the Bishop of Lichfield reconsecrated the new chancel which has recently been added to the parish church of Wednesbury. The chancel is spacious, and is built of Codsall stone, and contains three stained-glass windows. The centre one represents the Descent of the Holy Ghost at Pentecost. The builders were Messrs. Dorse and Son, Cradley Heath; the architect Mr. Basil Champneys, of London; and Mr. Arthur Kemp has acted as clerk of the works. The total cost has been £1,954. The nave has been recoloured by Messrs. Beardmore and Lowe, and the woodwork of the choir stalls has been executed by Mr. R. Bridgman, of Lichfield.

A new mission church and Sunday-school, which have been erected in William-street North, in connection with St. George's Church, Birmingham, was opened on Friday. Messrs. Dunn and Hipkiss were intrusted with the designs, and Mr. Webb obtained the contract. The building comprises a large mission hall and two class-rooms.

The staff of Mr. Andrew Potter, of Melbourne Works and Church-lane, Wolverhampton, numbering between four and five hundred, were last week conveyed in brakes to Bridgenorth, arriving there early in the forenoon, when, after visiting the principal places of interest in the neighbourhood, they returned to the Bandon Arms Hotel, where an excellent dinner was provided.

The new National Provincial Bank of England, Bristol, is warmed and ventilated throughout by means of Shorland's patent Manchester stoves, some with ascending and some with descending smoke flues, all supplied by Mr. E. H. Shorland, of Manchester.

Building Intelligence.

Leeds. — The new branch bank for the Birmingham and Midland Bank will be situate in Kirkgate on the south side, and immediately opposite to the market. The façade will be Classical in design, with a frontage of 41ft., and an imposing elevation 55ft. high, which will be executed in stone. The interior walls are to be lined with Italian marble, the floor will be paved with mosaic work, the ceiling will be panelled, and the whole of the counters, desks, and fittings will be of solid walnut. The design has been prepared by Mr. William Bakewell, architect, of Leeds, and will be carried out under his superintendence. The work has been let to Messrs. Nicholson and Son, Heavyside, Barraud, Moore, and Bateman.

Loughborough.—The opening of the Loughborough Town Hall, recently purchased by the Town Council, was celebrated on the 15th inst. (after undergoing extensive alterations) by his Worship the Mayor, Alderman Griggs, J.P., who invited upwards of 500 guests to a reception and ball. The alterations and decorations, at the cost of about £2,300, have been carried out by Mr. George H. Barrowcliff, architect, of Loughborough. On the 24th ult., in the afternoon, the burgesses, to show their high appreciation of the valuable services rendered to the town by the mayor since its incorporation two years ago, presented him with an address and a portrait of himself painted by Mr. Alfred Hartley, of Chelsea.

Northington.—The new church of St. John the Evangelist, situated on the slope of Northington Down, was consecrated by the Bishop of Guildford on Wednesday week. The church, which is Late Gothic freely treated in detail, was designed by Mr. T. G. Jackson, M.A., and consists of nave, chancel, tower, and north aisle. It has been erected principally by the estate workmen, and under the superintendence of Mr. Thomas Potter, M.S.A., Lord Ashburton's clerk of works. The walls are of Portland cement concrete, those of the tower being 4ft. in thickness, faced externally with flintwork and Chilmark stone dressings, and Caen stone internally. The flintwork is inlaid in panels of various designs. Each of the twelve lights contains the figure of an Apostle, one of them being a portrait of the late Lord Digby. The seating throughout is of black American walnut; the nave seats have traceried ends and carved panels, no two of which are alike. The chancel stalls have high backs and canopies and carved standard ends. The organ case is of the same material, rich in tracery and carving, and overhangs the stalls on the north side. The pulpit is of Caen stone. The reredos is of alabaster, with a panel representing the Last Supper. The chancel is paved with marble mosaic. The tower is of Chilmark stone with flint panel inlays. It consisis of two stages, the upper of which is lighted on each face with two louvre windows, 24ft. in height, a traceried parapet surmounting the whole. From each angle springs a pinnacle with crocketed spirelets, that at the south-east angle being larger than the rest. The woodwork generally, including the nave seats, chancel stalls, and organ case, was made in the estate workshops by the estate workmen. Messrs. Farmer and Brindley executed the carving and pavement of the chancel, the reredos, and font. Messrs. Hart, Son, Peard, and Co. made the lectern and altar rails. The total cost has amounted to nearly £15,000; the seating accommodation, including choir, is for 260 persons. We illustrated the exterior of the church in our issue of Feb. 1, 1889, and the interior on Jan. 10, 1890.

Southport. — Primitive Methodist Sunday Schools, Southport, have just been commenced in Derby-road. They are designed on a large scale, accommodation being provided for the carrying on of every department of Sunday-school work. The large assembly hall is in the centre of the building, with a balcony round three sides of the same (carried on iron brackets without columns), and surrounded, both on the ground and balcony floors, with lecture room, infants'-room, 16 class-rooms of various sizes, library, choir-room, and minister's vestry. The assembly-hall is 37ft. wide and 48ft. 6in. long on the ground floor, and 62ft. long on the balcony floor, in addition to a large rostrum and choir recess. The hall is half open-timbered in the roof, being ceiled at level of collar-beam, and,

in addition to the front windows, is lighted by means of vertical lantern windows on both sides of the roof, and ascending the whole length of the hall. There are two main entrances fronting Derby-road, in which are the principal staircases to the balcony, also side entrances and separate outside doors to the choir and minister's vestry. The floors of these vestries are on the level of the rostrum and orchestra. Side staircases are also provided from the rostrum to the balcony. The large hall will seat 500 adults, and in the class and lecture rooms there is accommodation for between 400 and 500. The whole of the internal woodwork will be varnished pitch pine. The building has a frontage of 80ft.; it will be built of bricks, being faced with Accrington plastic bricks, interspersed with Yorkshire stone dressings. The total cost will be £3,000. The work is being executed by local tradesmen, under the superintendence of Mr. F. W. Dixon, Oldham, whose design was selected in competition.

Weston-super-Mare.—The foundation-stone of St. Saviour's Mission Church, in Locking-road, was laid on Tuesday week. The church is to be built in the Early English style, and cruciform on plan. The accommodation will consist of nave, 27ft. wide in clear of walls, aisles 10ft. wide, and transepts 23ft. wide. The chancel, which will terminate at the east with a semi-decagonal apse, will be 22ft. wide. There will be an organ-chamber on the south side of the chancel, and vestry under tower. The external walls will be built with local blue limestone, with Bath and Box stone dressings. The interior, except the chancel, which will be faced with Corsham stone, will be lined with buff bricks with stone dressings, and red rubbers for bands, and voussoirs of arches. The shafts of the columns of the chancel windows and chancel arch will be executed in Devonshire marble. The arcade columns to the nave will be of red Mansfield stone. The contract is being carried out by Mr. James Wilcox, of Weston-super-Mare, and the architect is Mr. S. J. Wilde, of the same town, whose design was selected in open competition. The first portion to be placed in hand is the chancel and organ-chamber, adding from the chancel arch westward an iron building by way of a temporary nave, so that the first structure will seat about 275 persons. The first section, which is now building, will cost about £2,000. The estimated cost of the entire building is £6,000.

Engineering Notes.

Proposed Tunnel between Ireland and Scotland.—A public meeting, convened by the Mayor of Belfast, to consider a scheme for constructing a tunnel between Ireland and Scotland, was held in that city on Friday. Mr. Barton, civil engineer, submitted his scheme, which is to construct a tunnel from the junction of the Belfast and Northern Counties Railway, four miles inland from Whitehaven, on the Antrim coast, to the centre of Wierston Hill, in Wigtonshire, also about four miles inland, the whole length to be about 34 miles. The tunnel, which would take a north-easterly course after leaving the Irish coast, in order to avoid a pool 600ft. deep off the Wigton coast, would have a gradient of 1 in 75, four miles on each side, and a gradient of 1 in 1,000 for the remaining 26 miles, with pumping and ventilating stations on the extreme coast-line on each side. The scheme had the support of Sir Douglas Fox, engineer of the Severn Tunnel; Sir Benjamin Baker, the Forth Bridge engineer; and Sir John Hawkshaw, of London. He estimated the total cost at £8,000,000, and the tunnel could be completed in ten or twelve years The meeting passed resolutions recognising the importance of the scheme, urging the Government to render financial assistance, and appointing a committee to consider and report upon the whole question.

The opening lecture of a course to registered plumbers was delivered in the Upper Queen-street Hall, Edinburgh, on Monday night by Professor Crum Brown, the subject being "The Chemistry of Alloys." Sir Alexander Christison, who presided, said that since February thirty-two plumbers from Edinburgh and district had been "registered." Professor Crum Brown devoted his remarks to a description and consideration of the composition and the properties of the alloys of solder and of brass.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. C. E.—J. P.—P. and Son.—B. of S.—M. and N.—J. H. W.

Correspondence.

THE COMPETITION FOR WHITEFIELD'S TABERNACLE.

To the Editor of the Building News.

Sir,—A good deal has been written in the professional journals with reference to my award of the premiums in this competition, to the general effect that the first premium ought to have been given to "Lux Mundi," and that no premium ought to have been given to "Winged Heart."

I sincerely admired the artistic and practical merits of Mr. Brydon's design—"Lux Mundi," but its cost and its acoustic qualities stood in its way. Of every design which on other grounds it seemed might possibly deserve a premium a careful approximate estimate was made; and though I could recognise that Mr. Brydon had striven to keep down cost, I could not see my way to report that his design could be carried out within—or even near—the limit of cost fixed.

Further, I did not consider that a dome of the size and height proposed was a suitable or safe ceiling for a large public place where clear hearing and easy speaking were of the first importance.

The objection to "Winged Heart" has been raised that it occupies a longer frontage to Tottenham Court-road than is figured on the lithographed plan issued to competitors, and when I discovered this fact I had to consider the position of this design carefully and another similarly drawn. The lithographed plan on the face of it proclaims itself incorrect, as the dimensions figured on the east frontage and those figured on the west frontage differ by 6ft., though there is no indication of any oblique boundary north or south. These two competitors appeared to be the only two who had cleared up this difficulty, and it did not seem reasonable or required by any principle of equity to exclude them for fitting their building to the site it was intended to occupy. Further, looking at the nature of the considerations which the decision would have to turn upon, it did not appear to me that either of them gained any advantage over the other competitors by reason of the difference in dimension of the east frontage, and there was nothing to suggest any suspicion of bad faith. I do not think that any one of my critics, under the circumstances, would have felt it right to act differently.—I am, &c., T. Roger Smith.

Sir,—I sincerely hope, with Mr. Woodward, that this matter may be taken up by the Institute. But the Institute wheels move slowly, and it would be desirable to have an authoritative opinion at an early date. Some of us are, even now, engaged in preparing plans for competitions, which bear considerable analogy to the "Whitefield" case, and this precedent places us "between Scylla and Charybdis." If we keep strictly to the conditions, our designs stand a chance of being passed over by Mr. Roger Smith or some like-minded assessor, for some more ambitious design. On the other hand, if we give to our designs (to quote Mr. Roger Smith) "such an amount of elegance, dignity, and convenience as will be appropriate to the present day," disregarding the stipulation as to cost, we may be ruled out of court, as having transgressed the conditions. I would, therefore, appeal to Mr. Waterhouse, as the President of the Institute and the member of the profession who has had most experience as an assessor, to give us, through your pages, the benefit of his opinion on the matter.—I am, &c.,

One in a Fog.

A COMPETITION FARCE AT BRISTOL.

Sir,—The memorial stones of a Wesleyan chapel at Westbury Park, Bristol, were laid last Tuesday.

Early in the present year, several architects were invited to submit designs in a limited competition for the proposed buildings, and in the instructions issued by the committee, the cost was placed at £1,800. They also set forth that two vestries were required, and that "a spire would be considered an improvement."

A London architect, who declined the invitation to compete, was subsequently appointed by the committee as assessor. The designs having been sent in, one was accepted as advised by the assessor, it being afterwards determined to modify the accepted drawings in order to reduce cost, also to omit the spire, together with one of the vestries provided for in the original instructions, for the same purpose.

Upon the receipt of tenders for the building according to the modified designs and omitting the spire and vestry, they were found to range from £3,334 to £2,748, the latter being accepted.

It was after this farce of architectural competition, limited to a cost of £1,800, without modification or omission, that the memorial stones were laid as before stated.

I inclose the original instructions, a newspaper report of the stone-laying, and names of assessor and successful competitor.—I am, &c.,

Not in It.

"CONGREGATIONAL BUILDING."

Sir,—Your leading article of last week recalled to notice a little volume of suggestions relating to this subject which I published a good many years ago. Since then, various experiments have been tried, and it is perhaps easier now than formerly to arrive at definite conclusions.

Speaking, for the moment, only of the largest schemes of this kind, one fact stands out clearly: We must deal with them as we can, not as we would. As a rule, they have to be cheap, and very cheap. Such constructions as that at Union Chapel, Islington (which you refer to), is quite out of the question for most of them. Yet, for a substantial building of its kind, with seats for 1,600 people, with a large public hall, large schools, infant-schools, numerous classrooms, vestries, and offices, and a caretaker's house, it was by no means costly. A ridiculous statement has gone forth to the world that the building alone cost £50,000. The facts are these: The original contract was about £22,000. While the building was in progress, supplementary contracts and arrangements were entered into by the committee, from time to time, for stone

dressings instead of brick; for pressed bricks instead of stocks; for a marble and onyx pulpit, marble and onyx gallery-parapets, marble pavements, marble organ-screen, wrought-iron grilles, grisaille glass, &c.; and these, with about eight hundred pounds' worth of ordinary builders' extras, brought the cost to nearly £28,000. Since then, the tower has been added; but the whole amount expended from first to last on the building (apart from site, &c.) has been very much nearer £30,000 than £50,000. So much for the accuracy of the reports which "fill all morning and evening newspapers."

Most buildings of the congregational class, however, need to be a far cheaper kind than this. Even stone columns, I think, will generally be out of the question, with all the expensive construction which stone columns lead to. But need we, therefore, fall back on our very old acquaintance, or rather, perhaps, our "ancient enemy," the cast-iron post? Surely not. Artists and utilitarians alike condemn it: and on grounds of public safety, it should be prohibited, unless protected by concrete or some similar coating, in all public buildings. Structural ironwork is already obliged by law to be so inclosed in concert-halls and music-halls, and why it should not be protected in churches and chapels also it is hard to see. Even wood, in pieces of any considerable size, is known to be far more fireproof than unprotected iron, and no place of public assembly should be liable to come down with a run, as these unprotected-iron-column structures do, a few minutes after an outbreak of fire. Before long we may hope that the lives of religious people will, in the eyes of the law, be held as valuable as the lives of musical ones, and that ironwork carrying walls and roof will everywhere alike have to be imbedded in concrete. But without waiting for this, the legislation which will end the iron-post or spindle-shanked age of architecture, we can each adopt the improvement for ourselves. A new way of building is before us, strong, cheap, and capable of being made beautiful: the way of building with rolled iron or steel, and concrete;—well-known and tried elsewhere, it has yet been little heard of in buildings for religious purposes. But it is full of possibilities, and if it were frankly and fairly adopted, it might help us, in this class of structures, out of half our difficulties.

Iron colums concreted round—and possibly with an outer casing of some finer substance—in addition, cannot be very small. For reasons of convenience, therefore, they must be spaced out with some thought and skill, and not merely dotted down in two rows from end to end of a building. It may, perhaps, be expected from this, that what have been termed "central area plans," that is, plans in which the central space is shaped as a polygon or a circle, will often be found very convenient for congregational buildings. They afford, or can easily be made to afford, an unobstructed view of the speaker; but there is a vital point here which is very commonly overlooked. It does not follow in the smallest degree that because a building is good for seeing in, that it will also be good for hearing in. The two things depend on quite different conditions, and there are churches in London in which one might be near enough to the minister to be able to throw a stool at him, like Jenny Geddes, and yet be quite unable to catch one word in a dozen of what he is saying.

Echo, reverberation, and loss of sound are the great dangers to which central-area buildings (as distinguished from very long and narrow ones) are most liable. Once keep clear of these, and the building will be acoustically good. Echo and reverberation come mainly from unbroken or only slightly broken surfaces, both in walls and ceilings. The more the ground-plan of a building is broken up—provided it is free from deep transepts or recesses—the less echo there will be from the walls. The four corners of a square or oblong plan, too, are favourite harbouring-places for echoes, more or less distinct; and in buildings remarkable for their acoustic merits (like the former Surrey Music Hall designed by Sir Horace Jones), we often find them cut off obliquely. But echo depends still more on the ceilings than on the walls; and here one cannot, I think, be too determined in breaking up and getting rid of all smooth surfaces. Architecturally, there is nothing more tempting to a designer than a dome as the finish of his central area; but such a feature, unless on a very small scale and greatly broken up by ribs and hollows, will be likely to finish the preacher quite as effectually as the church. A groined ceiling with many ribs, and with surfaces meeting at many angles, is far more successful; and so also are many forms of roof, not too steep in pitch, and with the central part flat. For singing, and perhaps for speaking, wooden ceilings also are better than stone or plaster ones.

There is another point at which traditional ideas of architecture come into collision with the practical necessities of a building meant for preaching in; and that is, on the question of height. A congregational building cannot, consistently with success, be lofty in proportion to its size. Here arises a difficulty in design; for where there are galleries, some considerable height in the walls is unavoidable. The most obvious and effectual remedy is probably to start the ceilings as low down as the need for light and air will allow, and to take care that they do not run high at any point. Great height—by which I mean, in a building with only one tier of galleries, a height of more than 50 to 60ft. at the utmost, and at the extreme point—is most exhausting to a speaker. It is equally painful to the audience, who are vainly trying to understand utterances which have gone up amongst the clouds, and are far above the level at which human beings habitually dwell. Experience seems to show that, in large central-area buildings, the extreme height in the centre should not, as a rule, exceed the width of the area from column to column. Thus, if the central space be 50ft. wide from column to column, the extreme height inside should not be more than 50ft. If the area be 60ft. or more from column to column, the extreme height should not exceed 60ft.; and if, with due regard to the shape of the ceiling (which should not be flat, except near the middle), it can be kept down to 50ft. or 55ft., so much the better both for speaking and hearing.

Galleries and staircases demand a treatise to themselves. But as to the latter, I cannot see here, any more than on the protection-of-ironwork question, why people in churches and chapels should not receive as much care from the public authorities as people in concert-rooms and music-halls. More than ten years ago it was made imperative in the latter that every staircase and passage that communicated with any part of the house holding 400 people or less should be 4ft. 6in. wide; with any part holding 500, 5ft. wide; holding 700, 6ft. wide, and so on up to 9ft. wide; that there should be at least one general staircase from all floors in addition; and that those neck-breaking and death-dealing contrivances called winders and winding stairs should be entirely prohibited. This, at least, has been the law in London; and why it, or some improvement on it, should not be applied to all public buildings, it is difficult to understand. The subject of gallery design is mainly an architectural one. The beautiful examples from Mr. Pearson's work to which your article of last week refers, and to which should be added an admirable piece of design in his new church at Bournemouth, are of too monumental a type to suggest much for use in congregational buildings. On the other hand, the clumsy wooden galleries which even Wren's genius could not prevent from being terrible disfigurements to his churches, and the baser imitations of them in the older and newer meeting-houses of the last and the present centuries, are not things of which this generation need desire to see much more.

For any really valuable suggestions—at least, relating to central-area churches—we must turn, I think, to the ancient central-area churches themselves, and especially to the examples which your article quotes at Ravenna and Milan. We might learn from these that galleries should not run horizontally across the main columns, nor even horizontally between them. Treated in this way, they are too prominent, too overpowering, too destructive of the architectural lines of the columns. But if planned with a concave sweep in each bay, and this sweep not continuous, but having the main column at a point or cusp of the curve, they will fall back into their places, and while not less useful than before, will do their work with something like modesty and grace.—I am, &c.,

James Cubitt.

HOUSING OF PAUPER LUNATICS.

Sir,—In my letters addressed to you during the past two weeks, I reviewed those clauses of the housing of the Working Classes Act, 1890, which are likely to become not less useful to the architect than the public generally, and now turn from this subject to the housing of the pauper lunatics, and its growing importance also to the architectural profession.

The working classes may be housed at a cost of £30 per head (man, woman, or child); but the housing of *one* lunatic pauper costs from £130 to £200, or even much more!

On January 1st, 1890, the number of insane patients chargeable to unions or parishes in the County of London, and to the County itself, who were placed elsewhere than in buildings belonging to the County of London, was 3,419, and the great extra cost of this arrangement is a matter for serious consideration, if it be remembered that the actual increase of lunatics, in the County of London alone, is said to be at the rate of 500 per annum.

It has occurred to me that there would be a great advantage to the public throughout the whole of the country if a central architectural department could be formed (partly under the control of the Commissioners in Lunacy) for the exclusive purpose of designing and providing asylums for lunatics. It is obvious that the work in its hands would be great at the outset, and no doubt would steadily increase year by year; for London alone will have to expend at least £65,000 per annum upon new asylums. How great, therefore, would be this work for the whole country if centralised! The advantages of this arrangement would be that architectural experience also would centralise, and such a department would be able to afford to remunerate its staff of officers, for large architects' commissions would be avoided; the support of this department would be by payments to be apportioned to each district in proportion to the numbers of lunatics provided for.

Another advantage by holding all asylums in common would be to the public, who would not, as now (in such districts as the County of London), have to board out lunatics at great extra expense in asylums belonging to other counties, while having at times, in certain districts, to maintain buildings not fully tenanted.

The housing of the pauper insane has hitherto been more costly in proportion than for any other section of the poorer class. The cost of the land (of which at least one hundred acres are requisite for an asylum for 1,000 patients) is the first serious item, and its selection is a difficult matter. Suitable sites are somewhat difficult to meet with, as the requirements are so varied. The situation should be elevated, with regard to the adjacent district, with cheerful adjuncts; it should not be at an unreasonable distance from the abode of the population from whom its inmates are collected, particularly with a view to the visits of patients' friends and the supply of fuel and provisions, &c. The water supply and sewage-farming questions are also points to be considered prior to the selection of a suitable locality for the buildings. It is not unlikely that future asylums will be limited to the accommodation of 1,000 patients each. Such an asylum should not cost more than £130,000; but if erected upon the extravagant lines of some works, the cost would be nearly double.

Unnecessary expense is often incurred in the erection of asylums; unduly liberal residential accommodation is often provided for the medical officers, chaplain, and others; extravagant engineering schemes are entered upon for heating and ventilation; over-costly cooking apparatus and laundry machinery are supplied, expensive chapels are provided (for three-fourths of the patients), vast corridors of unnecessary length and width, and picturesque lodges, &c., all tend to a great outlay of public money.

I have also observed, in three or four cases, a great loss in consequence of the bad management of the levels of the large areas of land upon which the buildings are placed, many thousands of pounds sometimes being expended in bringing the earth to conformity with a building wholly unsuitable for the position.

The Local Government Act, 1888, authorises any county council or councils to join in appointing, out of their respective bodies, a joint committee for any purpose. A general combination might be of great advantage for the purpose of providing asylum accommodation.—I am, &c.,

Oct. 21. George H. Bibby, F.R.I.B.A.

A new Wesleyan chapel is in course of erection at Saltash, from plans by Mr. H. J. Snell, of Plymouth; Mr. Finch, also of Plymouth, is the builder, the amount of the contract being about £3,500.

Intercommunication.

QUESTIONS.

[10415.]—**Plaster.**—I shall be obliged if someone with experience in the construction of half-timber buildings in the North will say what is the best proportion of plaster for filling-in the panels of outside work. The studs are 3in. thick, with V-grooves filled in with stone slates in rough, small pieces.—Ebor.

[10416.]—**Association of Public Sanitary Inspectors.**—Will one of your many readers imform me how an inspector to an urban authority can become a member of the above association; or give me the secretary's address, which I have been unable to find out? —R. W., Surveyor's Office, Burnham, Somerset.

[10417.]—**Surveying.** — Will any reader oblige by plotting out a field from the following, which I have come across on page 22, of "Land and Engineering Surveying," by T. Baker, C.E.?—

REPLIES.

[10400.]—**Weather Bar.**—"Surrey" does not say whether casement is "French" or not, whether it opens inwards or outwards, and whether it is hung folding. However, I give sketch of arrangement for casement window which should answer his purpose. Sash to open

outwards. Galvanised water-bar set in cement; sill of frame and bottom rail of sash of oak or pitch pine. In sketch, wall is 14in., stone sill 11 by 6, and oak sill 5 by 7.—N. D.

[10408.] — **Party-Fence Wall.** — "Doubtful" appears to intend to rebuild the garden wall to a greater height for the full thickness of the old wall. This he must not do without the adjoining owner's consent. He will find some extracts from legal decisions on the point in Banister Fletcher's volume on the Building Act, pp. 107-111.—Wm. Woodward.

CHIPS.

At the Exeter City Workhouse a new system of water mains, fire hydrants, and appliances, together with escape windows for the various dormitories, have been recently completed, from plans prepared by Mr. E. G. Warren, surveyor to the Corporation of Guardians, the former being carried out by Messrs. Downe and Baker, and the latter by Mr. G. Diggines, both of Exeter.

The London County Council decided on Tuesday to purchase Bostal Wood, consisting of 74 acres, of Sir Julian Goldsmid, at the rate of £200 per acre, on condition that the Plumstead district board paid half the cost. The asylums committee reported that the accommodation for lunatics would be insufficient, even when the two undertakings in progress, the new asylum at Claybury for 2,000 patients and the extension at Cane Hill for 600 patients, were complete, and recommended that preliminary steps be taken for the erection of another asylum for 2,000 patients. Consideration of the report was postponed.

King Charles of Roumania laid, on Tuesday, the foundation stone of a new railway bridge across the Danube, at Tchernavoda. The new bridge will be the longest in Europe, and will form the shortest means of communication between the North and Black Seas.

The ceremony of turning the first sod of the branch line of railway to Lee-on-the-Solent took place on Wednesday.

LEGAL INTELLIGENCE.

Action for Personal Injuries.—Important Point.—On Monday at the Shoreditch County Court, before his Honour Judge Prentice and a jury, the case of "Lane v. Ewin Bros." came on for hearing. This was an action brought by George Lane, 3, Durant-street, Old Bethnal Green-road, to recover from the defendants, Messrs. Ewin, builders and contractors, damages for personal injuries alleged to have been received through the negligence of the defendants' servants. Mr. Crispe was counsel for the plaintiff, and Mr. Tatlock for the defendants. In opening the case, Mr. Crispe said the action had been remitted from the High Court for trial. In July of 1889, the plaintiff was working for the defendants on a building partly in Berners-street and partly in Oxford-street, which was being pulled down by the defendants. The accident happened on the 25th of July. The jury should know that when workmen were desirous of lowering timber, they usually cut holes in the flooring for the purpose. They sometimes threw the pieces from the window; but if they did this it was their duty to give warning to people who might be about. On the afternoon of the accident the plaintiff had occasion to fetch something necessary for his work, and was walking between the building and the hoarding round it, when he was struck on the head by a heavy piece of timber which had been thrown by the men. No warning was given to the plaintiff by the men. He was picked up in an insensible condition, and run over to the Middlesex Hospital, where his injuries were attended to by the house-surgeon. In consequence of the accident the plaintiff was unable to follow his employment for eight weeks. The plaintiff, George Lane, was called, and in answer to his counsel, said he was a builders' foreman, and he also took contracts. He was working for the defendants under a verbal contract, and was to be paid the sum of £10 for shoring up the party-walls. There was a hoarding round the building. There were a number of doorways in the hoarding, and he was walking to one of these when the piece of timber fell upon him. There were holes in the flooring for the purpose of lowering the materials down. These holes were called in the trade "wells," or "pitch-holes." He was walking to the door in front of the hoarding to get something to sharpen his saw with when he was struck on the head. He was knocked down and rendered unconscious. The piece of timber that struck him was about 7ft. long, and weighed about 24lb., perhaps more. The medical man who examined him at the hospital had since gone abroad. He had a cut across the head about 3½in. in length, and another at the back of his head about 1½in. He went back to his work on the Monday following the accident, but he was unable to do any. He was suffering from giddiness. He superintended the work for a few days. He afterwards became worse, and was attended by another doctor. On his advice he did not attempt to do any work, as it was necessary that he should have a clear head. He had been a builder's foreman for fifteen years, and his average earnings amounted to £3 per week, and he lost that for eight weeks. When materials were thrown, it was the custom in the trade for a man standing at the top to shout "below." In cross-examination, plaintiff said he had been used to the pulling down of houses. He supposed that the hoardings around buildings were for the purpose of keeping people from being injured. There was a space of 5ft. between the building and the hoarding, and he was walking in that space when he was struck. He was employed by Mr. James Ewin. Mr. Tatlock asked whether plaintiff was to find the labour, and at first he said "Yes"; but he afterwards corrected this, and said that Messrs. Ewin were to find the labourers for the job. He was with one firm for twelve years. On this job he was never warned when timber was being thrown out. He had been there a fortnight when the accident happened.—George Thorndyck said he was foreman to Mr. Wood, a builder, at Bethnal Green. If timber or materials were thrown from the window it was the custom to have two men, above and below, to give warning.—Edward Runnicles, a master builder, of 102, Lefevre-road, North Bow, corroborated, and this closed the plaintiff's case.—Mr. Tatlock submitted that there was nothing to go to the jury. He contended that the plaintiff was a contractor.—The Judge: He has not proved that the timber was thrown. A long argument ensued, and in the result His Honour said he would non-suit the plaintiff; but as the question as to whether he was a contractor, in the legal sense of the word, was an important one, he would give him leave to appeal.

The Relation of Builders and Architects.—In the Southwark County Court on Monday, before His Honour Judge Holroyd, the Adamant Company, of Birmingham (London agents: Kinnard, Collins, and Co.), sued Messrs. Pacey and Clark for £32 1s. 4d., for work done and goods supplied. The action was a remitted one. Mr. A. K. Loyd, instructed by Messrs. Robinson, Preston, and Steen, appeared for the plaintiffs, and Mr. Marshall for the defendants. Counsel's statement of plaintiffs' case was that defendants were engaged in certain work upon the Jacob's Well public-house, Hanover-street, Spitalfields. In the specification it stated that ordinary lath and plaster was to be used in the work; but there was a provision, giving the architect power to vary the specification, the amount to be paid under the contract being increased or reduced, according to the character of such variation. In the course of the work, the architect, Mr. Archer, came to the conclusion that a quicker drying plaster than the specification provided for was necessary, and instructed the builders to use the Adamant Company's materials. The materials were supplied and the account subsequently applied for by the London agents. They were first told that the builders must see the architect before the account was paid, but afterwards no progress towards the settlement of the account could be made.—Mr. Thos. S. Archer, the architect, gave evidence that the cement he ordered the builders to use was not more costly than the specification provided for. He never told the builders he would pay the Adamant Company's account. He only put the builders in communication with the company. Cross-examined, he had not long ago £140 in hand of the contract money, out of which he paid the district surveyor's fees, paving fees, &c. He had some money in hand now, but it was claimed by a lot of people, creditors of the defendants, and he had put it in the hands of his solicitors. He could have paid the Adamant Company's account; but why should he have made them preferential creditors?—The defence set up was that defendants had never given the company any order at all. Mr. Clark went into the witness-box, and swore to this, and that he told the representative of the Adamant Co., that he was not responsible for the payment. In cross-examination, he admitted that on the day the architect told him to use Adamant cement, he wrote to the London agents and asked them to give him a call in the morning. He would not have consented to the change in the material to be used, without an understanding with the architect as to who was to pay the account, as it would involve extra expenditure.—His Honour, in summing up, pointed out that it was clear defendant sent a post-card to the London agent for the plaintiffs to come and see him. Afterwards they sent in materials, which were used. Defendant never said he did not want the goods. Invoices were sent in, and no objection made till the agents tried to collect the account. Judgment must be given against the defendant, with costs.

CHIPS.

Mr. Harry W. Taylor, of Birmingham, has been appointed as sanitary inspector and surveyor to the Market Bosworth rural sanitary authority. He has lately been engaged as assistant surveyor and clerk of works on two sewerage contracts at Coalville, for the Ashby-de-la-Zouch rural sanitary authority. He is at present engineer to the sewerage works at Rathy for the Bosworth board, and entered on his new duties on Oct. 22.

On the occasion of the Bishop of Chester's visitation of clergy on Tuesday, the Duke of Westminster presented a pastoral staff to the Bishop at the entrance of the choir of Chester Cathedral. The staff was surmounted by a silver-gilt cross, the centre circle of which displays figures of Christ and the Virgin Mary. Effigies of the ancient saints, of Abbot Richard and Bishop Pearson, all locally connected, ornaments the standard, and the staff is jewelled with topaz and other stones.

The township commissioners of Bilston have adopted plans by Messrs. Martin and Cox for the proposed new bath.

The committee of the Science and Art Schools, at Gloucester have received a letter from Mrs. Price offering to give the sum of £5,000, the estimated cost of carrying out the designs of Messrs. Waller and Son, of Gloucester, for a new school of art on a site already purchased, as a memorial of her late husband. The offer, which obviates the necessity for an appeal for funds for the new building, has been accepted.

At a meeting of the common council of the City of London on Tuesday the Lord Mayor read a letter from Mr. Onslow Ford, A.R.A., stating that it would afford him much pleasure if the Corporation would accept from him, as a gift, his statue of Mr. Henry Irving as "Hamlet," which has been exhibited at the Academy, to be permanently exhibited in their Art Gallery at Guildhall. The offer was gratefully accepted.

A convalescent home for women and children was dedicated at Otham, near Maidstone, last week. It consists of two large wards with four beds in each, two single wards, a sitting-room, and a matron's room, each 23ft. 6in. by 16ft. 6in. The building was designed by Mr. Richard Creed, of Finsbury-circus, and was erected by Mr. Avard, of Tonbridge-road, Maidstone.

WATER SUPPLY AND SANITARY MATTERS.

Grays Sewerage.—The Local Board of Grays Thurrock, in Essex, lately advertised an open competition for the best scheme for the sewerage and sewage disposal of the town. The present population is 12,000, and it is rapidly increasing. The Local Board have unanimously selected a scheme prepared by Mr. W. H. Radford, C.E., of Nottingham, and he has been engaged to superintend the execution of the works. The pumping station will be placed on the east side of the Marsh-road, and the whole of the sewage will be brought down to the site by gravitation through 8½ miles of pipe sewers. One of the most important features of the scheme is that there will only be one pumping station, and with a storage-tank for the reception of the night sewage. The pumps will only be required to be worked by day, unless there is an exceptional storm. The pumping machinery is in duplicate, and it will raise 120,000 gallons per hour. The sewage will be pumped a lift of 97ft. to the Lodge Farm, where it will be purified by broad irrigation on 93 acres of light dry land, eminently adapted for the purpose. Ten acres will be laid out as a special intermittent filtration area. The land would suffice for a population of 30,000 if necessary. All surplus storm-waters will flow into the Thames by gravitation at low water, and will be pumped into the Thames at high water. Tidal and automatic flushing arrangements are provided. Mr. Radford proposes a separate system of five miles of pipe sewers for road surface-water, which will be stored in open back-waters during high water, and turned into the Thames by gravitation at low water. The total cost of the engineering works will be £19,400.

Matlock Bridge Waterworks.—The Waterworks Company at Matlock Bridge have called in Mr. W. H. Radford, C.E., of Nottingham, to report whether it is advisable to increase the present supply of water; and, if so, which of the springs in the neighbourhood would form the best source of additional supply.

STATUES, MEMORIALS, &c.

Plymouth.—The Duke of Edinburgh unveiled on Tuesday, the anniversary of the Battle of Trafalgar, on Plymouth Hoe, the memorial erected by national subscription to commemerate the defeat of the Spanish Armada. The memorial originated in the statue erected to Drake some years ago, when it was thought that all the heroes who distinguished themselves in opposing the "invincible" ships of his Spanish Majesty should have some enduring monument erected to their prowess and patriotism. The leading feature of the monument is a figure of Britannia, who, placed high on a pedestal of granite, overlooks the Plymouth Sound as if keeping watch and guard against the approach of another Armada. By her left side stands a lion, also in a watchful attitude, and various martial trophies surround the monument. Below the main figure, which is in bronze, and has been executed by Mr. W. G. May, of London, are medallions of the Elizabethan heroes, and still lower down are the arms of various towns that contributed to the defence of the nation during Armada days. The architect of the memorial is Mr. Herbert A. K. Gribble, whose design, selected in competition, was illustrated by us May 4, 1888.

Messrs. Jones and Willis have on view at their showrooms, in Edmund-street, Birmingham, an oak reredos, which they have executed for erection in Boylestone Church, Derby. The reredos, which was designed by Mr. Naylor, of the firm of Naylor and Sale, Derby, has as its subject "The Lord's Supper," and the illustration is remarkable for the depth of the carving. The subject is beneath a canopy of three arches, surmounted by carved crestings.

The erection of the Robertson drinking fountain has just been commenced on Bondgate-hill, Alnwick. It is to be Italian Renaissance in character and constructed of local freestone, the architect is Mr. George Reavell, jun., of Alnwick.

A mural tablet of English alabaster is about to be placed in the Baptist chapel at Tiverton, as a memorial of the late Mr. Powell, the choirmaster, treasurer, and Sunday-school superintendent. Mr. Harry Hems, of Exeter, is executing the work.

An exhibition of carpets, to contain a complete collection of modern model carpets from Oriental manufactories, will be held in Vienna, at the Commercial Museum, from the 1st of April till the 15th of June next year.

At the last meeting of the Newcastle Corporation Mr. W. D. Cruddas, one of the Directors of the Elswick Works, made a gift of more than four acres to the city for a recreation ground. The open space is in Scotswood road, near the works, and is valued at £10,000. There are now eight public parks in Newcastle.

Our Office Table.

The annual report, calendar, and list of members of the Architectural Association, familiarly known to students as the "Brown Book," again shows an increase in bulk, the number of pages having been raised from 176 to 192. The annual report of the Committee records the completion of an eventful session, which has been marked by the termination of the labours of the Special Committee on Education, and the presentation of its report. Papers were read last session by Messrs. F. T. Baggallay, B. F. Fletcher, E. P. Warren, R. T. Blomfield, S. B. Beale, Arthur Cates, E. W. Mountford, R. Elsey Smith, W. A. Pite, Henry Holiday, A. E. Bartlett, and Keith D. Young. The work of the classes has been maintained with varying success. The attendance has in several cases decreased, while there is, the committee think, gratifying evidence of more thorough and continuous work in almost every class. The courses of lectures on Architecture, and Construction, and Geology, delivered by Messrs. H. Stannus, F. R. Farrow, and Weldon, were also attended by a smaller number of members than in previous sessions. Perhaps, as a consequence of the falling-off of the classes, the library records show a considerable decrease in the total number, both of readers and of books borrowed. *Per contra*, the sessional and vacation visits were well supported; but the substitution of a supper for the annual dinner did not result in an increase of attendance. The accounts for the year show a total increase of over £960, and the balance in hand has increased from £117 10s. 10d., at which it stood a twelvemonth since, to £128 11s. 5d. The roll of membership is the longest yet attained in the history of the association, being 1,129, an increase of 35 on last year. The proportion of metropolitan members is still very large, being 827 against 302 resident elsewhere.

The School Board for Bath were informed at their last meeting that, in response to the advertisements issued inviting plans for new schools from the architects of the city, only one set of plans had been received, from Mr. C. Bryan Oliver. That gentleman was, however, one of the eight signatories to a memorial from Bath architects, presented by Mr. W. J. Willcox, county surveyor. In this protest they called attention to certain conditions which are now recognised in the profession for conducting public competitions. (1) That the architect whose plan is selected shall be employed to carry out the work at the usual charges. (2) That certain premiums shall be offered to two or three at least of the non-successful competitors. (3) That a qualified professional assessor be appointed to adjudicate on the plans, and his award to be final. (4) That the plans not adopted be returned to their authors. The reading of this gave rise to an exhaustive discussion. Mr. Quin said it did not matter twopence about architects or their views; what did matter to them as a board was to get the best value for their money. The Rev. G. Bowden moved that an assessor be employed, and that a premium be paid for the second and third best set of plans. The clerk, however, declared that the Education Department would not allow the payment of premiums, and it was decided that inquiries be made of the Department on the point. There was a general feeling that an assessor be appointed, to act only as an adviser to the board, who should reserve to themselves the right of the final decision. The clerk's confident and reiterated assertion that the Department would not sanction the offer of premiums is rather surprising, and suggests that he cannot know what is being done in other towns. Curiously enough, on the previous day the Oldham School Board decided, after a long discussion, to give premiums of £50, £15, and £10 for the proposed Coppice School in that borough, and to appoint an assessor.

The use of cork as a covering for steam-pipes is largely adoped in France. The same covering is recommended as a protection of water-service pipes against frost. The cork is cut to fit the pipes in the form of pieces, with radial joints, then bound round by wire; or bands of cork of certain thicknesses to suit different sized pipes are wound round the pipes, these being lapped spirally round, and covered by another band of waterproof canvas in the same manner, and afterwards covered by a thick coating of tar. Great economy in fuel has been proved in the case of pipes so heated. It is stated that a cast iron pipe, 10in. diam., so covered, showed a saving of 38s. per square yard of surface for 300 days of 12 hours. For service pipes and elbows, especially those which come through areas, and are placed in outer walls, the use of the cork casing would be an advantage, and its cost soon saved by immunity from bursting during frost.

An examination in the theory and practice of plumbing, under the auspices of the local District Council, for the purpose of granting certificates of registration, took place at the Merchant Venturers' School, Bristol, on Saturday last. Candidates attended from various parts of the district, and the practical work comprised leadbossing to a given shape and joint-wiping, and the theoretical questions which were sent down in a sealed envelope by the Worshipful Company of Plumbers were such as to test the candidates' knowledge of materials, internal and external work, sanitary arrangements, and water supply. Unfortunately, none of the candidates was able to satisfy the examiners, who were Mr. W. Titmas, R.P.C., representing the Worshipful Company of Plumbers, Mr. T. S. Pope, architect, Bristol, and Messrs. G. Bracher, W. H. Perry, T. J. Edmonds, and W. H. Hobbs on behalf of the Local Council. Some of the candidates showed a fair amount of intelligence, and all were advised to devote time to study and present themselves at the expiration of twelve months.

CHIPS.

Lord Stanley of Preston, the Governor General of Canada, opened the Cape Breton Railway from Hawkesbury to Sydney on Saturday. The Viceregal train was the first to pass over the bridge spanning the grand narrows of the Bras d'Or Lake, which has been erected at a cost of 500,000dol.

The Ayr Public Library Committee have agreed to advertise for competitive plans for the new public library. The site is to cost £1,825, leaving £8,175 for the building.

The *Bosphore Egyptien* for October 1 announces an act of astounding vandalism. Three gangs of workmen, under two local sheikhs, are daily extracting blocks from the lower courses of the two largest Pyramids of Gizeh. These are broken up on the spot, and carried away on camel-back for building purposes. The sheikhs allege that they are doing this work of destruction by permission of the Egyptian Government; whereas they have, it is said, obtained only a permit authorising them to remove scattered blocks.

A new theatre is about to be built on the site of houses demolished in Cranbourne-street and Cranbourne-court, Leicester-square, for Miss Huntingdon. Messrs. C. J. Phipps and Spender Chadwick are the architects.

Churches have lately been built in the Kiwitea and at Dannevirke, New Zealand, from designs of Mr. F. de J. Clere, F.R.I.B.A., the Wellington diocesan architect. The same gentleman is preparing plans for the enlargement of the church at Palmerston North, and a new church at Waitotara, both in New Zealand.

The committee of the Nicholson Institute at Leek, to be opened on Nov. 6th, have accepted from Messrs. W. Sugden and Son, the gift of four models, by Mr. Benjamin Creswick, for emblematic statues on the façade of the Newcastle-unde-Lyme municipal buildings. The models are about half life-size, and are fixed upon the screen between the news-room and the entrance. They represent Painting, Literature, Music, and Architecture.

The Wakefield Union Rural Sanitary Authority have resolved to petition the Local Government Board for powers to borrow on loan the following sums—viz., £1,850 for the carrying out of a scheme of water supply to the township of Crofton; £1,400 for water supply to the township of Walton; £1,500 for the improvement of the existing water supply to the township of Skitlington; and £1,650 for the construction of a main outfall sewer for the drainage of the Common-lane district in the township of East Ardsley. The plans and estimates for these works have been prepared by their engineer, Mr. Frank Massie, Assoc.M.Inst.C.E., F.S.I.

The rapid growth of trade in Wellington, N.Z, has caused many improvements to be made in connection with its wharf and quays. Enormous sheds for the accommodation of wool and flax have lately been provided, and now the Harbour Board, which is one of the most flourishing in the southern hemisphere, is about to build in brick new offices and bonded warehouse. Mr. F. de J. Clere, F.R.I.B.A., has been intrusted with the preparation of the designs, and the building, when completed, will be one of the largest in Wellington. It will have an area of 9,300ft., and a cubical capacity of 497,550ft.

MEETINGS FOR THE ENSUING WEEK.

Friday.—Architectural Association. Discussion on "The Past, Present, and Future of the Association." 7.30 p.m.

Saturday.—Working Men's College. Free lecture by Miss Jane Harrison, "The Parthenon Marbles, and their special relation to recent investigations." 8.30 p.m.

Architectural Association, 9, Conduit-street, W.—The 2nd Ordinary Meeting will be held on Friday, Oct. 31, at 7.30 p.m. Papers by Walter Millard, A. Beresford Pite, A. Needham Wilson, and Owen Fleming, on "The Past, Present, and Future of the Architectural Association."

Fred. R. Farrow, Ernest S. Gale } Hon. Secs.

CHIPS.

The parish church of Braunston, Rutland, was reopened last week, after the restoration of the nave, from plans by Mr. J. C. Traylen, of Stamford. The chancel was restored two years since. The present section of the work includes the repairs of all masonry, the removal of the old floor, and relaying of the entire area with wood blocks on a concrete foundation, reseating in oak, and the restoration of the ancient font, which had been broken up and buried by a former vicar. Mr. Halliday, of Clipsham, was the contractor, and the outlay has been £450.

The Carlisle city council have received a report on the new public market, stating that the total cost of the undertaking will be £42,172. When the design of Messrs. Cawston and Graham, of London, was selected in competition, that firm estimated the outlay at £19,280; but the accepted tenders for the separate trades reached £26,724, an amount considerably augmented by the failure of the original contractor for the ironwork to execute his undertaking.

A pulpit is to be erected in the nave of Manchester Cathedral, as a memorial of the late Dean Oakley.

A memorial to Alexander L. Holley, the United States engineer and inventor, was unveiled in Washington-square, New York city, on the 2nd inst., in the presence of the members of the Iron and Steel Institute of Great Britain. The memorial is a bust of bronze, modelled by Mr. J. Q. A. Ward, and is set on a pedestal of limestone.

Dissolution of partnership is announced as between W. H. Croaker and F. Croaker, of Great Dover-street, Southwark, builders and contractors.

The church of St. Boniface, Nursling, near Southampton, was reopened on the 16th inst., after restoration. Between £400 and £500 has been expended upon the restoration. Mr. F. W. Kinneir Tarte, of Furnival-street, E.C., was the architect, and Mr. T. Ware, Nursling, the builder. The plaster ceiling in the Mill chapel has been replaced. The floor of the chancel has been raised, and the steps altered. The walls of the nave have been re-plastered, and for the old ceiling a new one in panelled wood has been substituted. From the floor of the nave the old tombstones have been removed, and a new pitch-pine block flooring substituted. The external improvements include a partially new roof, and the raising of the north and south gables. The pulpit, which dates from the 17th century, has been restored by Mr. C. G. Stuart Menteth.

The opening services were conducted on the 16th inst. in the new Free church at Haddington. The building has been erected at a cost of over £5,000, and occupies a prominent site at the west of the town. The architects are Messrs. Sydney Mitchell and Wilson, Edinburgh.

The foundation stone of a new Free Methodist church at Workington was laid on Thursday, the 16th inst. The cost of the new edifice, of which Mr. J. Smithson Moffatt, M.S.A., of Whitehaven, is the architect, will be £900.

The first stone of the new fruit and vegetable market, in Farringdon-road, was laid by the Lord Mayor on Wednesday. The building, which will be erected at the corner of Charterhouse-street and Farringdon-road, will be of iron and glass. The design is by Mr. Alexander Peebles, the City architect. The contract for the substructure and basement work has been taken by Messrs. Rudd and Son, of Grantham, at £41,973. The estimated cost of the superstructure is £15,000. The market will form part of the central group of markets upon which, during the past forty years, the Corporation has spent £3,210,000, of which total the Central Markets in Smithfield represent £1,760,000.

A new roof, ceiling, and other alterations to Rehoboth Chapel, Llangollen, have been completed by Mr. Isaac Roberts, builder, Llangollen. The gas-fittings were supplied by Messrs. Jones and Willis, Birmingham. The total outlay was about £600; the work was carried out under the superintendence of Mr. Richard Davies, architect, Bangor.

The engineer to the London County Council, Mr. A. R. Binnie, has made an exhaustive report on the water question, and is of opinion that a new and independent supply from the Welsh mountains would be one of the best modes of solving the problem now before Londoners. In regard to the "pipe" objection, he observes that this a difficulty which he could readily overcome.

In our report of the dedication of the new Roman Catholic church at Cambridge, we should have said that the whole of the sculpture and carving of the exterior (with the exception of that at two entrances) was executed by Mr. James Ovens, of Aqueduct-street, Preston, who also did part of the internal carving, on which Messrs. Rattee and Kett, of Cambridge, and Mr. R. L. Boulton, of Cheltenham, were also engaged.

The first meeting of the forthcoming session of the Institution of Civil Engineers will be held on Tuesday evening, Nov. 11th.

The parish church of Hipswell, near Richmond, Yorks, which still retains its high pews, is about to be restored, a meeting having been held in the parish last week, at which a committee was appointed and substantial offers of money were made.

Holloway's Pills.—The Great Need.—The blood is the life, and on its purity our existence depends. These Pills thoroughly cleanse the vital fluid from all contaminations, and by that means strengthen and invigorate the whole system. The balsamic nature of Holloway's Pills exercises marvellous power in giving tone to debilitated and nervous constitutions.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

ELECTRIC LIGHTING.

COMPLETE INSTALLATIONS OR WIRING ONLY { ESTIMATES GIVEN.

STRODE & CO. 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. **LONDON**

New Branch Showrooms:—188, PICCADILLY, W.
Telephone No. 3958.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.

Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Alnwick.—For paving and channelling a new street, from South-road to Wagon-way, for the local board. Mr. G. Wilson, surveyor:—

Weatheritt, W.	£32 0 0
Whinham, J.	31 10 0
Wilson, J., and Son (accepted)	30 0 0

Croydon.—For the erection of board schools at Woodside:—

Bullock, A. (accepted)	£7,494 0 0

Batley Carr.—For the erection and completion of two houses, &c., at Batley Carr. Messrs. P. Spencer and Son, Batley Carr, architects. Quantities by the architects:—

Masons:—Oldroyd, J. and T., Batley.
Joiners:—Richardson, J., and Sons, Staincliffe.
Plumber and glazier:—Shepley, J., Dewsbury.
Painter:—Lodge, J., Batley Carr.
Plasterer:—Parker, W., Heckmondwike.
Slater:—Hargreaves, G., Dewsbury.
Ironfounders:—James, W., and Sons, Dewsbury.

Brentwood.—For the erection of house and shop, Station-road, Brentwood, for Mr. H. Owen, J.P. Mr. W. G. Shoebridge, 158, Strand, W.C., architect:—

Turtle and Appleton, Wandsworth	£810 0 0
White, A., and Co., Rotherhithe	797 0 0
Winter Bros., Brentwood	757 0 0
Rogers and Robson, Brentwood	739 0 0
Barrett and Power, Hackney*	630 0 0

* Accepted.

Brockley.—For alterations to 183, Brockley-road, for Mr. T. W. Oxley. Mr. J. J. Downes, 11, The Parade, Lewisham High-road, architect:—

Mould, W.	£197 10 0
Wilson, A.	195 0 0
Hughes and Son	150 0 0
Best, S. (accepted)	134 15 0

All of Brockley.

Burnham, Essex.—For alterations and additions to the Queen's Head p.h., for Messrs. Gray and Son. Mr. P. M. Beaumont, A.M.I.C.E., Maldon, architect:—

Cook, A. M., Burnham	£250 0 0
Read, C., Burnham	248 5 0
Collins, C. C., Tillingham (accepted)	220 0 0

Buanham, Essex.—For alterations and repairs at the Victoria p.h., for Messrs. Gray and Son. Mr. P. M. Beaumont, A.M.I.C.E., Maldon, architect:—

Collins, C. C., Tillingham	£100 0 0
Read, C., Burnham	89 10 0
Cook, A. M., Burnham (accepted)	88 0 0

Folkestone.—For alterations to the town hall, for the corporation:—

Payer, A. E., Folkestone (accepted)	£3,785

Gosport.—For building new drill-shed at Gosport, for the 2nd Hants Artillery Volunteers. Messrs. Rake and Cogswell, architects:—

Croad, J.	£890 0 0
Morgan, Isted, and Morgan	795 0 0
Dugan, J.	792 0 0
Lewis, D. W.	777 0 0
Bevis, F.	770 0 0
Lowe, W.	740 0 0
Beech, G.	740 0 0
Hall, T. P.	695 0 0
Daish, C. M.	685 0 0
Crockerell, J. (accepted)	644 0 0

Hoxton.—For rebuilding No. 58, Hoxton-square. Mr. W. H. Duffield, architect:—

Goodwin	£2,597 0 0
Ashford	2,370 0 0
Shurmur, W.	1,980 0 0
Castle	1,947 0 0
Wales, B.	1,775 0 0

Hull.—For the erection of the proposed Hymer's College, Hull, including the addition of dining-hall to the existing house. Messrs. Botterill, Son, and Bilson, 23, Parliament-street, Hull, architects. Quantities by the architects:—

Hockney and Liggins	£15,650 0 0
Blackburn, F.	15,622 0 0
Jackson, G., and Son	14,850 0 0
Harper, M.	14,153 8 0
Skinner, J. T.	13,290 0 0
Marsden and Hodson	12,892 11 0
Houlton, G.*	12,883 0 0

All of Hull.

* Recommended for acceptance.

Kingsland.—For new workshops at No. 167, Kingsland-road, for Messrs. J. J. Bennett and Son:—

Shurmur, W. (accepted)	£1,945 0 0

Landport.—For certain alterations and additions to the Working Men's Liberal Union, Landport. Messrs. Rake and Cogswell, architects:—

Roberts	£830 0 0
Matthews Bros.	795 0 0
Beden, J.	753 0 0
Boulton, F.	699 0 0
Beech	630 0 0
Scammell and Dowdell	625 0 0
Evans, H.	610 0 0
Bowler	591 0 0
Beaton	576 14 2
White and Sons	560 0 0
McPhail	559 0 0
Porter, A. E.	555 0 0
Dawson, C., Jun.	530 2 6
Nobes and Sons (accepted)	514 15 0

London.—For pulling down and rebuilding the Mansfield Arms p.h., Mansfield-road, Kentish Town, N.W., for Mr. R. Davies. Mr. A. E. Pridmore, architect:—

McCormack and Sons	£5,477 0 0
Taylor and Son	5,297 0 0
Julian	4,990 0 0
Evans	4,835 0 0
Lamble, S. R.	4,561 0 0
King and Co.	4,557 0 0
Mills	4,517 0 0
Toms	4,469 0 0
Salter	4,429 0 0
Killby and Gayford	4,368 0 0
Allen and Sons	4,348 0 0
Lundy, S. H. (accepted)	3,389 0 0

London.—For finishing and fitting up the following premises, for the London and Suburban Co-operative Stores, Ltd.:—32, Charing Cross-road; 65, Holloway-road; 305 and 306, Upper-street, Islington. Mr. J Waldram, C.E., 13, Buckingham-street, W.C., surveyor:—

Fell, J., Leamington (accepted).

London.—For reconstructing the steps on the east and west sides of Waterloo Bridge, for the London County Council. Mr. T. Blashill, superintending architect:—

Mowlem and Co. (accepted)	£1,282 0 0

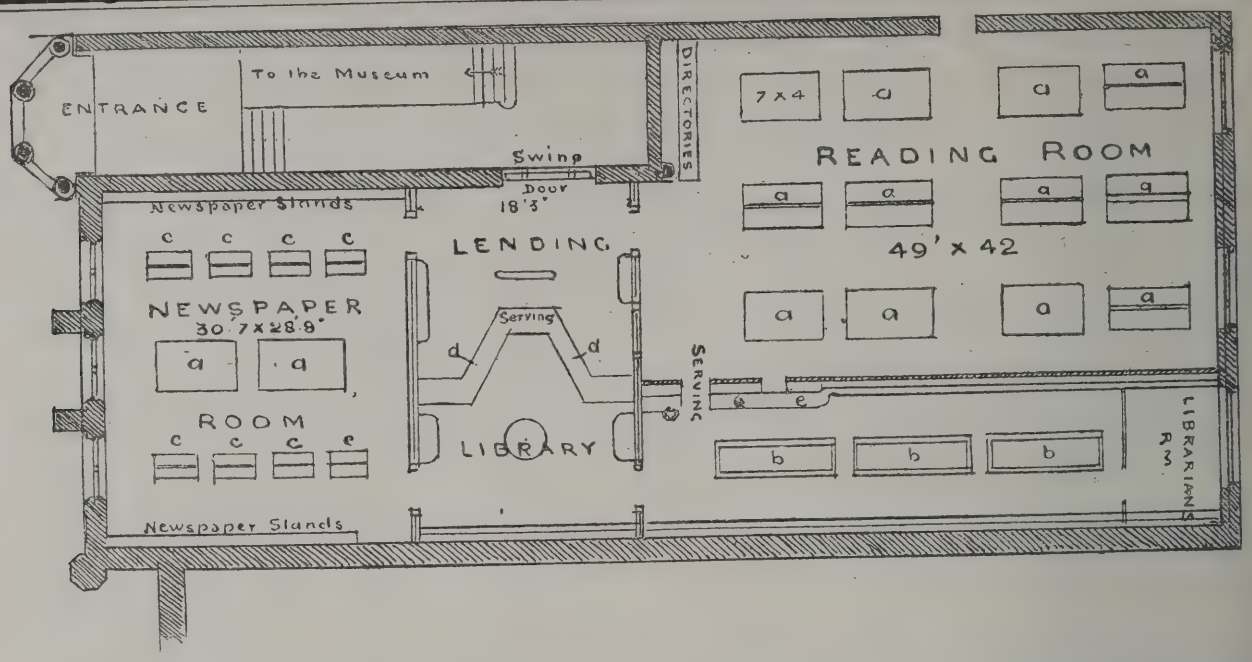
FRIDAY, OCTOBER 31, 1890.

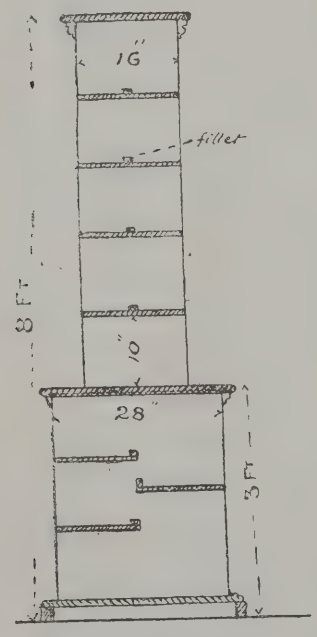
THE DUTIES OF THE ASSESSOR.



COMPETITION awards, if they do not satisfy those who are candidates, may least endeavour to disarm opponents. he frequency of competitions ought to have ught promoters and architects the necesty of observing some laws for their guidnce. Assessors, after all, are but human, nd are apt to make mistakes in their ecisions, like judges in Courts of Law freiently do. It may be of some advantage call attention to some rule of procedure in e selection of designs, for our experience competitions has shown that judges of rchitectural works are no more agreed as to ny principle of action than other judges. Ve might look back and take an historical trospect of past decisions to prove what we ve to say; we might recall the circumstances some recent competitions, but we will pare ourselves and our readers this reference. uite recent decisions have shown contractory principles of selection. What should the assessor's duties may appear to be mple enough, provided always he has the od judgment and taste which the office sumes him to possess. The task of selectg a design for, say, municipal offices, is no ght affair, for it is not merely to select the st able design as an architectural work, t involves the careful consideration of an, the convenience of public apartments d offices. If in both these respects a rtain design is better than others, it ought be selected. It may be easy to find one nich complies, in which case the task of e assessor would be easy; but he may ve to decide between a well-considered an with a poor elevation, and a weak an and artistic design, in which case nsiderable judgment and artistic skill are cessary in striking the balance of merit. ur knowledge of competitions points her to the prevalence of the association clever planning and inartistic treatnt, thus rendering it very necessary that architectural assessor should be a roughly qualified man, able to judge, not ly of an able scheme, but an artistic terior sketch. How few are strong in h aspects it is needless to say here, for committee who had the undertaking of important public building, such as nicipal offices, would naturally appoint, an assessor, one who had himself carried buildings of the class, and who had a utation for practical knowledge of their reements. His artistic ability might be, and en is, quite a secondary thought. Only then, en good plan and elevational designing synonymous, can the duties of an assessor considered light, or when the artistic nent is subordinate or immaterial to the k, as, for example, in the designs for lic baths and washhouses, union workses, and buildings of a decidedly utilian character. In these cases, plan construction are the only points to be sidered in the selection, and therefore the ies of the judge are very much easier. ut in some recent decisions merit of plan design have been lost sight of for two er considerations that ought not rightly e the conditions of a public competition. hey are, promoters ought to state so at onset. We allude to compliance with ted instructions and cost. If adherence number of conditions, including that of , are considered to be the main object of mpetition for a building, the advertise- t ought to be worded in a manner to make the meaning clear. It ought to be to the effect: "Wanted, a design to comply with certain instructions, and to cost not more than the given amount." One can hardly imagine a committee or board adopting a course so contrary to their real object, for if they did really require a design that should most closely comply with certain requirements in a technical manner, and not to cost more than a given sum, they could scarcely do a wiser thing than to get their own surveyor to prepare a set of plans. But, as a fact, the promoters of competitions desire to obtain the best design they can, and are prepared to forego any technical point if they can obtain a clever and architectural scheme. They advertise for ability and artistic taste, for if they did not they had better consult a surveyor or engineer at once. Therefore, we say that compliance with technical instruction and cost can hardly be considered as a foremost merit in selecting a design. If an assessor, acting according to his own sense of justice as to what is meritorious, considers these elements before that of skill in design, he certainly commits an error. Those who have sent in meritorious designs feel aggrieved by being rejected for having not considered some trivial detail, as the size of a room, or the easement of a neighbouring light. Those who closely adhere to printed instructions but send inferior designs, complain of injustice being done them. Both have grounds for complaining. The first-named class can justly ask what the advertisers wanted if not skill and art; the second named can plead that they have been too conscientious. The mistake is made in not knowing what is wanted: it is due to those who invite the profession on ill-judged conditions—whichever way the assessor acts, he is surely held to have done wrong.

It is useful, then, to inquire on what principle the architectural assessor should act. To answer this question, he should first learn what is required. "Is it the ablest design, or that which fits nearest the advertised instructions and pocket of the committee?" Generally speaking, he has nothing to do with drawing up the instructions: his aid is called in afterwards to assist the committee. When he has to make his own selection and report upon the designs under these circumstances, the first duty he has to fulfil is to study the instructions. Handicapped by verbal directions of the committee, he is not in a position to award the prize to a design which commends itself first to him, and his duties are too often restricted to find which design meets the requirements as to accommodation and cost. He has to make a rough estimate of the designs, or to cube them, and after he has performed this duty, he cannot reasonably do anything else than recommend the one which comes nearest the amount stipulated. To our minds this office is hardly one that an assessor should be called upon to perform, as it belongs more properly to the surveyor, who should be instructed to make rough estimates for the guidance of the assessor. It would much facilitate his duties if he were informed by the committee how the instructions were to be interpreted, to which points in them importance was to be attached. Much responsibility would be removed if the architectural assessor who accepted instructions drawn up without his concurrence, were to have the power of saying which of the instructions were reasonable or to retire from a position often rendered untenable. The same thing would be accomplished if those called in to act as judges were to formulate a certain mode of procedure or to decline to act unless they possessed certain powers. It would not be long before those who invited designs saw the importance of engaging a professional referee at the commencement, to assist in drawing up the instructions. Till then, blunders, ill-considered instructions, jobbery, and recriminations will continue. A primary condition of every selected design should be that it is the best and most skilful—that is, that its points of merit in plan, construction, and treatment are superior to others in the same competition. In every case, the kind of building will dictate to the referee which of these three elements of design ought to be first considered, or to weigh in his mind their respective merits. If the estimate is disproportionately high, and beyond the means of the committee, there appears to be no other reasonable alternative than to fall back on the second next best, if there should be one, that can be carried out within the limit set, or to abandon the competition. The assessor's duties extend no further; he would be acting wrongly to select an inferior design simply because its estimate is reasonable. Yet we have had a few of these decisions lately. Technical points must be judged according to their importance. It would not be just, for example, to select a design which greatly exceeded the limits marked on the plan, even supposing it possessed merits. The assessor is called upon to weigh the relative disadvantages of increased cost and excess of area covered, other things being equal. A few feet more of frontage, or a wrong boundary line taken for building, must be deemed a more serious objection than excess of cost. These are points about which every assessor is called upon to use his discretion. Circumstances alter cases; but a sense of proportion is demanded in taking into account discrepancies and errors. In some instances a technical mistake in the design will not be of vital importance; while in others it may become a substantial reason for rejecting the design. The recent competition for Whitefield Tabernacle has called out many criticisms and expressions of opinion on the award of an able architect, and serve to indicate the urgency of adopting some explicit line of procedure based on common-sense principles that cannot be open to animadversion. That selection did not appear satisfactory to many because merits acknowledged by the assessor himself had been set aside for other considerations less strong or convincing. The study of the correspondence in our columns is instructive on the question.

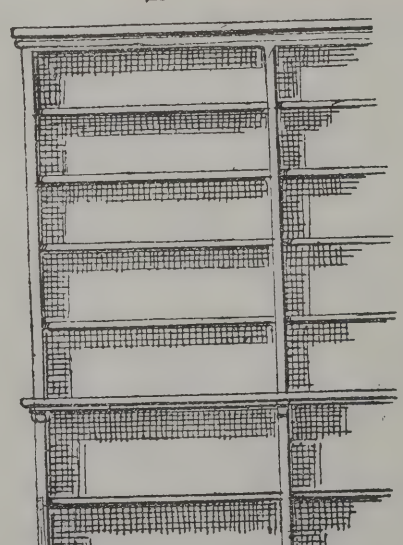
FREE PUBLIC LIBRARIES.—VI.



WE have referred to the indicator, the newspaper and periodical rack, and the newspaper stand, and now desire to say a few words on bookcases. We have already spoken of the modes of stacking the books or cases against the walls—whether they should be arranged flatwise with the walls, or projecting therefrom, at right angles, known respectively as the "rack" and "alcove" systems—according to one or the other of which the architect has to arrange his windows and piers. It now remains to show the construction of the shelves and uprights which form the cases for the books. The plan of shelving round the walls is not the most economical kind of storage, and the labour of finding a book is increased; but by the plan of adopting "standard" bookcases, which can be placed to form alcoves or recesses, or arranged in parallel rows with passages between, books can be accommodated on both sides, and the labour of the staff lightened. Besides which, distinct bookcases form groups of books, and admit of easier finding and classification. Thus, if the bookcases are arranged in rows at right angles to counter of lending library and between windows, considerable facility is afforded the staff.

A standard bookcase should not be of greater height than 8ft. (and contain eight to ten shelves), which is quite high enough for reaching to the top shelf on a stool or

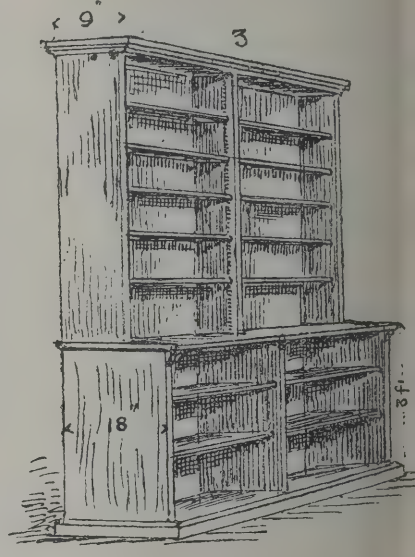
step; when higher rooms have to be utilised, a mezzanine or gallery becomes necessary. As regards length, this dimension must be determinable chiefly by the width of room. No shelf should be longer than 3ft. 6in., if over this length shelves bend with the weight



1

of books; but a length shorter than this is to be preferred, and 30in. is thought to be the most desirable length. The shelves should not be less than 8in. wide and 1in. thick. The section we give (Fig. 1) shows a bookcase for a double row of books, conforming to the above dimensions. Five shelves for books are provided, the distance between the shelves being 10in. In the lower part of case large folios and quartos can be placed on both sides. It will be seen on the section that partitions between the double rows of books are avoided. These partitions obstruct the free passage of air through, and the corners are apt to accumulate dust. To obviate them, a fillet is fixed along each shelf in the centre as a stop. Sketch 3 represents a wall bookcase 8ft. high with ledged base, the latter 18in. deep and 3ft. in height. The shelves should be movable, supported on metal strips with catches. A standard bookcase, 8ft. high, will allow for 10 shelves, including the base, and these spaces will be sufficient for octavos and 12mo. books. In reference libraries, eight shelves will be found enough, as larger volumes have to be accommodated.

In the reference library six volumes per lineal foot of shelving is a good average, and for the lending library eight to ten volumes per foot. The bookcases for the reference library, which is used by the public, may be placed round the walls, and be protected by a rail about 3ft. in front; those in the lending library and stores, only accessible by the staff, should be placed transversely across the room with passages between them, each case being double, as in the standard bookcase we have shown. The spaces between bookcases ought to be about 3ft. 6in. As an example of arrangement in a public library we are enabled to give, by the kindness of Mr. Greenhough, the librarian, a detailed plan of the Reading Free Library (4). The position of the lending library and the form of the counter are worth notice; the return sides of counter, which are at an angle, support the indicators as shown in *d d*. Mr. Greenhough states that, on the



2

whole, the arrangements are good, and give complete satisfaction.

The lighting, heating, and ventilation are all important considerations in a public library. Gas is so destructive to bindings, especially leather on the upper shelves, is dirty and objectionable on sanitary ground that every means ought to be taken to reduce these objections to a minimum. The noxious gases of combustion should

3

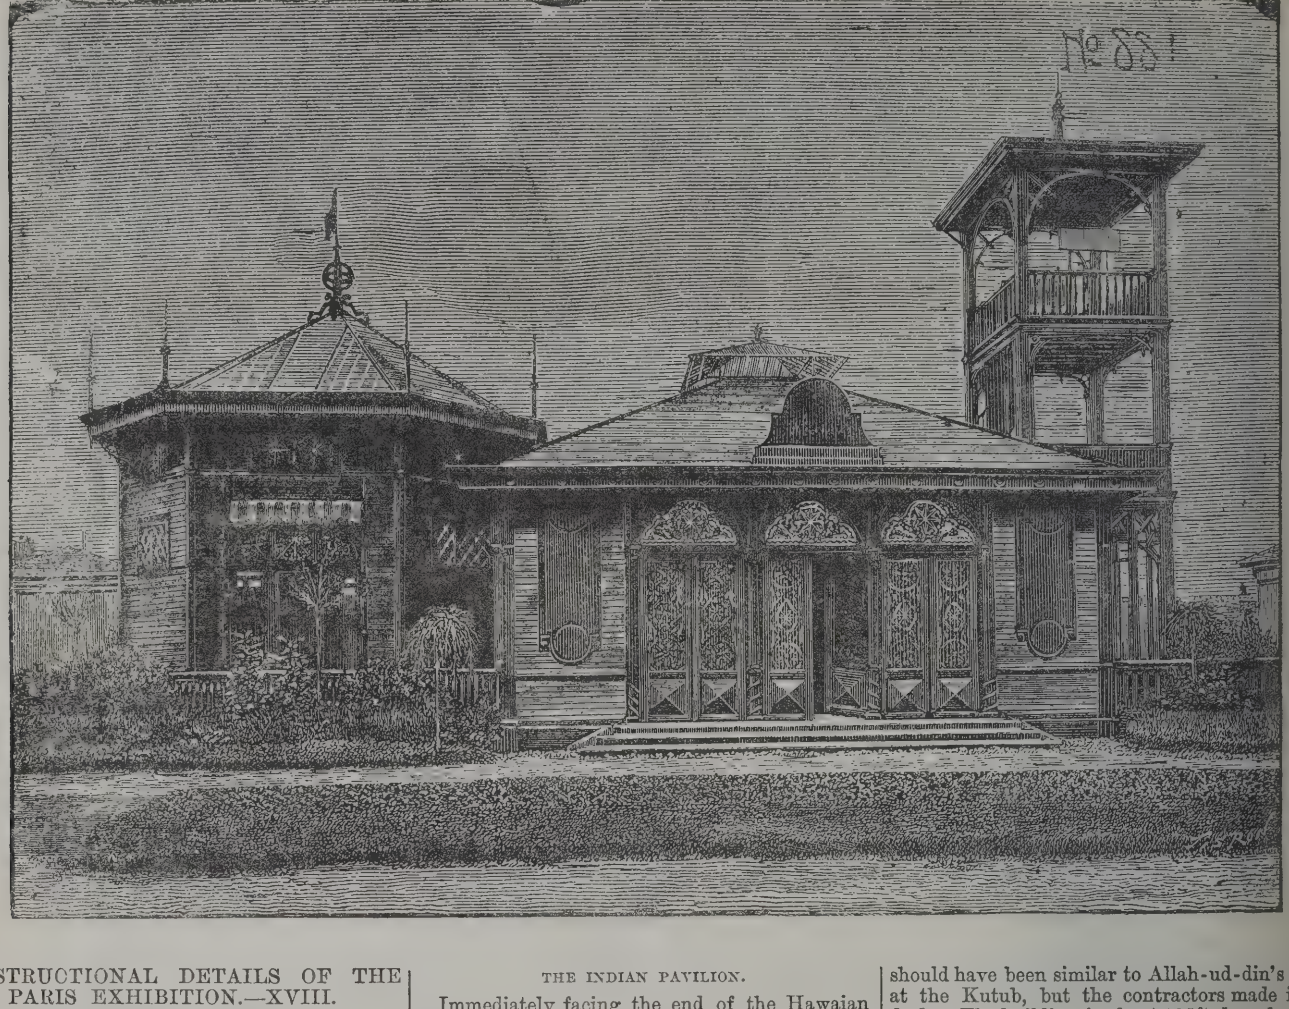
carried away as directly as possible, so that the air in the room should not be vitia... The several ventilating gas-lamps now in market meet this condition to a large ext... Strode and Co.'s ventilating sun-burn... another form, based on the right prin... in which the products of combustio... carried away. In all these forms eco... of gas, increase and steadiness of ... are secured. Mr. W. H. Greenh...

F.R.Hist.S., the librarian of the public library, Reading, read a valuable paper on this subject at the late Congress of Librarians, in which he shows that the regenerative form of the "Wenham" lamp is the most secure method against fire, and he cited a table by Professor Vivian B. Lewes, which shows that this regenerative lamp gives a higher illuminating power per cubic foot of gas consumed than other burners, also a much smaller proportion of carbonic acid and water-vapour is produced per candle-power. It also consumes a much smaller proportion of oxygen as compared with other gas-burners.

The employment of the electric light for libraries must soon be recognised as the most desirable form of illuminating. Mr. Greenhough gives some very useful data in comparing the two kinds of light. A much smaller proportion of heat is radiated from the electric light as compared with that radiated from gaslight. It is asserted by a scientific authority that "to produce an equal amount of light, coal-gas gives off about 100 times more heat than does the electric arc-lamp, and that in the process of combustion 94 per cent. of ordinary gas are transmitted into heat, while only 6 per cent. are available for the production of light. In his paper on the "Ventilation, Heating, and Lighting of Libraries," the author gives the results of the effects produced by the two systems of lighting in the news-room of the Reading Public Library (see plan 4). The experiments, according to him, clearly prove "that after the gas had been burning three hours (Sugg's governors, equal to 360 candles), the thermometer at 5ft. from the floor had risen 4°, and at 16ft. from the floor had risen 15°, although the temperature in the open air had not changed. When the arc-lamps of 2,400 candle-power were in operation, and after they had been lighted three hours the thermometer at 5ft. from the floor registered a fall of one degree, and showed no change at 16ft. from the floor, but the outside thermometer had fallen 2·5."

The Reading Library affords a fair example of electric lighting. The local electric lighting company is paid by contract £80 per annum for supplying the current to eight arc lamps in the library and reading-rooms, including providing the carbons and keeping the lamps in order. The prices are certainly low. The arc lamps are of 1,200 candle-power each, but 60 per cent. of the light is absorbed by thick opal globes necessary to protect the eye and to diffuse the light. The total illuminating power is therefore equal to about 4,320 candles. Mr. Greenhough says if 100 8-candle power glow-lamps had been adopted, the expense of lighting would not only have been nearly double that for arc lamps, but the total lighting power would have only been equal to about 800 candles. The cost for gas last year was £79, while the total lighting power was equal to some 1,360 candles. The result speaks for itself. We recommend the reader to peruse Mr. Greenhough's useful paper on the question of lighting and heating.

To remove the heated air near the ceiling is one of the most important objects to accomplish, and this can be accomplished by a well-considered distribution of outlets in the ceiling above the open gas-burners, so that their heat may assist the ascensional current to carry off the products of combustion. Such means of inducing up-draught in the outlet tubes may be used, as those afforded by Boyle and Son's air-pump ventilator and Kershaw's pneumatic ventilator. For fresh-air admission the vertical tube, or Tobin system, is recommended. These tubes, Mr. Greenhough says, should be carried to about 6 or 7ft. from the floor in height, and be properly distributed and apportioned. He says "an excellent way to place the tubes in a reading-room is, when practicable, in a continuous length round the room against the wall, and with a projection of about 2in., thus forming a kind of dado; an advantage is gained by placing the tubes against an outer wall, as by so doing the fresh air may be brought directly into the tubes through an opening in the wall." Lids or valves, to regulate the amount of fresh air admitted, are necessary at the top of the tubes.



Of the various methods of warming, that by means of hot-water pipes is recommended. These may be distributed in coils or pipes, with valves for regulating the heated air admitted. A combination of warm air and hot water may be found more efficient in many libraries, and Grundy's apparatus offers a desirable mode of heating the fresh air admitted. Steam pipes are open to objection, and boilers are apt to explode; ordinary fire-grates give only a partial heat, not adapted for large reading- or news-rooms.

ARCHITECTURAL STUDIES IN FRANCE.

[WITH ILLUSTRATIONS.]

THE late Rev. J. L. Petit, M.A., F.S.A., was no mean authority on archæological and architectural subjects during the early days of the Gothic Revival, and much that is best in the practical work of that period was, at least to some extent, influenced for the better by his writings. Foremost among his books perhaps was the volume which he published in 1854 under the above title. His volume was considerably enhanced in value by the engravings furnished by the well-known artist, Professor Delamotte. We have now before us a new and revised edition brought out by Mr. Edward Bell, M.A., F.S.A.,* who has added some foot-notes and useful references, but the main portion of the work remains unaltered. The large and unwieldy form of the original has, however, given place to a handy and convenient book, suitable for ready reference, with the old lithographic illustrations reproduced to a reduced scale in *fac simile*. Mr. Petit's sketches were so exceedingly bold, not to say coarse, in style of drawing, that these studies of his have really lost none of their value in the present reproductions. The reissue of such a work as that before us is an incident of special interest to the lover of Mediæval antiquities, showing as it does a conviction that there still remains among us a large class of readers who value existing examples of Mediæval art, even though the resuscitation of the Gothic style, at least in its entirety, has for the present proved fallacious. Hope, Pugin, Carter, Rickman, Whewell, and Willis furnish honoured authorities in the school to which Petit belonged, and their works still constitute the backbone, so to speak, of our books of reference on the grammar of architecture in England during the middle ages. Sharpe, Scott, and Street developed its study, aided by such enthusiasts as Burges and E. W. Godwin, thus leaving, no doubt, much of the earlier work of revival a considerable way behind. The researches of these pioneers, who first systematised the study of Mediæval building, if sometimes crude to present ideas, had a distinct freshness and zeal about them which even now is exceedingly stimulating, and the manner particularly in which writers like Petit pursued their way, gives their opinions more than a passing interest, and, moreover, adds a considerable theoretic value to their utterances. The drawings in the book under notice show us in a fairly accurate manner several buildings which have since been restored out of all knowledge, or possibly been removed entirely, as in some cases, by the reckless innovations which have from time to time been committed under the plea of "improvements." Petit's book was not the chronicle of a single tour, but is to be taken rather as the outcome of many visits, generally made with a definite purpose in view. We do not propose here to follow the writer again through his very readable treatise, in which the student will find many a page worthy of verbatim quotation, for although Mr. Petit was not a practical architect, he was a critical and keen observer of no mean capacity, entirely in love with his subject of study, and actuated by a highly-artistic judgment, quite above and beyond the dry bones of mere antiquarian limitations, for, much as he reverenced the past, his hope lay—as a true student of a living art—in the possibilities of the future and its developments. In his preface, the author gives a list of books which he found useful. The editor adds two more; but he surely should have mentioned the Sharpe Memorial Volume, which so fully illustrates the domed churches of Charente, to say nothing of the volumes of sketches which have appeared since Petit wrote from the hands of Shaw, Nesfield, R. J. Johnson, Burges, and Galsworthy Davie. No doubt these are already familiar; but a footnote which includes Macgibbon's "Architecture of Provence and the Riviera" should bear some reference in the direction we have ventured to point out. By the courtesy of the publishers, we are enabled to give herewith a selection of some of the more characteristic illustrations in the book, the two central ones being from Mr. Petit's own sketches on the spot. Other illustrations in the volume are careful woodcuts, showing details and mouldings to elucidate the author's descriptions or general views engraved from his rough studies, which sometimes had, as he acknowledges, to be supplemented by the artistic imagination of the draughtsman employed to render them suitable for the engraver. Illustrations of the latter kind undoubtedly are not to be relied on beyond giving general impressions of the subjects to be represented. Taking the sketches in the order in which they are arranged on our sheet, we have first of all, in the top left-hand corner, a general view of St. Saturim, a little round-arched chapel, which forms a very curious relic of its kind dating from the 11th century. It is a perfect cross church of the transverse triapsal form, and has a central tower. The semicircular apses spring directly out of the tower, and internally have a semidomical roof. The whole width, taken at the transept, and including the thickness of the walls, is not above 14ft. It is not far from the once-beautiful abbey of St. Wandrille, near Caudebec. Bougy Church (the central study on our sheet) in Calvados, near Evrecy, has a little central spire turret like those to be met with in Gloucestershire and Wiltshire, such as Harscomb, Boxwell, and West Littleton. The next sketch is a view of the church at La Palud, in Charente, which, though dissimilar in outline, is in many respects very like Courcôme. It stands near the beautiful ruins of the Abbey of La Couronne, six or seven miles from Angoulême, on the Bordeaux-road. The spire has the usual "fir-apple" ornament upon it peculiar to this district, as at Roulet, Perigueux, &c. It belongs probably to the 12th century. The first of the lower three sketches represents the village church of Monts, near Tours, and not far from Montbazon. It has semicircular plain arches with a semicircular apse, having tolerably rich Romanesque work about it. The last sketch in this sheet illustrates Artannes Church, situated close to the last named. At its east end is attached a castellated mansion, apparently of the 15th century; but most of the church is earlier. The chancel is square-ended, with ribbed vaulting somewhat domical. The central tower is low, and covered with a wooden spire. It has a pair of round-headed windows on each face. The nave is much earlier than the tower, and internally is very interesting, with the quaint pulpit on the right of the chancel-arch. The chief illustration in the central lower position on our sheet shows St. Sernin, Toulouse, from the north-west. This is one of the largest and finest Romanesque churches of the South of France. It consists of a long nave with two aisles on each side, north and south transepts of great length, and two apsidal chapels to each transept looking eastward, a choir with polygonal apse, aisle, and radiating chapels. At the west end is a kind of transept about the depth of one bay of the nave, but not projecting beyond the walls of the external aisles. In the centre is a lofty octagonal tower tapering in five stages. The three lower ones are Romanesque, and the whole is constructed of brick covered with plaster. There are several other drawings of this church in the book besides this one. In parting with this new edition of an old friend, which we welcome, we may say in conclusion that the publishers have done their part well. The paper is good and so is the printing. The cover, too, is suitable, in quiet green, well adapted for the library, so far as a cloth-covered book of reference can be.

* Architectural Studies in France. By the Rev. J. L. Petit. New and revised edition by Edward Bell, M.A., F.S.A. London: George Bell and Sons. 1890.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XVIII.

By Banister Fletcher, Jun., A.R.I.B.A.

PARAGUAY PAVILION.

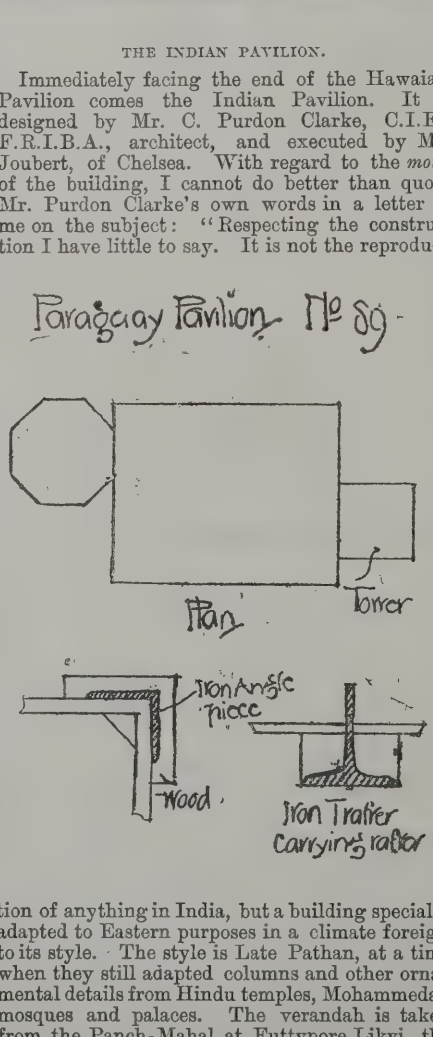
THIS pavilion is an example of a building executed in wood and strengthened at the angles, &c., with iron. The cost was £2,000, and M. Moreau, the architect, had to design it so that it could be taken down and re-erected in Paraguay.

The plan is divided into three parts (No. 89), arranged side by side, and consist of a central one-story building, 32ft. by 32ft., and 26ft. high. On one side of this an octagonal one-story building, 28ft. across, and 30ft. high, and on the other a tower in three open stories, 10ft. by 10ft. by 48ft. high. See illustration (No. 88) above.

With the object of easy removal it has been designed in a great number of pieces, and consists of light iron framing weighing about three tons and filled in with wood panels. The ironwork is covered with pitch-pine wood on the exterior, so that the construction is not shown. The roof is covered with zinc.

THE GUATEMALA PAVILION

was erected by M. Gridaine, a French architect, and is only interesting as being a reproduction of a typical country house in Guatemala, and is of the châlet type, and, of course, in wood, two stories high.



The elevation is considerably brightened about the central entrance by the importation of tiles into the decoration. It is covered with red tiles, and between the main wood uprights it is filled in with pitch-pine boarding. It covers a space of 5,400sq.ft.

THE HAWAII PAVILION

s built in the exposed pan-de-bois type, in which he wood framing shows, and filled in with brick-work. It is a rectangle in plan, and surrounded on three sides by a verandah, with thatch roofing carried on wooden columns. The filling-in between the wood framing is of bricks in patterns of various colours. The design is based on a modern Hawaian house. The building is covered with tiles, and the entrance has a large panel in terracotta over it. The side of the building, which has no verandah, is ornamented with panels in glazed terracotta. The lighting is side windows above the thatch roof to the verandahs.

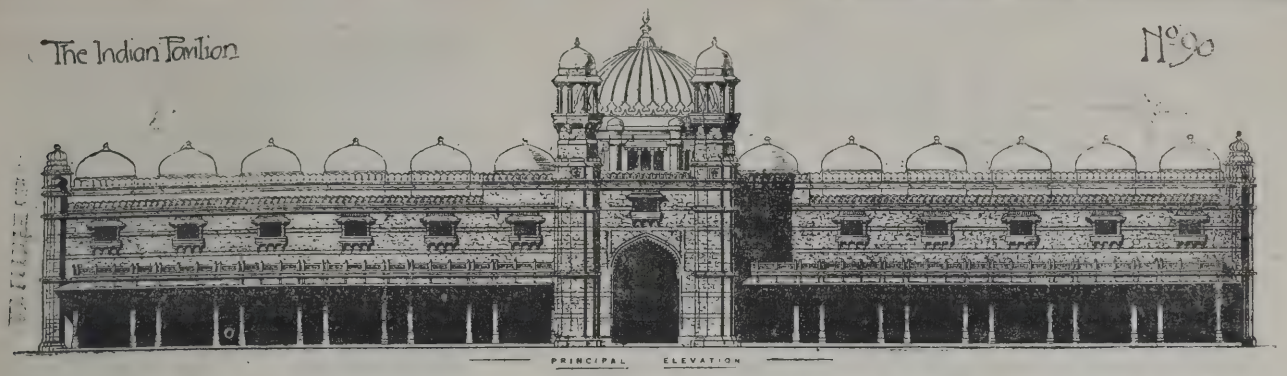
THE INDIAN PAVILION.

Immediately facing the end of the Hawaian Pavilion comes the Indian Pavilion. It is designed by Mr. C. Purdon Clarke, C.I.E., F.R.I.B.A., architect, and executed by Mr. Joubert, of Chelsea. With regard to the *motif* of the building, I cannot do better than quote Mr. Purdon Clarke's own words in a letter to me on the subject: "Respecting the construction I have little to say. It is not the reproduction of anything in India, but a building specially adapted to Eastern purposes in a climate foreign to its style. The style is Late Pathan, at a time when they still adapted columns and other ornamental details from Hindu temples, Mohammedan mosques and palaces. The verandah is taken from the Panch-Mahal at Futtypore Likvi, the outer walls, principal side, and back entrance from several mosques at Ahmedabad, and the central hall from a portion of the mosque at the Kutub, Delhi, where Jain columns were used. The colour

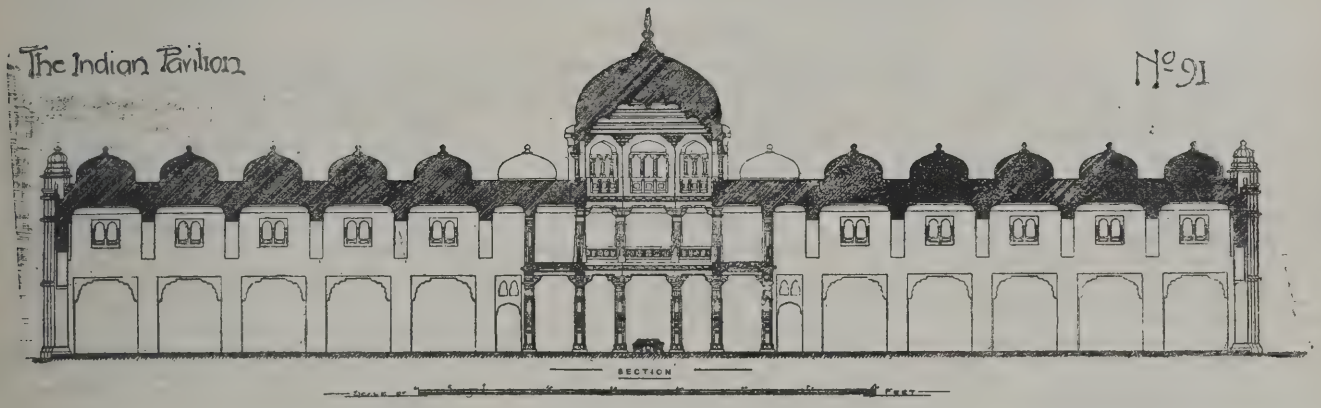
should have been similar to Allah-ud-din's tom at the Kutub, but the contractors made it to dark. The building is about 185ft. long by 46f broad, and cost £2,800." Mr. Purdon Clark subsequently very kindly sent the attached plan elevation, and section, and also a perspective, an in reference to a question from me as to th precise name of the building, he very kindly ga the following explanation:—"The building h been called by various names, but as a temporar resting-place for traders or merchants in th East it would be called a Serai. In the Par Exhibition of 1878 I built a pavilion, and at th Colonial and Indian Exhibition a portion of palace with outer courtyard surrounded by th usual shops; but in the present case the buildin is between a covered bazaar and a karavan serai." The building is executed with woode framing and rough plaster covering, with dar red bands. The plan and distribution will b better understood from the plan, &c. The galler at the first floor to the octagonal dome is ap proached by a staircase at the side. The model for the columns and other parts have been take from the Indian Museum under Mr. Purdo Clarke's direction. The 20 shops are occupie by Indian exhibitors, and by Messrs. Liberty, Regent-street, London, who have done so muc to popularise Indian art and manufactures i England. It is one of the most satisfactory the temporary pavilions in the Exhibition, grea care having been taken in the modellings, & The three pavilions still left along this side ar those of China, Roumania, and Siam.

THE CHINESE PAVILION

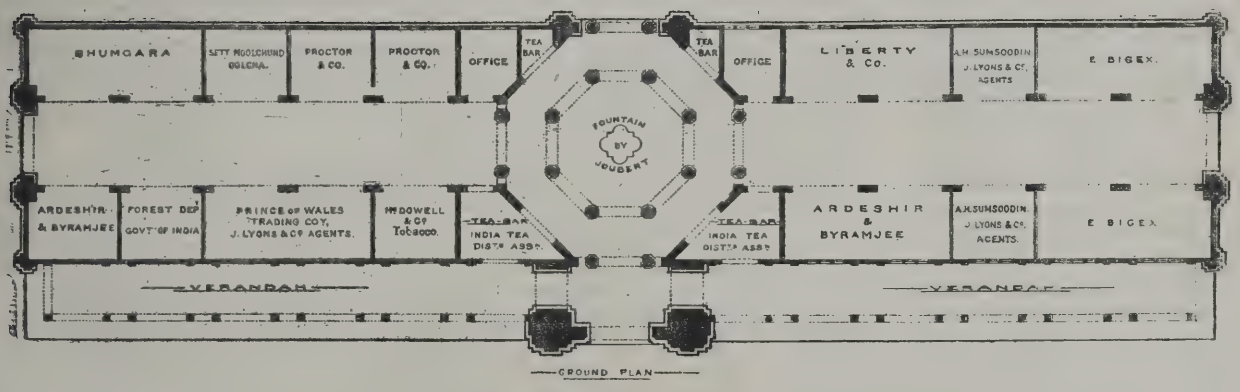
is typical, with its three turrets and exterio decorations of sculptured and coloured woods.



THE ROUMANIAN CHALET



is a typical Roumanian country house, with tower and overhanging roof. It is built wit wood framing and plaster.



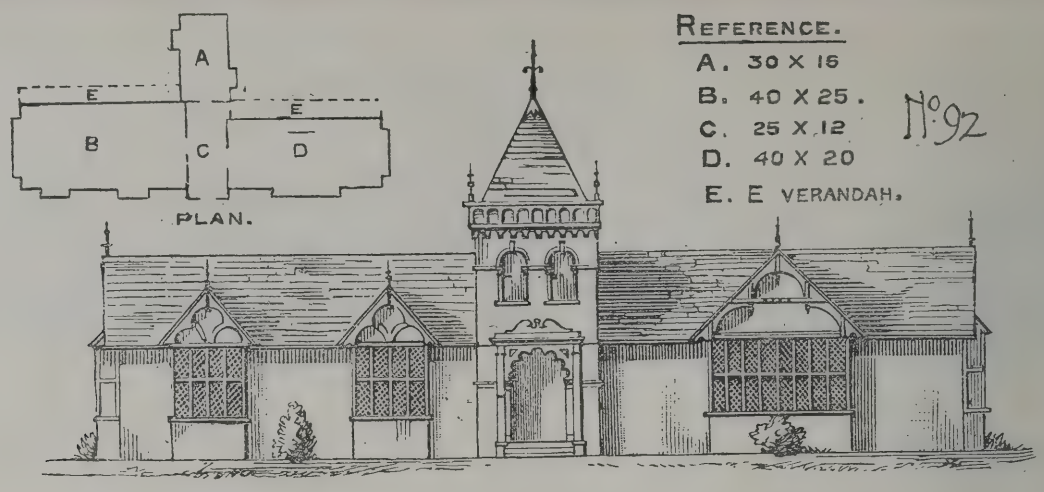
THE SIAM PAVILION

is a wooden construction, reproducing a moder Siamese building.

The façades of the "groupes divers" which abu on this side of the Avenue de Suffren, are som of them, interesting and characteristic; but I wi simply take one—the façade to the Greek sectio a small woodcut of which I give. The archite

is M. Lauffroy. The length is 115ft. by 39ft. high. On each side of the central entrance are two wings, and in the flat space between the base and cornice is painted on one side a view of the Acropolis at Athens, with the names of the most important towns in Ancient Greece (Athens, Corinth, Sparta, and Thebes); and on the other side of the entrance, of the manufacturing town of Lauvium, with the most important towns of Modern Greece painted above (Pireus, Syraceuse, Corfu, and Patras), thus connecting in an appropriate manner the contents of the Exposition.

THE MOROCCO VILLAGE



covers a space of 2,400sq.yds., with the Imperial Pavilion in the centre of the group. The different buildings composing this group are in the Moorish architecture of Spain, with their columns, pointed doorways, and horse-shoe arches. It is, of course, interesting as an example of this style.

THE RUE DU CAIRE,

running along up to the "Galerie des Machines," gives one an exceedingly good idea of an old Cairo street, with the one exception that it is not narrow enough. This is, however, a rather important item. A street of this kind gets half its picturesqueness from being narrow. Most of the doorways and projecting window-casements have been brought direct from Egypt, as also the lattice windows, which are such an important feature in Egyptian work; Monsieur le Baron Delort de Gleon, a French nobleman, being principally instrumental. In a great many respects, "La Rue du Caire" is more ancient in its size than are to be found at Cairo itself, from the fact that the greatest part of these get rebuilt in more modern styles, whereas this street in the Paris Exhibition is all ancient. The minaret, however, is not real, but is a copy of the minaret Kaid-bey. The ornamentation to the walls in the shape of plaques, crocodiles, &c., and old faïence decorations have been brought from Cairo. The *tout ensemble* is most effective, and is one of the most picturesque "installations" at the Exposition. Wending our way back to the Eiffel Tower, and commencing our inspection of the buildings on the east of that structure, and afterwards proceeding to the Avenue Bourdonnais, we can see at once that the structures on this side of the Champ de Mars are not nearly so instructive as on the other. The building of the Manufactures de l'Etat, by the Eiffel Tower, is a plain, ugly building of iron framing and brick filling. "Le Pavillon de la Société Eiffel" is composed of iron pilasters and brick-nog filling-in, and consists of one large room with a dome in the centre.

THE GAS PAVILION

was designed by M. Picq, architect also to the Chili Pavilion, and covers a space of about 510 square yards, and contains a basement, ground, and first floor. It will be seen from the engraving that it is Renaissance in style, and is constructed in pan-de-bois, or brick-nog walling, and faced with plaster. Above the first floor starts the glass dome at one of the angles of the building, and there is an open verandah over the other part. The building is erected by an association of gas manufacturers to enlighten the public on the value of gas as an illuminant properly applied, and as to the various uses to which it may be put for heating, warming, and cooking, and

also as a motive power. There is a retrospective exhibition in connection with gas on the ground floor. The gallery of gas-motors in the basement is fitted up with the best-known motors (including an Otto) in working order, raising the water to different stages of the house, and working the lift. This room is lighted by albocarbon lights. The kitchen is furnished completely with gas-kitchener, &c., and lighted by ventilated Wenham lamps. The Salle d'Exposition d'Appareils contains the different kinds of gas-lamps, hot-water heaters, and gas-heating apparatus. The ground and first floor are furnished in the same way with every speciality for a private house, the different rooms being fitted up for their respective uses—*e.g.*, a library, smoking-room, and reception-room. The first floor contains a salon, bedroom, bathrooms, workroom, billiard-room, and salle à manger. The whole is interesting as an endeavour to show how, with suitable surroundings, gas may be applied to almost anything with advantage.

THE BRITISH COMMISSION BUILDING

has been erected by Mr. T. C. Humphreys, of Knightsbridge, London, and is built of corrugated iron and thatch roofing. The diagram above shows the plan, &c. There is nothing to be remarked in its construction.

THE SOCIETY OF ARCHITECTS.

THE Council of the Society of Architects, in their annual report, just published, state that the past year has been one of steady progress. During the session three honorary members and forty-four members have been added to the society, while one other, who had previously been removed under Rule 36, was re-admitted. Four deaths have occurred, and there have been seventeen retirements from various causes, leaving a nett increase of twenty-seven, or more than double that of the previous session. The number on the rolls is now—Honorary members, 4; ordinary members, 396; associates, 10, making a total of 410; while the calendar for 1889 showed 2, 375, and 12 in the respective classes. Reference is made in the report to the excursion to South Wales held in August of last year. At the ordinary meetings of the society, held at St. James's Hall, Piccadilly, papers were read by the President (Mr. R. Walker) and Messrs. G. E. Terry, A. W. Rimington, A. Fisher, E. P. Allam, Albert Goodman, H. R. Gough, G. A. T. Middleton, C. E. Gritton, and E. Tidman. The finances are in a satisfactory condition, as a balance of £39 8s. 5d. can now be shown, instead of a deficit of £14 4s. 11d., which had to be declared last year. The report adds: "Several members have sought and obtained advice from the Council when difficult matters in connection with their practice have arisen. Communications of this character are always considered as confidential, and the Council are at all times willing to assist members in this way when it is in their power to do so. The Council greatly regret that the second reading of the Architects' Registration Bill has not yet been reached. Although they have no official connection with the Bill Committee, they yet are anxious that the Bill should speedily become law, and they would urge the members, individually, to use every effort in their power to bring about this most desirable end." The inaugural meeting for the next session will take place on Tuesday week, Nov. 11th, when an address will be delivered by Mr. Robert Walker, of Cork, the President.

THE TURNERS' COMPANY PRIZE COMPETITION.

THE annual exhibition of specimens of hand-turning, held by the Worshipful Company of Turners at the Mansion House, is scarcely so varied as on former occasions. The three sections of exhibits include pottery, glass, and metal, and we confine our notice to the two former as being the most important. In pottery, under Class A, for pottery thrown on the wheel in one piece without joints, the first prize, the Freedom of the Company and £5, is awarded to A. Bartlett, of Lambeth, for a pair of vases cleverly executed and of ordinary shape. William Askew, Upper Kennington-lane, obtains the second prize, bronze medal and £3, for a rather heavy vase, which for beauty of design and symmetry does not compare with the third-prize work. The judges have awarded a certificate of merit and £3 to James Newman, of Burslem, for a pair of vases, differing in design, but both of pleasing proportions and shape. The fourth prize (second certificate of merit and £2) awarded to Mr. G. T. Scott, of Burslem, is given to a vase of rather clumsy outline and ill-proportioned base and neck. Two other prizes are given for works of this class. In Class B the silver medal is awarded to Horace Trigg, Smallthorn, Staffordshire, for a pair of cleanly turned vases of the artist's own design. The shape of these vases can hardly be called elegant: the body is clumsy. The second prize (bronze medal and £3) is given to William Askew, of Kennington-lane, for a large vase with handle of uniform shape, the upper part of body below the neck being flat. The third prize (1st certificate of merit and £3) to "Alhambra" is of original shape, and is thrown and shaved by the competitor. A vase of lumpy outline takes the fourth prize; R. R. Kilgower, Cobridge, Staffordshire, is the art workman. Class C, in which pieces of turned or shaved pottery ornamented by the runner or other hand tool only, are exhibited, with the permission to introduce incised work and coloured and glazed ware, is not a numerous class. Rupert Steel, of Shelton, Hanley, receives the silver medal, the second prize (bronze medal and £3) being given to Mr. Watson, of Lambeth Pottery, for a pair of elegant fluted vases, one of Etruscan or Greek shape, with inlaid fret round the upper edge of body of vase; the other is a ewer shown for fluted handle and body, and also of elegant design. F. Hancock, Burslem, and H. Ford, of the same town, receive 3rd prizes. Two sage-green and white vases on pedestals, the body ornamented with horizontal grooves and dental enrichment in the two colours, takes the 5th prize. The apprentices' works include a few creditable performances. F. Watkin, Burslem, takes the 1st prize (£2) for a flower-pot and vase of nice shape; and Joseph Aldis, Vauxhall, the first prize in Class B for a vase of good outline. The base of the second prize vase is too small.

In classes B and C, the judges are satisfied with the progress made.

The stone specimens include a few clever examples of design and workmanship, and various substances of a mineral character, such as porphyry, granite, jasper, agate, serpentine, fluor spar, &c. The first prize (silver medal and freedom of the Company), is won by Alfred Job Greatorex, Matlock, for a fluor-spar tazza, a material harder than Blue John or serpentine, and containing iron pyrites, which had to be cut out of bowl with special tools. The spar is of rare quality. The second prize is won by Charles Stevens, Penzance, for a handsomely hand-turned tazza vase in Lizard serpentine. The design is novel and well proportioned, and the base composed of four dolphins, cut out of one piece. In all eight prizes have been awarded in this material. The judges speak in commendation of the merit and treatment of a very brittle material, and the graceful proportions of the fluor-spar vase, and the equality of two serpentine jars, and praise the tazza for the turning and the sharpness of the mouldings.

In the glass we may mention, more particularly in class C, the first prize, work of Edward J. Hillebauer, of Whitefriars-street, consisting of a claret-jug, engraved and de signed by the artist, a young workman; and the pair of decanters which take the second prize, the work of Adolph. Pallme, Farringdon-road.

SHADOWS.—VI.

WE will continue to study the system of shadows for curved surfaces. We have to find the shadow of the spherically headed niche, Fig. 21. Draw the horizontal line A X, and then divide the circumference of the head into a certain number of equal parts; say eight parts, A B C D E F, &c., marking off the corresponding points on the plan at *a b c d e*, &c. Next draw the shadow lines at 45° from each of these points in both plan and elevation. The projection of the points *a b c* in the plan, will give us in the elevation the points A B C, the shadows of A B C. These points A B C being below the centre line A X of the niche, will be the true shadows of A B C. But in the case of the points D E G, &c., the shadows obtained in this manner would not be correct, because instead of being thrown against a vertical plane, they are thrown against the curved surface of the head of the niche, this curved surface advancing in proportion to the amount of the rise of the curve.

In order to find the true shadows of these points, we have to use the following method: the shadow of the point F, if the curve of the vault did not advance in rising, would be at K. In order to find the true shadow of F we must shorten the shadow line in proportion to the distance which the curve of the vault advances. To do this—from the point K we draw the horizontal line K 1, and from the point 1 let fall the vertical 1 1. The distance X 1 is equal to the distance of the advancement of the curve of the vault at the height of the point K. On the plan mark off x 1 equal to the distance X 1, and with the centre e describe the curve 1 k, cutting the line $f f$ at the point k; by projecting this point to the elevation we obtain the true shadow point of F.

For the shadow of point E we proceed in the same manner. From the point M draw the horizontal M 2, and let fall the vertical 2 2. Mark off on the plan a distance x 2 equal to X 2,

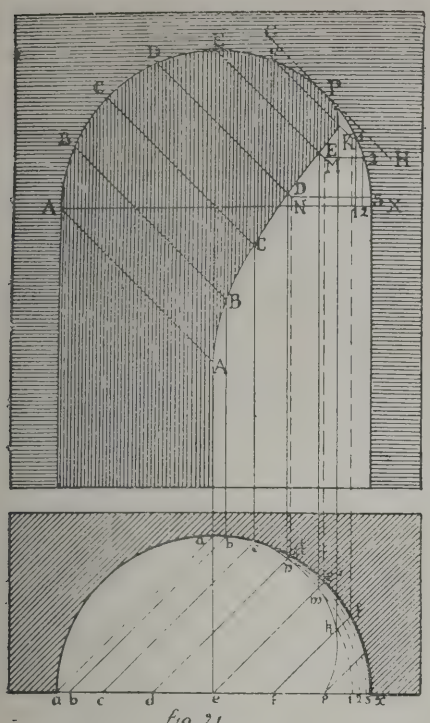


fig 21

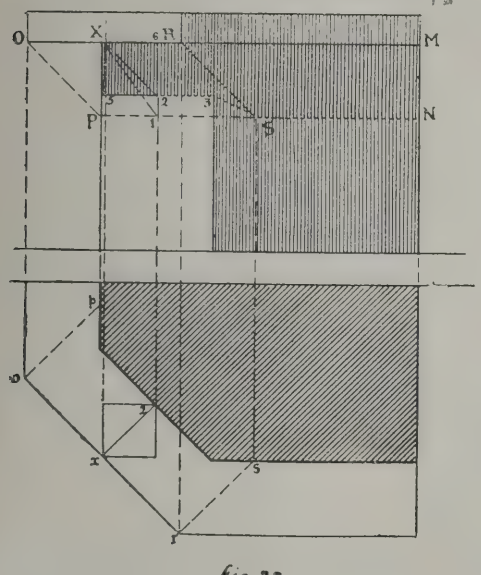

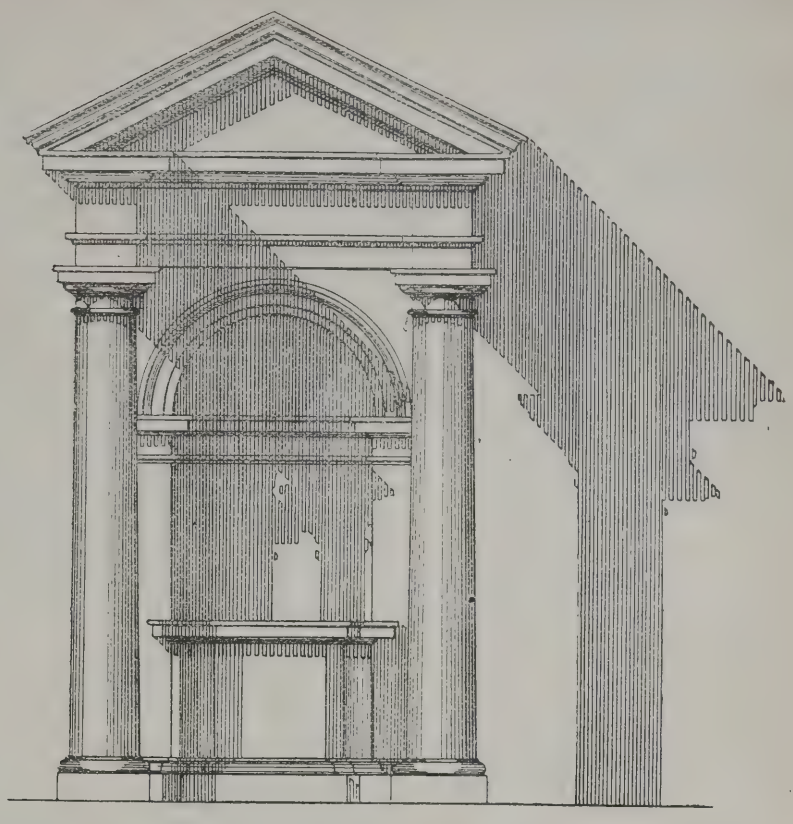

fig 22.

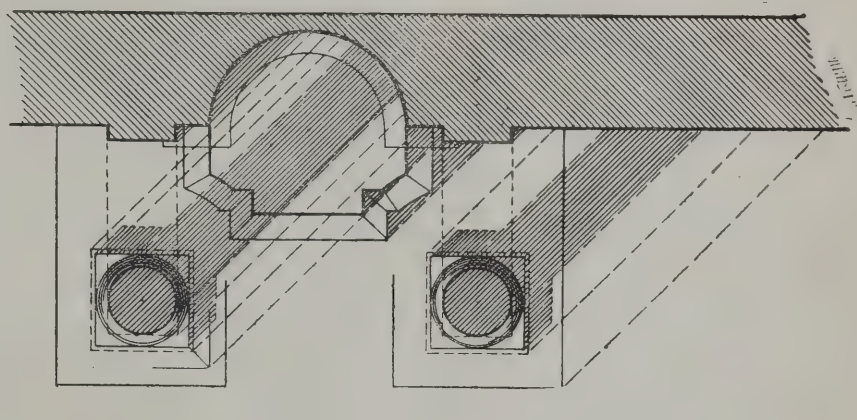

fig 23

and describe the curve 2 *m*, cutting the line *e e* at *m*; the projection of this point to the elevation will give us E—the true shadow of the point E. In the same manner we obtain the point D—the true shadow of D. The curve drawn through all these points A B C D E F P will be the shadow of the niche. The rays of light striking directly at the tangent point P, all the points P F E, &c., will cast a shadow, the points P X being in the light. The tangent point P is the commencement of the lighted portion, therefore the curve containing the shadow will start from point P. Of course the greater the number of points taken on the circumference of the niche, the greater will be the exactitude of the shadow obtained. This system of shadows applies to the interior of vaults, domes, &c. A little observation will at once make clear any deviation from the ordinary rules that may be necessary.

In Fig. 22 we have a block with one of its angles cut off at 45°, and crowned by a simple projecting cornice. We have to find the shadow thrown by the projecting cornice against the sides of the block, and more especially the shadow thrown by and against the plane at the angle. At first it would seem that the shadow should follow the straight line P S N, but this would be an error. The shadow of the portion R M of the cornice is, after what we have seen in preceding examples, easily found. The shadow line at 45° from the point O cuts the side of the block at P; draw the horizontal line P S N. The shadow line from point R meets P S N at S, the projection of *s* at S. S N is the shadow of R M. The shadow of the remaining portion O R of the cornice will be thrown partly on the angle plane, and partly on the front plane of the block.

We know that the rays of light are directly parallel to the diagonal of a cube—that is, at 45° to both the horizontal and vertical planes. Let us imagine a cube placed in the middle of the angle plane, as at *x* 2 on plan, and X 5 2 6 in elevation, the diagonal will be *x* 2 and X 2. We see, therefore, that the shadow of *x* X must follow the direction of *x* 2 and X 2; the point 2 will be the extremity of the shadow of X, and the horizontal 5 2 3 will represent the shadow of O R on the angle plane. X 1 could not be the shadow line of X, for the figure in the elevation would no longer be a cube, and X 1 would not be the diagonal of a cube, and therefore not at 45° to the horizontal and vertical planes. The line joining 3 S will be the remaining portion of the shadow of O R.

At Fig. 23 we have a niche and pedestal flanked by two columns supporting an entablature and pediment. The student would find it good practice to work out to a larger scale the shadows of the *ensemble*, carefully following the rules and variations given for the preceding examples.

ARTHUR VYE-PARMINTER.

Palais des Beaux Arts, Lille.

CHIPS.

The Tottenham School Board have instructed Mr. Charles Bell, architect, to prepare designs for the enlargement of the Stamford Hill Schools for 500 children.

A new U. P. church was opened at Chapelknowe, Gretna Green, on Thursday week. The new building is built of stone, accommodates over 200 persons, and has a lofty open roof. Mr. Geo. Dale Oliver, of Carlisle, is the architect.

The tower of Chesham Church, Bucks, has just been enriched by having a new set of Cambridge quarter-chimes fitted to the clock, and also a tune-playing carillon, fixed at the same time. John Smith and Sons, Midland Clock Works, Derby, were the makers.

On Saturday the chairman of the South Stockton local board laid the foundation-stone of new public buildings for that town. The site is close to the railway station, and on the site of an old Wesleyan Chapel. Mr. J. M. Garry, of West Hartlepool, is the architect of the building, and Mr. W. C. Atkinson, of Stockton, the builder.

Messrs. Shelley and Co., of 55, Lionel-street, Birmingham, have obtained a three years' contract from H.M. War Office for supplying and fixing their patent "Unique" glazing in the Royal Arsenal and Dockyard, Woolwich; Royal Gunpowder Factory and Buildings at Quinton Hill, Waltham Abbey; Royal Small Arms Factory, Enfield Lock; and any other Government establishment in England.

COLOGNE CATHEDRAL—DETAIL OF THE WESTERN SPIRES.

We gave a general view of this world-famed church in the Building News for Nov. 29th, 1889, together with a photograph of the finial, the last stone of which was laid by the late Emperor William of Germany on May 15th, 1880. We published with these illustrations a somewhat lengthy account of the building, so that to-day little remains to be said. The photograph given herewith represents the highly-elaborate detail of these really wonderful spires, enriched as they are with a perfect network of tracery rising out of a veritable forest of pinnacles, gables, and buttress finials. Their vast scale is emphasised by the figure of a man standing on one of the parapets, thus rendering the illustration for all practical purposes equal to a drawing to scale. The photograph is from one of a series for which the Photographic Society of Great Britain awarded their medal to Herr Anselm Schmitz, of Cologne.

SAUCHIEBURN, STIRLINGSHIRE, N.B.

This mansion is in course of erection on a fine site about four miles from Stirling, and, when completed, will be one of the largest in the country. The style adopted is a free treatment of Scottish Baronial. The chief external features are the keep tower, 90ft. high, crowned with a machicolated parapet with battlements and open bartizans, and a circular tower, 16½ft. in diam., which has a flat roof, and is surmounted with an open balustrade. The walls are lined internally with brick, an air-space being left between the outer stone wall and the brick lining. This arrangement renders the use of lath for plaster unnecessary, and will make the house impervious to rats or mice. The whole of the servants' offices, which are unusually large, are lined with Burmantofts glazed brick of different colours; the upper portion of the walls being white or ivory colour, with deeper toned dadoes and friezes. The house contains drawing-room, library, boudoir, dining-room, billiard-room, and smoking-room, along with a large number of bedrooms and dressing-rooms. There is also a commodious family suite, including, besides the ordinary accommodation, a modelling-room for Lady Maitland, a private secretary's room, a business-room, charter-room, and laboratory for Sir James. The drawing-room, library, and boudoir form an imposing suite of rooms, more than 70ft. long. The hall is two stories high, and there is also a picture gallery 50ft. long. The whole of the reception-rooms and many of the bedrooms have handsome beamed and panelled ceilings, and all the former rooms will be finished in hard woods. The stone used for the building is red sandstone, from Corncockle Quarry, Dumfriesshire. The accepted tenders amount to about £25,000. The contractors are Mr. John Souden, Edinburgh, mason-work; Messrs. J. and A. Main, Falkirk, carpenter-work; Mr. John Scott, St. Ninian's, Stirling, plumber-work; Mr. James Annan, Edinburgh, plaster-work; Messrs. W. Highet and Son, Ayr, slater-work. The clerk of works is Mr. James Hogg, and the architects Messrs. Sydney Mitchell and Wilson, 13, Young-street, Edinburgh. The plans have been carefully considered by Sir James Maitland, and the architects are carrying out his ideas and wishes. The result will be a singularly compact and comfortable house. It may be interesting to note that the house occupies the site of the Battlefield of Sauchieburn, and that the flagstaff erected on the spot where King Robert the Bruce stood during the Battle of Bannockburn is only a mile away, and in full view of the house. The park is one of the largest in Scotland, and contains much fine old timber; while the views from it are magnificent, including as they do Stirling Rock and Castle, the Abbey Craig, the Ochiel Hills, the Links o' Forth, and the mountains on the Highland Border.

TONGE HALL, MIDDLETON, LANCASHIRE.

Tonge Hall, near Middleton, county of Lancaster, according to county records, appears to have been built by one Christopher Tonge, born 1566, and died at Tonge Hall, 1601. His father was Richard, and his eldest son a Richard, the second son, Asheton. "R. T." appears on an old iron latch-plate on one of the barns, and in yellow stain in one of the leaded quarries of the windows, now upside down, and upon two lead spout-heads with a date 1703. In 1726 the house and the estate seem to have passed into other hands, and the date and the name of the man who became possessed of it are visible, scratched in one of the window panes. The two fronts illustrated show all that is left of interest. There are no indications now of what extent the house may have once been. There is no sign of any refined detail anywhere, story-posts and beams roughly shaped and chamfered with the adze form the finish. The filling-in to oak quatrefoil panels is but of plaster and reeds 3in. thick at the most. The most striking feature about the old house is the excessive repetition of the quatrefoil panel, and the prominence given to the oak pinning of the cusping to the framing. The pins have been left outstanding about an inch, and produce a curious effect as their shadows lengthen. As is so commonly the case with these houses in exposed situations, the south and west fronts have perished and been replaced in ordinary brickwork. The rest is in a most precarious condition, and has just been vacated by the tenant, for whom a new commonplace house is built. Possession of the old house has been acquired by Mr. William Asheton Tonge, who hopes, at least, to be able to save it from destruction. The house stands well on high ground in the midst of what was fine, rolling country, wood, and meadow. Now its fair lands are reduced to a few sour fields, farmed against heavy odds in the form of streams of black smoke drifting all day long from the factory chimneys in the immediate neighbourhood.

BUSINESS PREMISES AT ANTWERP FOR THE ANGLO-BELGIAN SUPPLY ASSOCIATION (LIMITED).

Our illustration shows a design prepared by Mr. H. Roumieu Gough, F.R.I.B.A., and his partner, Mr. P. M. Roberts, for co-operative stores to be erected on a commanding central corner site in Antwerp. The building will occupy an area of about 7,000ft., and will be carried out in red brickwork with granite basement, plinth, and pilasters, and Antwerp grey stone dressings. The floor will be of fireproof construction. The directors of the association, of which Lord Waterpark is chairman, believe that there is a good opening for the investment of English capital in this busy seaport and flourishing city, where at present nothing of the kind on any scale of importance has been attempted, although it is well known that many of the ships leaving the port of Antwerp are provisioned from London, and several of the inhabitants, both English and Belgian, are in the habit of sending orders to co-operative stores in London. The company contemplate opening branch establishments in other parts of Belgium. The design illustrated was lately submitted to the King of the Belgians by Mr. Gough, and it met with his Majesty's cordial approval.

SOME FRENCH SKETCHES.

(For description, see p. 603.)

ASHLEY HOUSE, SHAFTESBURY AVENUE.

This block of commercial buildings occupies a commanding site near New Oxford-street, and can be seen from a considerable distance in almost every direction. It stands next the French Protestant Church, and near Bloomsbury Chapel at the end of Shaftesbury Avenue. There are four floors devoted to residential flats, and the lower part is occupied by shops. The walls are of red brick, and the dressings are of stone, with granite pilasters below. The roofs are covered with slates. Mr. Charles Bell, F.R.I.B.A., acted as architect for Mr. Henry Bailey, who is the occupier of the site. Messrs. Atkins and Atkins are the agents.

SCHOOLS OF ART.

Royal Female School of Art.—The annual exhibition of drawings by students in this school of art has been held this week at 43, Queen-square. The National Gilchrist Scholarship of £50 for two years has been awarded to Miss R. C. Whiteside, of Sheffield. The competition for this scholarship consisted of eight sets of works sent from country schools only, and the award was made by Mr. E. J. Poynter, R.A. For the second year in the Gilchrist Scholarship competition the successful artist is Miss F. M. Hodges. In the life room Edith M. Ball has gained a national bronze medal and a national Queen's prize; and Queen's prizes have also been awarded to Edith Harwood, Sarah C. R. Horton, and Alice M. Langford. The national silver and bronze medals have been gained by Miss F. E. Giles and Miss H. E. Dunnell respectively for chalk drawings from the antique. Other national Queen's prizes have been allotted as follows:—Constance A. Coxeter, Helena M. Evans, Lucy Gee, Alice L. Lester, and Emily Weaver. The following is a list of students for whose work the various scholarships have been awarded:—Ida M. Kirkpatrick, Queen's Scholarship, value £60; Alice M. Langford, Clothworkers', value £30; Hariot E. Dunnell, Atkinson Scholarship, £25; Maud Keary, Brightwen Scholarship, £10; and Constance A. Coxeter, Katherine E. Cornish, and Edith M. Latzarus, each a subscribers' scholarship.

COMPETITION.

Camberwell Public Baths.—We are informed that (acting under the advice of their professional referee, Mr. Charles Barry, F.S.A.) the design of Messrs. Spalding and Cross, for public baths on the Camberwell-green site, has been selected by the Camberwell Baths Commissioners. The estimated cost of this building is about £24,000.

CHIPS.

At a general assembly of the Royal Society of British Artists, the following gentlemen were elected members of the Society:—John Fulwood, W. H. Llewellyn, J. A. Lomax, members; and E. Burne-Jones, A.R.A., and John Burr, honorary members.

The result of the soundings for the proposed Channel Bridge, which were taken by Messrs. Renaud and George Hersent in July and August, have been published in Paris. The route is found to be a little shorter than was expected and it is said to present every guarantee as regards solidity and stability. The depths are not quite so great as they were supposed to be. M. Renaud's examination has further shown that by going a little further north a perfectly straight route can be obtained with a better foundation and less depth of water. This route would be four kilomètres shorter, and would, therefore, considerably decrease the cost of construction.

The Government Institution hitherto known as the Normal School of Science and Royal School of Mines will in future be called the Royal College of Science, London.

Damage to the amount of £80,000 was done at Paris on Sunday by the destruction of the premises of the Wood Paving Company on the Quai Grenelle.

ARCHITECTURAL STUDIES IN FRANCE.

ASHLEY HOUSE, SHAFTESBURY AVENUE.—Mr. Charles Bell, F.R.I.B.A., *Architect.*

WAYSIDE NOTES.

EVERY well-meaning individual considers the subject of the housing of the working classes in much the same light as do the members of the London County Council, who, on Tuesday's meeting, spoke in favour of the adoption of the report of the Housing of the Working Classes Committee; but it is not everyone who will think that the proposals made in this report are above criticism. Far be it from me to throw cold water upon the scheme. After much trouble and discussion in past meetings of the Council, after much essay-writing and much public speaking, and after Parliamentary labours, the councillors have at last been able to turn their attention to the practical aspect of the question. The committee appointed for the special purpose have come forward with tangible projects, and a definite plan in view. Ill-conceived, therefore, would be any mere carpings. These I have no wish to make; though, at the same time, and while viewing with satisfaction the business-like manner in which the Council have commenced the discussions of the proposals of their Committee, it is evident, from the remarks of criticising members, that these proposals do not give anything like complete satisfaction. The cause of this, however, seems to be rather that the committee have not sufficiently disclosed their intentions to the council in general. Broad outlines have been given, instead of a complete and finished picture; consequently, councillors have filled up the voids from their imaginings, and expressed dissatisfaction with the result. Such, at least, appears to me to be the most natural explanation of much of the adverse criticism evidenced at Tuesday's meeting.

That there should be some criticism of a scheme that will be a mere introduction to future operations on an even more extensive scale, is by no means an unwholesome sign. The first operations of the Council in the poor-housing problem—its first essay to more humanely shelter the working classes—will naturally form a precedent for subsequent undertakings in the same direction. It is of importance, then, that no ill-advised principle be adopted at the outset. If there is any danger of this in the present case, it is referable to an indication on the part of the Housing of the Working Classes Committee to think lightly of the neglect and apathy shown in matters of this kind by local authorities, and to at once assume the rôle of the "willing horse." This is all very well in its way, and the motives prompting to such a spirit may be most honourable and commendable where private affairs are concerned. In public matters, however, it must be remembered that not to enforce observance of by-laws and regulations that will assist in effecting desired reforms, and to at once fall back on one's own resources, is to handle lightly the funds provided by the ratepayer. So far as I can make out from the report of the Council's meeting, and the remarks of speakers, a charge of this nature could be made if the policy proposed be pursued without some modification. If such be the case, one can hardly imagine the London ratepayer looking upon the doings of the Council with a favourable eye.

Whatever may be the first concrete accomplishment of the Council, whatever its nature and scope, and wheresoever it be located, it seems, to my way of thinking, of the utmost importance that no stone be left unturned, *as a prelude to this*, to compel local authorities and others, under old, new, or consolidated Acts, to carry out, to the very letter, every improvement for the benefit and welfare of the poor that may be their duty. Unless a step of this nature be taken by the Council the public will declaim against them, and not without reason, nor necessarily because folk are blind to the need of reforms. To neglect this compulsion of negligent authorities and others, will be not only to ill economise public funds, but to encourage further ignoring of by-laws and regulations. First, then, let the Committee for the Housing of the Working Classes assure the Council and the public that a rigorous enforcement of the law will be commenced and carried through to the bitter end; afterwards the schemes for the reconstruction of districts and the erection of new and extensive blocks may be brought forward. They will then be favourably received by most persons, and the Council will only have been acting in conformity with a common principle that teaches us to bring all possible forces and influences to bear on the accomplishment of any desired end.

No objections have been raised to the main principles guiding the proposals of the Committee, so far, at least, as regards those evidencing a desire to provide better accommodation. The objections refer to the scant information vouchsafed to members as to the £300,000 scheme for Bethnal Green, and to the possible neglect of powers to compel the action of local authorities, both of which are mentioned above. Remove, in a complete and thorough manner, these obstacles to faith on the part alike of councillors and public, and the good work will proceed. Even taking the Bethnal Green project, we can judge from the descriptions of the present miserable condition of the particular district concerned, how great would be the improvement—moral, social, and physical—were some reconstruction such as that proposed by the Committee carried through. If this, or some other like scheme, be successful, others will be taken up readily. If a failure, an obstacle to the solution of this pressing social question will be thrown in the way. Humanity would suffer for the blunder. How great, then, the need for caution, and how sincere should be the present desire to make the first essay in the right path.

On the 3rd (Monday) is Mr. Waterhouse's presidential address at the Institute. The event will be anticipated with much pleasure by that portion of the architectural world privileged to attend. Many are speculating as to the subject-matter of the address. A friend says he will not be surprised if it be touching the improvement of the metropolis. All I can say is, that it is sure to be as usual — genial, apropos, and prospective.

On the 11th day of November, in this year of biennial presidents, Mr. Robert Walker, of Cork, will address the members of the Society of Architects. I am no more inspired as to the nature of the discourse to be delivered in the St. James's Hall than I am as to that at "No. 9"; but this I do know — that Mr. Walker "holds" an audience as well as any president of any architectural society, past or present, and that if anything is likely to be neglected in the address it will not be the subject of the higher education of architects. I look forward with great pleasure to the 11th, and anticipate allusions to education, examination, and registration, lightened by all that is pleasant and topical, and viewed with warm-hearted Irish humour.

Mr. Leonard Stokes has discharged his duty to the Association, and very charmingly and ably, too, as I only expected. The A.A. may be now considered to be in full swing again, and after the 11th, the new session of Institute, Association, and Society, will mark the close of one more architectural big-gooseberry season. Is the A.A. going to emerge at the close of this session in its new garb? Mr. Stokes and his colleagues are certainly making headway, and I see much that indicates the truth of what I said last session, that the objections raised to the reformation scheme were born, not of principle, but of a dislike to see a drastic measure rushed through at quite the fag-end of a term. For my own part, I seem already to see the accomplishment, for weal or woe, of the feat of reconstitution. I doubt whether the lines ultimately adopted will bear much resemblance to those already laid down; but what will it matter that the letters are unlike so long as the spirit of the reform remains constant? In itself this latter is excellent, and as such I again wish it may pervade all well-intentioned members of the Association. Referring to a portion of the presidential address, it seems a pity that such things should be; but the fact remains that Mr. Stokes will win —I won't say *hearts*, but *converts* – should any remain unconverted—by an appeal to, or rather a considerate regard for, members' pockets. If the scheme can be carried out by merely raising the subscription of members that are to be, by all means let ours remain at ten-and-six; but if the reform is to be made at all, and if, to its complete realisation, an all-round raising of subscriptions is necessary, would it not be a pity to spoil the ship for a ha'porth of tar, so to speak? There may be considerable opposition, as in days past, to the proposal to double the amount of subscription, and I have no personal wish to pay a guinea where one half the sum will suffice; but this I do say—that, half-measures being futile, the education committee, if going forward, must do so boldly, and, in some senses, relentlessly: they must have a jolly good try for the guinea.

The New Grand Junction Railway, of which we have heard from time to time, now seems likely to became an accomplished fact. In the *Times* of the 29th, those interested in this project will find a full and complete account of the proposed new trunk line to the North, which, with the assistance of a railway map of England, should give a very clear idea of the scheme. Where's it going to end? is naturally one's first curious inquiry, and, according to the writer of the article, the terminus of the N. G. T. Ry. will be somewhere close to Lord's cricket ground. Within the next two or three weeks Parliamentary notices will be lodged for nearly 100 miles of new trunk line and for the new London terminus. When complete, one of the oldest of railway companies, erstwhile known as the Manchester, Sheffield, and Lincolnshire Railway, will be able to drop its old title in favour of the new and more improving designation, while travellers to the North will have yet another route over and above those already offered.

GOTH.

CHIPS.

A large clock has just been erected in the parish church of Ilsington, South Devon. It is fitted with all the latest improvements. It shows time on three dials, each 6ft. across. Messrs. John Smith and Sons, Midland Clock Works, Derby, have carried out the work.

Mr. Charles Bell, F.R.I.B.A., was the architect for the wings to the Printers' Almshouses in 1870, and also for the completion of them this year, a rather rare thing for the same architect to be retained after an interval of 20 years. The builder is Mr. Mills, of Blackfriars. Mr. Chas. Bell is now restoring the old school at Steeple Bempstead, Essex, erected in 1590, every feature being retained, and all the materials, which are sound. The bricks are 2in., purpose-made. The contractor is Mr. Humphreys, of the same place.

The important improvements to Weymouth Harbour have now been completed. An amount of about £40,000 has been expended, under the directions of Mr. W. Barlow-Morgan, A.M.I.C.E., and the result is said to be most satisfactory as regards the G.W.R. Channel service. The contract was taken by Mr. H. I. Sanders, of Southampton, some years since. The work throughout has been attended with very great difficulty, in consequence of the shingly nature of the soil.

Mr. George Siddall, senior draughtsman in the railway works at Crewe, met his death one day last week by being knocked down and run over as he was crossing the line. Mr. Siddall was well known in Rotherham, where he served his articles with the late Mr. Blackmore, architect, at the same time as did Mr. R. J. Mitchell-Withers.

On Saturday Sir John Stirling-Maxwell of Pollok formally opened the Maxwell Park and laid the memorial stone of the new Burgh Buildings in Pollokshields. The park, which is the gift of Sir John Stirling-Maxwell, and is situated in Glencairn Drive, extends to twenty acres, and has been laid out by the commissioners.

The memorial window presented by Mr. R. B. M. Lingard-Monk, of Fulshaw Hall, Wilmslow, to the series of stained-glass windows which have been promised for the clerestory in the nave of Manchester Cathedral, was completed on Saturday. This is the third stained-glass window in the north clerestory, and contains five panels, representing Aaron as High Priest offering sacrifice; the remaining three windows, which are now plain, have been promised, and will be proceeded with in due course.

The Master Cutler laid on Friday the corner stone for the new rooms which are being built in connection with Petre-street Primitive Methodist Sunday Schools, Sheffield. The cost of the extension will be £450. Mr. C. J. Innocent is the architect, and the work is being carried out by Messrs. Longden and Sons, all of Sheffield.

A Jubilee memorial to Daguerre, the inventor of photography, has been placed on the wall of the National Museum at Washington. The design, by J. Scott Hartley, of New York, consists of a granite base and globe, together standing 16ft. high, with a female figure in bronze of heroic size, represented as placing a wreath on a medallion bust of Daguerre.

A new organ (built by Messrs. Abbott and Smith, of Leeds) has been presented to the parish church, Epworth. New choir stalls have also been placed in the chancel.

"BUILDING NEWS" DESIGNING CLUB.

AWARD OF PRIZES 1889-90.

THE following are the results of the BUILDING NEWS Designing Club Competitions for the past session based upon the synopsis of the several contests given below:—

1st prize of £10 10s., "Wallaby" (Mr. R. S. Dods, 11, Grange-terrace, Edinburgh).

2nd prize of £5 5s., "Fiddler" (Mr. Lancelot Fedden, 19, Avonmore-road, West Kensington, W.)

3rd prize of £3 3s., "North Star" (Mr. T. H. Dean, 4, Grosvenor-square, Brooklands, near Manchester).

Hon. mention, "Red Rover" (Mr. T. A. Cook Parkbery, Talbot-road, Axton, Birkenhead, Liverpool).

The following members are commended for their work:—"Skull and Cross Bones" (Mr. C. E. Hutchinson, Sunderland), and "Tyne" (Mr. H. C. Creighton, Newcastle-on-Tyne).

ANALYSIS OF SUBJECTS.

A.—A Doctor's House.—1, "Red Rover"; 2, "Myth"; 3, "North Star."

B.—A Study Chimneypiece.—1, "Wallaby"; 2, "Coaly Tyne."

C.—A Cemetery Chapel.—1, "Fiddler"; 2, "Red Rover"; 3, "Tyne."

D.—A Stable.—1, "Fiddler"; 2, "Skull and Crossbones"; 3, "North Star."

E.—A Cabmen's Shelter.—1, "North Star"; 2, "Wallaby"; 3, "Tyne."

F.—Row of Cottages.—1, "Fiddler"; 2, "Skull and Crossbones"; 3, "North Star."

G.—A Village Bank.—1, "Wallaby"; 2, "North Star"; 3, "Fiddler."

H.—A Village Parish Hall.—1, "Wallaby"; 2, "Red Rover"; 3, "Fiddler."

There is thus an exceedingly close contest between "Wallaby" and "Fiddler."

The following are the rules and conditions of competition for 1890-91, commencing from the present time:—

1. Drawings to be sent in 28 days after the publication of the list of subjects.

2. Usually two subjects will be given every month, from which a competitor may choose.

3. The drawings to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 22in. by 14in., with no washes or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts to be shown in ruled "hatching" or blocked in. The scale to be used will be given with each subject.

4. Drawings to be forwarded unmounted, by post, care being taken to roll the short way of the drawing, as packages over 18in. long are not transmissible through the post.

5. On entering the class (which may be done at any time), each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing, as a guarantee of good faith, the *nom de plume* the author intends to adopt being boldly marked on the front of each separate drawing.

6. Prizes of £10 10s., £5 5s., and £3 3s. will be awarded to the best series of designs, such series not to consist of less than six subjects. Our decision to be final.

7. Before awarding the prizes any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.

8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.

9. A critical notice of the designs sent in of each series will be given in an early issue following the receipt of the drawings.

FIRST LIST OF SUBJECTS.

A.—*A Small School of Art for a Village*, comprising at least four class-rooms or studios, one to be suited for life studies, and to have a small dressing-room for model attached. A master's room to be provided, and a small office. Studios 15ft. high. Site in a village street on frontage line to measure 75ft. in width and 30ft. deep; no entrance from rear. Front of site faces north. Style left to competitor. Scale, 8ft. to the inch. Sufficient elevations and plans to illustrate design, with small perspective sketch.

CONTEMPORARY BRITISH SURVEYORS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

WE commence to-day a brief series of portraits which constitutes a slight departure from those already given. It will embrace some of the leading building surveyors who have been engaged on some of the chief works of the day. This series, naturally among architectural surveyors, commences with Mr. Thomas Miller Rickman, F.S.A., son of Thomas Rickman, F.S.A., author of "An Attempt to Discriminate the Styles of English Architecture." He was educated at King Edward's School and the Proprietary School, Birmingham, and articled to R. C. Hussey, F.S.A., in 1843 at Birmingham. He came with him to London in 1849, and remained some years as his managing clerk, devoting much of his time to the study of English architecture. In 1854 he became Associate of the R.I.B.A., and was then President of the Architectural Association. From about 1854 to 1860 Mr. Rickman contributed to the BUILDING NEWS. In 1856-7 he entered into practice at Stoke-upon-Trent in partnership with Mr. C. Lynam, and in 1858 commenced practice in London as an architect and surveyor; this practice soon drifted into that of a measuring surveyor. In 1860 he passed the Institute examination for the office of district surveyor, and, in 1865 was elected Fellow of the Society of Antiquarians. From 1870 to 1875 he was a representative of the Architectural Association on the Architectural Alliance, to which he was latterly the acting secretary. In 1871 Mr. Rickman became Associate of the Institution of Civil Engineers, and in 1873 was elected as "Conseiller Honoraire de la Société des Architectes du Departement du Nord." In 1873 he became Fellow of the Surveyors' Institution, in whose examinations he has assisted since their establishment in 1882, and he has sat on the Council since 1885. In 1886 Mr. Rickman was elected member of the Practice Standing Committee of the R.I.B.A., of which he has continued one of the hon. secs. He has also sat during the last session as member of the Council of the Institute, being one of the first Associates returned on that body. The portrait of Mr. Rickman is from the studio of Mr. Bassano, of Bond-street, W.

Mr. Elias Pitts Squarey, the President of the Surveyors' Institution, was born at Salisbury in the year 1823. He became the pupil of Mr. James Rawlence, F.S.I., then of Heale Farm, near Salisbury (now of Bulbridge, Wilton), his present partner, under whom he studied agriculture and surveying. At the age of eighteen he commenced farming on his own account, on some 500 to 600 acres, at Teffont, in Wiltshire, and after a few years he entered, in 1848, upon the occupation and management of a farm of 1,200 acres at Odstock, under the Earl of Radnor. His opinion and advice upon affairs of estate management soon began to be largely taken, and the occasions upon which the assistance of both himself and Mr. Rawlence were sought, in connection with valuations and other matters belonging to the profession of the land-agent and surveyor, became frequent, when Mr. Rawlence took his former pupil into partnership; and, as a result, the firm of Rawlence and Squarey was established at Salisbury in 1852. Their business grew rapidly, and in 1860 they opened their offices in Westminster. The principal business of the firm continues to be carried forward at the offices in Salisbury. But an opportunity for special usefulness for the London office soon arose in the creation, under special statutory powers, of the Land Loan and Enfranchisement Company. The purposes and position of the company are too well known to require any description in this place, and Mr. Squarey was one of the original directors. Amongst the positions which Mr. Squarey fills, it may also be mentioned that he has for many years been a director of the Wilts and Dorset Banking Company, and that he is one of Lord Wantage's active supporters on the Board of the Small Farm and Labourers' Land Company. He has frequently been called upon to give evidence before Royal Commissions and Committees of both Houses of Parliament. He has been appointed upon the Examining Boards of the Agricultural Colleges of Cirencester and Downton, and he is a member of the Surveyors' Club. When the movement began amongst surveyors for the establishment of the Surveyors' Institution, Mr. Squarey was one of those who founded the Institution. He was elected vice-president in 1880. He succeeded Mr. Beadel in the presidential chair. Mr. Squarey's contributions to the literature of his profession, and to agricultural literature in general, have not been inconsiderable. In addition to many contributions to the *Transactions* of the Surveyors' Institution, his pen has been in frequent requisition for the pages of the R.A.S.E. *Journal* and the *Journal* of the Bath and West of England Society. For the issue of the Royal Society's *Journal*, which was made in connection with the Paris Exhibition of 1878, Mr. Squarey was one of those invited to contribute articles. Mr. Squarey lives at "The Moot," at Downton, near Salisbury. The place is one of the most interesting in the country. At "The Moot" are to be seen, almost intact, the remains of an ancient amphitheatre, over which learned societies have debated until out of their discussion has grown the general opinion that it was a meeting-place of the old Saxon Witenagemote, of which our present Parliament is the lineal descendant, and learned societies have agreed upon the ancient uses of the place. Mr. Squarey's portrait is produced from a photograph by Mr. J. Owen, of Salisbury.

Mr. Henry Arthur Hunt, of the firm of Hunt and Steward, of Parliament-street, is a son of the late Sir Henry Arthur Hunt, C.B., the eminent surveyor, whose death we recorded in our pages last year. Mr. Hunt was born in the year 1836, and educated at Westminster School, which he left at an early age to enter the workshops of the late Mr. Thos. Cubitt, the celebrated builder, in order to learn the practical part of his intended profession. He afterwards was with Mr. Philip Hardwick, the architect, and subsequently in his father's office. Since 1859 he has been in practice with his partner, Mr. Herbert Steward. Mr. Hunt is surveyor to the Earl Cadogan, an appointment he has held for many years. He is also surveyor to the trustees of the Paddington estate, the Corporation of the Sons of the Clergy, the Dean and Chapter of Westminster, and the Royal Commissioners for the Exhibition of 1851. Mr. Hunt is chairman of the Westminster Improvement Commission, a position to which he was appointed by the First Commissioner of Works. Mr. Hunt takes an active interest in education. He is deputy chairman of the United Westminster Schools, having been a trustee since their institution under the Endowed Schools Act, and has been on the house committee of the Masonic Institution for Girls for some years. Mr. Hunt is a trustee and one of the founders with Mr. Herbert Praed, the Hon. Philip Stanhope, M.P., and Mr. Hodgson-Pratt, of the Grosvenor Club for Workmen, in Pimlico, one of the most successful institutions of the kind in London, numbering 700 or 800 members. He is an original member of the Surveyors' Institution, and an associate member of the Institution of Civil Engineers.

Mr. Herbert Thomas Steward was born in the year 1838, and was also educated at Westminster School. He was a pupil of the late Sir Henry Arthur Hunt for some seven years. Mr. Steward is an original member of the Surveyors' Institution, and is Surveyor to the Governing Body of Charterhouse School. The firm has carried on a large and various practice as surveyors during the last 30 years, and have been architects for many buildings in London and the country. They have been concerned in the estimates for many large building contracts—notably the Royal Courts of Justice, the Natural History Museum, South Kensington; the Home and Colonial Offices, Whitehall; the General Post Office West, St. Martin's-le-Grand; the northern extension of the Post Office in St. Martin's-le-Grand, the Houses of Parliament for the Cape of Good Hope, the Exhibition building of the year 1862, the Whitehall and St. Stephen's clubs, the National Safe Deposit Co. buildings, Queen Victoria-street; the National Provincial and Messrs. Childs' banks, the Society for Promoting Christian Knowledge buildings in Northumberland-avenue, and many other public and private buildings. They were extensively employed by various contractors in many of the fortifications that were erected under the Fortifications Acts in the Thames and the Medway, the Isle of Wight, Portsmouth, and Plymouth. Many large contracts in various parts of England for docks, railways, water, and gas works, and other engineering matters, have passed through their hands; and they have been extensively engaged for the South-Western and other railway companies. Mr. Hunt's portrait was taken by Messrs. Lock and Whitfield, of Regent-street;

and Mr. Steward's photograph is by Messrs. Elliott and Fry, of Baker-street, W.

Mr. Frederick Grainger Widnell, of the firm of Widnell and Trollope, was born in London in 1829. He was articled in 1844 to Mr. W. J. Gardiner, who was then in the office of Mr. Philip Hardwick, the architect, where Mr. Widnell served a portion of his pupilage. In 1851 Mr. Widnell was employed in measuring at the New Palace of Westminster, under Sir Charles Barry, on the termination of Messrs. Grissell and Peto's contract, and a year later, in conjunction with Mr. Trollope, established the well-known firm in which he is partner, their first business being the measurement of the further works at the New Palace of Westminster, undertaken by Mr. John Jay. During the Crimean War the firm was largely employed on the estimates and measurements of the important buildings erected at Woolwich Arsenal. From 1854 to 1880 Mr. Widnell's firm had in their hands the measurements for the several builders of the works in London under the Commissioners of Works and Public Buildings. From 1858 to 1866 the firm was extensively engaged upon the works carried out under Lord Palmerston's Fortification Loan at Dover, Portsmouth, Plymouth, and Milford Haven. In 1867 Mr. Widnell's partner (Mr. Trollope) became surveyor to Haileybury College. In 1873 Mr. Widnell was appointed surveyor to the Admiralty, and in this capacity has measured the various works (buildings, docks, and caissons) at Keyham, Devonport, Chatham, and Portsmouth, the "extension works" at the latter dockyard costing over 1¾ million of money. The firm have also got out the quantities for several of the most important lunatic asylums in the kingdom, and, in conjunction with Messrs. Hunt and Steward, prepared the quantities for the Royal Courts of Justice, undoubtedly the largest building in this country ever made the subject of one contract. Mr. Widnell, as representing the builders, measured the fitting up of St. Paul's Cathedral on the occasion of the Thanksgiving Service in 1872, and of Westminster Abbey for the Jubilee celebration in 1887. Few surveyors in this branch of practice have had a larger or more varied experience than Mr. Widnell, and no one is more justly honoured and esteemed by his professional brethren. Mr. Widnell is a Fellow of the Surveyors' Institute, and has on more than one occasion been specially associated with the Council of that body in deliberating on important matters of practice. The portrait given was produced by Mr. S. A. Walker, of Regent-street, W.

Mr. James Gandy, F.S.I., has had an extensive practice as an architectural surveyor, having, under the late George Edmund Street, R.A., been engaged in most parts of the United Kingdom on his numerous works, including the Royal Courts of Justice since the superstructure of that building was commenced. More recently he has been employed under Mr. Thos. E. Collcutt, the architect for the Imperial Institute of the United Kingdom, the Colonies, and India; also on several others of that gentleman's important works. Mr. Gandy has also, at various times, represented Mr. J. J. Stevenson, and other eminent architects, and has of late been engaged as umpire and otherwise on various arbitration matters connected with the building trade. Mr. T. Fall, of Baker-street, photographed Mr. Gandy for our series.

"KING JOHN'S PALACE."

A VERY large number of members of the Hampshire Field Club visited, on Thursday, October 23, the Norman house at the bottom of Blue Anchor-lane, Southampton, which has just been restored for Mr. W. F. G. Spranger, under the direction of Mr. T. K. Dymond. The *Hampshire Independent*, in reporting the proceedings, says that special interest attaches to this almost unique example of Norman Domestic architecture, which has of late been occupied as a coal-yard and stable. Under the supervision of Mr. Dymond, aided by Mr. E. Cooper Poole, architect, windows which had long been blocked up with stone were made once more to let in light, damaged portions were repaired, whilst inside the whitewash was cleaned off the beams of the roof and walls. The round-headed Norman doorway in Blue Anchor-lane has also been opened. There are three 2-light windows, with central shaft, from the carved capital of which spring the small semicircular arches. Inside, the windows open into very deep arched recesses, the rear arches of which possess a fine Norman moulding, fortunately preserved in the two windows facing the quay. A similar two-light window facing the lane probably lighted a short corridor which communicated between the great hall (now open to the sky) and the withdrawing room; the inner arch of this window is not moulded like the others. In removing the stones with which the windows were blocked up some of the ancient supports of the casements were found, and these have been utilised in the windows now put in, which are glazed in diamond pattern. The basement under the great hall was lighted by a beautiful little window, which was built up, but has now been opened. The roof of this interesting building, which is of chestnut, was pronounced by Mr. Dymond and other antiquaries to be the original roof, but some of the party were of opinion that it is of a later age. The walls are now covered with canvas, on which are suspended some copies of the famous Bayeux tapestry. There is not, as Mr. T. W. Shore said, another place in England where one can see so good a specimen of Norman Domestic building. It dates from the time of Henry I., and, though the tradition that it was King John's Palace is of modern origin, Mr. Shore thought it was borne out by history, and he quoted some documents in support of this. Thus in 1207 King John ordered the royal hall in Southampton to be repaired by the bailiffs of the town. And from the Itinerary of King John we learn that he visited Southampton on many different occasions. From the "Close Rolls of Henry III.," it appeared that Henry in 1222 addressed the bailiffs of Southampton, and ordered them "to repair our quay at Southampton, and to take care that our quay *in front of our house* suffers no harm." In 1224 the same bailiffs were ordered to repair the doors in other parts of the palace. It seemed to have remained a palace till in 1338 the French burnt and looted Southampton. After that date it was converted into a defensive place by the piers and arches outside, some of which come across the double Norman windows mentioned above.

THE SANITARY CONDITION OF LONDON BOARD SCHOOLS.

THE Works Committee of the London School Board presented a report to that body yesterday (Thursday) dealing with the sanitary condition of various schools in different districts, and the reports of the Finance Committee show that the necessary cost of placing these buildings in a sanitary condition will entail expenditure for which no estimate has been made during the current year. The first school dealt with is the Byron and Bright-street School, Bromley-by-Bow. This school was not built by the Board but is a "permanent transferred" school, the Board, therefore, not being responsible for the drainage, which, the architect (Mr. T. J. Bailey) reports, has frequently been troublesome. To divert the drains from running under the class-rooms, and to place the sanitation of the school in a satisfactory condition, would cost from £800 to £1,000. The large school in Bellenden-road, Peckham, is about ten years old. There were reports in the early part of the year that cases of diphtheria had occurred among the infants and girls. The report of the architect was to the effect that there was no ventilation to the drains, closets, or waste-pipes, and, so far as he could ascertain, the drains were not disconnected with the sewer; consequently the whole were charged with sewer gas. To remedy the evils he considered were existing would cost from £300 to £500. The Board did not adopt the report at the time, and the managers then pressed that the work should be carried out. Then the Board's medical officer was requested to examine and report on the school. Dr. W. R. Smith pointed out that the present sanitary arrangements are liable to injure the health of those attending the school, and he made recommendations that steps should be taken without delay to remedy the defects, and also to remove the teachers' offices to outside the school buildings. The committee, in recommending that the works shall be carried out, state that they could be planned with a view to additions which it is proposed to make to the school. The next report relates to Monteith-road School, Old Ford, the main drain of which, the assistant architect reported, it would be advisable to relay. The cost of this work would be £200. The Queen's Head-street School, Essex-road, Islington, was reported by the assistant architect to require the drainage for the girls' and infants' departments to be relaid, and the committee have recommended the work to be done. In respect to some of the defects in the schools of the Board, proceedings have been commenced against some of the builders. One builder has engaged, on condition that the action shall be stayed, to make good work to the extent of nearly £400 and to pay the Board's taxed costs of a reference, including the fees of witnesses, as well as to waive costs in an action which was stayed. In another case the builder has counterclaimed for libel.

THE LATE MR. R. A. LEDWARD.

WE regret to announce the death of that promising young sculptor, Mr. R. A. Ledward, who died on Tuesday morning last, at the early age of thirty-three. He was greatly respected by all his brother artists for his gentle and true artistic nature, and his loss will be deeply felt by all who knew him.

Mr. Ledward was born in Burslem, Staffordshire, in 1857, his early life being spent in the Potteries. In 1879 he gained a National Scholarship, and came to London, entering the schools at South Kensington. During his three years' studentship he gained, among many other awards, a gold medal for modelling; he was afterwards appointed a master of modelling in the schools. At the time of his death he was the modelling master at the Westminster and Blackheath Schools of Art. For the last eight years he has exhibited at the Royal Academy and other exhibitions. Among his ten known works may be mentioned "A Young Mother," which, for its tenderness of feeling and strong modelling, was undoubtedly one of the best works of the year. This work alone makes his early death a great loss to the art world. He also executed many excellent busts, among others that of Sir Philip Cunliffe Owen, Mr. W. Woodall, M.P., Mr. Broadhurst, M.P., and Mr. Daniel Grant, M.P. For the information of his numerous friends, we announce that the funeral will take place to-day (Friday) at Perrivale Church, near Ealing, at 12 o'clock.

BOOKS RECEIVED.

Outlines of Compensation Law, by WILLIAM ARCHBUTT POCOCK, of the Middle Temple, Barrister-at-Law, &c. (London: Frank P. Wilson, *Estates Gazette* Office), embodies in a popular and concise form the law of compensation as it is laid down under the Land Clauses Consolidation Act, 1845. Mr. Pocock explains the chief clauses of the act, and endeavours, by citing various cases, to show the principles upon which the making and resisting of claims are founded. Surveyors, engineers, and sometimes architects, are called upon to advise in cases of this sort, and it is very necessary for them to know the main features of the Act in question, and the decisions that have been made under it. The "Notice to Treat" required by sect. 18 is clearly laid down. The party served with such a notice ought to endeavour to come to an arrangement with the promoters. For this end particulars are required to be furnished them to enable them to ascertain the true value of lands, and offer a proper compensation. The notice to treat may not be followed by an agreement between the parties. It is not a contract; but it creates a relation between the company and the owners analogous to that of vendor and purchaser, the price not, however, being determined. When the price is settled, the transaction together becomes a contract, and can be enforced by an action for specific performance. All parties interested, every lessee and sub-lessee, is entitled to represent his own interest. Should negotiations fall through, or the owner fails to treat, Section 21 comes into force. If the claim does not exceed £50, or the claimant's interest is not greater than as tenant for a year, the compensation must be settled by two justices (Sec. 24). If it exceeds £50, the claimant can demand arbitration, or a jury. These and other circumstances are clearly defined; also the provisions for the appointment of arbitration and for jury. The principles of compensation are discussed. The primary one is that compensation shall be assessed "for the loss

which the owner sustains, the cost being the value of the thing to him, not its value to the persons acquiring it." When damage is caused to land, anything directly incurred is matter for compensation. Thus, damage by enforced removal by compulsory process is to be assessed. What amount of compensation is fair is a point for surveyors, but is dealt with in a general manner. Some useful suggestions are given under this head, and the book will be found a useful little guide to the surveyor and valuer engaged in compensation cases, or any land or house owner who wishes to know the practical effect of certain sections of the Act, such, for example, as those referring to arbitration (25-27), to jury (38-57), and to other matters.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Architectural Association. — Advanced Class of Construction and Practice.—At the opening meeting of this class at Conduit-street on Wednesday night, Mr. H. W. Burrows read a most able paper on "Building Stones," with special reference to their selection, durability, &c., and methods for testing the latter. The special visitor for the occasion was Mr. Hancock, the general manager of the Bath Stone Firms (Limited), who was accompanied by the London representative of the firms, Mr. Crawford, and who had kindly come specially from Bath to attend the meeting. After supplementing the information contained in Mr. Burrows's paper, he gave an exhaustive description of the new stone preservative, "Fluote," and exhibited several specimens of various Bath stones "fluoted" and "unfluoted," giving evidences from actual experiment of the effect of the liquid. A hearty vote of thanks was accorded him and the lecturer.

Glasgow Institute of Architects.—The twenty-second annual meeting of this institute was held last week, Mr. John Gordon, president, in the chair. The report stated that the number of members on the roll was 47, with 8 honorary members, making 55 in all. Reference was made to the fact that the Royal Scottish Academy had recently applied to the Privy Council for a revised charter; but the application in its original form, it was stated, had been opposed by many architects in Scotland, and the Institute had joined in the opposition. The affairs of the Institute continued in a satisfactory condition. According to the financial statement, the income for the year amounted to £98 15s. 6d., and the capital account now stood at £367 19s. 9d. The reports were adopted.

York Architectural Association. — The annual meeting of this association was held in the Church Institute on Friday evening, the president, Mr. W. G. Penty, F.R.I.B.A., in the chair. The following gentlemen were elected as members, viz.:—Mr. A. Creer, A.M.I.C.E., City Surveyor; Mr. F. Spencer Yates, A.M.I.C.E., Assistant Surveyor; Mr. F. Allcock, Mr. J. W. Windass, Mr. J. R. Wright, and Mr. Thomas Molding. The hon. sec., Mr. William Hepper, read the report of the eighth session of this association, which stated that the number of Fellows increased each year, the total number of members now on the books being 53. During the winter months five papers were read, and during the summer months three visits had been paid. There had been considerable demand for the books in the library. The treasurer's (Mr. R. Yeoman's) report showed that there remains a balance of about £23 in favour of the association, exclusive of the value of the library, upon which £7 had been expended during the session. The following gentlemen were appointed officers for the ensuing session:—President, Mr. Arthur Pollard; vice-presidents, Mr. C. H. Channon, of Malton, and Mr. Creer, the City Surveyor; hon. sec. and librarian, Mr. William Hepper; treasurer, Mr. R. N. Yeomans; committee, Mr. A. Burleigh, R. A. Parkin, J. U. Braithwaite, B. Spencer Yates, and E. Fellgate; *ex-officio* past presidents, Mr. W. G. Penty, and Mr. Wm. Hepper. The awards of prizes were announced as follows:—Class A, for junior students: One guinea in books, presented by Mr. Alderman McKay to Mr. Walter Bennett; Class B, for senior students: One-and-a-half guineas in books, presented by the Committee to Mr. Walter Bennett; Class C, the President's Prize, value two guineas in books, presented to Mr. E. Ridsdale Tate, for pen-and-ink sketches. The competition drawings were exhibited at the meeting.

Building Intelligence.

Bexley.—A new Congregational Church was opened on the 16th inst. The church is 68ft. by 32ft. 6in. internally, and 31ft. high to the centre of the ceiling, which is boarded and varnished. The platform end is apsidal in plan, with three rose windows in the walls above the platform filled with coloured leaded glass. All the windows also are filled with cathedral tinted leaded lights. The class-rooms, 10ft. by 12ft., open into the main room on one side by pointed arches, the spandrels of which are filled in with leaded lights. There is a four-light tracery window in front gable, and on one side a stone octagonal pinnacle is carried up to a height of 62ft., with the wrought-iron finial. The floors are of wood blocks on concrete. The lobbies are tiled. A ventilating trunk and Boyle's roof turret ventilator, surmounted by a cusped octagonal frame-work of wood and slated spire and iron finial, is provided for ventilation, in addition to hopper casements in many of the windows, and fresh air inlet flues. The exterior visible from the roads is faced with Kentish rag, with Doulting stone tracery and dressings. The roofs are slated, with red ridge tiles. The whole of the works have been executed from the designs of Mr. George Baines, Great Winchester-street, E.C., Mr. Vessey, of Bexley, acting as clerk of works. The contract of the building was let to Messrs. J. George Naylar and Son, of Rochester, for £2,384, and £119 for the upper part of the turret and spire. The seats, which are of pitch pine varnished, were made by Messrs. G. B. Hammer and Co., 370, Strand, at a cost of £101.

Bootle.—The ceremony of laying the memorial stone of the new church of St. Matthew, Stanley-road, Bootle, was performed on the 23rd inst. The ground-plan consists of nave with six arches, the two westernmost being narrower than the others; north and south aisles; chancel, raised four steps above nave, with chancel aisle on north side; organ-chamber, choir, and clergy vestries, with separate entrances on the south side. The principal entrance will have a small room over it, the staircase to which will be in a turret, with belfry above. The font will be under the large west window, and will be recessed, seats for church officers being arranged on either side. The organ-chamber will be lofty, and provision will be made for carrying the organ over the choir vestry. The following are the principal dimensions, viz:—Nave, 82ft. by 27ft. and 48ft. high; chancel, 34ft. 6in. by 23ft. 6in. and 46ft. high; chancel aisle, 25ft. by 11ft; total length of church, 116ft. 6in.; total width of church, 50ft. The church will be built entirely of brick, the exterior being faced with red Ruabon brick and terracotta. The columns of the nave arcade will be of Ruabon stone. The whole of the woodwork, except choir-stalls and furniture in chancel, will be of pitch pine. The flooring of the church will be wood blocks, except that at chancel and sacrarium, which will be tile mosaic. The style of architecture is Transition from Norman to Early English. Messrs. Aldridge and Dearson, of Liverpool, are the architects, and Mr. Thomas Urmson, of Liverpool, is the contractor.

Hongkong. — The Austen Arms Hotel is situated at the Peak, Hongkong, at an elevation of 1,400ft. above the sea, and the whole of the materials had to be transported from the sea level on the backs of Chinese coolies. The building is of red brick plastered, the pillars, capitals, and dressings being of granite. The roof is of red Chinese tiles, floors of verandahs and corridors of tesselated tiles. The whole of the ground-floor woodwork is of teak, the upper floors being of Singapore hardwood and China fir. The internal walls over the large public rooms are carried on iron columns and girders supplied by Messrs. H. Young and Co., of Pimlico. The accommodation comprises large dining hall, drawing, reading, smoking, and billiard rooms, private dining and sitting rooms, and about 60 bedrooms, each with bath-room. The whole of the work was constructed by Chinese contractors, and the cost will be about £25,000. The architects are Messrs. Danby, Leigh, and Orange, of Kongkong.

London.—The Bishop of Rochester on Saturday last dedicated a new mission church and hall at Canterbury-road, S.E., which has been erected by Corpus Christi College, Cambridge, in connection with their mission at Camberwell. The building consists of two floors, having a large hall, &c., on ground floor, and a church on first floor. The church is quite distinct from the lower part, and is approached by two wide stone staircases with direct access to the street. The building has fireproof floors throughout, and has cost nearly £5,000. The architect is Mr. Richard J. Lovell, A.R.I.B.A., of 46, Queen Victoria-street, E.C. — The same architect has also recently erected in the East-end a model "doss house." This contains accommodation for 45 lodgers, one floor being devoted to beds with screen between, and two floors having cubicles, which really form a distinct room for each lodger. On the ground floor is a large entrance hall, and stone staircase to each floor, with w.c.'s on each landing; common kitchen, with lockers for each lodger, deputy's room, and bar with pantry and stove. On the basement are the lavatories, with hot and cold supply to each basin, bath-rooms lined with white glazed bricks, and with hot and cold supply, deputy's bedroom and washing-room, with appliances for the lodgers to wash and dry their clothes. There is a yard with urinal, and the roof of the house is flat, serving as a recreation ground and for smoking in summer.

Manchester.—The Boys' Refuge in Strangeways was opened by Mr. H. M. Stanley on Tuesday. Designed in the Queen Anne Style, the structure occupies a site at the junction of Great Ducie-street and Francis-street, in front of the old Refuge buildings. The architects, Messrs. Maxwell and Tuke, aimed at producing a building which should have a substantial and domesticated character, with no suggestion of the workhouse type. Three separate "homes" are combined within its walls. In the largest of these, intended to house lads rescued from the streets, accommodation is provided here for 60 or 70 lads. On the right of the entrance is the reading-room, and on the left the games and visitors' rooms; while, overlooking the entrance, the superintendent's office commands a view of all the departments. The dining-room, four class-rooms, and the master's and matron's room are placed on the first floor. The second and third floors are divided into cubicles, and each floor is provided with bath-rooms and lavatories. A large covered gymnasium is provided at the rear of the building. In the centre of the block is the Brigade Boys' Home for between 40 and 50 boys. The basement of this division contains bath and lavatories, disinfecting closets, and work- and play-rooms. On the ground floor are the dining-room, the kitchen, the day-room, and a shop. The dormitories are on the higher floors. The remaining division of the block is intended to be used as a training home for intending emigrants to Canada, and accommodation is furnished for between 50 and 60 lads. In the basement are a workshop and smithy. Messrs. Robert Neill and Son are the contractors for the building, which has been erected at a cost considerably exceeding £10,000.

Sheffield.—The new school which has been erected by the Sheffield School Board at Abbeydale was opened on Monday. The building is two stories high, with gables and large windows, without unnecessary ornament. Coursed wallstone is used on all sides of the school, with ashlar dressings, and Westmoreland slates. Pitch pine is applied for all interior woodwork. Accommodation is provided on the ground floor for 420 boys, and on the upper floor for 420 girls, one class-room being fitted up for cookery instruction. It is intended to build an infant-school at the rear. Every separate class can enter and leave the school without crossing any other class. The cloak-rooms are placed so as to facilitate the separation of the classes. The contract for the building, including boundary walling, but exclusive of furniture, is £5,770. The contractors for the whole of the work are Messrs. Thomas Lowe and Sons of Burton. The architect is Mr. C. J. Innocent, F.R.I.B.A., F.S.I., of George-street, Sheffield, and Mr. J. Laidler has acted as clerk of the works.—St. John's Wesleyan Chapel, in Crookes Moor-road, of which the foundation stone was laid during the Sheffield Conference in July, 1889, was opened last week. The undertaking has involved an outlay of £7,000, in addition to the £4,000 previously expended on an adjoining building now to be used as a lecture hall and classrooms. The chapel is in the Gothic style. In addition to the chapel, which has sittings for 800 persons, there are two

large schoolrooms, one over the other, and connected by a staircase, around which are clustered on the different levels vestries, classrooms, and committee-rooms, a band-room, an infants' school, ladies' rooms, tea-room, cloak-room, and store-room. The various classrooms are connected with the main schoolroom by electric bells. The contractors were — masonry, Mr. James Fidler, Eckington; joinery, Messrs. W. Crookes and Son, Division-street; slating, Mr. W. J. Tune, Attercliffe-road; plastering, Messrs. Carter, Unwin, and Son; plumbing and gas-fitting, Mr. J. B. Corrie; glazing, Mr. H. Sutton, Birmingham; carving, Mr. F. Tory. The pulpit has been erected by Messrs. Johnson and Appleyards, from the architect's designs. Mr. C. J. Innocent, George-street, is the architect, and the clerk of works is Mr. George Malpas.

St. Mary's Church, Somers-town.—This church was re-opened by the Bishop of Marlborough on Saturday last, after having been closed three months for alterations. The building was originally erected in 1826 by the Brothers Inwood, architects of St. Pancras Church, and might fairly claim to be the ugliest church in London. A long notice of it appears in the *Gentleman's Magazine* of 1827, in which it is justly characterised as the worst specimen of "Carpenter's Gothic" ever erected. Enormous galleries, cast-iron shafts supporting a lath-and-plaster vault, wooden tracery of the baldest kind in the windows, and the grime of years were scarcely remedied by the crude attempts at ornament which had been bestowed upon the walls. Two years ago a small apse was added at the east end from the designs of Mr. Ewan Christian, F.S.A., and the work has now been carried some stages further. The galleries have been removed, and a stone band of tracery inserted at their level, so as to break the height of the two-light windows and accommodate the memorial glass formerly under the galleries. The whole of the roof and walls have been painted and partly decorated, and an attempt has been made to give a character to the slender pillars by inserting a nail-head moulding between the shafts, and substituting Early English caps of good type for the hideous "fungoid" growths of the original work. The organ has been removed to the north aisle, and new systems of heating and lighting introduced. The architect is Mr. Reginald Colebrooke Reade, M.A., of Torquay.

Truro.—At the annual meeting of the executive committee of Truro Cathedral, held last week, a discussion took place on the defects which have appeared in the Jura marble which composes the floor of the sanctuary, choir, and baptistery. It was thought that the whole of the floors ought to be examined and reported on by an experienced expert. Marble pavements required, it was stated, constant looking after, and attention at least once every two years. The defects were first noticed in March, 1888, only four months after the cathedral was opened, and since then attempts have been made to make it good. A considerable portion of the marble is loose. It was decided to write to Mr. Pearson, R.A., the architect, calling his attention to the state of the floors. This communication will come from the sub-committee, while the Archdeacon drafted another letter which comes from the executive committee, also to Mr. Pearson, calling his urgent attention to the matter, and pointing out how soon after the opening of the building the defects were perceived.

West Kirby.—Last week the corner stone of the new church of St. Andrew, West Kirby, Wirral Hundred, was laid. The cost of the church, when completed with chancel, organ chamber, tower, and spire, will be from £6,000 to £7,000, but at present the nave and aisles only are being built at a cost of about £4,000. The church will be in the style of the Early Perpendicular period, and is being erected in local redstone, the interior of the walls being faced in ashlar of the same material. The tracery of the windows is of simple character. The roofs will be open-timbered in pitch pine, with hammer-beam principals, supported by moulded shafts, rising from the bases of the arcade columns. The east end will be temporarily built up until the permanent chancel, central tower, and vestries are erected. Mr. W. H. Ford, of Birkenhead, is the contractor for the whole of the work, which is being carried out under the superintendence of the architects, Messrs. Douglas and Fordham, of Chester.

Engineering Notes.

Another Subway under the Mersey.—The proposal for forming a roadway beneath the Mersey between Liverpool and Birkenhead, for which an Act was obtained ten years ago, and which although not put into operation has been kept alive by extension Acts, is again being mooted. The present scheme is for a tunnel having an internal diameter of 24ft. 6in., with a width between curbs of 19ft., and a centre-line headway of 19ft. The mode of construction will be by a cast-iron shield in segments, hydraulic cement being forced through the joints during progress. Channels will lead into the culvert below, from which the drainage will be forced by the hydraulic power which actuates the lifts. The same power will provide ventilation by forcing a sufficient supply of fresh air suited to the requirements of the traffic. The roadway itself being practically level, it can be paved with wood, so that noiselessness and ease of transport for all classes of traffic will be secured. At each end of the tunnel there will be eight lifts, four for ingress and four for egress. Six of these lifts will be 45ft. long by 12ft. wide, and two will have a length of 60ft. with the same width. The last two are to provide for loads with exceptionally long overhang, such as rails, &c. The company which proposes to form the tunnel will have a capital of £700,000, and the working expenses are estimated at £10,000 a year.

A New Trunk Railway to the North.—In the course of the next two or three weeks the Parliamentary notices will be lodged for nearly 100 miles of new trunk line and a new London terminus for the Manchester, Sheffield, and Lincolnshire Railway, which, should it obtain the powers sought for, will blossom forth into the New Grand Junction Railway. The Bill proposes an extension of the M.S. and L. system from Nottingham (to which town a line, ten miles in length, is now being made by this company from Beighton Junction), viâ Leicester, Lutterworth, Rugby, Daventry, and Morton Pinckney to Quainton-road, six miles north-west of Aylesbury, and only 45 miles from London, where it will join existing or partially-built lines, providing a direct communication with the Metropolitan Railway system. The distance is thus 126 miles by the new road, which is itself 81 miles in length, between London and Nottingham, and 103 between London and Leicester. The Midland distances are respectively 124 and 99¼; but the new company will in each case have the better of the gradients. A new Metropolitan terminus is proposed to be constructed on the Eyre Estate, near Lord's Cricket Ground.

Douglas, Isle of Man.—The foundation stone of the "Eiffel" Tower and Suspension Bridge was laid with Masonic ceremony on the 16th inst. The works are to be carried out from designs by Mr. T. Floyd, C.E., of Westminster. The Bridge Company have arranged to widen Parade-street, and effect other improvements. The tower will consist of six floors. The basement floor will contain the vestibule, approach to the staircase, and lifts. The ground now covered by Queen's-place will be occupied by the hydraulic machinery, and the remainder of this floor is to be occupied by a hall 120ft. by 107ft., with a gallery all round, adapted for a circus or skating rink. The second floor will contain a large hall 140ft. by 107ft., and the measurements without the recesses will be 120ft. by 80ft., the floor being 43ft. 4in. in height. The size of the third floor is exactly similar to the first, and the height is 43ft. 4in., or 86ft. 8in. from the basement. The size of the fourth floor is 180ft. by 107ft. It comprises a concert hall 100ft. by 40ft., partially covered by a dome roof. There will be also on this floor an approach to the bridge, together with bazaars, shops, &c., including an outside gallery running all round and forming a promenade. The fifth floor is approached by a staircase in the concert-hall, and is 60ft. square. There will be a second lift provided to take persons up to the sixth floor. The fifth floor will be 172ft. from the basement. The sixth and last floor is 22ft. square, including a gallery, and is reached either by a lift from the fifth floor or by a staircase winding round the framework of the lift. The room is admirably adapted for an observatory. The floor is 330ft. above the basement, and will be higher than the top of Douglas Head. The floor is to be surmounted with a little turret containing an electric light, and on the top of this is to be a flagstaff. The height of the whole tower, to the top of the flagstaff from the basement, will be 375ft. The construction up to the third floor is to be formed of vertical columns of cast iron, planed to horizontal axes and bolted together. On these will rest wrought-iron girders, the carrying girders being 80ft. long and 8ft. deep. That to be used for the first floor is of the box type, in order to bear the strain of dancing. Hydraulic lifts are provided to each floor and gallery, visitors alighting on a landing 20ft. by 40ft. in area. The staircase, of stone, will be approached by a large vestibule 18ft. in width. The steps will be 14½in. in breadth and 5in. high, and will reach to the floor level of the bridge, 130ft. high.

Hodbarrow, Cumberland.—On the northern shore of the Duddon estuary, in the county of Cumberland, there has been steadily worked during the last 20 years or more a mine, producing a large quantity of rich red hematite iron. This mine is owned by the Hodbarrow Mining Company. The ore having been excavated as close to the sea margin as it has been possible to work without letting down the surface of the land and admitting the sea, thereby drowning the mine, the company have recently obtained a fresh lease, undertaking to construct a barrier to keep back the sea along the portion of the estuary in front of the mine, in order that they may win the ore from underneath some 25 acres of the sea-bed. To effect this object a substantial sea barrier has now been constructed, forming both a breakwater and a watertight dam. By means of this work the sea was about three months since successfully excluded from the area to be worked. The masonry and sluices for the discharge of rainfall and land soakage having now been completed, the final and memorial block was laid on Thursday in last week. The barrier is two-thirds of a mile in length, and for about one-half this length is 50ft. in height from foundations to parapet. At high water of high spring tides there is a depth of rather more than 20ft. against the seaward face of the work. The engineer of the work is Sir John Coode, and the contractors are Messrs. Lucas and Aird. The working of the iron ore over a further period of 25 years is anticipated, thus giving employment during that time to about 1,500 men.

CHIPS.

The new parish church of St. James, West-end, Southampton, was dedicated on Wednesday week. It is Early Perpendicular in style, and seats 460 persons. The facing materials are Otterbourne red bricks, with designs of Weldon stone externally and of Bath stone internally. The flooring of the nave and aisles is of wood blocks, while the chancel is paved with tiles. Sir A. W. Blomfield, A.R.A., was the architect, and Mr. Parmenter, of Southampton, the builder. The outlay has been £6,500.

The dissolution of partnership is announced as between A. H. Mackmurdo and E. Rathbone, under the style of Mackmurdo, Horne, and Rathbone, Liverpool, "architects, house decorators, and surveyors."

Miss Perowne, daughter of the Dean of Peterborough, writes, stating that since the reopening of that cathedral last week, five new stalls have been promised by different donors, raising the number from 12 to 19 out of the 40 stalls which Mr. J. L. Pearson, R.A., the architect to the Dean and Chapter, proposes to put up.

In the first division of the Court of Session, Edinburgh, on Tuesday, Messrs. Drysdale and Gilmour, contractors, of Leith-walk, in that city, presented a petition for the judicial winding up of the Edinburgh International Exhibition Association. The petitioners, who erected the Exhibition buildings, state that there is still a balance of £9,000 due to them, which the association have failed to pay. They add that the exhibition will result in a large deficiency and a heavy loss to the creditors, and they ask the court to appoint a judicial liquidator. The court adjourned the consideration of the petition.

At Stockleigh English, Devon, on Friday, the restoration of the church tower and the recasting of the set of four bells were commemorated. The tower, which was in a dilapidated and dangerous state, has been thoroughly restored by Messrs. Luscombe and Son, Exeter, and the set of four old bells have been recast by Messrs. Gillett and Johnson, of Croydon. The work of rehanging them has been carried out by Mr. Harry Stokes, of Woodbury, space being left for an additional bell, which will be placed in the tower very shortly, making a peal of five.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 80c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—C. H. M.—D. and Co.—J. S. and Co.—J. H. and Co.—M.

Correspondence.

WHITEFIELD'S CHAPEL COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—Without wishing to enter into any discussion on the above, I shall be glad if you will kindly permit me to controvert Prof. Smith's dictum—in his letter last week—that a domed ceiling is neither suitable nor safe where clear hearing and speaking are of the first importance. Really it is much to be regretted the Professor should give the weight of his name to a general statement of that kind. It depends entirely on the skill with which the dome is carried out, and no more beautiful or suitable covering for a large central area has ever been devised. Acoustically it has been successful over and over again. Let me instance only two examples in support of this: the well-known St. Stephen's, Walbrook, and Union Chapel, Islington—the latter being practically a domed church. Both are about the size of that proposed in "Lux Mundi," and both are admirable for hearing and seeing.

The question of cost has already been more than answered in Prof. Smith's report, but I have always understood that, within reasonable limits, the great object is to produce good architecture, not cheap. The whole question is begged in this case by the limit of cost being unreasonable.—I am, &c.,

J. M. BRYDON.

5, Cambridge-place, Regent's Park, N. W.,
October 28th.

SIR,—I have seen the plan which was issued to competitors for the above-named tabernacle, and I have read Professor Roger Smith's letter which appeared in your last week's issue.

My views as to the unsatisfactory nature of the Professor's award are in no way modified, and I have, therefore, given notice that I will bring the subject before the R.I.B.A. at its next business meeting, which takes place on Nov. 17.

I trust that all members who take an interest in a subject so important to the profession and to the public, will make an effort to be present, and to record their opinion.—I am, &c.,

WM. WOODWARD.

7, Duke-street, Adelphi, W.C., Oct. 29th.

SIR,—The explanation of Prof. Smith in your last issue is really so extremely unsatisfactory that I think that the whole of the facts should be placed before the Institute for their opinion as to the conduct of the assessor, whom, I believe, they nominated at the request of the promoters of the competition. This course has been taken in other competitions when the action of the referee has been called into question, and it is eminently desirable that this case should come under the R.I.B.A.'s consideration.—I am, &c.,

A COMPETITOR.

[So several other competitors have already said. But do any of them really believe the Institute will move in the matter? Did it ever do so in any case of the kind?—ED.]

ISLINGTON BATHS COMPETITION.

SIR,—The designs selected for premiums by the assessor contain so many bad features that one is astonished at the result. I have not heard during the last 30 years that the assessor has ever erected public baths and washhouses, therefore conclude that the special practical knowledge of the subject has been wanting, and so account for the extraordinary decision. Great injustice is done without a remedy, as there are no means of reconsidering architectural awards, however wrong they may be; therefore I think that the assessor should be mentioned in the particulars to architects, so that they may know if the designs are to be judged by a practical expert in the work or not.—I am, &c.,

OBSERVER.

THE "A. A." SCHEME OF EDUCATION.

SIR,—It seems a pity that in these so-called practical days generous people should waste their money in such wild goose theories as the one propounded by the A. A. under the name of "Architectural Training."

What we want is not that there should be more educational advantages outside the office, for there are plenty now to the earnest seeker after knowledge; but what is wanted is that the man who receives the premium should fulfil his part of the contract, and give his pupil an insight into the mysteries of the profession. Not one man in fifty who takes a pupil—and with him as big a premium as he can get—ever thinks of taking a little trouble with him after the articles are signed; and, unless the young man has the cuteness or natural ability to pick up a few crumbs from the assistants' boards, he only results in that miserable and pitiful creature "an improver." He receives no teaching, unless it be to mix ink or to copy letters (in my case both these), and when his articles are expired is glad to go into another office for little or no salary to learn that which another man was paid for imparting.

No, Sir; what we want is that common honesty and fairness should obtain amongst architects; and until the principals turn their attention from fine speeches at the A. A. meetings and look at home, until then will the profession be the object of scorn amongst builders and their clerks and the puzzle of the outside public.—I am, &c.,

ANOTHER OLD T-SQUARE.

An addition to the many tablets which give increased interest to the interior of York Minster has just been erected in the west aisle of the north transept in memory of three officers and 298 non-commissioned officers and men of the 51st Regiment, the 1st Battalion King's Own Yorkshire Light Infantry, who fell in India, 1872 to 1887. It has been designed by Mr. G. F. Bodley, A.R.A., the Minister architect.

The ceremony of laying the foundation-stone of the buildings which are to form an addition to Woodilee Asylum, Lenzie, was performed by the Chairman of the Barony Parochial Board, Glasgow. The style of the extension will be Elizabethan, and the cost £40,000. Accommodation will be found in the extended hospital wings for 180 inmates, while there will be two new blocks, distinct from the main buildings, for chronic patients.

Intercommunication.

QUESTIONS.

[10418.]—**Weight on Bracket.**—I should be glad to know what weight a 1in. cast-iron bracket 2ft. by 2ft., projecting from a cast-iron column, will safely carry? and how arrived at?—S. M.

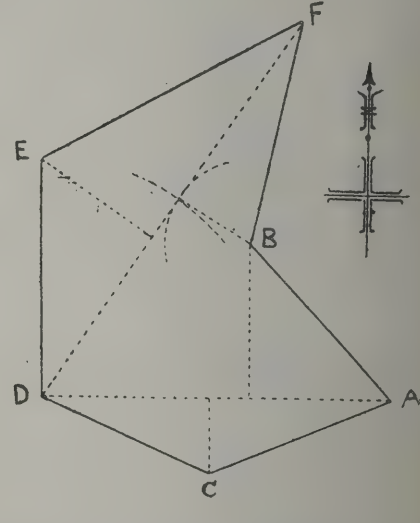
[10419.]—**Horizontal Flue.**—I am about to lay a horizontal flue from glasshouse boilers, and propose to use 18in. fireclay pipes, bedded in, and covered with lias lime concrete. The length is about 70 yards, to terminate with a brick vertical shaft 30ft. high, lined with 18in. fireclay pipes half-way up, and 14in. ditto to top. The horizontal flue will have one easy bend, bringing flue to right angles. There will be a rise of about 2in. in 10ft., three manholes in the entire length. I propose to have a pilot stove at base of shaft. Will a practical reader inform me if this will answer. Suggestions will be gladly received.—ENQUIRER.

[10420.]—**Artisans' Cottages.**—What are the best books giving plans and specifications of artisans' cottages, &c.—GEO. L. JOZAT.

[10421.]—**Hotel.**—Will anyone give me the address of one or more first-class hotels built recently at a cost of from £10,000 to £20,000? Not commercial, but for visitors. North of London preferred.—ARGUS.

[10422.]—**Tennis Courts.**—Having to lay out several turf tennis courts, I shall be greatly obliged if someone will kindly inform me the best specification for forming the groundwork on an existing sandy soil.—TENNIS.

[10423.]—**Accounts**—A simple and satisfactory method of keeping accounts for an architect, with the description of books required, and explanations, would be of service to—BOOK-KEEPER.



REPLIES.

[10410.]—**A Difficulty.**—"Querist" must make the best of a bad job. There is nothing to be ashamed of in the joint, although there was no necessity for it.—R. WATSON.

[10411.]—**A Builder in a Difficulty.**—Have the executed work valued by a competent surveyor, and consult a solicitor.—R. WATSON.

[10414.]—**Signing Contracts.**—Both employer and contractor should sign all contract documents, and in the case of a firm, each member must sign.—R. WATSON.

[10417.]—**Surveying.**—Commence by laying down westwards from A the line A D, 744 long. Then, looking ing in the direction of D, set off perperdiculars from A D—viz., at 303 set off on the right 333 to B, and at 386, 161 on the left to C Now, with D and B as centres, and radii 520 and 181 respectively, describe arcs cutting one another, and through their point of intersection draw D F 970 in

length. From 413 on D F set off a perpendicular on the left to E, 290 long. Join A C, C D, D E, E F, F B, and B A, which are the boundary of the field. This figure is plotted to a scale of 4 chains to an inch. This survey is supposed to have been made by the aid of a cross-staff for setting out the perpendiculars, and for the benefit of any student reader who may be tempted to imitate this example, let me add that modern surveyors never think of using this system of surveying, as it is, in fact, only adapted for approximate measuring, such as, for instance, finding the area of mowing done by piecework. Mr. Usill, in his "Practical Surveying," p. 29, tersely says: "I have no hesitation in condemning its use upon nearly every ground. . . . . I cannot see any feature of recommendation in the cross-staff.—N. D.

Earl Compton submitted to the London County Council, on Tuesday, the report of a committee, which recommended the improvement, at a cost of £300,000, of an area of 15 acres in Bethnal-green and Shoreditch, which the officer of health had condemned as insanitary. An amendment in favour of a preliminary inquiry as to the liability of the owners of the unhealthy houses in question was unopposed, and the discussion was adjourned to a special meeting to be held on Monday next.

LEGAL INTELLIGENCE.

Re William Oldrey and Co.—Under the failure, which occurred in July last, of G. Pluckrose and H. Oldrey, builders and contractors, trading at Westbourne Park and Kensal-road, a summary of the debtors' affairs has been issued, with the Official Receiver's observations thereon. The debtors, under the will of the late William Oldrey (who died in September, 1886), acquired his business, and had since traded in partnership. In November, 1888, a building upon which the debtors were engaged collapsed, several workmen being killed and others injured. Actions for damages followed, the result of one of such actions (treated as a test case) being adverse to the debtors. They attribute their failure to this fact, and estimate their contingent liabilities under this head at £4,600. The statement of affairs shows gross liabilities £12,793, of which £4,702 are expected to rank, and an estimated surplus in assets of £125. The public examination stands adjourned to Friday in next week, Nov. 7.

In Re R. Evans.—A receiving order having been made on the 18th October, 1889, against Robert Evans, an architect and surveyor, of Southdown-road, Wimbledon, a statement of affairs has been submitted, in which the unsecured liabilities are returned at £6,118, with an estimated surplus in assets of £1,355. The debtor commenced business about 30 years ago without capital, and in 1869 he was adjudged bankrupt, no dividend apparently being paid. He again became a bankrupt in 1878, when trading at Chiswick as a builder, but the adjudication was annulled upon payment of a composition of 1s. in the pound. He subsequently acquired interests in certain building estates, arranging with a firm of solicitors to undertake the financial working of them for their mutual benefit. He attributed his failure entirely to his inability to obtain a settlement in respect to these estates with his partners, and alleged that the greater part of his liabilities are in reference to guarantees for debts incurred by builders on the property which he has now been called upon to pay.

Frontage Lines.—At Lambeth Police-court on Saturday, two summonses were heard against the City and South London Railway Company for building stations at the corner of New-street, Kennington Park-road, and Harleyford-road beyond the line of frontage, and without the consent in writing of the London County Council, contrary to the statute 25 and 26 Vic. c. 102, and 45 Vic. c. 14. The question at issue was with regard to the building of two of the company's stations. These stations, it was contended, had been built upon the old forecourts of houses and brought out right to the garden rail, and beyond the original and proper line of frontage. The County Council considered the company had built such stations without sanction, and contrary to the Building Act. The defence was that the company had powers under their own Act of Parliament to do as they had done. Mr. Mullins, clerk to Mr. Banister Fletcher, district surveyor, was called, and proved that in May, when the station at New-street was in course of erection, communications were sent to the company, and a caution was given that such building was beyond the proper line of frontage, and that they might be proceeded against. The further hearing of the matter was adjourned.

St. Andrew's Mission Church, Acton, and Brentford district schools, Isleworth, are warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

On Wednesday next the ceremony of turning the first sod of a new railway, which is to connect the rising seaside resort of Lee-on-the-Solent with the South-Western Railway, and so bring it within a three hours' journey of London, was performed by the chairman of the railway company. The new railway will run along the coast from Brockenhurst, having a station at Privett, and terminating at a station within a few yards of the Lee pier. The contract for the line has been entrusted to Mr. D. G. Lang, of the Adelphi, Strand, it being stipulated that the work shall be completed by July 1 next year.

The foundation stone of the cottage hospital at Bromsgrove was laid on Friday. The site is on the New-road, near to the town. The buildings will be arranged on the pavilion principle, and will comprise a central block, two stories in height, consisting of entrance hall, vestibule, central hall, day rooms for convalescents, and matron's room, with necessary stores and offices at the rear, and bedrooms for matron and servants, store rooms, &c., on the upper floor. On each side the central block the wings will be connected with corridors leading to the male and female wards respectively. Each ward will be 35ft. by 18ft. 6in., and 12ft. 6in. in height. There will be accommodation for six beds in each ward. The plans are by Mr. John Cotton, architect, of Birmingham; Mr. Jonathan Brazier, of Bromsgrove, being the builder.

WATER SUPPLY AND SANITARY MATTERS.

Cambridge.—The town council has adopted the conclusions of Mr. James Mansergh as to the mode of collecting the sewage of the town, and has asked Mr. J. T. Wood to modify his scheme in general accordauce with those suggestions.

Swinton.—The sewage purification works have just been completed. Swinton is about five miles from Manchester, and contains a population of about 16,000. The sewage is dealt with upon a farm of about 32 acres in extent. Until recently the method of treatment was by a system of irrigation. In course of time this method proved totally inadequate, and the state of the brook into which the effluent passed became so bad that legal proceedings were commenced some time ago by riparian owners. The local board then adopted the present scheme. The sewage is conveyed to the farm by means of three main sewers, two low level and one high level, but all high enough to obviate the necessity of pumping. The purification process adopted is that of the International Sewage and Water Purification Company, Limited. The outfall sewers discharge into a small chamber, in which is placed a strainer with cleaning rakes attached, where all large solids are arrested. The sewage in passing then drives a 6ft. undershot water-wheel, which supplies the power necessary for working the mixer (Beloe's patent), by means of which the precipitating substance is added to the sewage. The precipitating and deodorising material used is called ferozone, and of this $12\frac{3}{4}$ cwt. per million gallons is used, costing 9s. 6d. per day, or £2 0s. 4d. per million gallons (including 13s. 6d. per ton for carriage). The settling tanks are four in number, with a total capacity of about 250gals. Two of the old tanks have been re-arranged and utilised, the cross-walls having been removed, and two new tanks have been built. The tank effluent is conveyed by pipes to the polarite filter beds. These have a total area of 350 square yards, and are divided into four. The bed consists of a total thickness of 3ft., made up in layers as follows:—4in. pipes embedded in 6in. of loose broken stone, 5in. of gravel, 4in. of sand, and at the top 6in. of polarite mixed with sufficient sand to make a layer 12in. in thickness, and 9in. of sand. The polarite is a specially-prepared porous, rustless, magnetic oxide of iron, insoluble in water. The purified effluent finally issues into a white glazed brick chamber, perfectly bright, without colour, and odourless. The total annual working expenses amount to £420, or $6\frac{3}{10}$d. per head of the population. The sewage purification works, now completed, have cost about £3,800. This sum includes all new works, but does not include anything for land, law, and engineering expenses, nor for the old works re-used, except alterations for same. The new works were designed and completed under the supervision of Mr. Theo. S. McCallum, C.E., of Manchester. The contractors were, Mr. H. Davies, Pendlebury, for the tanks, &c.; and Mr. S. Johnson, Pendleton, for the filters, &c.

CHIPS.

Sir Edgar Boehm is engaged upon a recumbent statue of the late Bishop of Durham, which is to be placed in Durham Cathedral.

The Cairo correspondent of the *Times* declares that there is absolutely no truth in the alleged destruction of the Pyramids for building material. The facts are that the loose stones accumulated at the base are being removed, which will lay bare the lowest courses and display the Pyramids to greater advantage. The work is being conducted under the superintendence of the museum authorities.

Mr. W. H. Scriven, architect and surveyor, Leeds, attempted to commit suicide on Friday by shooting himself in the head when in the closet adjoining his offices in Commercial-buildings, Park-row, in that town. It is stated that for about four years Mr. Scriven's mind has been seriously affected, and has suffered from severe depression.

A stained-glass window has lately been placed in Newcastle-under-Lyme parish church, in memory of the late Mr. Evan Oakes Williams, of Newcastle-court, Shropshire. The subject is "Our Saviour blessing little children," with canopy and base. The window is by Mr. John Davies, 73, Wyle-cop, Shrewsbury.

A correspondence has taken place in the *Birmingham Daily Post* on the drainage system adopted in that town. Mr. Thomson Plevins, architect, Birmingham, points out several difficulties in the water-closet system, and while objecting to earth-closets as unsuitable for general use, and to pan closets as offensive, he suggests that the health committee of that town should recommend flushing closets. Dr. Lawson Tait concurs in Mr. Plevins' objection to the ordinary w.c., adding: "The interception principle, of which the pan system is only a temporary and somewhat clumsy exponent, is the only safe one for a town constituted as is Birmingham."

Our Office Table.

The inaugural meeting for the present session of the Royal Institute of British Architects will take place on Monday evening next, when an address will be delivered by the President, Mr. Alfred Waterhouse, R.A. A business meeting of the Institute will be held a fortnight later, and on the evening of Monday, the 1st December, Mr. R. Phené Spiers, F.S.A., will read a paper on "Sassanian Architecture." The following general meetings will be—December 15th, to be devoted to the reading of short papers on an art subject to be hereafter announced; February 2nd, "The School of Bramante and its Expansion Throughout Italy and the Rest of Europe," by Baron Henri de Geymüller; February 16th, "Seville Cathedral," by Mr. G. Somers Clarke, F.S.A.; March 23rd, "Some Aspects of Sculpture in Relation to Architecture," by Mr. George Simonds; April 6th, "Origin and Mutation in Indian and Eastern Architecture," by Mr. William Simpson, R.I.; April 20th, short papers on a subject not yet announced; May 25th, "Some Old Churches in the Neighbourhood of Cleves," by Mr. H. W. Brewer; and June 22nd, "Mediæval Architecture in Sweden, with special reference to the Cathedrals of Upsala, Abo, and Lund," by Mr. J. Tavenor Perry.

In his "private and confidential" report to the London County Council on the water supply of the metropolis, Mr. A. R. Binnie, their engineer-in-chief, points out that at no great distance of time London must have a new source of supply, which may be obtained either from the Upper Wye or the Upper Severn, or from Dartmoor. Dartmoor has not been suggested before as a source of supply for the capital, but its elevation, heavy rainfall, and clean granitic gathering ground make it a site where good water could be obtained, and its distance is not against it. It is now thought that the County Council will not agree to the arbitration clause such as the City Corporation propose in their Bill for the purchase of the water companies' undertakings, and it is stated that the Council will introduce a Bill of their own, providing, so far as they can now provide, for a new source of supply. The estimated cost of the Upper Wye scheme is £9,000,000 to supply 230,000,0000 gallons per day, and that of the Upper Severn is £11,400,023 to supply the same quantity.

An exhibition of works by David Cox will be opened on Tuesday next at the Birmingham Art Gallery, which will probably prove to be the finest collection of pictures and water-colour drawings by this landscape artist ever brought together in one room. Mr. Whitworth Wallis, F.S.A., the director, has succeeded in borrowing more than 450 examples. Among the numerous collectors who are lending may be mentioned Lord Armstrong, Lord Willoughby d'Eresby, Sir W. H. Houldsworth, M.P., Mr. W. Cuthbert Quilter, M.P., Mr. James Orrock, R.I., Right Hon. Joseph Chamberlain, M.P., Mrs. Enoch Harvey, Dr. Jex Blake, and many others, including members of the Betts and Nettlefold families. Messrs. Holbrook Gaskell, William Agnew, Peter Allen, Philip H. Rathbone, Benson Rathbone, R. D. Holt, E. Grindley, and J. A. E. Rayner are also lending works. The late Mr. Enoch Harvey, who took the greatest interest in the exhibition, had promised to lend 22 pictures, which, by the kindness of Mrs. Harvey, will be seen in a prominent position. The exhibition is being held in connection with the Congress of the National Association for the Advancement of Art, which will be in Birmingham on Tuesday, Wednesday, and Thursday in next week.

The following gentlemen, having satisfied the examiners at the examination held in London on the 3rd and 4th inst. by the Association of Municipal and Sanitary Engineers and Surveyors, have been granted certificates of competency by the Council of the Association—viz.: C. F. Ball (Croydon), W. Dyach (Aberdeen), F. J. Edge (Neath), W. Hall (Ealing), J. Manley (Chacewater), and F. Sumner (Kilburn). The next examination will be held in London in April, 1891.

The first concert of the session of the A.A. Lyric Club was held at the headquarters, Mona Hotel, Covent Garden, on the 28th inst. The programme, arranged by Mr. J. D. Scott, was very successfully carried out, Mr. W. Burrell, the

president, being in the chair. The following gentlemen, amongst others, gave their services, which were very heartily appreciated: Messrs. J. D. Scott, Pywell, Lidstone (violin), W. E. Johnson, S. B. Garcia, F. H. Collins, and C. D'Imhof, who was again the accompanyist. Any member of the Architectural Association who is desirous of joining the club should apply to the hon. secs., Messrs. W. H. White and Theo. Moore.

CHIPS.

By a fire, which took place at Messrs. Boyers', builders and contractors, Amberley-road, Paddington, on Saturday night, the carpenters' workshops were destroyed.

The picturesque old tower of Llanisheen Church, near Cardiff, has been thoroughly restored, under the supervision of Messrs. Kempson and Fowler, of Llandaff; new bell-framing and a peal of six bells have also been added. The work has been carried out by Mr. G. Hartnell, builder, of Crwys-road, Cardiff, and the bells supplied and fixed by Messrs. Llewellins and James, of Bristol.

Messrs. Colls and Sons notify the removal of their city offices from Moorgate-street to No. 5, Coleman-street. The new premises will contain a sample-room, which will give facility for the selection of fittings, materials, and decorations in general use, and of the more modern improvements in building appliances. The yard and main works will remain, as heretofore, at Camberwell.

A special service was held in Bristol Cathedral yesterday (Thursday) afternoon in connection with the celebration of the restoration of the north transept, and the unveiling of the window given by the Dolphin Society as a memorial of Edward Colston.

A new chapel has been opened at Heckmondwike, built from the designs of Mr. A. A. Stott. The chief contractors were Messrs. W. and J. Milner, of Mirfield, for masonry, and Messrs. Fothergill and Schofield, of Batley Carr, for joinery.

A set of iron floriated hinges has been made for the entrance doors of St. Colman's Cathedral, Queenstown, from the designs of Mr. C. G. Ashlin, R.H.A. They are in the Early French style, similar to those of the Cathedral of Notre Dame, Paris. They have been wrought by Messrs. Fagan and Sons, of Brunswick-street, Dublin.

Maryon Park, the new recreation ground at Charlton, was formally handed over to the London County Council on Saturday by the donor, Sir S. Maryon Wilson.

M. Charles Verlat, director of the Academy of Fine Arts at Antwerp, has died, aged 66. He was a pupil of De Keyser, and excelled in all branches of the pictorial arts, especially in animal painting.

The local board of health for Clevedon, Somerset, have received the written report of Mr. J. Abenethy, C.E., of London, on the present condition of the pier, and recommendations for its improvement. He recommended that the present head be removed and a new one be constructed of cast-iron screw piles, connected by iron bracing, utilising some of the old iron. On the face of the pierhead should be erected a wooden landing stage; and the whole deck should be relaid and the iron-work scraped and painted. Three alternative plans were submitted: the first to cost about £7,000, the second about £9,000, and the third about £15,000.

The School Board for Bath have appointed Mr. E. R. Robson assessor in the competition for a new school in the Lower Bristol-road, which is confined to architects practising in the city.

A new Bible Christian chapel, Miskin-street, Cathays, Cardiff, was opened on Wednesday week. The building, which will seat about 600 persons, has a gallery, and has cost over £2,000. The architect was Mr. J. F. Fawckner, of Newport, and the builder Mr. L. Purnell, while Mr. A. M. Blake acted as clerk of the works.

The new infirmary at Liverpool, built from the designs of Mr. A. Waterhouse, R.A., was opened by the Duke of Clarence and Avondale on Wednesday.

A new public hall has been erected at Kingston-on-Thames, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

A second section of the restoration of the Norman Church of Wroxeter, Salop, was completed last week. Last year the tower was repaired and partially rebuilt at the cost of the Duke of Cleveland, and now a porch has been added to the church, the outlay being borne by the same donor. For both works Mr. H. H. Treasure, of Shrewsbury, was the architect, and Mr. Muirhead, of Newport, Salop, the contractor.

MEETINGS FOR THE ENSUING WEEK.

Saturday (To-Morrow).—Association of Public Sanitary Inspectors. "A Pioneer of Sanitary Science," by the President, Dr. B. W. Richardson. Carpenters' Hall. 6 p.m.

Monday.—Liverpool Architectural Society. "Notes in Holland and Belgium," by J. M. Woodhouse, of Manchester. 7 p.m.
Society of Engineers. "Utilisation of Exhaust Steam," by Percy Griffith. 7.30 p.m.
Royal Institute of British Architects Opening Address by the President, Mr. A. Waterhouse, R.A. 8 p.m.

Tuesday.—National Art Congress at Birmingham. Presidential and other Addresses, 11 a.m. Sectional Meetings, 2 p.m.
Glasgow Architectural Association. "Greek Architecture: Late Period," by R. J. Gildard. 8 p.m.

Wednesday.—National Art Congress at Birmingham. Address by T. Graham Jackson. 11 a.m.

Thursday.—National Art Congress at Birmingham. Address by A. H. Mackmurdo. 11 a.m.

A new London Board school in Prospect-terrace, Gray's Inn-road, was opened on Friday. It accommodates 995 children, and cost £13,000 for building and £19,000 for the site, which has an area of 19,000sq.ft.

The pulpit to be erected in the choir of Norwich Cathedral is now making good progress in the studios of the sculptor (Mr. Harry Hems, of Exeter), and would have been finished and *in situ* ere this had not the lengthened strike in the western capital stopped nearly all work there throughout the past summer. It is to be entirely of English oak, and has been designed by Mr. John P. Seddon, the *motif*, as regards general detail, having been the exquisite oak carving on the old stalls, close by where the pulpit is destined to stand. In niches all around the body of the pulpit will be statuettes in the round, representing the four evangelists and the four great preachers, SS. Peter, Paul, James the Bishop, and Stephen.

Sir Frederick Mappin has presented a stained-glass window to the church of St. John, Ranmoor, near Sheffield. The subject is the Crucifixion, and the commission has been executed by Mr. W. F. Dixon, William-street, Lowndes-square.

The fine church of St. George, at Easton-in-Gordano, near Bristol, has just been presented by Mr. Henry Mirehouse, with a reredos constructed of polished alabaster and English marble. The work rests upon a massive retable of Ipplepen red variegated marble, and consists of a triple array of recessed panels, with cusped and crocketed gables, all in alabaster. The heads of the arches are supported by carved capitals, resting upon serpentine columns. The figures are carved in high relief, and are in outline thrown up by backgrounds of gold tesseræ. The central group represents the birth of our Lord. Mr. Harry Hems, of Exeter, executed the reredos, which was unveiled on Sunday.

A new side altar, of the Sacred Heart, and two choir screens are being fixed in St. Mary's Church, Warrington, the whole of the carving, &c., being executed by Messrs. Boulton and Sons, of Cheltenham, from the designs of Messrs. Pugin and Pugin, architects, London.

The Judicial Committee of the Irish Privy Council approved on Wednesday a scheme for the construction of a light railway from Skibbereen to Baltimore, which the Cork and Bandon Railway Company have offered to work, and for the construction of which the Treasury has made a gift of £6,700.

A poll of the ratepayers of St. Mary, Newington, has taken place on the question of the adoption of the Public Libraries Act. The number of voting papers issued was 12,724, but only 4,889 ratepayers voted, 2,841 being in favour, and 2,048 against the proposal.

A village hall at Orpington, Kent, built at a cost of £5,000, was opened by Sir John Lubbock on Wednesday week. Mr. G. St. Pierre Harris, of London and Orpington, was the architect, and Messrs. Holt and Son were the builders.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

ELECTRIC LIGHTING.

COMPLETE INSTALLATIONS OR WIRING ONLY { ESTIMATES GIVEN.

STRODE & CO. 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. LONDON

New Branch Showrooms:—188, PICCADILLY, W.
Telephone No. 3958.

Holloway's Pills.—Colds, Catarrhs, and other febrile affections can be readily arrested in their early stages by these pills, if taken according to their accompanying directions. In addition to their cooling and purifying properties, these pills control the circulation, reduce febrile symptoms, relax the skin, promote perspiration, and restore health.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.

FRIDAY, NOVEMBER 7, 1890.

PATENTING PLANS.

THE idea of patenting the plan of an architectural design is at least somewhat novel; but one well-known firm of Sheffield architects have been venturesome enough to take that step, and they send us a copy of the specification of their patent for "Improvements in arranging the plan of buildings applicable to Government, county, municipal, and other public offices and courts." Messrs. Flockton and Gibbs, whose design for the Sheffield Municipal buildings we illustrated on July 25th of the present year, and which was an ingenious endeavour to make each set of offices for a department complete in itself, and to avoid the confusion arising from a number of offices ranged along a corridor, have patented the principle therein shown. We refer our readers to the plans we gave of these designs, to make more clear the nature of the so-called invention. Referring to the printed copy of the specification of the patent sent to us, Messrs. Flockton and Gibbs state: "The plan generally adopted in buildings of this class is the arranging of rooms on one or both sides of a passage or hall common to the public and all the departments. Where there are a number of offices or other rooms in one department, these, if placed along one side only of the public passage or hall, as is the case in the Manchester Town Hall and the Birmingham Council House, are necessarily so extended as to be very inconvenient for intercommunication and control; the occupants of the rooms at one end of the range, if they wish to consult with or give orders to the occupants of the rooms at the other end of the range, must either pass through each room between them, in which case there is liability to disturbance of the occupants of the intermediate rooms, or they must pass down the public passage or hall, where they are liable to meet with the public, and be prevented speedily attending to their business." It is also stated that the control by the superior officials of a department in so extended a line is difficult, and if each room has a door into the public passage there is loss of control over the subordinate officials, and the number of doors is confusing to the public and to the occupants of the rooms by unnecessary inquiries made by strangers. The plan for which a patent is claimed is described in the following clause:—"The plan for which we claim novelty is the placing of the rooms of each department in a separate wing or compartment of the building arranging the rooms within it as if each wing or compartment were a separate building with entrance for the public to each department through or by an inquiry or general office, and with no other entrance for the public to the private offices; and combining the several departments into one building by grouping the wings or compartments around a central public hall or passage, through which alone the public can gain admittance to the inquiry or general offices of the several departments." The plan so formed can be restricted to a one-story building or repeated with some modifications on each floor of a many storied building with a public staircase or hoist in the public hall. It is also made a part of the patent, that "every public entrance should be direct to the central public hall or passage, and lead nowhere else. The wings or compartments may be varied in form, and the rooms of a department may be grouped within the wing or compartment in any plan most convenient for the requirements of that department, provided that the entrances to the private offices are by or through an inquiry or general office." The specification further states that each wing or compartment may have an official passage from the inquiry office to the private offices, and also an official entrance from the street to the official passage. The advantages claimed by this plan are briefly these: The public cannot intrude upon the privacy of the superior officials without being announced, and the private offices being away from the central public hall, are more quiet than if they adjoined thereto. Each wing is complete in itself, the supervision and the control of the entrances and exits of subordinate officials being more perfect. The length of the public hall or passage is reduced to a minimum, and the distances thereby diminished. The plan of building is rendered more simple by the arrangement of one entrance to each department than by having several doors and staircases. The public can find the department wanted with less trouble. The officials may communicate without appearing in public. Other advantages are that courts or areas may be minimised, as all the windows may face outside, the plan occupies less area, and secondary public staircases are not necessary. The specification goes on to state that the authors are not aware of any office building, public or private, having been built on the plan proposed. That adopted at the Glasgow Municipal Buildings, where several of the departments are detached from other departments on the ground floor by carriage drives, yet has public passages through the several departments, and has none of the advantages claimed for the patented plan. At the Leeds Municipal Buildings there are five entrances from the central hall into the accountant's departments on the ground floor. The Greenock Buildings have the collectors' offices of the various departments grouped round a central hall; but the other offices are separated, and can be only reached by public stairs and passages. The Admiralty Offices have the novel arrangement of double passages, with area for light and air between, but this rather increases than diminishes the disadvantages of the old system. Plans are appended to illustrate the principle as applied to two departments on the ground floor and on the upper floor of the same building; another plan to show the principle adapted to three departments on one floor of a rectangular building, and also to a cruciform plan; and a third plan gives the arrangement applied to six departments on one floor. Other arrangements can be formed on the same principle. The plan for two departments on the ground floor is practically the same as we illustrated on July 25th for the authors' design for the Sheffield Municipal Buildings.

Our readers will see that the principle on which Messrs. Flockton and Gibbs have claimed protection is that of grouping the departments of a public building, each complete and separate in respect of its entrances, round one public hall. As the authors invite the members of the profession and the public to take the opportunity of opposing the grant of the patent should there be any ground for so doing, we leave the principle of planning to the attention of our readers; at the same time, at the request of the authors, we draw attention to the following, a section of the Patents, Designs, and Trade Marks Amendment Act, 1885: "When a complete specification has been accepted it is open to public inspection, and notice of acceptance will be advertised in the official journal of the Patent Office. Any person may at any time within two months of the date of such advertisement [29th October last] give notice of opposition to the grant of a patent on the grounds stated in Sec. 11 of the Patents, &c., Act, 1883." We will not enter here into the alleged novelties of the plan, as we are of the opinion that the same principle has been used, and may be seen on plans of public offices. The main point of Messrs. Flockton and Gibbs's plan is that there is a single public entrance to each department through a general office, which is close to the public hall, the passages being confined to the use of officials of the departments.

The question which most concerns us is the advantage of protecting by a patent any improvement or novel feature of arrangement. As every architectural design is more or loss of an invention, it may be asked Why should not the architect avail himself of the Patent Act as well as any other inventor? Would not the system be a stimulus to invention? Copyrighting designs is not unknown in America, and we have now before us a series of copyrighted designs of "Modern Rural Homes," arranged and designed by the "National Architects' Union," of Philadelphia. We dread to think of what patenting the elevational features of designs would lead to.

The advantages of protecting by patent a clever plan are, first, that it would be an incentive to invention amongst the few by giving them an individual interest in their design; second, a good idea would be more likely to be perfected; there would be attempts to improve and patent modifications. On the other hand, there are objections. The patenting of a design would seriously hamper the profession, for they would have to steer clear of existing rights. It would handicap a large proportion of architects who now avail themselves of the common property in architectural ideas. Many very clever plans are a combination of the grouped and corridor principles; but these would be avoided if they were protected by patent. For instance, the "pavilion" system with the isolated lobby has been a commonly-adopted principle in all hospital plans; but if the inventor had patented the idea, so desirable a plan would have been avoided till the expiration of the patent. The radiating, the circular systems of ward construction are ideas that can be made to subserve the purpose of designers; but if they were protected they would be very little adopted.

The "central hall" principle of designing buildings for Congregational churches might have been patented if ancient examples had not shown the same principle; if it had been, fewer attempts would have been made to utilise the plan. A further disadvantage of the system of patenting would be to introduce a commercial element into design. The few who became patentees of novelties in architecture would take care to make the most of their inventions, and only allow them to be used on payment of a royalty. To the bulk of the profession this would be prejudicial. Independent design could not be encouraged as it is now. But there are besides, practical difficulties in the way of applying the Patent Act to designs or plans of buildings. An architect who had thought out a good plan would have to make a diligent search at the Patent Office to see if he had been forestalled; when a complete specification has been accepted by the Patent Office, it will be the duty of the profession to give notice of opposition to the grant of a patent on any of the grounds mentioned in the Act. How is a man to know whether his idea has not been actually used before? A most costly search would be necessary to satisfy him. The difficulty is in preparing a specification or drawing of any particular arrangement that will be definite enough; as any idea to be of real value must be sufficiently elastic to admit of being varied to actual circumstances. We can understand an architect patenting a new spring door, a fireproof floor, or a roof—things that admit of easy definition—but it

becomes very problematical to show any order or arrangement of doors, walls, or departments in connection with a central hall that shall entitle its author to a grant of a patent—a mere matter of order in planning departments can scarcely be a subject for a patent. At least it appears to us doubtful whether patented plans may not be more imaginary than real, and there would be many ways of rendering them void. What would prevent an architect from adopting a modification of a patent? In any alteration to an existing building a very slight modification might produce exactly the arrangement for which a claim has been made.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

CONSPICUOUS among the pictures in the large room of the Suffolk Street Galleries is the work of the president, Wyke Bayliss, "The After-Glow in St. Peter's, Rome" (241). It is a grand central perspective looking up the nave of the great basilica. Gloom has settled over the interior; the reflecting surfaces of marble in floor and arcade impart a solemnity, heightened by the light under the dome, which throws into relief the high altar and baldacchino. The architectural details are painted with consummate skill, and shows that Mr. Wyke Bayliss is a master of Renaissance no less than of Gothic; the charm and poetry of light and shade have been rendered with all the felicity of his pencil. The interior of Orvieto as seen in the early morning (50) is a noble drawing in water colours; perhaps even more characteristic of Mr. Wyke Bayliss's subtile pencil and dexterous manipulation of iridescent hues. Haynes King has two finished figure studies of girls, "A Fireside Reverie" and "Watching the Kettle," both pretty bits of domestic *genre*. "The Feast of St. John: Finistere" (238) by G. Sherwood Hunter, is a cleverly painted incident—a night procession; the reflection on the faces is happily rendered. This painter's other studies in Brittany, of old fisher-folk at Marken (445), and other Zuyder Zee sketches of domestic life are of interest. Val Davis has a delicately-painted subject, "A Sunny Corner." We notice also W. H. Pike's clever groups of Venetian incident (Nos. 254 and 298), all examples of freedom of drawing; the life and colour of these bright little pictures are excellent. L. C. Henley's figure, "All in a Garden Fair," is graceful. We notice near it a large canvas, "A Cornish Pastoral," by Julius Olsson (264), intensely green and hard. Jas. E. Grace delights us by his delicately-painted woodland studies, "Sunshine and Shade" (268), and "In the Fall of the Year" (418); and in the same tender mood we place Stuart Lloyd's "After Clouds and Sunset," by some quiet river or harbour. "Wells, Norfolk" (276), is one of these pictures—luminous and full of mellow, quiet colour; the dark, sharply-defined houses against the sky, and the reflected lights are very telling, and to the meditative mind, the admirer of the saddening and pensive beauties of landscape, Mr. Lloyd's work is sure to be appreciated, as he knows how to awaken those emotions. The reflected light in John Burr's "Maid of All Work" (283), and the healthful drawing of the tired girl, who has fallen asleep in a chair with her housemaid's brush in hand, is worthy of the artist. Over the fireplace is a bit of charming woodland in delicate colour by Yeend King, "The Last of the Leaves." Adam E. Proctor's "Pastures New" (304) is broadly handled in a nice tone. The view of Durham by V. P. Yglesias (313); "Homeward Bound" (317), by Yeend King; "Glimmering Night," by J. H. Snell (341); Jas. Peel's "Wensleydale" (380); and Albert Kinsley's "Autumn Fading into Age" (392) are a few of the landscapes in which tone, sympathy, and delicate colour are to be found. No student of the sea and the life of the sailor has done more than F. Brangwyn, who in his large and important picture, "We therefore Commit his Body to the Deep" (381), gives us a noble sermon on canvas of the everyday life and hardships of seafaring men. The group of sturdy fellows who are holding the body of their dead comrade while the chaplain reads the burial service, is a master piece of painting. On the foreground of the deck of the large vessel stand two other men watching in respectful reverence the mournful ceremony. The colour is in a rather low key, and the drawing and accessories in good keeping. In Nelson Dawson's strong seascape, "The Sunset Breeze" (374), one is apt to ask whether so light a sky is not reflected in the sea. Mr. Dawson has, it may be, justification for making his sea deep blue. The trawler, and the treatment, and the high horizon are points of note. A further acquisition to the strength of this gallery in sea painting is Edwin Ellis's "Seaside Neighbours" a headland laved by a deep blue sea. Portraiture of the poetic vein is well represented by G. Sheridan Knowles's "Enid" (308), a face suggestive of Tennyson's lines, and his "Desdemona" (316), very reflective and full of expression. Lord Tennyson's portrait by G. F. Watts, R.A., is a valuable addition. Chas. E. Marshall's "Held by a Thread" has a little too much of the picture-dealer's pretty element in it, though the strong light is well managed, and there is much that appeals to the popular mind in the execution; the same remark applies with more force to R. J. Gordon's rather dramatic subject, "A Rehearsal" (399), a lady sumptuously attired in rich old-gold coloured silk with train, practising before her master. Extreme in its contrast to this, but infinitely more powerful in its reality of human life, is the sombre picture of Theodore Cook, "A Subscription Ball" (389), who shows in a dingy back court two or three pairs of girls of the waif and stray class dancing to an organ, to the satisfaction of some poorly-clad people of their own class. As a realistic representation of the lower order the expression of countenance of the girls, their slatternly dress and amusing deportment, Mr. Cook's work is unsurpassed. In the other two rooms we notice a masterly-painted animal subject, by J. S. Noble, "Weary, but Watchful" (426), sheep on a hillside, though less happy than "On the Road to the Tryst" (371), a herd of Highland cattle. No. 438, "Play Up, Surrey," by G. Roller, is a cleverly-painted full-length portrait of a well-known cricketer — its colossal scale spoils it. W. H. Y. Titcomb's clever study of a lady in walking attire, seated against a white fur; the landscape of Jas. Peel (462); and a clever piece of character painting, "Old Chums," by Theodore Cook (478), are noticeable. F. Cayley Robinson's "On a Silver Sea" should be entitled "A Blue Sea"—clever in its shadows and reflections (488). Over the fireplace is a very charming piece of *genre*, "La Fin d'un Rêve" (527), in Dudley Hardy's best style. F. Brangwyn has two very delicate sea studies (524 and 532). A. de Breanski, "Quary Wood" (505); D. Downing's clever study of a sportsman in top-coat, fortifying himself with a glass of hot whisky; R. W. A. Rouse's "The Brow of the Hill," with cattle, though wanting in atmosphere; J. H. Snell's soft and subtly-painted landscapes (519, 545, 561); and the clear afterglow by Leopold Rivers (567), with the capital portrait of M. Phipps Jackson (547), by J. A. Fitzgerald, are the more prominent pictures in oil.

Among the water-colour drawings we must mention the sunlight effect on road in W. Follen Bishop's "Amberley, Sussex" (6), the sketch of "Rye, Sussex," admirable in the evening reflection and drawing of trawlers, by Arch. Webb; "Shoreham Harbour," by F. Hamilton Jackson; Carlton A. Smith's "Blackberry Gatherers" (10), a very dainty piece of drawing and colour; R. B. Nisbet's "Autumn" (14), lacking atmosphere; and some feeling work by Leopold Rivers (19, 65), in which there is excellent tone and clever sky. The intense blue sea and sky in Fred Mayor's "Three Little Breton Maids" (28), is rather staring, but broad in treatment. Harvey Allport has a picturesque sketch of the "Thames at Billingsgate" (34); and Newton Benett (32) a drawing of "Cattle Market, Sandwich." The work of J. M. Bromley in "Coldash Common" (35), "On the Wye" (55), "Old Houses, Yalding," "Changing Leaves" (142), shows the same conscientious delineation and charm of colour that he has hitherto displayed. One admirable sketch of "York Minster," by Ernest George (63), must be noticed. John Fraser has a luminous drawing of "Lynmouth Fishermen," A. W. Weedon's "Marshes, Winchelsea"; Jules Lessore's "Romsey Market Place" (62), a small but broad sketch, with glimpse of Abbey; Stuart Lloyd's clear and clever drawing of "Rye" (71), John Fulwood's exquisite landscape and river meandering (77), A. M. Rossi's touching incident and clever drawing, "Without a Mother" (84), a little boy putting his socks on at the side of his cot, with a dog companion, are all worthy of attention. Nelson Dawson's drawing of rocks (87), and his very clever and large picture of a shipwrecked boat crew endeavouring to attract notice in a rough sea (126), are of high merit. T. B. Hardy also sends a powerful coast-view, stormy sea (153). W. Harding Smith, two clever architectural drawings, "Crypt of St. Zeno, Verona" (190), and "Pilgrims' Steps, Canterbury" (220), in which class we notice a very clever drawing of the apsidal chapels of the church at Brioude, Auvergne, by R. Phené Spiers (144), and F. P. Barraud's careful drawing of the Choir, Chester Cathedral (206). A terracotta panel, in relief "Women at the Sepulchre," by G. Tinworth must be mentioned.

INSTITUTE OF PAINTERS IN OIL COLOURS.

WITH the exception of a few pictures, the walls of the galleries in Piccadilly present a level of rather respectable mediocrity than of boldness. Such strong and vigorous pictures as those of Robert W. Allan R.W.S., John R. Reid, T. Hope McLachlan help to throw into the background the works of painters of the moderate school. To do justice to each work it is necessary that the critic should endeavour to discount those influences of the stronger and more vigorous methods. Taking a few of the more successful works, we must award praise equally to the mild and tenderer subjects, such as those of R. Halfnight in "Cottar's Home," a soft autumnal landscape (1), and the carefully painted domestic incident of C. Burton Barber, "Too Many Cooks" (14); as to the stronger and more robust handling, as seen in Robert W. Allan's "Haymaking" (2), or to the powerful impressionism of T. Hope McLachlan in "Genevieve" (44) and of John R. Reid. Of these latter painters' work we can admire the earnestness and reality, though the method appears hard, and contrary to the tradition of English painting. The darkness and powerful feeling awakened by "Genevieve" (the sainted patroness of Paris as a shepherd (44), the poetic charm in "A Pastoral" (234), and the hillside "On Askham Fell" (244), appeal not to the many. Mr. John R. Reid's genius is of the same order. The landscape, "Posthamel Farm" (27), powerful in its reality, no glamour of sentiment or picturesqueness is thrown over the simple transcript, the colours look hars

and the handling hard; yet a little study suffices to bring out the artist's meaning and intensity of feeling. "Our River" (143) is not a mere pretty piece of painting that may represent anywhere, but a poem in colour, in which there is a meaning. No. 292, "The Sunny Days of Childhood," is veritably a dream in colour, full of strong sunlight; the youth of both sexes along the brink of a river overshadowed by trees, are disporting themselves like children; the girl in strong light seated at the foot of a tree, has not a suggestion of prettiness in her features, but a type of ordinary girlhood among the toilers by the sea. It is in the charm of colour and the richness of the palette, the blending of hues, lights, and shadows, that we see the artist's work. Frank W. Topham, "He Loves Me—He Loves Me Not!" (6) is a pretty but commonplace study—a girl leaning against a stile repeating the old line. "Too Many Cooks," by C. Burton Barber, already mentioned, is prettily conceived in the grouping of child and dogs. There are several landscapes of more or less merit—C. E. Johnson's "Horse Pond" (37), a corner of meadows skirting a lane coming down to a pond, has all the elements of a pleasing landscape, and some carefully-painted trees. More breadth characterises H. Hughes Stanton's "A Peep of the Arun" (43), with its distance of undulating scenery. E. M. Wimperis is strong, as usual. "A Fresh Day" (92), a broad and breezy common, is particularly vigorous and the colour excellent; "Under the Willows" (318), cattle near a brook, is delightfully fresh and natural. Edw. W. Waite, another painter of open commons, has a pleasant study in Surrey, with a stream meandering through. In Yeend King's "Haddon" we feel the only thing desired is to substitute a less intense and more natural green for the foliage, yet it is a charming peep of the old Hall. J. L. Pickering, "Haunted" (76), paints a desolate house surrounded by gaunt, leafless trees. The old, half-timbered mansion is uninhabited, the old entrance-gates off their hinges, and the trees and water have a weird effect; but there is charming poetry and romance in its conception and handling in the semi-gloom of evening. His other contribution, "Eskdale" (606), is a powerful study of rock and bank. Ernest Parton paints in too vivid a key of green—his "Summer Days at Wargrave" (162), is spoilt. He is far more happy in "Summer Days in Sunny France" (488), a broad, shadowless meadow, and his large canvas in the East Gallery (511), the bank of a river, lightened up by lilies in bloom and a cottage. Sea and coast are represented by such master pencils as Edwin Hayes, C. Napier Hemy, and Alfred East. "Off Portsmouth Harbour" (98) is a noble piece of sea-painting, with gleam of sunshine on forts and craft, and its background of rain clouds, worthy of Edwin Hayes. "A Grey Sunset, Brighton" (327), and a powerful sea study, "Tantallon" (523), in the East Gallery, are other pictures by this master of sea form and colour. C. Napier Hemy has a charming picture of "A Cornish Porth" (57) with its rough jetty of rocks and bright reflected light. "Waves in Sunlight" (45), by Harry Quilter, is a study of rocky coast. The sea is intense in its blueness and the work a little too mannered. Alfred East's autumnal picture on Loch Tay (136), and Miss Lily Bristow's sketch at Exmouth Docks (167)—the latter in nice colour; and Geo. Wetherbee's "Sea Idyl" (23) are other subjects. James Orrock in 33 gives us a freshly-painted landscape, and R. W. A. Rouse (91) a clever cloud study with pearly hues and reflection on water of marsh. The most successful picture of domestic *genre* is John H. Bacon's "A Song of Long Ago," a little girl seated at a piano singing to her aged grandmother (111), touching and full of deep pathos. The subdued light and the faces of both old lady and child are tenderly treated, and in good colour. Other figure studies include J. Skelton's "Arrest of Charles Darnay," from Dickens's "Tale of Two Cities" (126); Haynes King's "An Interesting Paragraph" (119); E. H. Horwitz's clever "Consulting an Expert," an old sailor looking at a little boat; and H. M. Livens's "Corner of a Studio" (47), H. R. Steer's "Freedom and Rest" (50). Miss Ethel Wright's end picture, "Whispers" (40), a nymph clad in light pink diaphanous drapery, her head leaning towards a shell held by a cupid—is deliciously handled, though lacking in the attributes of an ideal treatment.

In the central gallery two small oil sketches, by John Fulleylove, of Ely Cathedral, one from the river and the other from Market-place (181, 189), are worth notice. A finished painting by E. Blair Leighton, "His Last Good-bye"—a young man bidding adieu to his sweetheart on the upper landing of a staircase—has grace and careful drawing of costume. In the same category we must place G. G. Kilburne's "Rivals"—two gentlemen in the 18th-century dress-coats, long vests, buckled shoes, and pigtails, in a drawing-room taking tea with a young lady; one, resting his hand on the mantelshelf, is addressing the lady, the other casting his eyes on his rival with surprise and indignation. The workmanship, we need not say, is excellent. In another vein, and of a different station in life, Arthur Hacker paints a touching and pathetic picture of a Scotchman caressing his grandchild, "His Daughter's Bairn." Sad thoughts and tenderness is written on the face of the grandfather, who has his arm round the neck of a fair little girl, and leans the other on a table on which a basin of porridge stands. Mr. Hacker can express sympathetic emotion, his colour, too, is in not too low a key. The president, Sir James D. Linton, still contents himself with *genre* subjects of an unambitious kind. This year he has two small finished figure studies of a girl dressed in pink. "Gathering Apples" (245) and the "Empty Nest" (400) are both skilfully drawn, sharply defined, and in nice colour. Almost photographic minuteness characterises these studies of the president, who has this time not given us the elaborate costumes and accessories of ladies' dress, but a more modest every-day attire. Both studies are simple and pretty. J. Haynes Williams's "Sweet Silence" is also a highly finished picture. A sweet face of a young lady in white satin in last century, short-waisted costume, and an exquisitely dressed beau, who is admiringly looking at her. The painter knows the taste of the public, and what kind of art pays best. F. D. Millet has also a charmingly painted incident, finished with his usual care and refinement, "Michaelmas Daisies" (319); the bowl and flowers behind the embroidery-frame are in exquisite colour, but the incident tells little. T. Gedge Cheeseman's amusing incident "Their Own Particular Hobby," two old picture buyers outside a second-hand stall examining an oil-painting (326), F. Cayley Robinson's "Ferryman's Daughter," strong in colour and reflection under boat (338)—are clever. Frank Walton's "Camp of Refuge" (380), is a charming piece of forest scenery, rather hard. W. H. Pike delights to give us Venetian groups of faces, flowers, and fruit (301, 391); but they are rather patchy. The little domestic subject of John Burr (377), is feelingly painted. We must notice also the excellent heads of Arthur Hacker and J. J. Shannon, each painted by the other (349, 398), and admirably true to life. R. Thorne Waite's "Blackberry Gatherers" (354), Adam Proctor's "Grey Day" (310), John Parker's "Weir, Streatley" (324), W. Padgett's "Village Cross" (169), Mrs. M. Bowden's "Anemones" (201), and works by Alfred Parsons, Hamilton Macullum (496), Joseph Knight, Ed. H. Faber (458), and Miss E. Magnus (394), deserve notice.

Passing to the East Gallery the chief pictures are few. "Lightsome Labour," by J. H. Lorimer, covers more canvas than its subject demands. The group of figures round the sack of potatoes are admirable, and the expression on the faces of the boy and girl clever. Below it, Keeley Halswelle has a charming marsh and rustic bridge, "On the Banks of the Ouse" (473), and his "Early Moonrise, Venice" (572), is a fine piece of pearly-grey cloud and sea-painting. Miss Janet Cowan's "Surrey Village" is charming in colour and broad in touch; John Scott's "Little Bo-Peep" is prettily conceived, but rather hard; John Stock's large picture, "The Release," a bold, glowing composition, but the figure of the disembodied dead out of proportion. Edwin Hayes' large seascape (523) is conspicuous for its fine colour; and the visitor will find much in T. B. Kennington's pathetic and telling scene "Adversity" (557), an oft-told tale of respectable poverty, and F. G. Cotman's large "Sunset." J. J. Shannon's rather meaningless portrait (642) is not worthy of the master, nor the position assigned. There are a few landscapes and figure subjects, such as Jas. Orrock's "Normanton-on-Soar" (645), rather mannered in style; Edmund G. Warren's landscapes, and E. M. Wimperis's freshly-painted "Cottage on the Common," the latter forcible and true to nature. E. Hargett's Sussex view (533) is hard. Adolph Birkenruth's "Amreis Garden" is graceful, poetic in sentiment, and in nice harmony.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the fifty-seventh session of the Institute was held on Monday evening, when the President, Mr. Alfred Waterhouse, R.A., delivered his inaugural address. Having congratulated the members on the improvements to the Conduit-street premises, carried out during the recess under the direction of Mr. Aston Webb, the honorary secretary, he mentioned that Miss Hannah Jones (the last surviving sister of the late Owen Jones), who died in September last, had bequeathed the residue of her estate, amounting to about £2,000, as an additional endowment to the Travelling Studentship she founded some years since as a memorial of her distinguished brother. The President continued:—Since the commencement of last session the new system of progressive examinations has come into operation. Two preliminary examinations for candidates qualifying as "probationers" have been held in various centres, 169 students presenting themselves; of these, 62 have been declared exempt, and 77 have passed the examination, making a total of 139 who are qualified in due time to come up for the intermediate examination, which will be held for the first time this month. In addition, 54 gentlemen have passed the qualifying examination in architecture, entitling them to become candidates for Associateship. If a man is to take a creditable position as an architect in the future, he must begin by passing these examinations. It seems to me as essential at the present day to have passed them as it was in former years to have spent a certain period in an architect's office as a pupil. I do not say that both courses are not still desirable, even necessary; but it will soon be found that the passing of these examinations is a *sine quâ non*. I would draw attention to a memorial from our colleagues in Edinburgh to H.M. Commissioners for the Scottish Universities, recommending the establishment of a curriculum in architecture at the University of Edinburgh, and the institution of a degree or other university distinction for those who have successfully pursued it. In my last address I animadverted on the impropriety of expecting builders competing for the execution of contracts to verify the correctness of the quantities on which they tender—a practice adhered to by H.M. Office of Works after it had been discontinued by London architects generally. This led to your Council addressing H.M. Commissioners

of Works on the subject, and brought a speedy reply to the effect that the practice would be discontinued. It is to be hoped that the high example thus set will be followed by those bodies in the provinces who may still adhere to what we cannot but consider an objectionable practice, not justified by equity, and calculated to bring the functions of the quantity surveyor into disrepute. We have received two deputations from several of the building trades, inviting us to use our influence for the insertion of certain clauses into our Heads of Builder's Contract—1st, to prevent the subletting of any portion of the work; 2ndly, that all labour employed by the contractor should be of the best quality; and, 3rdly, that the contractor should not pay less than the recognised or trades-union rate of wages, and should observe all recognised rules or customs as to working hours. The Council did not see its way to take any collective action in the matter. Among the subjects which have engaged our earnest attention during the past session, none is of more importance than the revision of the Acts which affect building operations in the Metropolis. The general public may view the subject with apathy, as not understanding how vitally it affects its comfort, health, and well being; in fact, the very magistrate on whom devolves the administration of the said Acts in cases of dispute is said to hate the sight of the district surveyor when he brings his unfathomable technicalities into court. A paper on "Building Legislation," read in this room by Mr. John Slater, in February last, was the theme of, and prelude to, two very interesting and important discussions, and to correspondence conducted by specialists in this matter. Those who took part in them agreed almost unanimously that the time has at length arrived for the codification and thorough amendment and simplification of the some fifteen or twenty Acts and amendments of the same which now regulate building operations in the Metropolis. A warning voice, however, that of Professor Aitchison, was raised against our striving after perfection, by making the cost of houses too great for those who are to live in them. Others objected to building regulations being too definite, so as in some cases to become tyrannical and absurd; but it seems to me that because an existing definition may be found to work in this way in practice—as, for instance, the clause in the Act which limits the sum of the openings in a wall to half its total area—it is a reason for the amendment of the clause rather than for its exclusion. The fault lies not with being too definite, but with the definition not being broad enough to meet varying contingencies. The Act of 1855, having been framed chiefly for preventing the spread of fire from one combustible wooden-floored building to another, is out of touch with improved fireproof construction, which ought, when properly applied, to allow of an increase in the cubic contents of buildings beyond the area now prescribed, at least where the building does not contain goods of an inflammable description. The Act does not allow for the increased amount of glass called for by the ever-growing pollution of our atmosphere; and, on the other hand, does not make due provision against the danger from fire incident to the use of lifts. It does not realise our greatly extended requirements in the present day; nor our extended building knowledge—our knowledge, for instance, of the treacherous nature of stone and iron in case of fire. The Act does not deal with important questions affecting the rights and obligations of adjoining owners; it does not concern itself, except by implication, with the underpinning of party-walls and of adjoining structures in cases where the new structure, going below the old one, affects the safety of the latter, and involves such a procedure. It ignores sanitation, and does not trouble itself about the formation of new building estates, where, of course, the evils we have most to deplore in our streets and thoroughfares can be most readily prevented. Mr. Slater urges, with reason, the necessity of either making our Building Acts of the future sufficiently expansive to meet such cases, or of giving our district surveyors a discretionary power to enable them to deal with special cases in a practical way. Probably his first alternative would present, in practice, the fewest difficulties. The urgency of this subject has been pressed upon us lately by the London Council (General Powers) Bill, which appearing at first as if it chiefly related to a bridge at Barking Creek, and the acquisition of a new park for South London, was in reality of much more widespread interest. It proposed, in fact, important amendments in the Metropolitan building regulations, some of which could not be looked upon with favour. A memorial was thereupon addressed by your Council to the London County Council on the subject. We pointed out that many of the changes proposed were of temporary expediency, and many wanted further consideration, as, for instance, those clauses affecting sites at the corner of two streets, in one of which the line of frontage had to be set back, where the owner of the corner site would have had to set back also without compensation; and those affecting the heights of new buildings. We further pointed out the desirability, when an application was refused, of the grounds of the objection being stated, so as to enable the applicant to amend his designs to meet such objection. We also remonstrated against this indirect mode of introducing legislation seriously affecting private rights and questions of principle, and urged the advantage of promoting a thorough amendment and consolidation of the Metropolitan building regulations. Some of these recommendations were accepted by the County Council, and their Bill was amended accordingly. One of the most important provisions of this new Act is the establishment of a Court of Appeal in questions of frontage, &c. The Court is to consist of three members—one appointed by the London County Council, one by your Council, and another by that of the Surveyors' Institution. The County Council deserves praise for its initiation of this reform—or rather this revival, under fresh conditions, of a tribunal established by the Act of 1844, but which, from its peculiar constitution, became a dead letter, and I sincerely hope it will work so well in practice as to show the propriety of giving to such Courts greatly extended powers in the future. The Act also fixes for the first time in London a limit to the height of new buildings not being the rebuilding of existing structures of a greater height. Ninety feet is the limit, exclusive of two stories in the roof, and of exceptional features, such as ornamental towers or turrets and dormers. This should satisfy even the most aspiring among us; if it does not, there is still the right of appeal to the tribunal before referred to. Having thanked Mr. Arthur Cates and Mr. E. T. Hall for the part taken in criticising and improving the Bill, Mr. Waterhouse continued: Even were we to get the most perfect Building Act for the regulation of our practice, it should be the function of someone—or rather of some collective body—to take a broad artistic view of that immense chaos called London; and, as opportunities arise, to point out in what way it can be improved as a work of art. The members composing such a body must be men of business as well as artists, or their recommendations would soon cease to have any practical value. In laying down the line of a new street, it would be their duty to see that its extremities either ended in some existing building worthy of closing the vista—as, for instance, the Strand, in the Church of St. Mary; or that a site was reserved for some future erection with that object in view. It would be their duty to see that the best sites along its course were reserved for buildings of a character becoming their position, and that a flagrant want of harmony was not suffered in contiguous elevations; and while always dealing indulgently with such as were modest and refined, the tribunal would be resolute in refusing the acceptance of designs of vulgar ostentation—creations of the nightmare school, of which, unhappily, we have examples already thrust upon us. Indeed, we may have more if there be no authority to check this worst form of inflated advertisement—the worst because it involves the prostitution of a noble art, and, when once erected, is not easily got rid of. I am not forgetful of Professor Kerr's pathetic inquiry, "If Heaven has made us Philistines, how can we help it?" But this, as it seems to me, is hardly a question of a man's right to do what he will with his own, provided he does not injure his neighbour. A street is public property, made not only for the use, but for the enjoyment, of the public, and it cannot be an enjoyment so long as it is vulgar or monotonous and ugly. I plead for the creation of some responsible body of men, by position, education, and cultivated taste specially fitted for the task, whose main duty should consist in advising upon and controlling, from an artistic point of view, those works on which the future of London so much depends. An architectural council, to be appointed by the Government, and to be partly composed of professional men, is wanted in London. I plead, moreover, for the public exhibition of the plans of all Metropolitan improvements prior to any final decision being taken upon them. Such a course would tend to create an intelligent interest in improvements which at present does not exist in London, and it would enable those who have to pay for them to consider in time if the proposals be good, practically and æsthetically, or otherwise. We have obtained a tribunal before which certain Metropolitan building cases will be tried, and if success attend the labours of this tribunal, other and perhaps more important matters relating to building may be referred to its judgment. So far so good. But more is wanted, namely, an architectural council for national works, which should also be intrusted with the consideration of proposed improvements, and of all those questions on which the future of London so much depends. The system recently inaugurated of publishing criticisms on the work of students for our various scholarships and prizes is one of great value. It shows the unsuccessful student wherein he has failed, and so guides him to a better chance of success in the future, pointing out even to the winners how to attain greater excellence, if willing to listen to the friendly advice of experience. With reference to the work of those to whom travelling studentships are awarded, what we should like to see is not mere evidence of their industry—that is seldom wanting—but a greater desire to make quality, apart from draughtsmanship, and not mere quantity, their aim. There should be among our students a little more of the thoroughness which characterises the work of the French students, whose magnificent studies displayed in the Galerie Rapp, in last year's Exposition, so much impressed those of us who had the opportunity of examining them. I say "a little more," because in France, perhaps, this work is carried out with too great elaboration. Still, I would have our students make themselves so conversant with any work they analyse as to be able to pass an examination on its construction and features; and it would be well if the knowledge thus previously acquired by the candidate in the study and delineation of some ancient example were put to the test in our examinations more strictly than appears to be the case. If the architect-student knew that it was not by the mere number and beauty of his sketches, and by the accuracy of his measured drawings of old edifices, that he would satisfy those who had sent him forth on his travels, but by the proofs he was able to afford that he had absorbed and digested what he had seen, our studentwork would sometimes be more thorough, and the men themselves in some cases would be the more ready designers after having had such preparation. Having got the ancient examples into their heads, instead of merely into their sketchbooks, they would learn to lean not on illustrations and other extraneous help, but on what had become a part of themselves, and so prove not mere copyists, but self-reliant and original designers. If such careful analysis of a single example of architecture is recommended to the student, it is highly important that he should know beforehand what buildings will best repay the time thus devoted to them; and it would be a work of very great interest and utility if those best qualified for the task were to catalogue such buildings, giving their date and most noteworthy features and characteristics, not disdaining to mention also their distance from the nearest railway station, and the existence and name of the neighbouring inn, if any. The student should be encouraged to go where he could study good architecture rather than redundant and often misapplied elaboration. A question is often asked as to the best mode of training a youth intended for the profession of architecture. How should the early days of one who intends to study architecture as a calling be spent to the best advantage? To such I reply: He should have received in his schooldays some preliminary training of a scientific as well as of an artistic character. He should learn early to understand and appreciate the beauties of a fine building—of the civic and domestic edifices, the grand cathedrals and churches, the noble streets and open spaces, with which many a city in this country is endowed. He should be taken to museums of "comparative sculpture" such as the initiative of Violet-le-Duc created in the Trocadero, and, in default of similarly arranged educational institutions at home, to the sculpture

galleries of the British and the South Kensington Museums. In fine, he should, in his early, pliable days, be shown the works—or casts or drawings of the works—of the great architects of various countries, and thereby acquire an insight into the magnitude, the nobility of the career upon which he is about to enter. At the same time, his ordinary education should not be neglected. He must pass the matriculation examination of a university, or the local examination conducted under the authority of a university, or he must obtain some testimonials of proficiency granted by well-known educational bodies. Then, armed with such letters of introduction, he should come to the Royal Institute of British Architects, where he will be cordially received; and thereupon, after the necessary inquiries as to his certificates and after examination of his powers of draughtmanship, he will be admitted a probationer. His next proceeding is to be articled, say for three years, to some practising architect on the conditions suggested in the form of articles which has recently been published, a most important item of which states that "with the object of enabling the pupil to qualify himself for passing the examinations for students and Associateship of the Royal Institute of British Architects, he, the principal, shall and will allow the pupil such absence as he, the principal, shall deem reasonable for the purpose of attending lectures, classes of instruction, and the said examinations." During the term of his articles the pupil, or rather the probationer to whom I am alluding, will have to prepare the "testimonies of study," which he has to submit to the Board of Examiners before he can be admitted to the intermediate examination; and to assist him in the preparation of these "testimonies" in London he will, if properly advised, become a member of the Architectural Association, attend its classes, periodical visits to buildings, &c., and thus mix with others engaged in a similar course of study. During all this period the Reference Library of the Institute is open to him, and he can borrow books not only from the Lending Library of the Association, but also from that of the Institute. At the end of his articles he passes the intermediate examination, is qualified as a student of the Royal Institute of British Architects, and his name and address are inserted in the register of members of the Institute, and published in our Kalendar. He afterwards competes for the prizes offered by the Association, and then for those offered by the Institute. He gains a prize, perhaps a studentship, which enables him to travel in France or Italy, or even as far as Greece. He returns to England, enters an office as assistant, prepares his probationary work for the final examination to qualify for candidature as Associate; he passes the examination and is registered Associate. I confess that this record of the younger days of an architectural student seems to me a fairly complete one. No President of this Institute, forty or even twenty years ago, could have told a similar tale. Possibly, in a not distant future, we may find it better to use a course of instruction somewhat analogous, let us say, to that pursued by Professor Ware in New York, as a preparation for entering an architect's office, than that theoretical instruction of the sort just indicated should go on *pari passu* with pupilage. For a pupil to reap the full benefit of his time in an office, he should as soon as possible find himself set to practical work, and work of this sort in a busy age can hardly wait for one who spends a considerable portion of his time in abstract study; indeed, this term of pupilage might be greatly shortened were it to follow rather than be contemporaneous with theoretic training. For many years the professional education of our pupils has been assisted by the well-directed efforts of the Architectural Association. Its method consists in the members helping themselves and each other; and no better could be devised. The general committee of the Association recently formulated a systematic course of instruction to meet the requirements of the Institute examinations, the programme of which course was to include the study of the principles of design and construction on the drawing-board in class. This more complete system of instruction was not, however, adopted by the general body of members of the Association, and the inauguration of the scheme has been postponed. I reiterate what I said last year, that the Institute should, if the way be made clear, give substantial help to those who, during a long and prosperous period, have shown an earnest determination to help themselves. But how or in what manner this helping hand should be offered to the junior body—how it would be received, or whether it would be taken at all—are points which do not appear to have received due consideration from those most concerned. Are we to indirectly support the Architectural Association, when it has made up its mind as to what it would like to accomplish in the way of teaching, and when it asks the Institute for aid? Or are we to set on foot some corporate machinery of our own for the systematic instruction of those members of the Association and others who are studying to pass the progressive examinations of the Institute? These are vital questions, which demand our most serious attention; and I will attempt to lay before you a short statement of facts relating to them. At present the educational work done by the Association does not appear to afford any great material assistance to the Institute. The Association numbers 1,129 members, of whom 276 are also members of the Institute, and 40 more are probationers of the Institute. The total number of our probationers is already 164, and of these only 40 are members of the Architectural Association. One thing therefore seems to me certain: the relative position of the junior and senior bodies of our profession in the matter of recruits has undergone, or at least is undergoing, a great and sensible change. The Institute has emerged from the state of a dilettante society into one of an eminently business-like kind, with recognised functions of a public as well as professional character. The Architectural Association, on its own showing, does not appear to possess at present the means to adequately fulfil the functions of a teaching body. Such being the case, it behoves us to look the new aspect of our relative positions in the face, in a business-like way. The general committee and the subordinate committees of the Architectural Association are largely, if not mainly, composed of members of the Institute, and the instructors in most of the classes are members. The Association holds its general meetings in the Institute rooms; when its honorary secretaries apply for the use of a room in which to hold a class, the Institute lends one. Every member of the Association under twenty-three years of age has the use of both the reference and lending libraries of the Institute; and any member over that age, if he asks permission, is allowed the use of the Institute library, which, as a matter of fact, is open all the year round to every architectural student properly recommended. The President or a representative of the Association has a seat at the council table of the Institute; in fact, it has the right to be there represented. The actual connection between the junior and senior bodies is much closer, much more intimate, than the majority of those who talk about the subject are aware; and the Institute has never seen cause to regret the closeness of that connection. It sees with interest and approval that the Association is asking itself the pertinent question whether the facilities it affords to students desirous of working in its classes are sufficient for the requirements of the time, and whether several things which involve considerable outlay of Association funds might not with advantage be abandoned with a view to augmenting the sum available for teaching purposes. At the present moment, in spite of the close connection which exists between the Institute and the Association, in spite of the fact that we both inhabit the same building, the two bodies maintain two distinct libraries and two distinct registers of architects' assistants; the two bodies publish two distinct Kalendars and two distinct Journals. Now, though fully alive to the advantages of healthy competition, especially to the young and aspiring, I question the utility of thus doubling our labours, if not our expenses; and from a business point of view alone, I venture to urge upon the members of the Association the desirability of considering, in conjunction with the Institute, the present duplication of our expenditure and consequent division or diminution of our forces. If I may be allowed to make a personal suggestion, I should say, let us join, not divide, our forces, and in such a manner that, while maintaining the autonomy of each body, the Association might devote its funds more exclusively to teaching purposes. We already house the Association for its general meetings; why should we not house its library, leaving the administration of the same to its honorary officers? Why should we not combine the two registers of assistants in one, to be kept in the office of the Institute by a clerk who should also answer the many and often unheeded applications that are made on the subject of the Association, its membership, its classes, &c.? Why should we not include the "A.A. Brown Book" in our annual calendar? Here, at least, are points which a joint committee of the two bodies might well consider, and in suggesting them I do so on my own personal responsibility; and, further, I have no thought or wish to see the two bodies, senior and junior, welded into one. On the contrary, any such amalgamation is impossible under the present constitution of the Institute; and, even were it possible, it is not, in my opinion, desirable in the interests of either the Institute or the Association. Having referred to the excellence of the lectures read before the Association and to the "Arts and Crafts" Association, who are, Mr. Waterhouse thinks, doing work which ought to have been done by the Royal Academy, the President added:—M. Lucien Magne, who, like his late father, is an architect practising in Paris, has recently written a criticism of the British architectural drawings exhibited last year in Paris. He thinks that our works are distinguished by their quality of picturesque composition, but they lack, he says, that original note which is the result of the proper appropriation of details and profiles to the desired effects of light and shade. Modern English architecture is of particular interest to our French confrère, in that it does not appear to be the expression of conventional teaching; but, on the contrary, a manifestation of particular wants. In the irregularity of plan, in the determination to give to each part of the façade a form resulting from the destination of each room within, M. Magne sees a reminiscence of the traditions of our art in the Middle Ages and the Early Renaissance. He then goes on to compare the design for the Imperial Institute with the majority of the compositions of the Pensionnaires de Rome, and says that in it Mr. Collcutt displays a liberty and boldness in his disposition of masses, an elegance in treating the silhouette of his building, which are not often to be found in the contemporary work of French architects. Such praise, coming from such a pen, is, of course, very gratifying to us; but it contains also a note of warning against the dangers attendant on the established teaching of architecture not as a science but as an art. I hope we may lay to heart the true lesson which our French confrère would instil—not to lose our freedom and liberty in design by reviving the formulas of an architectural education conducted everywhere on the same lines. I do not think there is at present any danger of this. The exercise of our liberty grows with what it feeds on; indeed, it seems to tend in many cases to licence: and there are modern buildings in this country which display in their details a recklessness of what thoughtful men, with ordinary reasoning power, consider appropriate. One of the dangers to be dreaded in alluding to contemporary work is that it may not have been my good fortune to have seen some of the best and most characteristic specimens of it, and that, therefore, mention of them may be unintentionally omitted. Speaking generally, I cannot help noticing a curious tendency in the work of some of the most esteemed of my contemporaries: the introduction in the same building of parts avowedly made to look as if designed by different people in different ages. We rightly appreciate the charm which is given to old buildings by the work of successive generations. The craze for the destruction of everything not of the original period of a building's history in its restoration has now happily passed away, and we are zealous to preserve the history written in the stones of our buildings as we find it, if there is no imperative reason for its removal. But surely that is a different thing from constructing fictitious history. If we cannot help being eclectic in some sort, ought we not at least to try to produce a harmony in our work, and leave it for others who shall come after us to introduce other styles and modes of detail? I feel it the more incumbent on me to say so, as having myself spontaneously sinned in this respect in my youth, and once or twice latterly at the instance of clients, who frequently, without due consideration to harmony and fitness, insist on the repetition of forms and details which have pleased them elsewhere. The tendency of our work in this country at present is unquestionably towards smallness of parts: we

strive for the picturesque rather than for grandeur, and lose much thereby. As an instance of a reaction against this tendency, I would venture to speak of Mr. Sedding's Sloane-street Church, with its two fine campanili, its magnificent windows, and its nave wider than that of St. Paul's Cathedral—in fact, to the unusual aspect of breadth and space which he has imparted to the structural parts of this fine work. Another instance of the dignity begotten of a broad and simple treatment, in the hands of a master like Mr. Norman Shaw, is the new central home of the Metropolitan Police. It is a building which forces itself on the attention, and gives pleasure in no ordinary way, however much the critics among us may think they could improve it in a detail here and there. Mr. Pearson is to be congratulated on the magnificent effect of his new front to the north transept of Westminster Abbey. I am told it is nearly line for line what was there before, and yet the impression produced is very different. This difference arises not merely from the newness of the stone, but from a certain artistic piquancy and 13th-century flavour about it which the poor pared-down and sadly mutilated old skin certainly did not possess. The Royal Commission on Westminster Abbey, convened to consider the building's capacity for further interments and monuments to the most illustrious of her Majesty's subjects, has not yet reported progress; but I may here mention, as the inquiry has been a public one, that though there is room in the Abbey for some eighty more interments, there seems to be no more space for monuments without doing still further damage to it in the future than has been done so ruthlessly in the past. The objection to the removal or rearrangement of any of the monuments, however destructive to the general appearance of the interior of the Abbey, or revolting to the taste of the day, seems insuperable in the present state of public opinion, and under these circumstances various schemes for erecting a memorial chapel within the precincts of the Abbey have been laid before the Commission, and duly considered. They will shortly be reported upon. Unanimity, however, on such a subject is not to be expected. I have been invited to say something about the painted decoration of St. Paul's. If I have hesitated to do this, it is chiefly because I do not know enough about the intentions of those who have charge of the work. The painting of the stonework near the reredos is at present obviously incomplete, and so it is impossible to judge of its ultimate effect; but few have shown themselves better fitted, by what they have done elsewhere, than Messrs. Bodley and Garner to advise in such a question. It is certain that Sir Christopher Wren painted in oil paint the walls of the nave and nave-aisles, and therefore some may say we have his authority for painting them again. It will hardly be questioned, however, that one of his motives for doing so was to avoid a worse evil: the disintegration of some of the stonework of the interior from damp. This seems to have been the case at the west end of the church; in the choir distemper was used, which seems to indicate that paint having been resorted to in part of the church, it was found necessary to bring the rest of the fabric into harmony with the painted part. When the cathedral was warmed with hot water, the coating of paint was no longer necessary as a preservative, and so it was removed and the colour wash removed with it. The stone has now a charming variety of tone, heightened in places with the white mortar in its pointing, and it is a very grave question whether we shall ever get any painted decoration as satisfying as, or approaching in dignity and solemnity to, what we have now in the warm and varied tones of the masonry, smoke-begrimed and dingy though they are. Whatever may be thought of its sculpture, mounted on a red marble background, and relieved by partial gilding, the reredos appears to me in its architectural portions to be a work worthy of its surroundings; but I am very jealous of its being treated as the keynote for the whole cathedral in point of colour, and should be inclined to question the advisability of any scheme of decoration which, in order to secure harmony throughout the whole building, would involve the repainting of the walls generally. If such renovation be determined upon, where is it to stop? Can it stop short of the western doorways? I am bound to admit, however, that the great architect of the building suggested such a treatment by what he himself did in its eastern extremity; though he perhaps here allowed himself, in the obscurity of the apse, a strength and contrast of colour which he may have felt would destroy the unity of the interior if carried down the choir and nave. On the other hand, were the plasterer's work in the vaulting relieved with gilding, the effect might be very charming, and without injury to the harmony of the interior. I feel it a delicate task to criticise what very likely I do not understand in all its bearings; but I am very sure of this: that we as architects do not look upon the work going on in St. Paul's with apathy, but are, on the contrary, keenly alive to its importance, and are most anxious that nothing should be done to destroy the dignity and unity of what is perhaps the grandest Renaissance monument in Christendom. The increasing attention paid to the use of faïence for internal decoration is a matter of much importance in our dirty atmosphere. It enables the architect to insure that his more important apartments shall remain as he designed them. Most of us who have had long experience as practising architects must have been occasionally disconcerted in discovering that some interior which depended greatly on its harmony of colour, and which we may have thought more or less a success when it left our hands, had been handed over when in need of repainting to "the tender mercies of some decorator, who, failing to appreciate the delicate scheme of colour upon which we had prided ourselves, or perhaps wishing to make his speciality more pronounced at the expense of the architecture of the room, had sown discord and vulgarity broadcast over our creation. Now, the use of faïence would put a stop to all this. If well applied—the forms specially designed, the colours, too, carefully studied, and violent contrast avoided—faïence offers to the architect a new and interesting field for permanent decoration. It seems almost impossible to be too careful in the juxtaposition of varied tints, as they look so much more violent in a building than when put side by side in the workshop. As an instance of the successful treatment of a ceiling in this material, I may instance that of the Union Discount Company in Cornhill, just completed from the designs of Mr. MacVicar Anderson. It is a matter of sincere regret that a few of our most distinguished brother architects who are not members of our body look upon the Institute with apparent indifference and distrust. That certain names are not to be found among our list of members is a grief to me. I cannot, of course, say that they would confer any benefits upon themselves by joining us, except the benefit that all must derive from united action for a good and worthy object. None of the architects whose absence from our body I deplore would dream of doing anything which our by-laws forbid us to do. It is not, therefore, the dread of losing the complete liberty of action we all hold so highly which prevents their joining us. I trust we shall never give up the hope of seeing them within our ranks, never let them feel that their presence here would be anything but most welcome, and an encouragement to us to persevere in our endeavours to make the Institute the worthy upholder of our art. The dignity, the greatness of our profession arises from its responsibilities; and in this it differs from all other artistic vocations. The painter has only to please himself in the subject, the inception, and execution of his work. If, when finished, it is thoroughly successful work, in all likelihood it will find a purchaser. The architect, on the other hand, can find nothing to do, can give no satisfactory proof of his capacity until somebody comes to him who is willing to trust him. Consider what that trust is. Not only is he intrusted with the expenditure of large sums of money, but of money expended in such a way as to affect the comfort, the happiness, often the whole tone of the existence, of those who employ him. The client who employs a worthless and incompetent architect not merely throws his money away; he has to endure a far heavier misfortune. He has to live the rest of his days in a house, or worship in a church, or conduct his business in an office or a bank, which he would willingly erase from the face of the earth if he saw his way to such a termination to his disappointment. But practically his annoyance cannot so be put an end to. If the building he has commissioned be ugly, ill-contrived, and badly executed, so it must remain—a constant source of trouble to himself, of derision to his friends and the public. We have, therefore, to show ourselves worthy in every way to be trusted. We have to be sympathetic, putting ourselves, so far as we can, into the circumstances of our clients—not leading them into unexpected expenditure, not, on the other hand, following their whims if our greater knowledge and experience tell us plainly that such a course will lead to disappointment. The architect, therefore, has to be not only an artist and a skilled constructor, but he must learn to appreciate the value of other people's money; he must be considerate, honest, patient, firm; and, above all, he must learn in imagination to put himself in the place of his clients, so as to understand their desires. If he were all this, we should hear little of complaint against the profession. We should be respected as we respect ourselves, each other, and our art, which ought to be to us the first consideration, entirely irrespective of material reward.

Professor Kerr, in moving a vote of thanks to the President, observed that the address to which they had just listened was a practical, commonsense discourse, going to the heart of everyone present, whether artist or man of business. It was so peculiarly discursive that it was difficult to take up any one point for comment. The President had referred to a haphazard remark dropped by the speaker on the Philistinism of the age; but he would point out that what he (Professor Kerr) said was not that architects were Philistines, but that they must endeavour to improve and ameliorate the Philistinism of the general public. The Government always assumed a Philistine attitude towards art, and was not likely to alter; but the present tendency of the public mind was unquestionably towards an improved artistic feeling. He believed that under the Anglo-Saxon flag a distinctly artistic nation was destined to arise.

Mr. William White, F.S.A., seconded the motion, which was put to the meeting by Mr. MacVicar Anderson, and carried by acclamation.

NATIONAL ART CONGRESS AT BIRMINGHAM.

During the present week the third annual meeting of the National Association for the Advancement of Art is being held in Birmingham. The opening meeting took place at the Midland Institute on Tuesday evening, when a Presidential address was delivered by Mr. J. E. Hodgson, R.A. While no institution or system of education could produce genius, we could provide a fitting reception for it, so that when a man of genius appeared he should have scope to develop himself, and should not languish for want of employment. The subject selected for this year's consideration by the Conference was that of Art Education. As the boundaries of human knowledge had been extended, education must be specialised, and this told disastrously on art, which admitted of no specialising. The range of art, like that of science, had extended, and the conditions under which it was practised had become much more complex. Education, therefore, had become more difficult in a corresponding way. When we turned to art as applied to industrial and decorative purposes we came to a state of things even still more complex. The Congress was seeking to educate public taste, to spread abroad a desire for what was beautiful, to bring together artists and workmen, and to clear away the dead load of indifference, of ignorance, and perverted taste which had been permitted to overwhelm this and almost every other country in Europe. In his address to the section of Museums and and Industrial Art, Mr. Philip Rathbone, the President, alluded to the educational value of stately municipal buildings, remarking that the town halls of Birmingham or Brussels made a man prouder of being a citizen of one of those cities than the knowledge that it contained so many hundred thousand inhabitants. He insisted on the intimate relation that ought to subsist betweeen sculpture and architecture, and satirised the want of intimate association or relation between our public statues and the buildings they faced.

Mr. J. Thackray Bunce followed with an address on the "Encouragement of Art by Municipalities."

Mr. Selwyn Image read a paper on "Colour in Relation to Internal Decoration." Along with our return of interest in embroidery, he said, sprang up what was really a mania for old china and pottery; and, as we covered every chair, couch, table, curtain, and screen in our houses with "art needlework," so the walls were hung over with plates, the mantelpieces and shelves

were crowded with pots. A dwelling-room, it should be remembered, is not a museum, and as with an undue display of needlework we sometimes make our houses too vividly recall a bazaar, so sometimes we make them too vividly recall a museum with our blue china and lustre ware.

Mr. Brett, A.R.A, suggested that having stained glass in windows monopolised all the colour in decoration.

Mr. T. G. Jackson considered that everything in a room should be useful. In houses furnished on artistic principles they too often found this overlooked. There was nothing so uncomfortable to sit upon as the chairs and sofas sold by certain art establishments.

Mr. Ralph Nevill, F.S.A., read a paper on "The Study of Local Architecture, especially by Schools of Art." He called special attention to the importance of the study of actual buildings as they exist instead of fine drawings and book-case architecture. To suggest the importance of a closer and more systematic study, he urged, is by no means unnecessary. In these days, when so many illustrations of buildings are published, it is tempting to copy the style of some well-known architect, without going through the training and acquiring the thorough knowledge that he has. The ordinary modern building shows no sign of any close study of the delightful old stone mullioned windows and gables of a stone country. The William of Orange, Anne, and earlier George periods all furnish abundant examples of good metal-work which should serve as examples to manufacturers of Birmingham. Yet every architect knows to his cost the immense trouble to get any of the humbler articles of such pattern as shall be at least tolerable. Take, for instance, iron casement furniture, and compare the old patterns with their graceful curves and turns, and the extremely common things that are thought good enough for even expensive fittings of to-day.

In the discussion afterwards, Mr. E. R. Taylor, the head master of the Birmingham Art Schools, suggested that defective art training had some-to do with the poverty of modern architecture in the local art schools. It was among the students who could draw only with a T-square that the architect's pupils were found.

On Wednesday, Mr. T. Graham Jackson, the President of the Architectural Section, delivered his address, his topic being "Architectural Education." Highly as he rated the system of apprenticeship, it was clear to him that the pupil would not find in it all he wanted. He would see in his master's office only the kind of work that happened to be going on, and would have to supplement it by private study. To practical studies the architect must add that which was to make him an artist, and to that end he had to take into consideration not only the current art of the day, but that of the past. Art had its literary and historical side, and he would have to study that independently of the work of the office, by reading and by visiting ancient buildings. Sketching must always form a principal part of an architect's education. Mechanical drawing formed a large part of an architect's work, and neat geometrical draughtsmanship up to a certain point had its use; but often a great deal too much stress was laid upon it. Supposing the would-be architect to have acquired a fair knowledge of practical construction, of the mode of making drawings for workmen to work from, and some skill in freehand drawing, Mr. Jackson would have him during his pupilage, or at the end of it, pass a few months under a clerk of works at some building —best of all on one for which he had been making drawings in the office, so that he might see how his own work on paper looked when realised in stone or wood. It was in that *rapprochement* of architecture to the handicrafts—of the architect to the craftsman—that he saw the only opening by which they were likely to make any sensible progress. Happily, the day had gone by when the architect's work was supposed to begin and end with the bricklaying, the carpentry, and the drains. The architect of to-day was expected to be able to design everything, from the building itself down to its furniture, and to work in all kinds of materials, from marble to stone, from stone to wood, and from wood to iron. He must understand colour as well as form, and be able to design not only the carving on his walls, but the needlework of the hangings, the wrought-ironwork of the gates and screens and railings, and all the metalwork down to the hinges, locks, handles, and finger-plates of his doors. But in order to design successfully in so many handicrafts it was necessary he should understand the technical difficulties and the possibilities of every one of them. The cry of the day among artists was the solidarity of art, the kinship of architecture, painting, and sculpture, as three modes of saying the same thing—three vehicles of artistic expression that ought never to have been forced asunder, and could not thrive apart. It was the healthiest sign of the day that that intercommunion of the arts and artists was gaining ground, and that the number of men was increasing who could design not only the building, but also its decoration, and not only the decoration, but also the building itself. The education by which he would have young architects trained for their work, was not one that began and ended on the office stool on which he perched as a pupil, and with mastering the principles of construction as explained in books and drawings, but one supplemented by reading, by sketching, by thinking, by following his work into the workshop or to the building, by constant communion with other artists, by learning to model, and, above all, to draw the figure from casts and from life, as the root and key of all decorative design and the centre of all art education.

Mr. Reginald T. Blomfield, in a paper on "Architect and Artist," roughly classified architects as the practitioner, the practical man, and the exploiter, or the man with the ghost. Architects failed in two ways—in attainment, and in their attitude towards their work. The architect who put his work out, and the artist who drew each line himself and made and remade his designs till they satisfied his own ideal, and spent days in modelling and in watching the modelling of his work—each received his 5 per cent., and the public was equally indifferent to them both. But the man who spent all that extra time and trouble was at least an artist. If an architect claimed to be an artist he must realise his responsibilities, recognise the fact that about half his work would be a labour of love to him and his own reward; and he ought to be prepared to make those sacrifices as a matter of course, or else acquiesce in his proper position as a business man or tradesman.

In a paper on "Education in Art," Mr. J. Brett, A.R.A., laid down the following three propositions:—1. That technical education, in the sense of practical training by artists, is not necessary; 2. That it has done more harm than good; and 3. That it cannot now be had. His severe strictures upon the art methods adopted by the Dutch and Modern French Schools, notably on Hobbema and Vandevelde in the former school, and Millet in the latter, gave rise to an animated discussion. The portrayal of "Modern Life in Art" was defended by Mr. Stanhope A. Forbes; "The Present State of English Water-Colour Painting" was regarded from a pessimist standpoint by Mr. W. J. Wainwright; while at a combined meeting of sections B, C, D, and E, an amusing paper on "Advertisements as a Field for Design" was read by Mr. Heywood Sumner, another by Mr. W. H. Bidlake on "Architectural Drawings," and a third by Mr. T. R. Ablett on "The Art of Art Teaching," in which the author declared that the battle of the interests of art examination had yet to be won. An interesting address on the secret of knowledge was delivered to working men in the evening by Mr. Hodgson, R.A., who had given it the title of "Open Sesame: or, How to Unlock the Treasure House."

Yesterday (Thursday) Mr. A. H. Mackmurdo delivered a Presidential Address in Section D; after which papers were read by Mr. Alfred Gilbert, A.R.A., on "Metal-work," and Mr. Henry Holiday on "The Figure in Design," and Mr. J. W. Tonks on "Art as Applied to Jewelry and Personal Ornament;" while a combined meeting of the four other sections was held in the afternoon to hear a paper by Mr. James Orrock, R.I., on "A Gallery of British Art." To-day (Friday) a Presidential Address will be delivered by Mr. George Simmonds in Section B (Sculpture), to be followed in that section by papers by Mr. E. Onslow Ford, A.R.A., and Mr. B. Creswick. Messrs. W. Kenwick, M.P., and E. R. Ashbee will address Section E, and at a joint meeting of the other four sections Mr. Aston Webb will read a paper on "The Education of Architects," and Mr. F. G. Jackson, of the Birmingham School of Art, one on "Art Education in Relation to Industry." The closing meeting will be held to-morrow morning, when an address will be delivered by Mr. W. B. Richmond, A.R.A.

PASTELS FROM THE LIFE.

WILD animals are scarcely the subjects for an architectural journal, but we draw early attention, nevertheless, to a very admirable collection of such studies just opened for public inspection in Mr. Dunthorne's highly artistic gallery in Vigo-street, W. Mr. Wm. Unsworth, the architect, has recently altered these galleries, which he originally designed, and he has certainly imparted an individuality to the "Rembrandt Head," as the premises are called, which is not to be matched in its way in London. The arcaded gallery leading from the entrance is treated with white woodwork of exceedingly refined detail, and the delicate ironwork in grille and other fittings deserve particular mention as instances of care in minor matters. Unfortunately, owing to unavoidable circumstances, this gallery is badly lighted; but otherwise the treatment, so far as the architect is responsible, deserves much praise. As to the pastels shown by Mr. J. T. Nettleship, we may say they are, generally speaking, full of vigour, true to nature, and perfectly natural in colour—qualities which at once command attention. The breadth so necessary in pastel drawing is prominent in all his work, and in no example is the artist's ability more conspicuous probably than in the small study of a Golden Eagle (No. 30), wherein the varied browns which mark the beautiful plumage of that truly noble bird are rendered with exquisite and almost miniature like delicacy. No. 28, "A Lion Roaring," is a bold but soft drawing; and the same remark specially applies to the "Polar Bear and Cub," No. 44. "The Wapiti Stag" (No. 56) furnishes a dashing drawing, showing its antlers to the fore; while in No. 60 we noticed the skill in rendering the texture of fur so characteristic of the brown bear, whose keen, small eyes even in repose are full of intelligence and active watchfulness. Space prevents our enumerating other specimens, though we cannot pass over "The Bloodhound Puppy," No. 49, which is lifelike to a degree. "The Griffin Vulture Flapping" (No. 43) is a more striking subject; and the "Blue and Yellow Macaw" (No. 11) naturally furnishes effect of brilliant colouring. The head here seems a trifle crude and hard in line, and we observed a water-colour sky washed in to the picture of a "Pony and Foal" on Dartmoor (No. 6) as an exception to pure pastel work.

CHIPS.

Patrick Kenny, a labourer, aged 54, was charged at the Lambeth Police-court on Saturday with stealing some pieces of wood, the property of Messrs. Peto Brothers, contractors for buildings in course of erection in Brandon-street. Evidence having been given in support of the charge, the prisoner, who was stated to have been formerly organising secretary to a Labourers' Union, was remanded till Wednesday, when he was committed for trial.

Urban powers in respect of building having been acquired by the Eton Union Rural Sanitary Authority, the model by-laws of the Local Government Board have been adopted with a few additions, and will be put in force as soon as they are sanctioned.

The Munich Academy of Arts has elected the following as honorary members:—The painters, Messrs. W. W. Ouless, R.A., and Reid, of London, and Mr. Guthrie, of Glasgow; Mr. Thornycroft, R.A., the sculptor; and Mr. Macbeth, A.R.A., the etcher.

A complimentary dinner given at the Wellington Room, Red Lion Hotel, on Monday night, to Mr. Thomas Glenister, by the chair manufacturers of High Wycombe, to celebrate the first occasion of a member of the trade occupying the position of Chief Magistrate of the town, was one of the largest reunions of members of the staple trade of the town that Wycombe has ever seen.

At a public meeting at South Stockton on Thursday in last week, a letter was read from Mr. Thomas Wrightson, of Norton Hall, offering to erect a building at a cost of £1,500 for a free library. The offer was accepted, and it was resolved to adopt the Free Libraries Act. Mr. Wrightson is a member of the firm of Messrs. Head, Wrightson, and Co., engineers, and has three times contested Stockton in the Conservative interest.

(See description on p. 666.)

HOUSE AT HASLEMERE.

This house occupies a commanding position on the high ground above the village of Shottermill. The central feature is a large hall, the entire height of the building, with billiard-table, musicians' gallery, &c. The chief material is red brick, with Portland and Ancaster stone dressings. The main staircase is in a continuation of the hall, with a lower ceiling, the central hall being lighted by a large glass lantern. A peculiarity in the construction of the house is in the fact that the kitchen offices are on the upper floor, and the effect of the building is enhanced by terraces of great length across the hillside, and by the use of old roofing tiles found on the estate. The architect is Mr. E. Francis C. Clarke, Westminster Chambers, and the contractor, Mr. Crossley, of Bromley, Kent.

NEW BOMBAY MUNICIPAL BUILDINGS.

We give this week illustrations of the above buildings now in course of erection immediately opposite the large Victoria Terminus, by the same architect, lately completed, and illustrated by us some four years ago. The style of architecture is a free treatment of Early Gothic with an Oriental feeling, which was considered to be the best adapted for the site and climate. The design is in strict harmony with the surrounding public buildings on the esplanade, namely, the Police Courts, Victoria Terminus, &c. The plan of the building is somewhat of the shape of a letter V, which gives the full benefit of the prevailing breeze to the different offices. The principal public entrance and grand staircase under dome are placed at the apex, or south end. The space occupied by the latter is first a square, the upper portion from the first floor being worked into a circle by interlacing arches supported on granite columns, which carry the small gallery and interior circular dome. This feature will be imposing, and one of the most telling in the buildings. The room above the dome will be utilised for storing records in racks erected for the purpose, and will be approached by a hydraulic lift from the back. In the tower above the record-room will be placed two floors, in which two large wrought-iron storage water tanks will be erected, containing a total quantity of 40,000 gallons of water. One tank will be utilised for the fire service of the buildings, and the other for working the hydraulic lift for the use of the corporators and officials. The tower works from a square having octagonal turrets crowned with domes at each angle into an eight-sided figure, then into a sixteen-sided figure, and finally into a circle, capped by a dome. The central gable facing south will be crowned by a colossal figure representing "Urbs prima in Indis," and below this, in a circular panel, will be carved the arms of the Corporation. The following offices are placed on the ground floor:—(1) In wing facing Hornby-row, town duty office, assessor's office with retiring room and w.c.; assistant assessor's office, with retiring room and w.c.; assessor's clerks' office, and ward office. (2) In wing-facing Cruikshank-road, health officer's office, with retiring room, w.c., &c.; assistant health officer's office with retiring-room, health officers' clerks' office, laboratory, two committee-rooms, for the use of the standing committee, and a separate carriage-porch, hall, and staircase, for the exclusive use of members of the Corporation when proceeding to the council-chamber on the first floor. The following offices are placed on the first floor: (1) In wing facing Hornby-road, chief accountant's office, with retiring-room, w.c., &c., chief accountant's clerks' office, small strong-room, record-room, hospital, committee-room, school committee-room, and clerks' office to committee-room. (2) In wing facing Cruikshank-road, municipal commissioner's office, with retiring-room, w.c., &c.; two assistants' office, with retiring-room, w.c., &c.; municipal commissioners' clerk's office, council chamber, with two retiring-rooms, w.c., &c.; secretary's office, with retiring-room, &c., and secretary's clerk's office. The council chamber will be 65ft. in length by 32ft. 6in. in breadth by 38ft. in height. The ceiling will be of teak wood and coved in section, but will be richly moulded, carved, and decorated. The arrangement of the seats and desks of the chamber is elliptical in form. Those for the president, municipal commissioner, secretary, &c., will be placed on a platform raised about 1ft. from the ground. The form of this chamber has been designed in accordance with well-known examples to insure the best acoustic results. The following offices are placed on the second floor: (1) In wing facing Hornby-row, deputy executive engineer (Roads and Building Department), with retiring-room, w.c., &c.; office for clerks and draughtsmen, deputy executive engineer (Waterworks Department), with retiring-room, w.c., &c.; office for clerks and draughtsmen and Tansa water-works office. (2) In wing facing Cruikshank-road — executive engineer's office with retiring-room, w.c., &c.; deputy executive engineer (Drainage Department) with retiring-room, w.c., &c.; office for clerks and draughtsmen of the Drainage Department, record-rooms over corridors to council chamber, and corridors in front of large dome. Detached latrines for European and native clerks, approached by covered corridors, have been provided on all floors. Wide and spacious corridors have been provided on all sides of the buildings, and on either side of the principal staircase and dome, for direct communication with the several offices, and for protection from sun and rain. Should a large public hall be required at some future time, Mr. Stevens has suggested that it may be placed on the ground north of the council chamber between the proposed new road and the police court, and further office accommodation by extending the buildings along the Hornby-road, communication being obtained to both buildings by bridging with 20ft. corridors over the road—the bridges to be similar in character to the Bridge of Sighs, at Venice, which would form handsome architectural features to the buildings—the space between the two wings of the buildings will be turfed and laid out as an ornamental garden with a fountain in the centre, which will have a pleasing and refreshing effect in a climate like that of Bombay. The cost of the buildings, including drainage, water supply, fire service, electric lighting, hydraulic lift, and furniture will amount to about 12 lacs of rupees, or about £100,000. The buildings are making rapid progress, they being already 20ft. above ground level, although they were only commenced about nine months ago; at the present rate of progress the buildings should be completed in another two-and-a-half years. Mr. F. W. Stevens, C.I.E., F.R.I.B.A., &c., of Bombay, is the architect; Ruo Sahib S. Khanderoo, the resident engineer or clerk of the works, and Messrs. Veukoo Baloo and Co., the contractors.

COTTAGE AT FLEET.

Our illustration shows a cottage just erected near the village of Fleet, Hampshire, for Mr. A. Boucher. It is substantially built with hollow walls, &c., the whole of the exterior walls being faced with red bricks of good colour obtained in the neighbourhood. The upper story is of pebble-cast on brickwork, and the half-timbered gables in unstained English oak. The whole of the roof is covered with tiles from the Hartshill Tile Co., of excellent quality and colour. The works were carried out by Messrs. J. Pool and Sons, Winchfield, Hampshire. The architect is Mr. S. Colman, 5, Lancaster-place, Strand.

DOUBLE CHAPEL IN THE CASTLE AT EGER, BOHEMIA.

The lower chapel was built in 1183 by Frederick Barbarossa. It is round-arched and plain groined; the columns and stone dressing are of grey granite, the groining being of fine granite and cement. The columns are slightly bellied, becoming reduced in thickness toward the top. The floor level being about 6ft. below the ground outside, the damp has risen, producing, however, a fine effect of colour. A stone staircase leads to the upper chapel, which dates from 1295. This chapel is Pointed in style having groined and ribbed vaulting. The effect on entering from below is very fine, although one cannot regard with favour the exaggerated portions of the columns, which are not white marble. The bases are well moulded, and the caps beautifully carved. The exterior is very plain, the only relief afforded to the wall being the pilasters which run up from ground to roof, and are intended to resist the thrust of the vaulting, though they do not in every case come opposite the ribs. The upper windows are moulded, but have no tracery.—F. Lishman.

CHIPS.

A new market hall at Sandbach was opened on Tuesday week by Lord Crewe, who gave to the town the site, till recently occupied by an old hostelry. The new building contains, on the first floor, a hall seating 500 persons, approached by three staircases, and containing a gallery. Below is a hall fitted with market stalls. At one end of the building is a clock tower. Mr. Bowers, of Nantwich, was the architect, and Mr. Stringer the builder. The cost has been £5,000.

The parish church of Linstead Parva, Suffolk, is about to be restored from plans prepared by Messrs. Bootle and Olley, of Great Yarmouth.

A new mission church in Joiner's-square, Hanley, was dedicated by the Bishop of Shrewsbury on Saturday. It has been built from designs by Mr. E. L. Maddock, and the contractors were Messrs. Cornes, of Hanley. It will accommodate about 300 and has cost about £3,000.

Mr. George Gordon Hoskins, F.R.I.B.A., was returned at the head of the poll, to the town council, in the only contested election at Darlington, the result being, according to the *Newcastle Chronicle*, "a foregone conclusion."

Among the adjudications in bankruptcy announced in Friday's *Gazette*, the names appear of Reuben Button, jun., Denton, near Gravesend, late of Stamford-hill, architect and surveyor; and John Cobden Eggar, Woodford-cum-Membris and Banbury, estate agent, architect, and surveyor.

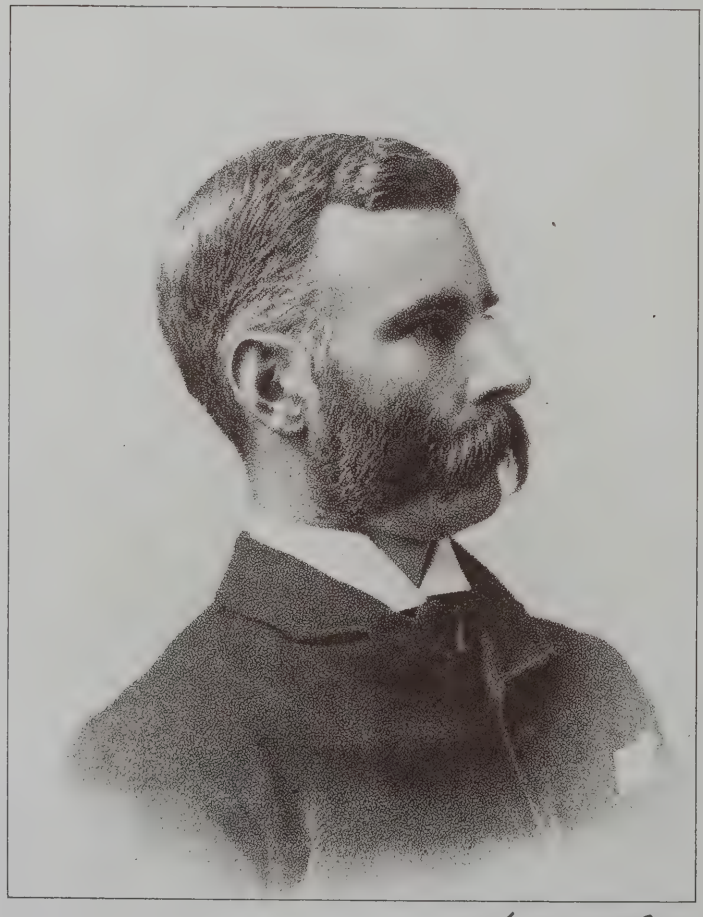
The church of Holy Trinity, Blackman-street, Southwark, a modern high-pewed edifice, lacking chancel, is to be restored from plans by Messrs. Carpenter and Ingelow. At a meeting held last week a restoration committee was appointed, with instructions to obtain a faculty.

The local board of Cadoxton-Barry have adopted a scheme prepared by Mr. J. C. Pardoe, the surveyor, for sewering the Barry Dock district. The estimated cost is £4,000.

The memorial to Canon Liddon will take the form of a recumbent figure on an altar-tomb, to be placed in the apse of St. Paul's.

A Factory Girls' Institute, built in Carr-street, Ipswich, from plans by Messrs. J. Shewell Corder and James Brown of that town, was opened last week. It is faced with red brick, and is three stories in height; it contains a restaurant, 45ft. by 25ft., a club-room, and apartments for the superintendent and servants. Mr. F. Bennett, of Ipswich, was the builder, and the cost was £1,500.

The chancel of All Saints' Church, Leeds, Staff., is undergoing internal decorations in colour, from designs by and under the superintendence of Mr. Gerald C. Horsley.



The gasworks at Rawmarsh, near Rotherham, were inaugurated on Friday by the chairman of the local board. The works have been erected at a cost of about £10,000. The scheme has been carried out under the direction of Mr. Newbegging, C.E., Manchester. The manufacture of gas has been already commenced.

WAYSIDE NOTES.

AS I had anticipated, the Presidential address at the R.I.B.A. was of that pleasant typical nature which appeals to the sympathies of an architect-audience. Mr. Waterhouse had prepared a most interesting commentary on subjects of vital importance to the profession, on vexed questions, and on matters still *sub judice*. From first to last the address was listened to with evident delight by the Fellows and Associates present, of whom there was a goodly company, the council-chamber being packed to its fullest extent. In every sentence was something of interest, either on practical or artistic grounds, and opinions such as those expressed upon the subject of "building legislation" must influence events in the near future. Sooner or later one feels that the council of taste to restrain the repeated perpetration of architectural atrocities in the streets of London must be created. Its absolute necessity becomes daily more apparent.

In the portion of the address relating to "students' work" there is much that should be directly taken to heart by the young architect. Particularly *à propos* is the reference to the recklessness of the average sketcher, who, perchance, may consider himself a *student* of old buildings. Would that Mr. Waterhouse's emphasis of the necessity for doing one thing thoroughly, instead of a lot of things badly, were pondered over by everyone sketching with a view to acquire architectural knowledge! That it is no mere fancied vice of the ordinary student, we are, many of us, well aware, and the result of which practice is the acquisition of a hybrid store of forms and features without the ghost of an idea how to make practical use of them. It were a great thing for the future of architecture in this country if the advice tendered to students on Monday evening led to a more thorough and analytic study of old buildings, on the part of those accustomed to skim off surfaces, obtaining, as they think, the cream of the design, whereas in reality only touching the evanescent surf, leaving beneath the deep waters of architectural truth.

Mr. Waterhouse has made some suggestions as to the future relations of Institute and Association, and many members of both societies will surely agree with him touching the economy in working expenses that will accrue from joint action in regard to the matters named. As to the likelihood of the suggestion being carried out, one feels rather doubtful, for, in the first place, it will not please every member of the R.I.B.A. We know this well enough. That the Association as a body would jump at any definite offer, generously made by the senior society, I fully believe; that a certain party in its constitution may think differently I also believe. The Association has large ideas just at present, and the Institute may be considered all very well in its way; "but——" Every moderate person will wish that the Institute Council could see its way to adopt the suggestion made in a truly liberal manner by its President, and that the Architectural Association, aware of the value of aid offered by the elder body, with which, in spirit, it is affiliated, will not let motives of any kind, except the desire of a noble independence, stand as a bar to acceptance. It is plainly evident that any amalgamation of the two bodies, if ultimately found desirable, must be very gradual. The welding must take place slowly if it is to take place at all. I would therefore humbly counsel the Association to accept, with all grace, any offer of the Institute to share burdens that may be the outcome of the kindly-mentioned suggestions made in the course of the Presidential address.

Mr. Waterhouse, I hear, was a little indisposed after the fatigues of Monday evening—a fact that will not surprise those who know the work the P.R.I.B.A. gets through, and the many calls on his time and strength occasioned by an extraordinarily extensive practice. Add to this the labour in preparing and delivering so full and finished an address as that given on Monday, and we shall only feel the more indebted to its author, and heartily trust that he quickly recovered his natural energy of mind and body.

On or about December 15, Mr. D'Oyly Carte's new theatre will be opened. This is a really fine building, and we shall all look forward to an opportunity to inspect its internal architecture. Concerning the manner of the arrangements for the planning, design, and construction of the work, the reader should well know, by this time, my own private opinion, so it will be unnecessary for me to excite myself further in the matter.

After a full understanding of the nature of the works comprised in the construction of the City and South London Railway, the engineering fraternity will accord with the sentiments expressed by the Prince of Wales, when, on Tuesday last, His Royal Highness spoke at the luncheon following the opening ceremony, and said that "the greatest credit redounds upon those who have contrived this scheme and have carried it to such perfection." As described in the public press, the undertaking would appear to possess that savour of bold originality that always accompanies a really great work. In it we see, so to speak, the working of the afflatus of the engineer. This originality has not only permeated the design and methods of construction, but pervaded the arrangements for working the railway. It is to be doubted whether it is here so beneficial, but the scheme for getting rid of ticket-buying and ticket-clipping, &c., is excellent, and will doubtless prove as good in practice.

The Bethnal-green scheme for providing new blocks of dwellings for the poor is to go through as proposed by the Housing of the Working Classes Committee of the London County Council. There was considerable discussion on the subject at Tuesday's meeting of the Council, but the majority of the Councillors were evidently in favour of the scheme. So be it; and at any rate the poor will benefit. But the "willing horse" will find an abundance of work to do. Yet it is a consolation to believe that the landlords of the wretched shanties to be bought up are to receive less compensation than they would have, had their tenements been more habitable. I must confess that I cannot quite make out how this is to be done under the existing laws, but suppose it is all right. As to the main idea of the improvement scheme, I like it; but certainly object, with many County Councillors, to the apparent neglect of legitimate means of coercing demoralised landlords.

The interesting time in connection with the outcry for dwellings for the poor will be some years hence, when we may learn whether the poor really get housed, or the same thing happens in connection with the occupation of the houses as has happened in connection with the occupying of "artisans'" dwellings. Moreover, as Colonel Hughes, M.P., County Councillor, said, a very large proportion of the working classes prefer living in small houses to model dwellings. Note, too, as bearing on this subject, the preference of the poor housewife for washing-day in her own cramped apartments to that in the clean, convenient, and comfortable wash-houses provided for her at a nominal fee by the State.

Whitehall Chapel Royal is to be permanently closed. As to its future we are ignorant. Never having been consecrated, it may be available for many different purposes.

A fire at the Ducal Palace, Venice, should not surprise us, much as we may be grieved. A friend of the *Times* correspondent at Rome writes that he recently visited the lower regions of the far-famed palace, and, having successfully braved volumes of smoke, discovered a brisk fire upon an open hearth in close proximity to stores of inflammable material. The friend says a pot of broth was being cooked, but this seems a curiously superfluous detail. What more concerns us is that if the good lady who appears to be a sort of caretaker at the palace continues her broth-cooking operations, we may some day hear of the much-eulogised marble sculptures being grilled.

The South London Polytechnics Committee have, with Mr. Rowlande Plumbe's assistance, selected six of the fifteen designs submitted for the Polytechnic in the Battersea Park-road. The successful architects—embracing some big names—go in again, so we may in due course hear of a final selection. Touching competitions, I note the advertisement from Exmouth, as to the £2,500 church to seat 600 persons, and the magnificent premiums of £15 and £5.

The British Consul-General at Bagdad, in his latest report, has given some interesting observations on the art of brickmaking as expounded by the brickmakers of that Eastern desert-bordered city. Stone being little used, there is a great demand for bricks at Bagdad, the place being principally built of kiln-dried bricks. The kilns surround the city, and when the Tigris or Euphrates overflow their banks, and the waters compass them about, they resemble so many islands, while bricklayers are stopped for want of bricks, and the supervising architects of Bagdad have more leisure to read their BUILDING NEWS. Price of bricks at Bagdad—our consul does not say whether at the kiln or delivered on the job—£1 16s. per thousand, 12in. square; and 18s. per thousand, 7in. square. How thick, is not stated; but a calculation might be made, given the fact that a donkey carries not more than 10 large or 25 small bricks. The bricks are of a chrome-yellow tint, and very brittle. The Consul-General thinks that there would be an opening in Bagdad for brickmaking on a scientific plan. There appear to be these facts to guide any intending adventurer:—At Trâh is a tenacious clay which might be worked perhaps; unskilled labour, 9d. per diem; 5d. for boys; fuel abundant; excellent wood at 1s. 6d. per cwt.; and "thorny desert scrub," now burnt in the kilns, 6d. per ass-load. Here is a chance for some manufacturers, and an opportunity for their travellers to go East for a season, and leave the weary British architect in peace. GOTH.

ST. SOPHIA'S, SALONICA.

MR. F. C. PENROSE, the surveyor of St. Paul's, quotes in the *Times* from some interesting letters written by Messrs. R. W. Schultz and Barnsley, students of the British Archæological School at Athens, who are now at Salonica. It is satisfactory to find that the Byzantine portion of the great basilica of St. Sophia has suffered very little by the recent disastrous fire. The students remark:

"We are taking the opportunity of St. Sophia's being in a deserted state to make new measured drawings of it—Texier's (exteriors especially) of this church being very far out, the drawings having evidently been made after a lapse of time, perhaps of years, from M. Texier's notes by people who had never seen the originals. The mosaics, although practically uninjured, are covered with a coating of smoke and dirt, which makes them unfit for drawing. Careful drawings could not be made of these without expensive scaffoldings in the dome and bema. The church is structurally still sound; some of the fine caps and old green marble pillars are irretrievably ruined. The dome is all right. The aisle roofs, which were wooden and modern, have been burnt, as also the Turkish colonnade in front. The fire has burnt out a part of the dirtiest and thickest populated part of the town, but in proportion of area it is, perhaps, about one-tenth or less of the inclosure within the walls. It lies close to the water and on the level. Seen from the sea, the town seems as if nothing had happened, blocks along the quay, which had escaped, hiding the mass of ruins behind."

The scandal in connection with the jobbery in the construction of the Government building at Chicago has culminated in the report of the United States Inspector of Buildings just issued. He says that the only way to save the buildings from absolute collapse will be to lay a new foundation for them, similar to that used in the Washington Monument. This, he says, would cost two and a half million dollars, and he believes it would be as cheap to erect new buildings.

The Early Norman church of St. Pancras, Coldred, was reopened last week by the newly-appointed Bishop of Dover after restoration. There is no tower, but a double bell cot at the west end, of 14th century date. The church is situated within the area of an ancient camp, of small size, inclosed by a lofty bank and a deep ditch irregularly circular in form. The roofs have lately been stripped, and lined with felt to exclude draught, while the plastered ceiling of the nave has been removed and boarded. The porch has been replaced by a new one of open timber work. The bell-turret, the upper portion of which had been destroyed and replaced by an unsightly parapet of brick, has been repaired, and its missing gablets rebuilt in stone. The flagging of the passages has given place to red and black tiles, and a layer of concrete placed beneath all the floors. A reredos, of oak, has been erected, and a vestry has been built on the north side of nave.

CONTEMPORARY ART WORKERS AND MANUFACTURERS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THIS sheet is the seventh of this series. Mr. John Farrell is the secretary and manager of Claridge's Patent Asphalte Company, Limited. He was on the provisional committee before the company was established in April, 1838, and has acted as secretary since 1840. When the company reached its Jubilee year in 1888, the proprietors present at the annual general meeting presented him with a testimonial of the value of £1,000. He is regarded by the staff of workmen as most exacting in the proper execution of all works, and has a faculty of detecting the slightest defect in the labour, which he never allows to pass unnoticed. To this, in some measure, may be due the high opinion entertained of the company by all the well-known members of the architectural profession, and the conviction that when a work is intrusted to the company it will be carried out in an efficient manner. The photo. was taken last month by Mr. Field, of Putney.

Mr. Robert Boyle, of Messrs. Robert Boyle and Son, Limited, the well known ventilating engineers of London and Glasgow, was born in the latter city in the year 1851, and, an inventor of note himself, comes of a family of inventors, his father, the late Mr. Robert Boyle, who died some twelve years ago, and also his grandfather, a famous surgeon in his day, having produced many valuable inventions of considerable public utility. Mr. Boyle's name is best known in connection with his improvements in ventilating and sanitary appliances, he and his father being the joint inventors of the celebrated Self-acting Air-Pump Ventilator, which revolutionised automatic ventilation; but which, however, in its original form has long been discarded in favour of improved constructions on the same principle invented by Mr. Boyle, and which, though much more powerful and of superior make, is now sold at 50 per cent. less than the inferior forms previously manufactured, constituting not only one of the most efficient, but is probably the cheapest, ventilator in the market. Mr. Boyle has laboured for the last twenty years in the cause of sanitary science, and as one of the founders of the profession of ventilation engineering, has largely contributed to raise this all-important subject from the obscure and neglected position it occupied to its present high place in the ranks of the sciences, and made the name of Boyle in connection with ventilation a household word throughout the world round, which Mr. Boyle has thrice travelled in the execution of his professional duties; a description of his last journey recently appearing in these columns under the heading "A Sanitary Crusade round the World," which gave some very interesting details of his labours for the promotion of improved sanitary measures in Egypt, India, China, and Japan; and he has well earned the distinction of gold medallist and other honours conferred upon him by different learned societies in this and other countries, the numerous scientific and other contributions to literature of which he is the author being well known and justly esteemed. The success of Mr. Boyle's system of ventilation wherever applied is so well known that no special reference need be made to it here. It is testified to by the highest authorities, including Mr. Alfred Waterhouse, Sir Arthur Blomfield, Mr. Arthur Cates, and Professor Aitchison. Mr. Patmore, of Ramsgate, is responsible for Mr. Boyle's photograph.

Mr. W. Eckstein was born in the year 1846. His father, Mr. John Eckstein, of Notting Hill, died at 33 years of age. William Eckstein being one of seven children, and his father being free of the City, he was educated at the City of London School, open to the sons of freemen; and although it was intended he should follow his brother in the public service, he elected to be brought up as a mechanical engineer, for which purpose he served time, and worked in the several branches at Messrs. Benham and Sons and Henry Clayton and Co. When he was 21, it was decided that he should go up for the Indian Public Works' examination, for which purpose he served with Mr. W. Parcey, of Westminster, who was engaged in designing some of the chief railway bridges for the Indian Trunk Lines. During the same time he studied at King's College higher mathematics, surveying, &c., and in due course went up for, and passed, the examinations for the Indian Public Works Department appointment, and went out under covenant with the Secretary of State for India, being known as a Stanley engineer. In 1868 he left for Calcutta, and, being fourth on the list, selected the North-Western Provinces, to which he was posted, and joined at Allahabad, from which time he superintended the various military and other buildings under construction at Allahabad, Cawnpore, Meerut, &c. After spending two years in the plains, his health was not all that could be desired, so Col. Fraser, the Chief Engineer, posted him to the new Chakrata Division, under Col. D. Ward, who was laying out the Chakrata Hills for a new sanatorium and convalescent depot. Mr. William Eckstein was associated with Col. Ward for about five years, during which time, besides the station work, he had charge of the upper section of the Hill Cart Road, the Sacquar Suspension Bridge over the Jumna on the Mussoorie Road, &c. When officers were required to open out works in the Bengal famine year of 1874, Mr. E. was drafted down country to the Tirhoot District, and was posted to the charge of relief works of the Chumparun District, and had the control of the operations between Morufferpore and Bettiah. He afterwards reverted to his duties in the Military Works, and was posted to the special division at Allahabad, under Major Clive; then to the executive charge of the Fyzabad division. His employment in the Military Works did not altogether suit his tastes, and he endeavoured to get posted to the railway branch, but although two or three superintending engineers applied for his services, the Inspector-General of Military Works would not part with him; consequently, after eight years' service, he applied for furlough. When he had been at home a few months he heard of an opening in the old-established firm of Hayward Brothers, Borough, manufacturers of various specialities, and became a partner in 1878, having his name connected with the firm, which was then Hayward Brothers and Eckstein. It was soon apparent that he would have the lion's share of the work, on account of Mr. Hayward's uncertain health, and who was absent for eight or nine years. He, however, threw his energy and perseverance into his work, and has now more than doubled the concern, which, though perhaps of medium size, still is one well reputed for excellence of work. Last year Mr. Eckstein added a foundry branch to the works. Besides working closely at his business, which was enough to occupy his whole time, Mr. Eckstein has served ten years as warden of the parish of St. Saviour's, Southwark; is a member of the local board of works, and on the general purposes committee. He is also a member of the committee for the re-building of the nave of St. Saviour's Church; has been an associate member of the Inst.C.E., and a member of the Society of Arts for over ten years. He was born free of the City, and has taken up his livery in the Stationers' Company. Our illustration is taken from a photograph by Barraud, Oxford-street.

Mr. Francis Holliday Pott trades in partnership with his father, William Holliday Pott, as Burt and Potts, wholesale ironmongers, engineers, and wrought-iron and gun-metal casement makers. Francis Holliday Pott commenced business in 1866, and in 1881 joined his father in partnership. In 1875 he assumed the entire control of the casement department, since which time many large and important orders have been carried out by the firm. The casements made by the firm have always been considered the best in the market, which is testified to by the flattering testimonials they hold from most of the leading architects. They have just finished an order for 276 gun-metal casements for Lord Windsor, Hewell Grange, near Bromsgrove, and they have at present in hand a large order for similar casements for Sir Hickman Bacon, Thonoc, Gainsborough. They have also just made the casements for the new almshouses for the Duke of Portland, on the Welbeck Estate. They have also carried out within a short time large orders for Lord Revelstoke, and many other noblemen and gentlemen. Mr. Pott's portrait is by Messrs. Russell and Sons, of Wimbledon.

Mr. Nevile Kempthorne, of the firm of Mainzer and Kempthorne, marble mosaic artists and workers, of No. 18, Berners-street, W., was born at St. Helena, where his father was colonial chaplain for 21 years. He received his education in England, first at Brighton, and afterwards commenced an engineer's training at King's College, London, from 1862 to 1866. Subsequently he became a pupil at the works of Messrs. James Simpson and Son, mechanical engineers, at Pimlico. For several years, as resident engineer, he acted on many important works connected with water supply, principally at Chertsey, Canterbury, Sevenoaks, Sudbury (in Suffolk), Kettering, and Blackburn; he also superintended the laying down of tramways at Wolverhampton, Gloucester, Chiswick, Hammersmith, and Richmond, and the erection of a number of buildings connected therewith. In 1880 he commenced practice at Acton, W., as a surveyor, and in 1887 he joined the present firm, in which his extensive practical knowledge of all branches of building work is of great assistance. New premises have lately been taken at Berners-street in order to provide facilities for the rapid growth of the business. Messrs. Byrne, of Richmond, executed this portrait.

Mr. Daniel Thomas Bostel was born in the year 1837, and at 12 years of age he was put to work in his father's carpenter's shop, elevated on two 3in. deals, that he might reach the bench, to learn joinery and general builder's work in the City of London; his father and family were citizens for many generations, and Freemen of the City and many of its various Guilds. Having constantly to attend on plumbers, Mr. Bostel conceived the idea that he should prefer to be a plumber, or rather, in those days, a "three-branch hand," and a favourable opportunity presenting, he got an engagement at Brighton to finish his time with a practical man doing a very comfortable business, who treated him as one of his own sons in every way. Determined to get on after leaving his employ, Mr. Bostel obtained employment at several good firms as journeyman, and after a short time took work for the trade, ultimately purchasing a very old-established business in Ship-street, Brighton. Here he executed some very good work, carrying out several large plumber's contracts, amongst them being the new workhouse (a very large institution, comprising hospitals for idiots and other separate large buildings), for which the architect seven years afterwards sent Mr. Bostel a certificate saying he had carried out the sanitary works to his entire satisfaction, and up to that period it had proved substantial, as not a single portion had needed attention. Mr. Bostel also did the whole of the plumber's work at Hobden's Baths, and a great part of the finishing of "Brill's." Finding his endeavours to carry out plumber's work as it ought to be carried out appreciated, Mr. Bostel determined, in 1873, to devote the whole of his thoughts and attention to sanitary work, inventing various improvements in drains, water-closets, traps, ventilating caps, and exhaust terminals, and this work is now familiar to the public all over the world. In 1878 he obtained the first prize medal from the Sanitary Institute of Great Britain in practical competition. Mr. Bostel claims the credit of being the first to make a safe and practical closet-trap and closet in one piece of Staffordshire ware, which is known in Europe as the Brighton Excelsior and in the U.S.A. as the Brighton. He has greatly simplified the system of house-drainage, and believes he could also greatly improve the system of sewering towns at a considerable reduction of cost, with a total absence of so-called "sewer ventilation," which simply means "poisoning the atmosphere," and at the same time giving a product that even the British farmer would be glad to use. Mr. Bostel has three sons with him in business. His photograph was taken by Mr. Downey, of Ebury-street.

ARCHITECTURAL ASSOCIATION.

THE second meeting for the present session of the Association was held on Friday evening, the President, Mr. Leonard Stokes, in the chair. —The adoption of the report and balance-sheet was moved by Mr. F. T. Baggallay, who remarked that neither could be said to be thoroughly satisfactory. The attendance in many of the classes had fallen off, and one or two had not been sustained at all; while the finances showed a decreased balance, one which had fallen from £775 to £692. Even this was illusory to some extent, for no allowance was made for depreciation in the valuation of furniture, books, and fittings; the arrears of subscriptions, too, had increased by £10. Plainly, they were not paying their way, and although it would be some years,

at that rate, before the balance was exhausted, yet it would be but a question of time.—Mr. C. H. Brodie, who seconded the motion, said while the report was not altogether satisfactory, it was not a disadvantage in all cases that the classes should have fallen off, so long as the quantity of the work turned out was as good as ever. The balance in hand was all nonsense, for who could check off the valuation if, as it appeared, it had not been re-estimated for many years.

The resolution was carried *nem con.*

Mr. F. R. Farrow remarked that Mr. W. R. Quick's classes would not be held concurrently, but the mechanical section would be taken every Monday until completed, and would be followed by that on graphic sections. The order of the forthcoming A. A. meetings had been reversed: the revision of the rules would be postponed from November 28th till the meeting of the 12th December, so as to give time for printing and circulating the alterations, and on November 28th Mr. White would read his promised paper.—Mr. Brodie presented a numerously signed petition asking that a notice-board, directing to the classrooms, common room, and library, might be put up in the hall, and the names painted on the entrance.—The President stated that the requisite permission had been obtained of the owners of No. 9, Conduit-street, and the work would be proceeded with.

The following 39 new members were elected:—F. T. Maltby, C. G. Mayhew, H. Godsill, T. A. Sladdin, P. F. Hockings, F. L. J. Barrow, F. E. Ward, W. J. A. Anderson, E. A. Richards, T. Leake, A. J. Dalton, C. P. Bannell, A. E. Kirk, E. P. Cameron, H. Webber, A. E. Allen, C. E. Thomas, C. H. Gatehouse, J. H. Jones, jun., H. E. Jones, W. A. Forsyth, T. J. W. Anderson, G. E. Boyes, P. C. Fuller, J. H. Tyars, F. W. Chancellor, R. T. Barker, A. H. L. Mackinnon, H. T. East, O. E. Hill, E. A. Vigers, C. E. Blackbourn, J. T. Chalmers-Francis, P. Soames, H. H. Robinson, Lester Bains, R. Jones, J. Haitree, and A. Spiers.

The President announced that Mr. Francis G. Hooper had found it necessary to resign his seat on the committee. That body had accepted the resignation with some regret, and would proceed at the next meeting to nominate a successor, but any other nominations could be made at that meeting by any two members.

THE PAST, PRESENT, AND FUTURE OF THE ASSOCIATION.

A series of four papers dealing with this topic were read by Messrs. A. Beresford Pite, Walter Millard, R. Needham Wilson, and Owen Fleming.

Mr. Pite urged that within certain limits and in attaining certain objects the Association had been a great success. The papers read at their meetings were often valuable to the whole body of architects, and rivalled in interest those produced for the Institute. Below the surface, in its classwork, the Association had been quite as successful, an important factor in this success having been that opportunities for architectural study had been given without interfering or competing with any of the surrounding and more regular methods of architectural education, nor had its classes clashed with the usual requirements of articles of pupilage. What had it done for the higher and ultimate objects of the profession? The improvement of the individual architect was not the only end in view or the final results of their operations. The work and influence of the Association need not, and ought not to be devoted to the cultivation of professionalism, to the neglect of wider and greater influence upon the practice of the art of architecture. In the past this field had been scarcely cultivated. The fact had not been grasped that by influencing for art a large body of young enthusiastic architects, the outward and visible architecture of our streets and country places might be vastly changed. The burning question, the will-o'-the-wisp of the hour, the present ideal of future attainment, was not the advancement of art or the recognition of its essential unity, but professional qualification, tested by enigmatic examination, to be sealed by legislative enactment in registration against all poaching by "auctioneers, land-agents, and surveyors," or other unauthorised and unchartered commission agents. The bosom of the Association was now heaving with emotion and excitement, not to ascertain wherein lay the power of such great designers as Burges, Street, Godwin, Thomson, or Cockerell, but as to how best to solve "apophyge," "hagioscope," "acroteria," or "ambon," and as to which was the safest method of guessing the number of columns in a temple, or either of spelling or pronouncing the names of some "leading architects" of a selected period. Could pedantry be more aptly illustrated than by such questionings, or the docility of the youthful architectural mind by submission to them? At present we were off the track, in the absence of Scott, Street, Burges, and Godwin. We had gone astray. The great designers that remained who were their later contemporaries, and who shared their powers and zeal, were silent, and preferred retirement, so that we were left to inartistic boards of examiners and the feebleness of their inexperience. The profession might be advanced, but the art would be forgotten. But what was the hope of the Architectural Association? Their system of co-operative assistance could be maintained and enlarged in whatever direction or degree might be necessary for the advancement of the architectural and artistic knowledge of members. Classes for drawing from the antique, for architectural modelling in wax or plaster, for perspective drawing, for the systematic criticism of modern work, and the analysing of the design of ancient buildings, might perhaps be added to those already existing, and embrace a practical and artistic range of subjects quite outside the purview of examination boards. There would then be no need for revolutionary measures, the ultimate object of which was to create a constituency for the Institute, and which must issue in the forsaking of the Association, so soon as the examination was passed and the A.R.I.B.A. acquired. The curriculum that had been propounded would essentially reform the whole work of the Association upon the basis of this examination programme of the Institute. It was proposed to do this very thoroughly, at the expense of their old traditions, and of their old success. Was the end to be attained worth the sacrifice? Would recognition of the examination as their goal and object advance the Association in numbers, friends, and usefulness? Would their old success remain to them as an independent body when they had sacrificed individuality to the generalisation of the academic programme? Did all this tend to the advancement of the art of architecture? He believed the Associateship examination of the Institute to be in part a fair test of certain qualifications for the surveyor's part of the architect's many-sided character, but it was ill-applied and ill-suited to encourage appreciation of daily office work, or to improve the daily practice of a student. It removed him from the study of a great and noble art to the consideration of papers of questions that revealed in every line the fact that the examiners had mistaken definition of terms or extemporaneous delineation of features for a knowledge of principles and discernment of fitness and beauty.

Mr. Millard urged that the whole profession as a body was reponsible for the training of its pupils, although at present that responsibility was not accepted. They saw two bodies occupying the same premises—the one undertaking to examine students, without caring how and whence their knowledge was obtained, and, indeed, emphatically declaring that it was not a teaching body; the other ardently professing to teach its members. For grappling with the problem of education for a great profession, the Architectural Association was now notoriously and ludicrously inadequate. And what wonder that it was so? Unendowed and not genuinely self-supporting it had for years depended for its main working power on voluntary labour, on the surplus energy of a comparatively small minority of its members, given occasionally out of their spare overtime; whilst on the part of the recipients of the benefits derived, the—anything but lavish—expenditure of one hundred and twenty-six pence per annum, with an odd shilling or two extra for class fees, had been supposed to count as a fair contribution to meet working expenses. Worse than being merely inefficient for existing needs, it had been misleading in encouraging the idea that all was well in the profession. At the present moment the Institute, by sheer good fortune, had an exceptional opportunity to not only make some atonement for past weakness, but to secure to itself a sure source of strength for the future, if only it would seize it and offer honourable terms to the Association. A good working alliance between the Institute and the Association presented the only rational solution of the question of professional education. The Association would be doing itself nothing but honour in becoming the educational branch of the Institute, for the prestige and real strength thereby accruing would far more than outweigh any loss of influence or dignity based on feeble and empty independence. He would suggest the establishment of pupil scholarships, similar to what existed for the Bar, whereby successful candidates were enabled to spend a definite period in the chambers of any leader they themselves might decide on reading with, the necessary premium being paid out of the scholarship fund. A fusion of the Institute and Association would mean power to both for real good; the alliance was indeed not only advisable and feasible, but ultimately inevitable.

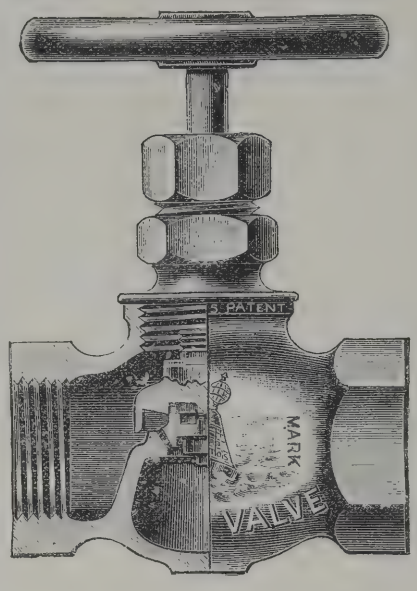
Mr. Needham Wilson said he saw no necessity for changes. If the educational methods that had obtained hitherto had been so successful, why were they so no longer? What had occurred to disturb the equilibrium of the Association, and to lead its members to believe that it was lagging behind the age? If they were losing ground, how was it the Association now numbered 1,129 members, against 1,052 two years ago; or did that indicate a paper strength represented by the £100 arrears of subscriptions? He took this augmentation of numbers to imply approval of the educational methods, and not an argument in favour of change. The fact that the increase of members was less this session than it was last session, suggested that it was the result of the proposed changes. The only reason that he could see for the proposed changes was the Institute examinations. He had nothing to say against the examination, as far as it went, but he objected to its being made the basis of their educational methods. The chief function of the Association was neither to compete with other organisations as to which should have the honour and glory of turning out academic architects, nor to become a mere cramming machine, nor to usurp the system of pupilage. Its educational functions were distinctly supplementary, and were designed to furnish the student with facilities for studying those subjects which he could do in office hours. He emphatically protested against any educational scheme that would have the effect of doing away with the pupilage system. He denied that academic training would make an architect. As to the admitted diminution in the number of members attending classes, he contended that mere numerical strength was no criterion to judge the class-work by, but the proportion of work done to members present and the nature of such work were the true indications. Analysing the statistics for the past few years, he showed that the lessened numbers in classes were due to the enforcement of rules requiring work from every member. Passing on to consider the reform of the Association, he confessed that much of his antipathy to the educational scheme lay in the fact of its embodying a proposal to raise the subscription—a proposal based on three main statements, viz., that it would be necessitated by the increased cost of the curriculum; that the Association's income was now insufficient for its requirements; and that additional clerical assistance was urgently needed for the secretary, or that a paid secretary must be appointed. As to the first, he condemned the scheme supposed to necessitate it; and, with regard to the second, he criticised the heavy expenditure on the conversazione and soirée each year, suggesting that one of these should be made less costly, and the other abandoned or rendered self-supporting. An ugly item in the balance-sheet was the large amount of subscriptions in arrear. As to the third point, economies effected in either would provide for the extra clerical assistance which was necessary.

Mr. Fleming said he considered that many influences were at work in making it essential, if the Association was to go forward, that it should modify its present scheme of teaching. Of these influences some were internal and some external to the Association, the most important of the former class being the great and growing dissatisfaction of the students working in the classes at the insequential character and superficiality of the instruction imparted. The visitors were too often lacking in fellow-feeling with the students, while owing to the change of visitors the train of thought was continually being diverted, and important branches of subjects were neglected. Another internal influence was the knowledge among the elder men that the educational system of the Association was neither connected nor definite. The

chief external influence rendering a change necessary was the recent development of the Institute scheme of examination, and yet another was to be found in the tendency in certain quarters to regard the Association and its teaching as a temporary expedient pending the establishment of some new collegiate body. A fifth influence was the fact that the new educational institutions known as Polytechnics mostly had classes for the study of building construction at extremely low fees. These classes were generally founded upon the South Kensington lines, and, therefore, treated of building construction as a complete science in itself, and not as it really was, an integral part of the art of architecture. This training engendered a habit of inartistic thought, and it was desirable, therefore, to discourage architectural students attending these classes by making the Association's equally thorough, business-like, and practical, while preserving the necessary interdependence between them and their correlative classes or lectures. The one essential feature in any successful amendment scheme must be a thorough revision and expansion of the curriculum. The proposed curriculum was, he maintained, well thought out, and necessarily independent of other institutions. Its financial basis was sound, as it had for its leading principle that all lecturers' fees and charges, materials consumed in teaching, should be paid for by the student benefited. Indeed, the committee had been temperate and judicious in their estimates, as there was every probability of the estimate proving reliable. He also urged the extreme necessity of raising the contributions of all members to insure the satisfactory execution of the scheme of education, and concluded by endeavouring to estimate the nature of the influence which the new scheme would have upon the future of English architecture. He trusted the profession would hereafter seek some power, not for mere registration or examination, but for a compulsory education which would be far more serviceable than a mere statutory hall-marking; and then, and not till then, might they look forward to a national school of architecture as highly skilled and as efficient as was our national school of medicine at the present day.

Mr. H. O. Cresswell, who proposed a vote of thanks to the readers of the papers, observed that they were equally divided in their counsel, for while Messrs. Pite and Wilson were satisfied with the working of the existing arrangements, Messrs. Millard and Fleming did not at all approve the present system. He was entirely at one with Mr. Wilson in thinking that too much was spent on the conversazione, and in thinking that a charge should be made for the soirée. As to the large amount of arrears, these were not so serious as they appeared on paper, for while subscriptions were technically due in advance, they were generally paid in during the session.

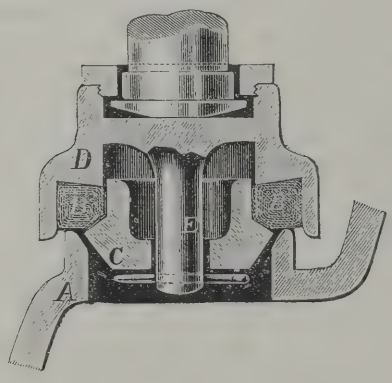
Mr. E. Donovan Webb, of Salisbury, suggested that capital might be obtained by allowing members to compound for subscriptions by one payment.



Mr. F. R. Farrow differed from Mr. Wilson as to the injury done to artists by receiving academic training. Instances of artist-architects so trained were, among others, Alexander Thomson, of Glasgow; Charles Garnier, of Paris; H. H. Richardson, of Boston; and Norman Shaw, of London. He seconded the vote of thanks.

Mr. Needham Wilson, in replying, said the four architects named were artists in spite of, and not in consequence of, their training, and Mr. Pite added that it was just because an architect was an artist first that he advocated the training him as an artist.

A NEW ASBESTOS-FACED VALVE.



THE valve we illustrate will meet a long-felt want by supplying a flexible seating, which can be renewed if necessary in a few minutes by an ordinary workman at a cost of a few pence and for which no special tools are required. A represents the form of seat in this valve, which, in addition to the ordinary angled seat, has a round edge to the packing-ring B when the latter is brought into contact with it. D is a loose valve, actuated in the ordinary manner by a screwed spindle working in gland of the valve top, which, when first set down, brings the packing-ring B on to the seat A, and for ordinary pressures a perfectly tight and elastic joint is thus made; but by setting the loose valve D hard down, the sliding cone C comes into contact with the angle of seat A, and being free on the guide-stud E is forced into the chamber of the loose-valve D, and by compressing the packing-ring B prevents it becoming damaged.

While the packing-ring B is thoroughly protected by the lower projection of the loose-valve D there is little tendency for D to become

damaged by the passage of steam or water through the valve; but should it even become entirely washed out, a tight metal-to-metal seating is the result, by A, C, and D being brought closely together.

It is claimed that the valve, through its elastic seating, is not affected either by grit, dirt, expansion, contraction, or uneven seating, which makes it alike suitable for the highest or lowest

pressures of steam, hydraulic, or general water-valves by the insertion of packing-rings made of the most suitable material to meet the various uses.

We have seen a 1½in. valve, made under this patent, which has been under test for three months at a steam-pressure of 100lb. per square inch and found to hold perfectly tight, after which it was put under hydraulic test, and by being lightly screwed down held a pressure of 2,240lb. per square inch.

The packing-ring used for these trials was made up specially in asbestos and is still in perfect order, and we are assured it has not been removed at any time during or since the above trials.

NEW SCOTLAND YARD.

THE imposing block of building that has been erected from the designs of Mr. Norman Shaw, R.A., on the Victoria Embankment, is now practically completed. We have already given our readers a brief description of the structure, the outlines of which are of a severe Renaissance character, the lower stories being constructed of Dartmoor granite prepared by convict labour. This high and massive granite basement, surmounted by red brick relieved by bands of Portland stone, with arch and key stones to the windows on the upper stories, and relieved at the angles of the upper stories by circular turrets forming oriel windows, distinguish the building from those in its vicinity, and impart to it, despite some adverse criticisms, a character appropriate to its destination and use. The roofs, with their massive gabled ends and high slated covering broken by chimney-stacks of large proportions, into which the flues are drawn, and which form important features, add much to the dignity of the composition as viewed from Westminster Bridge and the Embankment. The main entrance of Cornish granite is very plain and bold, and leads by a flight of steps to the ground floor. Below this is the basement, covered by groined vaulting of brick, on piers of blue brick, and lighted by areas, an example of solidity and sound workmanship that cannot be surpassed. The piers and walls rest on a substratum of concrete, in some points carried to a depth of 20ft. and more, and in this construction the Opera House and Mansions foundations have been utilised. In some parts the soil and peat have been excavated to a depth of nearly 50ft., as the springs met with were troublesome. The bricks from Cambridgeshire are set in cement in this part, and by the vigilance of the clerk of works the foundations are so solidly constructed that not the slightest settlement has been detected.

Ascending the steps at the main entrance on the west side, we enter a wide corridor, about 11ft. in width, which runs along the embankment block, having rooms on either side. Corridors at right-angles near the ends, and another parallel to the main-entrance corridor, form a hollow block with a central court about 70ft. square. The whole block of buildings is thus a parallelogram, 128ft. towards the Emankment and 160ft. in depth. Near the ends of main corridor are two large staircases of concrete, with treads of Craigleith stone. The front and back blocks have rooms on each side of corridor; the side blocks on the east and west sides have rooms only on the outside of each corridor, the latter being lighted from the centre court. The rooms on either side of the corridors are devoted to the assistant commissioner, interview rooms, and various clerks. Above this is a mezzanine floor for clerks. On the first-floor are the rooms of the chief commissioner, constables, messengers, and clerks, together with waiting-rooms. An upper first floor is obtained over this, and above it is a second floor, with a large telegraph office, 50ft. by 22ft. by 19ft. in height, on the south side. The third floor is appropriated to the executive kitchen department and housekeeper's rooms. The floors in the roof comprise numerous stores, including tailors' shops, tunic-stores, boot-stores, stationery, and other necessaries for so large a department of the public service. The eight or nine floors are very plainly finished, the corridors are generally arched, the walls finished in Keene's cement, the floors of Wilkinson's mosaic with red tile borders. The rooms of various sizes opening from the corridors have Lowe's wood block floors, admirable specimens of workmanship, surrounded by margins of red tile supplied by J. C. Edwards, of Ruabon. The walls are of Keen's cement, with dado moulding; the doors are of two-panel, of equal height, the panels being of papier mâché, fixed on each side of the oak-framed door, with bold projecting mouldings; the windows of each room have casements fitted with Eliot's water bars, and the fanlights over have patent fanlight openers. The ceilings are in some cases panelled and furnished in cement. There are four main staircases, and hydraulic lifts on opposite sides of each corridor; the lifts are the work of the American Elevator Co. The Chief Commissioner's rooms on first floor at the angle, includes one of the angle oriel or turret projections, and has a high dado of walnut. Lavatories and closets are provided in the corridors on each floor. The corridors are heated by hot-water coils and pipes. The whole of the arches over the east basement, and the suite of rooms under the parterres, the foundations, also the gutters, have been covered and lined with Claridge's Patent Asphalte, as we have previously described. One feature worth notice, is that the large cornice has been lined with this asphalte instead of with lead, and we hear that the result is highly satisfactory. The inner court is being paved with Granolithic stone, by Stuart's Granolithic Paving Company. The construction throughout is fireproof. Messrs. Homan and Rodgers have supplied the iron-work for the roof; and Messrs. Measures the

girdering of the floors. Messrs. John Grover and Son have carried out the work in a highly satisfactory manner, under the personal attention of Mr. George Eraut, the clerk of works; and we learn that every stone in the building has been placed on its natural quarry bed.

COMPETITIONS.

The Battersea Polytechnic.—The committee of the South London Polytechnic Institutes have, with the advice and assistance of their consulting architect, Mr. Rowland Plumbe, F.R.I.B.A., just selected six sets of drawings from the fifteen sent them in the preliminary competition for a design for the proposed Battersea Polytechnic. The authors of the six selected designs have now been invited to take part in the final competition in which the drawings will be made to an enlarged scale, viz., $\frac{1}{4}$in. to a foot, in lieu of the $\frac{1}{8}$in. to a foot scale in the preliminary competition. The six successful competitors are: Mr. John Belcher, F.R.I.B.A., Messrs. Henman and Harrison, Mr. E. A. Mountford, Messrs. Roger Smith, Son and Gale, Mr. T. Osborne Smith, and Mr. Sidney R. Smith. The proposed Polytechnic is to cost a sum of £40,000, and will be erected on a site of about two acres, facing the Battersea Park-road. In order to complete the committee's scheme, and fit up the Institute when built, a sum of nearly £10,000 is still required.

Blackburn.—In a limited competition for a new Wesleyan chapel and Sunday school at Mellor, near Blackburn, the design of Mr. Walter Barrow, architect, of Preston, has been accepted.

New York.—The project for the Cathedral Church of St. John the Divine has reached another stage, as the five final designs were sent in on November 1st (last Saturday). The authors of these plans are Messrs. Potter and Robinson, Huss and Buck, Heins, La Farge, and W. Halsey Wood, all of whom are architects practising in the States. The site for the cathedral is a commanding one on Manhattan Island, and therefore will become a landmark overlooking the Harlem plain. Most of the competitors have adopted a rendering of the Americanised style of Gothic, and, if we may credit the reports which have just reached us, their designs are intended to realise the problems of the present in a sublime type of ecclesiastical construction, and thus demonstrate with perpetual significance for the multiplied millions of coming ages, the absolute plasticity, the supreme utility, the growing force and ecclesiologic lines of Gothic consummation, with its artistic unification and inexhaustible resources as the dominant expression of Divine Providence altogether unlooked-for and unknown to the great European builders!!

Oswestry Municipal Buildings Competition.—Twenty-six sets of plans have been received in this competition, and are now in course of examination by Mr. Lockwood, the assessor. The award will be made known shortly.

A new concert hall is about to be erected at the junction of five thoroughfares in Sidmouth. It will cover an area of 1,200ft. by 45ft., and will consist of offices on the ground floor, while on the floor above will be a hall, 60ft. by 35ft., in addition to the space occupied by the stage, and a small hall, 42ft. by 25ft. The work will be carried out for the lord of the manor from plans by Mr. C. Murray, of London and Sidmouth.

Colonel Luard, R.E., one of the Local Government Board's Inspectors, held inquiries on Friday at the villages of Crofton and Walton, near Wakefield, relative to the applications which have been made by the Rural Sanitary Authority for Wakefield to the Local Government Board for permission to borrow £1,850 to defray the cost of supplying Crofton with water, and for £1,400 to provide water for Walton. Mr. Massey, engineer to the rural authority, and others gave evidence in support of the proposal.

The Colles Memorial Hall, which has been erected at Melton Mowbray to the memory of the late Dr. Colles, who was for nearly forty years vicar of the parish, was opened by the Bishop of Peterborough on Friday. The new building, which is situated on the north side of the vicarage, contains a parish hall, reading and writing rooms, a library, gymnasium, and soup kitchen. The hall has been erected by Messrs. E. Clarke and Son, of Melton, whose contract amounted to upwards of £1,000. The architect, whose plans were selected in competition, was Mr. A. T. Draper, of Leicester.

Building Intelligence.

Blaydon-upon-Tyne. — New co-operative stores have been opened here. The building is three stories in height. The design is a free treatment of French Renaissance, broken up with gablets. The stone has been obtained from Gunnerton. The architects are Messrs. Thompson and Dunn, of Newcastle.

London County Council.—At Tuesday's meeting of this council the consideration of the scheme for the improvement of the area between Bethnal-green-road and Shoreditch High-street, called the Boundary-street area, 15 acres in extent, and comprising 20 streets, was resumed. The Housing of the Working Classes Committee had reported that the area comprised 730 houses, and the population, exclusive of those in lodging-houses, was 5,566—viz., 3,370 adults and 2,196 children, who occupy 2,545 rooms. The draft scheme of the Committee was unanimously approved, an amendment providing for the gradual clearance of the area and the rehousing of those displaced having been agreed to. At the same meeting a further stage was reached in the proposals for widening St. George's-place, Knightsbridge, an improvement estimated to cost £32,067, it being agreed to lend at 3½ per cent. one fourth of that amount to the Vestry of St. George's, Hanover-square, that being the amount of that local authority's contribution towards the outlay.

Peterston-super-Ely.—The restoration of this quaint and interesting church, for which a faculty has been granted, has been intrusted to Messrs. Kempson and Fowler, architects, of Llandaff. The work includes a new solid oak chancel-arch, screen, and pulpit, new oak chancel seats, new two-light chancel window, the raising of the east window, and filling both with painted glass, the subjects being "The Crucifixion" and "Faith and Hope," new mosaic floor in chancel and the wall decoration of same, the removal of font to its old position, a new heating apparatus, and the restoration of the tower, &c.

Wednesfield. — The cottage homes which have been erected in Amos-lane, Wednesfield, by the Wolverhampton Board of Guardians for the accommodation of pauper children were formally opened on Tuesday. The homes are built of red brick, with stone facings. The buildings include four homes for boys and four for girls, each having accommodation for thirty children. These children will be under the care of foster parents, two in each home; and while the boys are trained in industrial pursuits, such as shoemaking, carpentering, &c., the girls will be instructed in domestic duties. A superintendent's residence is erected on the left of the entrance, and probationary wards and porter's lodge are on the opposite side. Two playgrounds are provided, and it is eventually intended to have swimming-baths. The cost of the buildings has been £17,000. The architect is Mr. G. Hurst Stanger, C.E., and the builders Messrs. Bradney and Co.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Manchester Society of Architects.—At the annual meeting of the Manchester Society of Architects, held Oct. 30th, Mr. R. Knill Freeman, F.R.I.B.A., was re-elected president. In the Students' Competition, the first prize of seven guineas was awarded to Mr. Roger Oldham, and the second of five guineas to Mr. Harold Brakspeare.

At a special meeting of the Midland Great Western Railway Company of Ireland, held on Tuesday, resolutions were adopted authorising the construction of three new lines, one from Galway to Clifden, another from Maryport to Mulrauny, and a third from Ballina to Killola. The aggregate Treasury grants for these lines amount to £440,000, which will about cover their cost.

The dedication of the Shafto Memorial Tower at St. Paul's Church, Spennymoor, together with eight tubular bells, was performed on Friday by the Bishop of Durham. The tower was erected in memory of the late Robert Duncombe Shafto, of Whitworth Park, Spennymoor. It has been designed by Mr. Henery, architect, Durham, and the contractor is Mr. W. Wardroper, also of Durham. The cost was over £2,000.

Engineering Notes.

City and South London Railway.—This undertaking, the first subway on which electricity will be used as a motive power constructed in England, was formally opened by the Prince of Wales, accompanied by the Duke of Clarence, on Tuesday. The distance traversed by the new railway is about 3½ miles. It begins at King William-street, E.C., and terminates at the Swan, Stockwell, with intermediate stations at the junction of Great Dover-street and Blackman-street, the Elephant and Castle, Kennington-road and the Oval, Kennington, the route being taken *viâ* the Elephant and Castle and Kennington Oval. The up and down lines are absolutely distinct, there being, in fact, two tunnels, and they do not necessarily run side by side, one tunnel being at certain points superposed over the other. After passing under the river the railway runs at a depth of about 60ft. beneath the roadway, which it follows throughout. Not only has there been little outlay on compensation to "frontagers," but the tunnelling is done for nearly the whole distance through a uniform stratum of clay. We have previously described the method of construction by means of a circular wrought-iron shield in six segments the full size of a single tunnel (11ft. 6in.), driven through the clay by hydraulic power. The hole thus formed was converted into a tunnel by lining it with half a dozen cast-iron plates, so shaped as to form segments of a circle having a diameter slightly less than the shield, and these were bolted together, the iron being protected on the outer surface by forcing cement grouting through holes in the plates, so as to form a solid concrete jacket to the tube. The railway is of the ordinary 4ft. 8½in. gauge, and the sleepers are laid without ballast directly on the lines, a third rail (an insulated flat bar of steel) being used as the conductor. Each train will consist of an electro-motor and three carriages, and a uniform 2d. fare will be charged. The railway, which has cost £220,000 per mile, was designed by the engineer, Mr. J. H. Greathead, and the work has been carried out under his superintendence, with Sir John Fowler and Sir B. Baker as consulting engineers, and Mr. Basil Mott as resident engineer. The contractors are Messrs. Walter Scott and Co., of Newcastle, who succeeded Mr. Gabbutt. The electrical installation has been carried out by Messrs. Mather and Platt, of Manchester, from plans by Drs. Edward and John Hopkinson.

CHIPS.

A public meeting of the ratepayers was held at Midleton on Monday for the purpose of considering the advisability of promoting a new scheme for erecting labourers' cottages throughout the union, adopted to the guardians at a cost of £20,000. The ratepayers unanimously endorsed the scheme.

At a meeting, held at Eastbourne on Monday, it was resolved to erect a memorial institute in honour of the late Canon Pitman, who was for 60 years vicar of Eastbourne. The scheme will cost about £2,000.

A special meeting of the Malvern Local Board was held on Friday to consider the expediency of promoting a Bill in Parliament authorising the board to spend about £40,000 in improving the water supply of the town. It was decided to proceed with the scheme for acquiring the Rabbit Warren estate.

Mr. E. W. Mountford, F.R.I.B.A., of 17, Buckingham-street, Strand, W.C., after being there for 10 years, has now removed to larger offices upon the first floor at No. 17. The house is upon the same side of the street as No. 22, but a few doors nearer the Thames Embankment.

Messrs. E. Appleton and Son, civil engineers, Torquay, have been instructed to prepare schemes for the drainage and water supply of Hatherleigh, Devon.

The list of receiving orders announced in Tuesday's *Gazette* includes the name of Walter Graham, of Air-street, W., architect.

A memorial screen, designed by Mr. C. H. Rew and executed by Mr. H. Hems, of Exeter, has been placed between the south transept and St. Catherine's Chapel in Berkhampstead Church.

The Bradford School Board adopted on Monday plans prepared by Mr. E. P. Peterson, for the enlargement of Drummond-road school by 312 places, at an estimated cost of £6 per head.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 8½, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom, for Canada, Nova Scotia, and the United States, £1 6s. 6d. or 5 dols. 50c. gold. To France or Belgium, £1 6s. 6d. or 26fr. 30c. To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Scholastic advertisements) is 6d. per line of eight words, the first line counting as two, the minimum charge being 4s. 6d. for 4½ words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 6s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on THURSDAY. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of VOLS. XLII., XLIX., L., LI., LIII., LV., LVI., and LVII. may still be had (price Twelve Shillings); all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volumes just ended should order at once, as many of them soon run out of print.

BRETHREN.—C. of S.—A. Co.—W. and J. B. F.—J. W.—G. W. and Co.

E. G. G.—We cannot tell you whether the Arnott stone is still made or not. We have seen no notice of it for a long time.—J. B.—Very good stuff indeed. You should go to Spindle and Co., 46, Cheapside.—PRACTICAL.—A Builder.—Inquire at R. [illegible], Bedford-street, Strand.—PARTY WALL.—[The party, or division, wall between the two cottages belong, in all probability, to both parties, A. and B., as owners in common. Acts of ownership will be the best evidence of the fact. It cannot certainly under the circumstances without giving notice to A. The common user of the wall by both proprietors is sufficient evidence of the wall being common property, as we have no doubt this is. Consult the by-laws of Midlock.]

IN our review of Mr. W. A. Piccoli's new book, "Outlines of Compensation Laws," in our last issue, p. 632, the words now printed in italics were omitted. "This notice to treat may . . . must not be followed by an agreement." The sections of the Act of 1845 referring to arbitration are 23, 25, and 27.

"BUILDING NEWS" DESIGNING CLUB.

ANDREW R. HEDDACK.—[If you read the instructions again for Subject A. you will see that the frontage is in a street where there are, of course, adjoining buildings. Light therefore, must be obtained secondary to the front and from rear. It is only an entrance to the premises from the rear which is not objectionable.—A. UNIVERSITY.—See above answer. The 15ft. in height for the upper studio may run up into the roof above the plate line, but not more than one-third up the roof. Details are left to competitors.—E. BRIGHTON.—No right of entrance from and return on right of plan.—LEONARD H. DUNCH.—[Top lights may be used, of course; but for schools of art classrooms they are not necessary.]—R. P. LEWIS.—[Open fireplaces look cheerful, but waste space in such studios.]—J. PAULL.—[The large blackboard is a necessary fitting for the room.]

Correspondence.

THE ALLEGED COMPETITION FARCE AT BRISTOL.

To the Editor of the BUILDING NEWS.

SIR,—In reply to a letter headed "A Competition Farce at Bristol," in your issue of 19th inst., by three designers, "Crux," "Equity," and "Double Circle," were submitted to me for adjudication.

The design submitted by "Double Circle" was incomplete, there being no sections or side elevations, and the plan was so inferior to the others that I at once placed it third in order of merit.

The alternative designs marked "Equity" were in every way inferior, even taking the better of the two to the design submitted by "Crux." I append two extracts from my report bearing upon the point of cost raised by "Not in It," and allow the public to form their own view:—

"Certainly neither of the first two competitors could get the work as shown on their drawings, and including everything required by your conditions, carried out as it should be, for the money limit; and whilst "Crux" boldly asserts this fact and gives his reasons, "Equity" makes a statement of cost within the amount, and gets it backed up by two contractors; but if he has any knowledge of Bristol prices, he must know how impossible it would be to do this, and at the same time do good work. I venture to assert that neither of the two contractors would sign a contract binding themselves to carry out the work for the estimate given.

"I think, however, your price is fixed too low for the requirements you ask, especially taking into consideration the situation of the site and the class of congregation that would worship in the building when erected, and I strongly advise your adoption of the plans of "Crux" with modifications."

As will be seen, by putting the cubical contents at the low estimate of 5½d. per foot cube, the respective prices would be, "Crux"—

157,530c.ft. at 5½d.	£3,615	18s.	9d.
Less suggested modifications ..	950	0	0
	2,665	18	9

"Equity"—

Design A. 156,370c.ft. at 5½d.	£3,629	6s.	5d.
Modified Do. B, 124,457c.ft. at 5½d.	2,851	13	7

It follows without saying that neither of the two first were within the limit of £1,800. The third competitor's designs could not be cubed, there being no sections submitted, but judging from his perspective with the front elevation and plan the assumption was that this design would have worked out at a higher figure than either of the others.

It appears from the letter of "Not in It" that the committee have followed my advice, had modifications made, and received a tender for £2,748, or within a small margin of my approximate estimate of £2,666, as above.—I am, &c.,

ARCHITECT.

CHIPS.

An hotel is about to be built by a limited liability company between Cadoxton and Holton. Messrs. Seward and Thomas, Cardiff and Cadoxton, are the architects, and the capital of the company will be about £7,000.

While the celebrated group of Theseus and the Centaur by Canova was being moved from the Volksgarten of Vienna to the new Museum of Art in that city on Friday, the roadway gave way under the great weight, and the mass of marble was overturned, with the result that the figure of Theseus was shattered. All the fragments were recovered, and will be cemented together.

A Sailors' Institute is being built at Cadoxton-Barry from plans by Messrs. James and Morgan, Charles-street Chambers, Cardiff.

A new organ, which has been built in Bromsley Church, Northumberland, was opened on Friday. The new instrument has been built by Messrs. Wordsworth and Co., of Leeds, and has cost £170.

The museum in Dyke-road, Brighton, containing the unique collection of British birds formed by the late Mr. E. T. Booth and bequeathed by him to the town, was formally handed over to the Corporation on Monday.

Mr. J. A. Shuttleworth, of Haileswage Hall, laid last week the key stone of one of the seven arches of the viaduct on the Dove and Chinley Railway. The viaduct will be 440ft. long and 60ft. high, the arches being 40ft. span, and built of Millstone Edge stone and lined with blue bricks from Staffordshire.

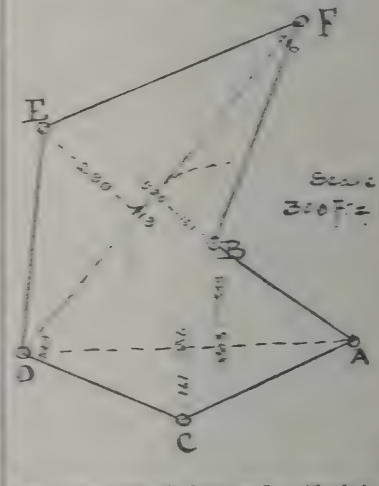
On Monday evening Prof. R. A. M. Stevenson, who occupies the chair of art at University College, Liverpool, personally conducted a large number of members of the Liverpool Art Club and others through the Autumn Exhibition in that city. In his comments on a number of pictures showing advanced modes of treatment, Mr. Stevenson revealed his sympathies with the Impressionist school.

Intercommunication.

QUESTIONS.

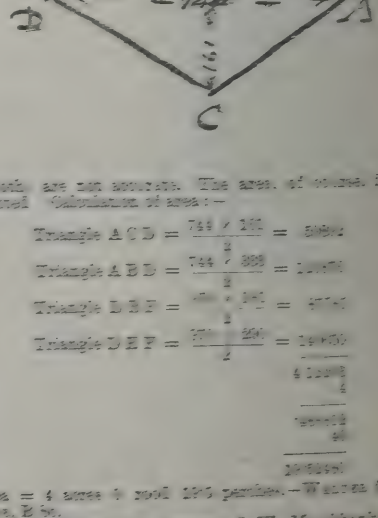
[10424.]—**Book-keeping.**—What is the best work published on this subject suitable for contractor. Also for job-master?—ENQUIRER.

[10425.]—**Bracket.**—Wanted formula for calculating strength of wrought-iron bracket, bolted to side of beam, carrying projecting plate and load over.—QUERIST.



[10426.]—**Bridge Construction.**—Will any experienced reader kindly give me the names of really good books on bridge construction.—(1) girder and truss bridges, (2) brick or stone bridges, and which deal (mathematically and also in an elementary manner, and which would be of service in making working plans of bridges for ordinary spans?—PERSEVERING STUDENT.

[10427.]—**Masonry.**—Can anyone describe the joint when it is better—to set stone in its "quarry-bed"? I think a masonry mason once told me this solidities should be worked with the bed upright; but I made no note at the time, and should like to see some practical hints on this point.—A LOOKER-ON.



[10428.]—**Church Estimating.**—Will some reader kindly inform me what is the best way to estimate the cost of a church, and what is the price taken per sitting?—H.

REPLIES.

[10417.]—**Surveying.**—I have not seen Baker's work, but the following diagram explains the planning. The

survey has evidently been made with chain and cross-staff. The difficulty in accurately plotting, supposing the perpendiculars are truly so (and the area is calculated on this assumption), is that the figures 903, 520 are in other

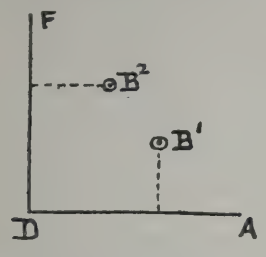
words are not accurate. The area, of course, is not altered. Calculation of area:—

Triangle A C D = $\frac{744 \times 520}{2}$ = 193440

Triangle A B D = $\frac{744 \times 903}{2}$ = 335916

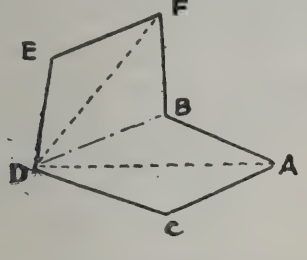
Triangle D B F = $\frac{\quad \times \quad}{2}$ = 47741

Triangle D E F = $\frac{\quad \times 290}{2}$ = 104450



4 [illegible]
4

[illegible]
96



Area = 4 acres 1 rood 1915 perches.—WILLIAM CARPENTER, Bath.

P. L. (Gray, H. G. Sarnen, J. W. Middleton, and others have also answered.—ED.]

[10417.]—**Surveying.**—The example of surveying from Mr. T. Baker's work on "Land and Engineering Surveying" may be plotted as follows:—The first line,

A D, is plotted in a westerly direction for a distance of 744 links, with the offsets to the right and left. This line is a diagonal. The next line, D F, is to be plotted to the right of D; but not necessarily at right angles to it. In the first instance, it may be plotted at right angles, with this result: The offsets from the lines A D, D F, to the point B^1 do not by this construction indicate the same point. If the line D F be made to revolve on the point D

until the point B^2 coincides with the point B^1, then the lines will be in true position, and by joining the points A C D E F B the boundary of the field will be obtained. The figure is then reduced to two trapeziums, the diagonals and offsets of which are given, and the area may be calculated in the usual manner.—J. P. Greenwood.

[10416.]—**Association of Public Sanitary Inspectors.**—In reply to your correspondent "R. W.," and for his information and that of others of your readers, I beg to say that the Hon. Secretary, Mr. S. C. Legg, 117, Powerscroft-road, Clapton, E., will be pleased to hear from any sanitary inspector desiring to join the Association of Public Sanitary Inspectors of Great Britain.—Edward Tidman, Member of Council.

[10419.]—**Horizontal Flue.**—Insert a large batswing gas-burner (or two, if necessary) in the upshaft, closing the flue with a door having a piece of talc inserted to enable the flame to be seen. This is immensely more active than the method you propose. —John Glendenning.

STAINED GLASS.

Bristol Cathedral.—The new window which has been placed in the north transept of the cathedral in memory of Edward Colston was unveiled on Thursday in last week. The window takes the place of one which it was found necessary to remove because of its decayed condition. The design is by Mr. J. L. Pearson, R.A., architect to the Cathedral Restoration Committee, and the stained glass work was intrusted to Messrs. Powell and Sons, of London. Running along the lower part of the window is a memorial inscription, and above this are six panels containing shields representing the Arms of Edward Colston, the Arms of the Society of Merchant Venturers, the Badge of the Dolphin Society, the Arms of the See of Bristol, together with those of the City of Bristol, and of Christ's Hospital, where Colston was educated. These shields are surmounted by the Colston motto: "Go and do thou likewise," in connection with the six scenes of the parable of the Good Samaritan. The next tier illustrates the Sermon on the Mount and Christ Blessing Little Children, each subject being illustrated in three lights. Above this again there are six New Testament philanthropists—viz., the Centurion, St. John the Apostle, Joseph of Arimathea, St. Barnabas, St. Paul, and Cornelius. The canopies of these figures and the panels below are studies from examples of the 14th century. The upper tracery of window contains a design illustrative of Christ on His Throne surrounded by the symbols of the four Evangelists. The new window measures 35ft. by 16ft., and a space of 17ft. is allowed between the floor and the base.

The housing of the poor and the provision of sanitary dwellings have lately attracted much consideration in Salford and Manchester, the local death-rate being very high compared with other large cities. The Salford Council on Thursday unanimously adopted a scheme for demolishing insanitary property, involving an expenditure of £50,000, and a prospective outlay of £400,000.

WATER SUPPLY AND SANITARY MATTERS.

Dublin.—Serious defects have been discovered in the sanitary system of the King's Hospital Blue-coat School, Blackhall-place, Dublin, and a report has been obtained from Mr. W. Kaye Parry, M.A., civil engineer, Dublin, upon the subject. The Governors have decided to completely reconstruct the sanitary arrangements from plans and specifications prepared by Mr. Kaye Parry.

Glasgow.—The Glasgow Waterworks Committee made an inspection on Friday of the extension works for the supply of the city at Strathblane, and subsequently inaugurated the New Mugdock Tunnel by directing the water flowing from Loch Katrine through it. The contractors, Messrs. Morrison and Mason, commenced the contract for the tunnel in the spring of 1886, and, owing to the old tunnel having been running its full capacity of forty million gallons per day, the work has been hastened forward as speedily as possible. The new tunnel is 1½ miles in length with a fall of 10in. per mile, and is capable of discharging about 80 million gallons per day. It runs parallel with and some 22 yards to the east of the old one. Three years were spent in piercing the ridge of hills between the Blane and Allander valleys, and fifteen months were occupied in concrete lining and dressing, and the bottom is lined with concrete for the whole length.

Matlock Bath Waterworks.—The Local Board of Matlock Bath have decided to increase the water supply of the town. A large supply is required in summer to provide for the visitors and excursionists. Mr. W. H. Radford, C.E., of Nottingham, has been called in and requested to prepare a scheme for the local board.

Maldon.—The works of sewerage and of sewage disposal for the town of Maldon, Essex, were opened by the mayor and corporation on Tuesday last, the 4th inst. The works have been carried out from the designs and under the superintendence of Messrs. R. B. Grantham and Son, of Northumberland Avenue, by Mr. G. Osenton, the contractor, Mr. John Wood acting as clerk of works. The town council has determined to form a promenade along the frontage of the river Blackwater, and to lay out a recreation ground in connection therewith.

Pollution of the River Calder.—On Tuesday Mr. J. T. Harrison, M.Inst.C.E., held a Local Government inquiry at the board-room, Earlsheaton, near Dewsbury, relative to an application by the Soothill Nether local board for sanction to borrow £12,000 for the purpose of carrying out a complete scheme of main drainage and sewage treatment. Mr. W. C. Handley, clerk to the board, stated that the population of the district was about 5,750, the effective rateable value £13,113, and the amount of the present debt £1,530. Mr. Malcolm Paterson, M.Inst.C.E., Bradford, the board's engineer, produced the plans and sections of the scheme, and explained the details. The scheme is entirely by gravitation, there being two main outfall sewers meeting at one point, and the method of treatment proposed is chemical precipitation in three tanks working separately, combined with filtration on land specially prepared to a depth of 5ft. or 6ft., the total area being 4 acres. The principal features of the scheme are (1) the separation of the storm-water from the sewage; (2) utilisation of the fall of the sewage for mixing chemicals; and (3) the taking of the manufacturing refuse into the sewers, thus striking at the root of river pollution, a step which, in view of the terrible state of the Calder, will doubtless be watched with interest by the West Riding County Council. The inspector advised the acquisition of the land at once by conditional agreement, and stated that in no case would the Local Government Board sanction the discharge of sewage clarified by precipitation without its passing over land, not even the supernatant water periodically discharged before cleansing the tanks, and further stated that with this proviso he would recommend the granting of the application.

Worcester.—At the Guildhall, Colonel Ducat, R.E., an inspector of the Local Government Board, commenced an inquiry on Tuesday into the question of sewage disposal, which has for a long time past engaged the attention of the authorities in Worcester. The notice announcing the holding of the inquiry set forth that the town council had applied to the Local Government Board for sanction to borrow £50,000 for the construction of sewage-disposal works, £580 for the construction of a new street, and £300 for purposes of street improvement. The schemes are opposed by a large body of ratepayers, who, like the corporation, are represented by counsel. Mr. Hastings, M.P., is watching the proceedings on behalf of the Dean and Chapter.

Alterations have been made to Colney Hatch Lunatic Asylum, including the ventilation, which is now carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

LEGAL INTELLIGENCE.

Damages for Misrepresentation as to House Drainage.—On Monday an action was tried by Mr. Justice Cave and a jury, in which the plaintiff, Mr. Farries, sought to recover damages from Mr. Hill, the trustee of a house in Stanstead-road, Forest-hill, for having let him the premises when in an insanitary condition. The plaintiff's family, after entering the house, were attacked with both scarlatina and diphtheria, from which one of his children died. The unsanitary state of the house was found on investigation by the sanitary inspector to be due to the system of connecting the waste-water pipes with the soil-pipes. The defendant's case was that he did not, as alleged by the plaintiff, absolutely guarantee the house to be in a perfectly good sanitary condition, but only expressed his belief that it was in such a condition. The jury awarded the plaintiff £85 damages, and decided in his favour upon a counter-claim for rent made by the defendant.

An Architect-and-Builder on Mortar.—At Wandsworth Police-court last week, Andrew Saunders, a builder, Graham-road, Wimbledon, was summoned by the local board for using, in the erection of a house in Worple-road, mortar which was not compounded of good lime, and clean, sharp sand, or other suitable material. F. W. Pearce, assistant surveyor to the local board, stated that in September he inspected the building and found two sorts of mortar in use. No complaint was made of the mortar which was used on the outside face of the external walls, but that used on the inside face was of bad quality, black mould being mixed with it in the proportion of one in three. Charles H. Cooper, surveyor to the board, said the mortar produced was decidedly bad, and easily crumbled between the fingers. The mould was totally unfit for the purpose for which it was used. For the defence, William Stansbury, "surveyor, architect, and builder and contractor," of Wandsworth, was called, and stated he had been in business twenty years, and had erected hundreds of houses. He had inspected the defendant's building, and found that very good mortar was used. So far from bad material being used in portions of the walls which were out of sight, if he complained of any, he should complain of that which was outside. The sample produced crumbled because it was removed from the wall before it had had time to set. It was composed of good sharp stuff and lime. Thousands of tons of it were used round Battersea. It was 90 per cent. better than that used by many people. He meant ninety out of every hundred would use worse mortar. He was satisfied with it, and he surveyed hundreds of houses every year. Cross-examined: Built by other people?—Yes. Is the material which the surveyor calls mould clean, sharp sand?—I can't say it is. It is a mixture of mould, ash, and dust. In imposing the full penalty of £5 and costs, Mr. Denman said the defendant's evidence entirely failed to satisfy him that the samples were not fair tests of the mortar which was being used on the premises. It was clearly proved that it was not proper mortar.

Re George Wall.—The bankrupt, who traded as a builder and contractor in Carlton-road, Kentish Town, under the style of Wall Brothers, applied on Tuesday to pass his public examination. He had been largely engaged in the erection of buildings for the London School Board, and claims to the amount of £13,000 (which the bankrupt disputes) have been made by the Board on the ground that the work had not be carried out in accordance with the contracts. The statement of affairs showed total liabilities £25,360, of which £13,088 are expected to rank, and assets £4,462. The bankrupt attributed his failure to losses on contracts occasioned by a rise in the price of materials, to miscalculations as to the cost of labour, and to his expenses having lately exceeded his profits. The bankrupt passed his examination.

A monument has been erected in the south or Clothworkers' aisle of the parish church of Tavistock, in memory of the Bredalls family. It is Jacobean in character, and has been carried out by Mr. Harry Hems, of Exeter.

The county council of Suffolk have raised the salary of Mr. H. Miller, jun., of Ipswich, who was was appointed county surveyor last year in succession to Mr. H. M. Eyton, retired, from £250, with £100 for expenses, to an inclusive sum of £400 a year.

The new church at Langley, near Birmingham, was consecrated last week. Messrs. Osborn and Reading, of Birmingham, with Messrs. Wood and Kenrick, of West Bromwich, have jointly acted as architects, and the building operations have been intrusted to Mr. T. Rowbotham, of Birmingham. The church will accommodate 617. Its design is a simple treatment in brick and stone of the Early Decorated style. The nave is 75ft. by 24ft., and the aisles 75ft. by 11ft. 3in. The chancel is 35ft. 6in. by 24ft. On the north side are the choir and clergy vestries, also the organ chamber; and on the south side an aisle 22ft. 9in. by 19ft. 3in.

Our Office Table.

Mr. Woodcock, who has liberally offered to bear one-half the cost of erecting a campanile to house the bells of St. Michael's, Coventry, has arranged with Mr. Alfred Waterhouse, R.A., Mr. R. Norman Shaw, R.A., and Mr. Ewan Christian to visit Coventry at an early date for the purpose of forming an opinion as to whether a well-designed campanile can be erected near to St. Michael's Church, without interfering with the architectural beauties of the towers and spires of St. Michael's and Holy Trinity, and in the event of their opinion being in the affirmative, then to select the most advantageous site for such proposed tower. The visit of inspection was to have taken place yesterday (Thursday), but Mr. Waterhouse wrote us on Tuesday, informing us that it has been postponed.

The death is recorded, on the 20th October, at his residence in Hampstead, of James Marjoribanks MacLaren, architect. He was the son of Mr. John MacLaren, J.P., of Middleton, Perthshire, and was 37 years of age. He served his articles in the office of the late Bailie Salmond, Glasgow, and proceeding to London, assisted, amongst others, Messrs. J. J. Stevenson and Mr. Richard Coad, the latter having been Sir G. Scott's chief assistant on the designs of the Albert Memorial. For some time Mr. MacLaren acted as Mr. Coad's partner, afterwards he began on his own account in London, and his chief successes in competition were St. Michael's Church, Crieff (this, however, not executed); Presbyterian Church, Dulwich; new wing to High School, Stirling; and recently he was associated with Mr. A. Stewart, C.E., and Mr. W. Dunn, architect, in obtaining the first premium for the Watkin Tower. The principal of his other works are, houses at Grangemouth for Messrs. MacLaren and Fairlie, alterations at Ripple Court, Kent, for Col. Sladen; house at Ledbury, for Mr. M. Biddulph, M.P.; Town Hall, Aberfeldy, Perthshire; hotel and lodges at Santa Catalina, Las Palmas, Canary Islands; and estate work for Sir Donald Currie, K.C.M.G., M.P., &c.

Mr. A. B. Mullett, of Washington, the most noted of the men who have successively held the position of Supervising Architect to the U.S. Treasury Department, died by his own hand on Monday, the 20th ult. He had been for a year mentally afflicted, and recently his malady had taken a turn for the worst. Mr. Mullett went to Washington from Ohio, at the invitation of Chief Justice Chase, soon after the close of the War. He had been in early life a carpenter and builder; but his extraordinary energy and capacity fitted him, in the opinion of the U.S. Government, for directing the public work, and he was first made assistant supervising architect, and, soon after, promoted to the chief place. Under his administration a great deal of the most costly public work in the State was carried out. The great cities of New York, Boston, Chicago, and Cincinnati, besides smaller ones, needed to be provided all at the same time with post-offices and Government buildings, and all that untiring industry and energy could do to forward the work was done by Mr. Mullett. His work was severely criticised, and he was compelled to retire from his post, but was retained in the Government service as special inspector. A few years later, when his old post was again vacant, the Government proposed to reappoint him; but during a long delay before the appointment was completed, Mr. Mullett expressed his impatience to a reporter, with the result that his name was erased from the list of candidates for the position. Mr. Mullett remained in Washington, and soon gained a considerable private practice. He attempted to enforce a claim for compensation for designing and supervising the immense building of the State War and Navy Department, which, as he maintained, he was called upon to carry out as a private architect, and not as a Government official; but the decision, after appeals, finally went against him. Although entrusted with the expenditure of almost countless millions of public money, he lived modestly on a very meagre salary, and died in financial straits.

A petition from the Society for the Preservation of the Monuments of Ancient Egypt has been drawn up for presentation to the Prime Minister, and now lies for signature at the rooms of the society, 9, Buckingham-street, Adelphi. It states that the destruction of the ancient monuments is a matter which has called forth a strong expression of public opinion lately, and urges that it is impossible to regard the obliteration of documents relating to the earliest recorded civilisation and works of art of rare beauty with feelings other than those of shame and indignation. Unhappily, the destruction which has been in progress during centuries has of late years been carried on with increased intensity. The growing prosperity of the country has created a demand for building materials, and the ancient monuments are now resorted to as quarries. Miracles of the sculptor's art and vast inscribed wall spaces are broken up for rubble or cast into the lime-kiln. But the worst cases of destruction have arisen from other causes, as in the recent notorious mutilations at Beni-Hassan. The petitioners are of opinion that the devastation can only be prevented by placing the monuments under proper inspection. They plead that Lord Salisbury will direct his agent at Cairo to move the Egyptian Government to appoint an English official inspector, who should be instructed to submit yearly reports of his proceedings.

On Monday Lord Dartmouth opened the new Technical Art and Industrial Museum at Hanley, and an elaborate souvenir of some 100 mottoes painted on the friezes of that building has been published by the architect, Mr. W. L. Sugden, whese taste in their selection is worthy of comment, ranging as the quotations do from the prophets and writers of the Scriptures, both old and new, as well as modern popes, bishops, painters, poets, and ancient Persian proverbs. Emerson, Ingersoll, Swift, and Thomas Hobbes are laid under contribution, and much interest has thus been added to the decorative treatment adopted in the structure, which these wise and elegant sayings elaborate. The cover of the little memento pamphlet is designed in a Renaissance style, slightly Rococo in its mannerism, but nevertheless cleverly varied in the balance of its composition, and appropriate in character. Inside a plan of the new building is given, with some sections of the galleries, though we are not shown what the exterior of the building is like. At the end, a short general essay on Technical Museums is given, and the advantage of such institutions is insisted upon. We have described this particular building very recently in our pages, and so need not repeat here what has already been said about its appropriate and useful character. The brochure to which we have now referred is artistically produced, capitally printed, and is sold at 6d. a copy.

Messrs. Walker and Roberts, of Liverpool, have presented to the Bootle Museum a screen of ornamental woodwork, so constructed as to show the decorative value of seventeen kinds of woods. It is thus described on the engraved brass plate which it bears:—"Fancy wood screen presented by Messrs. Walker and Roberts, timber merchants, Liverpool. The screen has been constructed to show the decorative or ornamental value of seventeen different kinds of wood. The floor is in teak, with borders and centres in walnut, mahogany, satinwood, cedar, and ebony. The figures of trees on the screen are water-colour drawings of the species which furnish the wood for the panels underneath—oak-tree above oak panel, pine-tree above pitch panel, and so on with each. There is a row of smaller panels above, each bearing the name of the kind of wood of which it is made. Surmounting the whole is a balustrade supporting a moulded cornice. In the arcade are introduced some finely-worked carvings of the foliage of different trees; and the individual effect of the English oak, the Indian teak, and the American walnut is seen in the framework of the back and each side of the screen respectively."

The annual report of the City and Guilds of London Institute shows that at the recent examination the total number of worked papers was 6,781, as against 6,606 in 1889. Of these, 3,507 obtained passes, as against 3,532 in 1889, showing a slight decrease in the number of successful papers. This decrease is mainly due to the failures in Mechanical Engineering—a subject in which the largest number of candidates always present themselves. This year the number of individual candidates was 6,667, against 6,448 in 1889. Of these, 3,456 succeeded in satisfying the examiners, 51 in two subjects. Last year the corresponding numbers were 3,455 and 77. The general percentage of failures has increased from 46·5 to 48·2. In Plumbing 569 papers were submitted, of which only 233 satisfied the examiners, showing a percentage of 59·0 failures; whereas in Carpentry and Joinery, out of 707 papers, the failures numbered 37·4 per cent.; and in Brickwork and Masonry, with 120 papers, the failures were only 29·1 per cent.

A number of applicants for registration by the Worshipful Company of Plumbers, under the rules of the National Training and Registration of Plumbers, were examined at the Guilds' Institute on Monday. There were present applicants from most of the districts of London, as well as from such distant places as Northampton, Lowestoft, Norwich, Shipston-on-Stour, &c. The examinations, while not unduly severe, were such as to thoroughly test the manual skill and theoretical knowledge of the candidates, each of whom, in addition to executing such practical work as pipe-bending, joint-making, lead-laying, &c., was required to answer a set of questions relating to the properties and qualities of the various materials employed by plumbers, external and internal constructions, sanitary arrangements, and water supply. Only half of the total number of candidates succeeded in passing the full examinations.

MEETINGS FOR THE ENSUING WEEK.

Tuesday.—Society of Architects. Inaugural Address, by the President, Robert Walker, of Cork. St. James's Hall, Piccadilly. 7.30 p.m.
Institution of Civil Engineers. "Steam on Common Roads," by J. Maclaren. 8 p.m.
Royal Society of Antiquaries of Ireland. General Meeting at Dublin.

The Society of Architects.—The First Ordinary Meeting of the Society of Architects for the Session 1890-91 will be held at St. James's Hall, Piccadilly, W., on Tuesday, Nov. 11th, 1890, at 7.30 o'clock p.m., when the President, Mr. R. Walker, A.M.Inst.C.E., will deliver the Opening Address of the Session.

Edgar Farman, Hon. Sec.
G. A. T. Middleton, Sec.

WAGES MOVEMENTS.

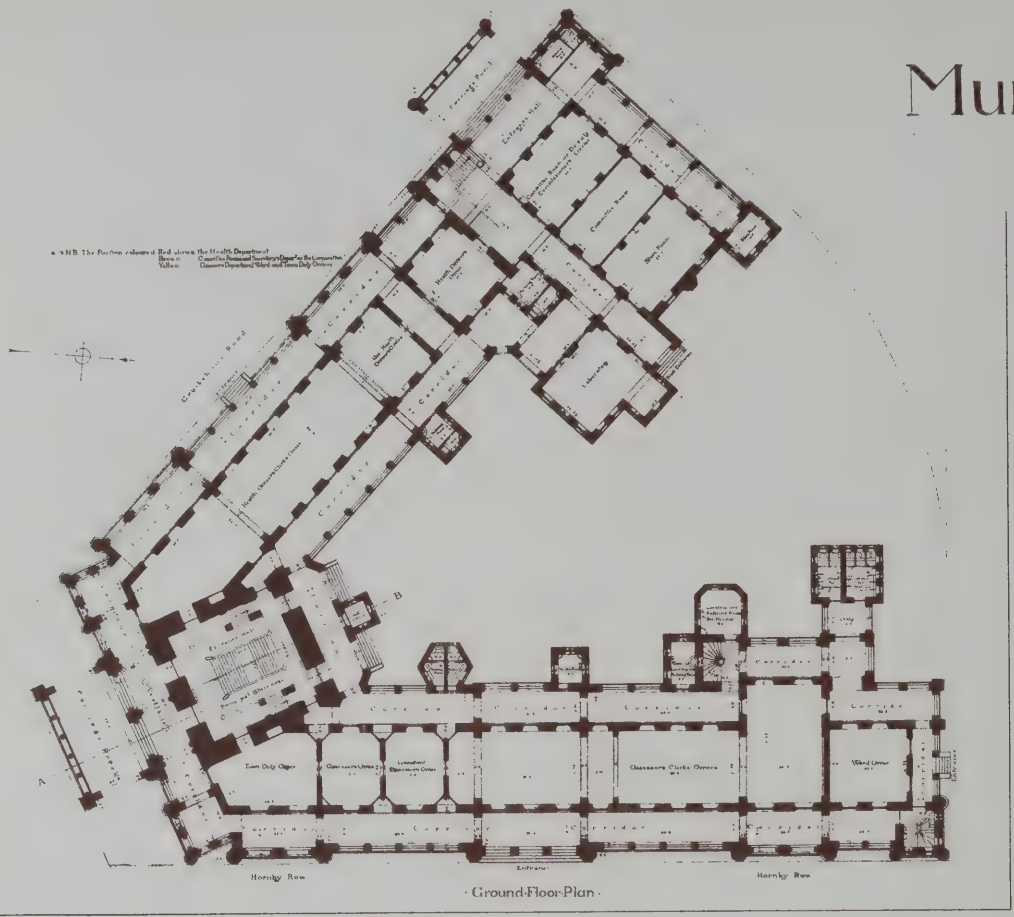
St. Alban's.—During last week a difference arose between a certain section of the masons employed by Messrs. Longmire and the foreman at the works on the Abbey, which resulted in the masons coming out on strike. The principal cause of difference was an attempt on the part of the foreman to reduce the time allowed for dinner from an hour to half-an-hour, which was resented by the men as contrary to the rules of the Operative Masons' Society.

CHIPS.

The National Provincial Bank of England, Poole, is warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Mr. E. H. Shorland, of Manchester.

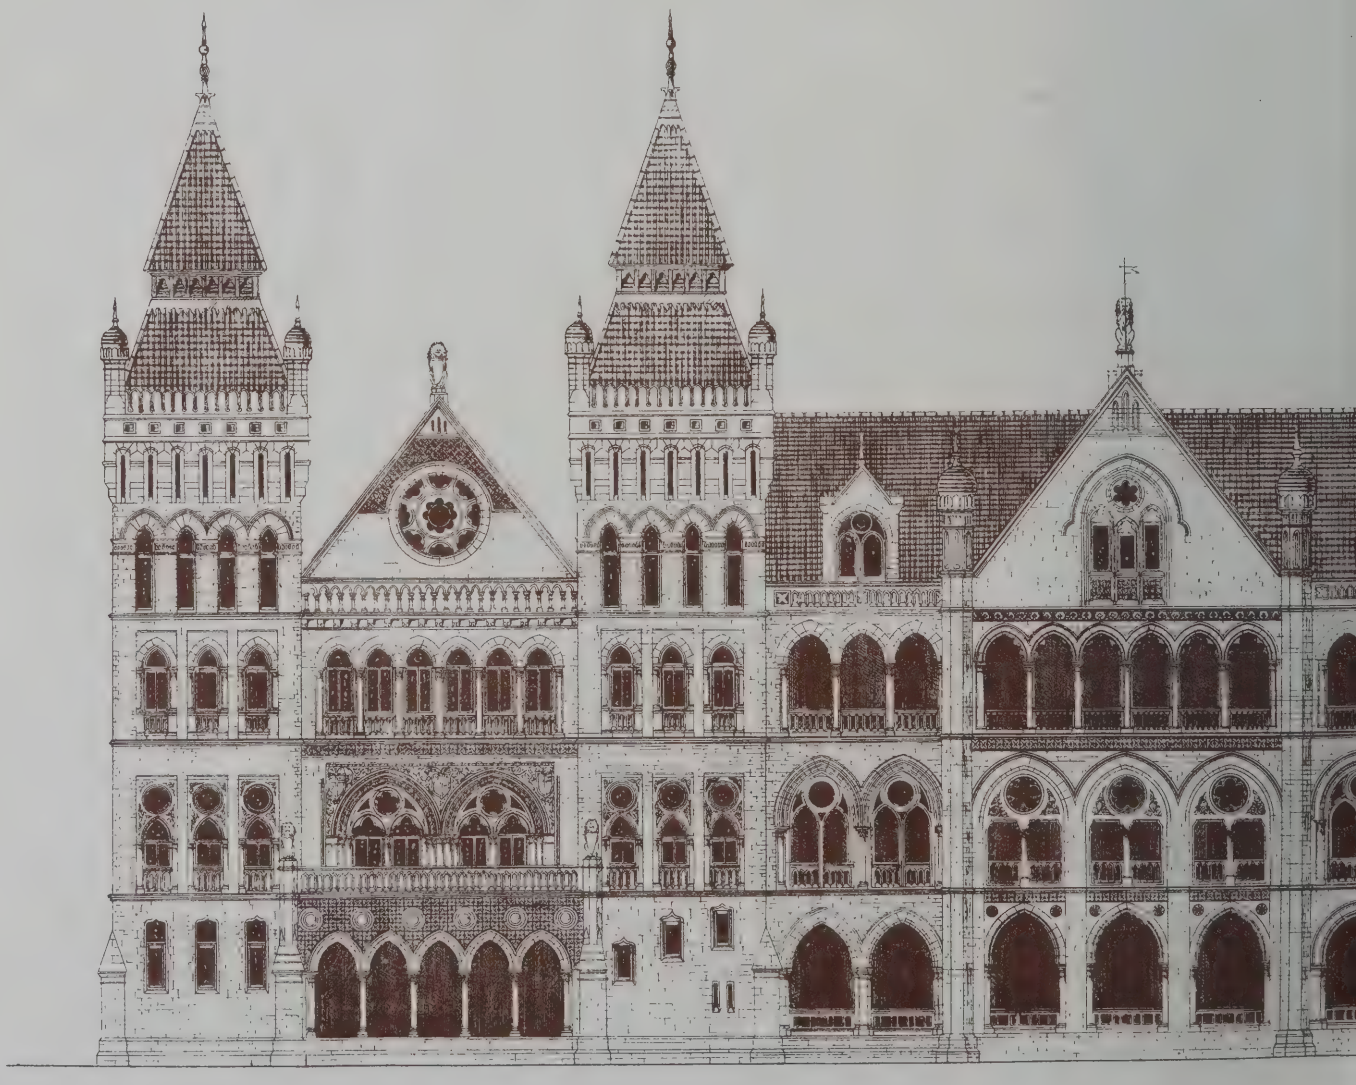
The church at Dormans, East Grinstead, has received an addition to its stained glass of a fine window, from the studio of Mr. Taylor, of Berners-street, the gift of a friend of the vicar.

Mr. William Dawes, architect, of 7, Oxford-circus-avenue, London, and 2, Cooper-street, Manchester, has taken Mr. Francis Frazer Hoyland into partnership, and the style of the firm will in future be Dawes and Hoyland.



A discovery of considerable artistic importance has just been made at Milan. In the process of scraping some walls at the hospital, there has been brought to light a copy of the famous "Last Supper" of Leonardo da Vinci. The newly-found fresco (which measures 20ft. 3in. by 10ft. 2in.) seems to be a replica to a slightly smaller scale of the composition as originally painted by Da Vinci, and contains details which have disappeared from the original in the course of much maltreatment and partial restorations, notably, some partly legible names and inscriptions traced on the borders of the draperies. It had long been known that in 1502 one Glaxiate was paid 26 Milanese pounds to make out a copy in the hospital, but all trace of the works had been lost.

A new bank for the Cornish Banking Company has just been completed in Queen's square, Penzance. Mr. J. W. Trounson, of that town, is the architect, and Messrs. Wynn and Son, of Helston, were the builders; the cost was £1,200.



A stained-glass window, the work of Mr. Kemp, of Brighton, has been placed in York Minster as a memorial of the late Hon. Guy Dawnay, M.P.

FRIDAY, NOVEMBER 14, 1890.

ARCHITECTS AND CRAFTSMEN.

TWO notes have been struck which sound rather discordant: one is for a higher education for architects, the other for the revival of craftsmanship. Those who are advocating the training and education of architects—a systematic course of instruction like that in Germany, Austria, or America—appear to have overlooked the essentially practical and technical nature of those courses, and to have taken a standard of collegiate education that ought to have been commenced in the school. A higher education to be beneficial must come down to the level of the craftsman as well as rise to the more exalted duties of the artist. To make the two educations of the architect and craftsman more separable than they are, by placing the former above the head of the workman, is the real evil that we have to deplore. We cannot reassert too strongly, that the dissolution of the relation that once existed between the accessory arts and architecture proper has been the cause of the fatal schism. Directly architecture began to be practised by so-called "professional" men, the accessory arts of sculpture, painting, glass, wood, and metal working lost their former standing as arts, and have been practised apart from, and even in opposition to, the architect by tradesmen and specialists. Long after the dawn of the Renaissance, artists like Grinling Gibbons were encouraged by leading architects and worked hand in hand with them. There was a union of art and craftsmanship; the architect gave the general idea or a rough sketch of the proposed detail or ornamental carving, and the working artist developed and completed it. How is it now? The artist-designer and the craftsman are distinct persons; the one designs what is often not practicable, and the other executes, it may be a hundred miles away, at his own studio, a work that should be executed only on the building or within sight of it. All touch between the artist and executant, or the building and the actual work, is lost. The executed work, when it comes to be fixed—say the carving of a pinnacle of a tomb, or the boss and finial of a choir-stall—looks mannered and "shoppy"; there is no sympathy between the ornament and the adjacent features of the building; there is no scale or proportionate detail or vigour in the work, as there would have been if the detail had been executed *in situ*, or within sight and touch of the actual work.

In his address before the architectural section of the Art Congress at Birmingham, Mr. T. G. Jackson, M.A., spoke some timely words on the subject of artistic education. How to teach the public to appreciate good architecture, and to know it from bad when they see it, is, after all, more important than anything which architects can do amongst themselves to better their position in the eyes of the world. How to fit an architect to acquire the knowledge to enable him to associate with cultured gentlemen—to make him, in fact, an educated man before he can practise — is one thing and an important question; how to make him a good architect and to qualify him for his artistic avocation is another matter. With regard to the first sort of education, we ought to be able to assume, as Mr. Jackson hinted, that the student has had a suitable education for his position. Alas! it is true we cannot in every case; but, at least, it ought to be a condition taken for granted. The real education of the architect begins after the scholastic. Valuable as pupilage is in training the pupil for business and professional routine; useful as sketching, artistic freehand, and mechanical drawing are as means to the end, they are useless if not applied to actual building and to the crafts connected with it. He can only make these accomplishments useful by consulting the needs of the craftsman — by going into the workshop or the building and learning what is actually necessary, realising for himself the most economical modes of converting materials and rendering them effective. The instruction given by schools of design is useless unless it is accompanied by actual contact with materials and the treatment that can be produced by tools, for, as Mr. Jackson says, the knowledge of ancient styles only results in "mere antiquarianism," unless the conditions of modern requirements are consulted. An architect's work, says the same gentleman, "is the direction of a variety of handicrafts to none of which he has himself been trained." The more necessary that he should know "enough about them to be able in the first place to design his work so that it can be made coherent, and next so that it can be made without needless trouble and expense. This knowledge he can only acquire in the workshops and on the building; books will never teach it, and the student cannot begin too soon to frequent the masons' sheds and the carpenters' shops. I would have every young man, during his pupilage or at the end of it, pass a few months under a clerk of works at some building—best of all on one for which he has been making drawings in the office, so that he may see how his work on paper looks when realised in stone or wood. This is an education that never ends; as necessary for the architect as for the pupil, &c." We commend Mr. Jackson's remarks to the attention of the profession. No architect, he says, "who respects himself and pretends to the character of an artist, will now resign the decoration of his building to other hands."

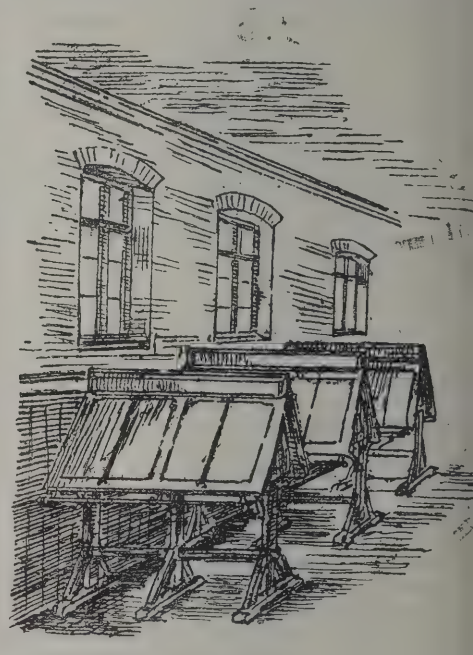
It is this kinship of architecture and the allied arts that is the thesis of all recent utterances on art matters, the days of mere building, or "agency-architects," are numbered, and the one endeavour of all those of "light and leading" in the profession is to bring together the artists and handicraftsman—to unite the various vehicles of art expression, and harmonise them. The architect is the only one who can rally these forces, and can bring the discordant notes of modern crafts into concord. For this purpose he should be educated in the methods and technical processes of the arts. Sculpture and painting and decoration must no longer be taught exclusively in the school and museum or studio. They must be acquired in connection with the materials. Form and colour cannot be divorced, as they have been so long, from the vehicles by which they are expressed. Competition designs for plaques, tiles, mosaic, carving, glass, wall hangings, textile fabrics, and metal may do very well to instruct in the styles of art, and to teach the student freehand drawing; but they do not make artists in those materials; the proof of which proposition is found in the fact that the designs which are most workable are those of skilled craftsmen who have a practical knowledge of tools and the trades, but very seldom of students who study these things as mere art exercises on paper. The weak point in the system in vogue at South Kensington is that the department places a theory before the student, and examples, but does not go farther; and in this respect it is behind the French national schools of decorative art, which are intended not to form artists, but artisans, as shown by Mr. Rathbone at the Congress.

One of the obstacles that has now to be overcome in any attempt to bring the arts into kinship is the isolating tendency of competition—in other words, Specialism. This is another phase. Each separate branch of handicraft has crystallised round a few set forms, and it is very hard to get a specialist in art to think in any other way but his own. The architect finds it hard to get a workman to carry out a particular design that happens to be a little out of the common run, or that entails a little trouble and thought in its execution; while he is equally unable to direct the operative as to the most desirable way of proceeding. The one lacks the operative's technical skill; the other requires the wider training of art-knowledge and style. Here, again, the division between the artist and the craftsman is evident; the design is prepared by one man and the execution is intrusted to another. We cannot wonder that so many good designs are spoilt in execution. The workman, unable to understand the designer's ideas and not willing to give up the task, devises some scheme of his own to get over the difficulty; but not being trained as an artist, does something which spoils the whole character of the work. The architect, if he had been technically instructed, would have foreseen the difficulty, and have invented a more artistic method of doing it.

Mr. J. E. Hodgson, R.A., in his address at the Art Congress at Birmingham, alluded to the disastrous effect of specialism in art. We have to look these drawbacks in the face. Our sculpture and carving, metal and glass work, have to be executed in workshops miles away by art craftsmen that have been trained under the rules and standards fixed by South Kensington. The designers who are employed are artists, not artisans, hence there results an indirect mode of carrying out the architect's ideas. The original design goes to the special artist of the manufacturing firm, who makes a design in accordance with the traditions of his establishment; and then this design is placed into the hands of workmen who know nothing of art, who have not the slightest personal interest in the design, and who have never seen the building. What can we expect as the result of this mechanical routine?—for such it surely is, each step in the proceeding being as isolated and distinct as if the work was produced by going through two or three machines. The architect's sketch is the only one within touch of the actual building. It is first modified or completely recast by the specialist, who then has no further to do with it. Next it is handed to a third individual, who executes it in a mechanical way, and if any difficulty occurs he has to find out the solution as best he can.

It is hardly necessary to illustrate this circumlocution in various branches of artistic work. The question is, How can the art and the craftsmanship be brought into contact and harmony? The only remedy is to teach architects the methods and materials of working, and to instruct the operative in the principles of design. The intermediate art-designer has been in the way. Our method of teaching art, as Mr. Hodgson pointed out, is imperfect. Instead of a Government Department fixing standards of taste according to certain models, with the result that individuality is suppressed, and all thinking on the part of the operative discredited, the department should supply the means and the agencies for teaching the craftsman how to design, allowing each to compete for original designs. Now, every student, whether he comes from Bristol or Birmingham, Nottingham or Newcastle, as it has been observed, is obliged to work in the same groove, which prevents the development of local types and schools indigenous to the localities. Mr. Hodgson rightly contends for decentralisation in art, a system which has been found to give the highest results in France and other Continental countries. Mr. Rathbone said: "The French national schools

of decorative art are intended, not to form artists, but decorative artisans." This appears to be the right ideal. The principles underlying art in its varied application to materials are taught practically; freehand drawing and modelling, the use of tools, and the capabilities and adaptabilities of different materials are taught, and the pupils are lastly encouraged to design for themselves and to enter competitions for original designs. The two things that are now inimical to art production are the want of recognition by architects and artists of the artisan's methods and materials, and the specialism and isolation that has resulted. We look to the future education of the architect to remove these advantages.



FREE PUBLIC LIBRARIES.—VII.

WE have briefly alluded to the systems used for heating public libraries. The hot-water system appears to be pretty general. Probably a combined system of warmed air and hot water will be found to be the most desirable and economical. The waiting-halls and borrowing lobbies should be kept to a comfortable degree of warmth, which they can be by the Grundy system, or one of the other improved methods, by introducing warmed air or by indirect radiation. Of course the architect must provide a basement for the heating apparatus, the delivery of the warm air from the hot-air chamber being by tubes opening on the level of the floor or in the skirting. If the warming is by hot water, the coils may be in chambers in the floor or otherwise by coil cases against the walls. The fresh air must be introduced from the outside to the chambers. It would be going beyond the object of these articles to discuss the details of any scheme for heating, as every case may be studied by itself. The many kinds of apparatus for heating, by convoluted and other forms of stoves in chambers in the basement, afford a good choice. Several modes of hot-water heating, though all based on the same principle, have been introduced, the chief difference being the form of radiator used. We cannot say that we admire the old box coils covered by cast-iron gratings or screens with tops—though they radiate a large amount of heat, and the tops can be made useful—for they become receptacles for dust and refuse. The same objection is found with regard to the grated chambers for pipes in the floor: they become filled with dust and refuse, though they are largely used in recently-built libraries. A neater and less objectionable form of hot-water radiator is now used, formed of vertical tubes and resembling steam radiators. These radiators consist of a series of upright wrought-iron tubes, with a top or entablature of cast-iron, the tubes being screwed into it. A similar cast-iron base or moulded plinth is also provided to receive the free ends of the tubes at the bottom. The water circulates from the base at one end through the pipes and top to the other end of base. Various forms of direct radiators are patented, all formed by upper and lower water-way connections. The horizontal radiators have the pipes horizontally placed, connected to vertical castings or waterways, and the pairs of pipes at one end form loops. These forms of radiator take up little room, and can be placed in recesses in the walls or between the bookcases. Of course, there should be means, by valves or otherwise, of regulating the heat. Its distribution in a news-room or reading-room is a matter that should have the first consideration. If warm air is admitted through a grating in the floor or in the wall, it ought to be near one of the doorways, so that the incoming air may be tempered. In the distribution of radiators the architect ought to consult the position of the bookcases, tables, and other furniture. Radiators or coils may be placed with convenience under the windows or in the recesses formed by bay windows, as at the Clapham Library. When the bookcases are arranged on the alcove system, already described, the hot-water radiators can be placed under the windows; their tops will then form useful shelves for the staff in assorting and looking over books.

For the floors of public libraries we think no kind is more suitable than wood-blocks. They are solid, there are no joints or crevices which get choked up with dust and dirt, and they are not so noisy as the ordinary hollow-boarded floor. Lowe's wood-block flooring has been laid down in several of the libraries recently built. At West Norwood the blocks are laid in herringbone fashion, the hot-water pipes being laid in channels covered by gratings in the floor. Both the news-room and newspaper-room are lighted by raised skylights in the central part of the roof, which is open-timbered, and with plaster panels, the only windows being at the end; each room is 40ft. by 23ft. A heating chamber is in the basement. Miss Durning Smith's Library in Lower Kennington-lane, designed by the same architect (Mr. S. R. J. Smith), is also heated by hot water, and has wood block-flooring. The book-case fittings are of sequoia wood. We mention these as small libraries, well adapted for the requirements of London suburbs.

Librarians of experience have much information which would be of value to architects. With respect to lighting—one of the weak points in many new libraries—they tell us that the windows are placed too low in the walls, instead of being high enough to prevent lounging near them, or to permit small wall bookcases to be placed beneath them. Top lighting has decided advantages—it obviates the disadvantage of reading with strong light in one's eyes. In the borrowers' lobbies many of the counters we have seen are in the dark, and it is difficult to read the indicators. They should be well lighted on both sides; but this is impossible as some of the lobbies are lighted—either there is an indirect borrowed light through glazed partitions, or the fanlight over the door is relied upon. Gas lighting has consequently to be used during the greater part of the day. Librarians are not agreed about the absolute need of ladies' and boys' reading-rooms; many of them say they are not necessary. The boys' reading-room, if required, should be under constant supervision next the lending library, and the ladies can be accommodated by special tables in the reading-room set apart for them. Experience also has shown that sanitary conveniences are likely to be abused in town libraries, and if they are provided, the automatic arrangement of locks opened by dropping a penny in a slot might be adopted with advantage.

The position of the windows in a reading-room or reference library is, as we have shown, a vital point in the planning of such a room, as upon it the arrangement of the bookshelves or cases will mainly depend. With side windows the alcove plan appears to be the one most desirable, as the light is admitted on both faces of the book cases, and the titles of the volumes can be read with greater distinctness. If the flat-wall or rack method is adopted, side-windows are objectionable, as they take up wall space unless they are placed high; also then the searcher or attendant has the light in his eyes, and the book backs are in shadow. In a narrow room arranged with alcoves or bays, the two sides of the cases at right angles to the wall might be shelved, the inner side left plain or panelled, so that the bookcase would be made deep enough for two rows of books back to back. The projection from the wall would be not more than 2 to 3ft. Between the bookcases and under the window shelves for large folios, or the radiators for heating, can be placed, whichever is the most necessary. At Wigan the reference library, which is a large and important one, has the alcove plan arranged in a structural manner. The bookcases which form the alcoves or bays continue up to the gallery floor on each side, forming deep recesses, and the ends of the cases are panelled as pilasters with brackets forming supports to the gallery. On the latter the same arrangement of bookcases, projecting at right angles to the walls, is noticed, between the ends of which and the gallery railing there is a passageway for the attendant. Our sketch shows a similar arrangement of

newspaper stands between the windows, allowing the light to fall on the newspapers, The other side of the room could be occupied by tables. A rather more economical plan for space is to have the half desk or stand with one slope placed flatway with the wall, as is done in several libraries, though this plan is only permissible when there is a top light or the windows are very high, otherwise the readers would have the light directly in front of them. Our readers will see, therefore, that the question of lighting by windows or skylights determines properly the mode of arranging the bookcases, the newspaper stands, and tables, and in their turn the arrangement of the furniture must become a factor in deciding upon the dimensions and proportion of the rooms. The two former principles ought necessarily to be the chief ones in settling upon the width of the room. Thus a top light enables any arrangement of cases and stands to be made; the stands with single slopes can be placed along the walls, and the centre of room occupied by the tables.

No less important than cases for books is the importance of keeping together in order, and out of dust and dirt, magazines, periodicals, valuable pamphlets, and paper-covered books. These cannot be placed on shelves. The "Marlborough Pamphlet cases" (Gould's patent), which are strongly and neatly made pasteboard cases, without springs or other corrodible metal contrivances which spoil the covers and pages, are well adapted for the purpose of preserving these often valuable forms of printed matter. A blank list for contents is attached to the inner sliding case, while the outer case has the appearance of a thick volume with lettered title, and can be placed upon the bookshelf. These cases are made of various sizes, and to take any of the journals and magazines. For unbound

literature and MSS. the Marlborough pamphlet case is a valuable addition to all the public libraries.

THE SOCIETY OF ARCHITECTS.

THE inaugural meeting of the seventh session of the Society of Architects was held on Tuesday evening at St. James's Hall, Piccadilly, the President, Mr. Robert Walker, A.M.Inst.C.E., of Cork, in the chair. The adoption of the report, of which we gave a summary in our issue of the 31st ult., p. 306, was moved by Mr. Alfred Howard, and seconded by Mr. D. Livingston, and agreed to, and the balance-sheet was also adopted on the motion of Messrs. E. J. Kibblewhite and T. R. Richards. The following gentlemen were elected as members:—Henry Bushell, P.A.S.I., 1, Finsbury-circus, E.C.; Richard James Jenkins, 56, Commercial-road, Portsmouth; Albert Frank Long, 1, Ash-walk, Warminster; and Charles Frederick Mitchell, the Polytechnic, 309, Regent-street, W.

The President then delivered

THE OPENING ADDRESS.

Having acknowledged his re-election to the chair, Mr. Walker congratulated the members on the fact that the annual report of the council showed an increase in numbers and an improved financial condition. In referring to the new galleries to be built from Mr. Christian's plans for the Tate Collection, he expressed a hope that the new building would be considerably larger than would be necessary to house that munificent gift to the nation, so as to provide for the reception of similar gifts in the future, and it should be so planned as to admit of extension from a central entrance. He would suggest that a section should be set apart for architectural drawings in the scheme for the new galleries. It might indeed be possible to found a school, or schools, of architecture in association with such a gallery. The President continued: As an introduction to our rules I find the following:—"The Society of Architects is an institution acting under the Literary and Scientific Institutions Act, 1854, 17 and 18 Vic., cap. 12, and is established for advancement of architectural art and practice." It appears to me that there is an obligation enjoined upon us by this prefix to our rules, which never ceases to demand honest and persistent efforts upon our parts to give effect to this object. How may this be done? We should commence with ourselves, and by constant attendance at the meetings help to render them more interesting and instructive, and qualify to take an intelligent and practical part in the work of advancement, by adding to our store of knowledge, and by improving those powers of mind and body which will make us more extensively useful to our fellows. The general question of the advancement of the profession is one that affects all practitioners, numbering, perhaps, five times the number outside of the professional bodies as are comprised within them; and the advancement of the whole and the finding of remedies for undoubted evils can only be brought about by a fixing of a minimum standard of general and technical educational attainments for aspirants to the ranks of the profession. I venture to say that this can only be done by passing an Education and Registration Act duly considered and safeguarded in the interests of the public and the profession, and which should recognise vested interests. For the following reasons, among many which may be adduced:—Firstly, it would at once provide the funds necessary to pay for teaching and examining bodies, the absence of which paralyses the action of voluntary bodies, no matter how earnest and praiseworthy the efforts of such bodies may be, by charging a moderate fee to the parties primarily interested—namely, the practitioners and the students. Secondly, in all forward movements for the quickening and revival of existing institutions, and for the advancement of the best interests of the community at large or any of its sections, it is acknowledged that the young present the best and most fruitful field for laying down the seed of permanent advancement and progress, and afford the most certain promise of a growing and abundant harvest of results. Applying this view to our profession, it would appear that education and examination form the only reliable bases to start from for the attainment of the advancement which is desired. Thirdly, the Bill before Parliament recognises vested interests and it safeguards the public, while it may be modified in details as may be considered wise in Committee. Further, the measure does not disturb any of the recognised bodies, whether they exist with or without charters. Their powers will not be impaired. The Act will only deal with their members by way of recognition, and not with the bodies, as such, by way of abrogating their functions, or curtailing their powers of expansion; on the contrary, it is a result looked forward to with great confidence, that all existing bodies throughout the kingdoms will be greatly increased in membership and efficiency. We held this view three or four years ago, and the interest awakened by merely promulgating the Bill has verified the accuracy of the prediction, as the professional returns will show. This question does not belong to any society or body, and perhaps you will bear with me while I say to my professional brethren outside our society, whom I have no right to address as I address you, that I am deeply anxious to discover how the members of the profession throughout the kingdoms, who hitherto have remained indifferent to this matter, may be induced to study this question so as to realise its importance, and see that it is their own question, interesting, not merely to a few, but of the first importance to the whole body of practitioners inside and outside of the institutions and societies. It has been made abundantly clear that advancement is needed, and that many evils exist which need removal. I do not remember that any body has controverted this statement. On the contrary, it has been acknowledged on all hands. I feel, however, that it would be well that the Registration Committee, to whom we can only make the suggestion, should collect what has been written on both sides of this question, eliminating irrelevant matter, and reissue it, in the hope that it may reach the apathetic and indifferent, and induce them to give the measure due consideration, and finally their support. Those who oppose the Education and Registration Bill do so chiefly on three grounds, so far as I am acquainted with their expressed views, and, to avoid being misunderstood, I desire to say that the concluding sentences of the last paragraph do not apply to them. I shall refer briefly to the three objections:—Firstly, it is objected that "the Bill registers unqualified men"! It registers all men who prove that they are in practice, because it would be unjust to do otherwise, and because Parliament will respect the vested interests of even incompetent men who have been endowed by the public with a practice; but, from the passing of the Bill, the element of incompetency will become a diminishing quantity, until it finally disappears from our ranks, when the public will be placed in such a position of security as may be obtained by the assurance that all practitioners are at least possessed of the minimum standard education and training necessary for the due discharge of the functions of an architect. In your published lectures and proceedings this objection has been fully and completely disposed of. Secondly, it is said that the Bill is unnecessary, because the chief, or oldest, architectural body has provided a voluntary examination for those desiring to enter its ranks as associates. This shows that the second class of objectors have failed to grasp the magnitude and scope of the question dealt with in the Bill, and do not appear to bear in mind that examination only bears the same relation to education that a thermometer does to temperature—namely, to record results for which it is in no way responsible. The thermometer performs a valuable function when testing temperatures that require to be changed for scientific and manufacturing purposes, and ascertaining and recording the progress of the changes until the necessary degree of heat or cold is reached, but it is no part of the effective force which produces the required results. Education and technical training are the effective forces necessary to be put in motion in this matter, and then fittingly steps in test examination to measure and record the results, and to repeat the tests until efficiency is discovered to exist, or the standard reached. It appears, therefore, to be placed beyond dispute that teaching and examining bodies should co-exist, or be allied and affiliated so as to produce reliable results, and it is not reasonable to expect any very marked evidences of advancement until they do co-exist, and in sufficient numbers to be commensurate with the extent of the work to be done. The voluntary examinations referred to should be availed of to the fullest extent, which has not been the case, although since the Registration Bill has been promulgated, considerably larger numbers have applied; but that is relatively to the numbers who presented themselves in former years, while, as compared with the thousands who comprise the army of practitioners throughout the kindoms, the number is small. The masses of professional aspirants cannot be reached until education and examination are co-existent and compulsory under a legally constituted and recognised authority, and it will perhaps be conceded that it will be impossible to teach and examine all from one centre. Supreme control may be in one centre, but the work should be distributed by means of sub-centres or branches established under prescribed conditions, and with due care in selecting localities. The absence of chairs of architecture in our colleges is a negative proof of the neglect on the part of those who may have been in a position to advance the interests of the profession in this respect, and did not do so. In every college in the kingdom the medical students have the advantage of seven professors' chairs, one for each of the sections into which their studies are divided; and owing, I understand, chiefly to the efforts of the Institution of Civil Engineers, there are spread amongst the colleges and universities 20 chairs of engineering, while there are only two chairs of architecture. I trust that this state of things may be speedily remedied. The third reason which has been given as an objection to passing the Bill is that of the time not being considered opportune. This is the language of procrastination. One may read between the lines, "Almost thou persuadest me to" support the Bill, and perhaps it may be intended that we should so read. What a host of sincerest flatterers King Agrippa has had all down through the ages which intervene between his time and ours! With what eagerness men have recourse to the putting off to a more convenient season all difficult, unpleasant, or embarrassing questions which beset the march of progress! It is the besetting sin of men who have opportunities, and lack the courage of their convictions to use them. The fruit of this weakness has ever been delay, not growth. In conclusion, the foundation of an architect's education should be laid in early youth, and all his studies should point to his ultimate occupation even before he enters upon his college or pupilage course. Technical knowledge is more conveniently acquired in early life, and an effort should therefore be made at that period to impart it. All education up to the end of pupilage is but learning the use of the tools with which the architect works during his practice. The power of architectural bodies to promote advancement is retarded owing to the want of funds, and the necessity for providing teaching which does not properly come within the scope of their corporate work. The Education Bill provides the effective force—funds, which, under proper authority and control in its administration, would do the work that voluntary bodies are unable to accomplish.

A hearty vote of thanks was accorded to the President for his address, on the motion of Mr. G. S. Bridgman, of Torquay, vice-president, seconded by Mr. T. Claxton Fidler, M.Inst.C.E., a visitor; and supported by Messrs. W. H. Seth-Smith, ex-president; S. G. Goss, and Ellis Marsland.

THE ART CONGRESS AT BIRMINGHAM.

WE resume from last week, p. 643, our report of the proceedings at this successful congress. The presidential address to the Section of Applied Art was delivered by Mr. A. H. Mackmurdo on Thursday, his topic being

MODERN CONDITIONS AS AFFECTING ARTISTIC PRODUCTION.

They were in Birmingham at this time expending a far larger sum than was absolutely necessary in providing Assize Courts, so as to obtain for the building the qualities of dignity, majesty, importance, and charm. The immediate and practical purpose might have been served as well by an ample, square, securely-built, and well-roofed block, with holes to get in at, and holes to look out of; it might have been done by just builder's work. Why, then, this expenditure for mere sentiment? Was it not because they felt that in this building was reflected the collective life of the community? Whether conscious of it or not, this was the meaning of their thought when they chose to sacrifice bread

for art, and demanded a building such as might embody and shadow forth these sentiments or instincts. "For the stone shall cry out of the wall, and the beam out of the timber shall answer it," not against them, but for them. As their outward life was, so their public works would be. If mean, ungenerous, sordid, factious, without large intention, without social feeling, so their buildings would inevitably be. If, on the other hand, municipal life were generous, orderly, compact, masculine, pioneered by a bold spirit towards large and unselfish issues, then for all time the world would know it by the buildings the future would inherit of their hands. The unsatisfactory nature of so-called artistic work, the poverty of it, the utter want of decorative quality in it, were due to the hurried spasmodic demand for its creation and completion. Were it not for this haste, we should have hundreds of artists engaged in giving a decorative quality to the commonplace, every-day furniture of life. But artists, instead of doing this, were painting very inferior pictures, and they would not turn their hands to this unless we demanded the same individuality of work in a piece of pottery, iron-work, jewellery, or stained glass as we demanded in the oil-painting we hung on our walls. To create the decorative quality, the artist, after submitting to the limitations of his material, must be left with a free hand. This, however, the manufacturer could not do, unless he had artists intimately associated with the workshop, living in the atmosphere of industry, as was the case in France and Belgium. To better artistic industry, he advised as a practical step that those who directed industrial workshops should confer at times with such a body as the Art-Workers' Guild.

ART IN JEWELLERY AND PERSONAL ORNAMENTS.

Mr. J. W. Tonks, in a paper on "Art as Applied to Jewellery and Personal Ornaments," said that there were two points to be decided by the artist previous to his giving consistent counsel to the modern jeweller. Firstly, what rules of construction should we adopt in a jewel—the Classic rule or the Mediæval? Was ornament to be regarded as an object to serve any use, or as a mere decoration which might be arranged according to any art fancy? Must the piece have a visible constructive outline, which should hold the parts together, or might it consist of a series of independent scrolls, soldered together wherever they happened to touch? Secondly, what was the true theory of colour in a jewel? Was a personal ornament to contain one leading colour only, with the idea that the dress of the wearer should be expected to harmonise with it; or might a jewel contain any number of colours in gems or enamel, or both, so that it should be expected to harmonise only with itself when examined separately? There had as yet been no articulate utterance of the artistic world upon these two vital problems. The Scandinavian, Frank, and Goth united with Etruscan and Greek, decided that the first object of an ornament should be the use it was intended to serve. With this object there were always well-defined lines of construction having due relation to the object of the piece, and the decoration was carefully subordinated to that end. When they got to the later filigree work of India, when they were past the early and palmy days of the Italian Renaissance, all this was changed. With regard to the colours of a jewel, nothing was more fascinating to an artist who had a special ornament to produce, than to feel that he could harmonise it in colours without regard to any ulterior consideration. An eminent firm in London, some twenty years ago, commissioned gifted artists to prepare designs after the style of the Mediæval jewellery, in which the theory of several colours in one jewel was sustained. The pieces were executed with care and judgment, but it afforded a significant moral, when, six years afterwards, in the window of a London pawnbroker, one of these art pieces was offered at a price little above the precious metal it contained.

AN ARTISTIC PROTEST AGAINST MODERN ADVERTISING.

Mr. J. Brett, A.R.A., moved the following resolution:—"That this Congress deplores the disorderly and reckless method of the present system of advertising, and, in view of the universal disfigurement of our towns occasioned thereby, considers that the whole subject needs the serious attention of the public." Mr. Stirling Lee seconded the motion, which was carried nanimously.

A GALLERY OF BRITISH ART.

At the afternoon sitting of the other sections Mr. J. Orrock, R.I., read a paper in advocacy of the establishment of a National Gallery of British Art. Mr. Orrock said the representation of the English School of Painting in our National Gallery had almost become a necessity, for the people were determined that this country of literature, science, and advanced civilisation should have her art fairly represented and judged on its merits. Englishmen have not only always had a strong artistic feeling, but have actually produced a great school of painting, as well as masters in many other departments of fine art. Even now, in spite of the continuous drain for foreign museums and private collections, we had still in this country more magnificent pictures by the great masters than were in all other countries on earth. This could be proved by the seemingly exhaustless mine of art from which the exhibitions of Old Masters at Burlington House had been annually supplied. Our taste for art led us to buy Cuyp, Hobbema, Ruysdael, and other celebrities of the Flemish and Dutch schools, when the works of those masters were neglected in their native country. The prices of our own art were rising every day, and in a few years it would be a serious thing to pay for our own masters' works, whereas a few years ago a "gallery" of them could have been bought for the price now paid for a Reynolds or a Romney. The poor Cinderella of English art, the water-colour art, had many masters, and although foreigners had been ever slow to give us our due as oil painters, they had always freely granted us the only place for our water-colours. The best landscape painters in water-colours had also been the best painters in oil; but Turner was greatest in water-colours, and Cotman, Cox, De Wint, Barrett, Holland, and others who were cried down as oil painters, took the first position now in that medium. In the National Gallery there were no pictures by those masters. Mr. Orrock went on to sketch the history of the agitation for a thorough representation of British art in the National Gallery, its relinquishment on the ground that there was no room, and also the over-ruling of the project of Sir Charles Robinson for the formation of a gallery of British art at Kensington Palace in favour of utilising the 1871 galleries at South Kensington. If £100,000 were spent on extending the National Gallery, the missing links in our British Art, in every department, could easily be supplied, and at a comparatively small cost, and he believed and knew that wealthy donors would come forward and help to fill up the vacancies. He had persistently felt that the National Gallery was the proper place for the great national exhibition of British art, and failing that, the Government ought to collect all the English pictures belonging to the nation, be they at South Kensington or elsewhere.

In the evening Mr. Starkie Gardner delivered an address to artisans at the Midland Institute on "Metal Work."

THE EDUCATION OF SCULPTORS.

On Friday Mr. E. Onslow Ford, A.R.A., read a paper on this subject. The time was more than ripe for efforts to be made to establish a really national school of sculpture in every important town in the country. Such a school should include masonry, stone-carving in all branches, designing and modelling, and every minor trade that was in any way connected with the art, so that work could be undertaken from beginning to end. The mastership of such a school should be obtained and held by election, and the reward would be the recompense obtained by way of private patronage.

THE RELATIONS OF SCULPTURE AND ARCHITECTURE.

Mr. B. Creswick (modelling master of the Birmingham Municipal School of Art), in a paper on this question, said we had numerous fine buildings, yet it was sad to see what little educational value or influence their sculpture exercised over the minds of the people, and how little it had done to add to the dignity and importance of our architecture. Scarcely did we find any indication of real thoughtful design in its application to the buildings upon which it was employed. Very much skilful labour was now done, full of rule and proportion; but, however admirable these qualities might be in themselves, they were not all that was to be desired. The educational value of sculpture that would place before the people nature in all its various phases—human, animal, and floral—was not taken into account by architects, sculptors, and others. It was impossible to over-estimate the effect of a systematic application of sculpture to our architecture, dealing with subjects that would make the people familar with all the events of English history. Such a system would form a powerful aid to the work of our art galleries, museums, and schools of art. —Considerable discussion followed.—Mr. T. G. Jackson illustrated how sculpture nowadays had to be done per contract, as with bricklaying and plumbing. He could not agree with the suggestion that boards should have the control of designs, for the probability was that a design having been submitted to so many gentlemen, with so many ideas, would have nothing original left in it.—Mr. Hugh Stannus congratulated Birmingham that its municipality had taken her School of Art under its wing, instead of leaving it under the domination of South Kensington.—Mr. E. R. Taylor thought that the reason people on entering the art galleries and museums rushed to the pictures was that in them some story was told which appealed to their feelings. The attention of the public could also be awakened by storiation in sculpture.

TECHNICAL EDUCATION AS APPLIED TO ART.

Alderman Kenrick, M.P., in a paper on this subject, pointed out the progress made in the last few years in Birmingham, the cause of which improvement he ascribed to (1) the establishment of a municipal art gallery and museum of art, thrown open to the public; and (2) the transfer of the School of Art to the City Council. Mr. C. R. Ashbee followed with a paper satirising the present rage for big polytechnic schemes, and suggested that the man of wealth, instead of giving £10,000 to one of those "booms," would do better to devote the interest of the money in the technical training of his workpeople on his own premises. A long discussion followed, in which Messrs. Hugh Stannus, Baldwin Brown, T. Ablett, Whitworth Wallis, and others took part. A resolution was passed advocating the Sunday opening of museums.

ARCHITECTURE AND EDUCATION.

A paper on this subject by Mr. Aston Webb was read in his absence, he being confined to bed by illness. He discussed at length the various agencies now in operation for the education of architects, and pleaded for the adoption of a co-ordinated scheme. He found no difficulty in picturing to himself a time, and that not so very far distant, when there should be one systematic method of architectural education throughout the United Kingdom, with the Royal Academy at its head; when architectural students, stimulated by a recognised examination in addition to the love of their art, would attend, as a matter of course, the art schools in their town and the lectures of the local architectural association, where they would go through a regular course to prepare them for the Institute examination; when one or two of the best students from each town would be annually drafted up to the Academy schools (greatly enlarged) for a final course, and a participation in the great struggle for the Academy Travelling Studentship, which would then take its place side by side with the French Prix de Rome; when Academy students would have free and systematic access to all lectures workshops, &c., throughout London, and also a free intercourse with the students in painting and sculpture, and, through the workshops of the technical institutes and other means, will meet the carver, the modeller, the smith, the lead-worker, the decorator, and glass-painter; then a would dawn on the architect of the future that these men should be admitted to a share in the design of the accessories of his building; and he would gather about him a band of men educated with him from his youth, and bound to him by ties somewhat similar to those of the public schools and universities of to-day, and would work out a building with them in all its completeness; and so would cease endeavouring to design every detail himself, or strive to make his building entirely different to any other that had previously been erected; and by degrees men might find themselves again on the architectural rails working on one line of metals and developing an architectural style.

STAINED GLASS.

In the evening Mr. Henry Holiday delivered a lecture to artisans on "Stained Glass." Cour

cillor Hardman presided over a large audience. Mr. Holiday described the processes used in the manufacture of stained glass, and the different kinds of material used. He then dealt with various schools of design and style, and pointed out that almost as much depended upon the position of the window in the building of which it formed a part as upon the material and style of the window itself.

On Saturday the Congress concluded its sittings. Mr. W. B. Richmond, A.R.A., addressing the Section of Painting, said a commercial feeling had crept over the art of painting and checked its development. In regard to street advertising, he regretted that artists did not try to foster the growth of a better class of posters, the public taste having been degraded. He suggested the appointment of a street inspector, and a tax on hoardings. A resolution was adopted in favour of regulating the education in each school of art in accordance with local industry.

ROBERT BOYLE AND SON, LIMITED.

THE directors of Robert Boyle and Son, Limited, ventilating engineers, London and Glasgow, have resolved to recommend a dividend of 12½ per cent., free of Income-tax, on the ordinary and deferred shares of the Company for the year ending September last, placing to the reserve fund one-sixth of the profits earned, and carrying forward to next year a balance of £1,299.

The year ended has been the most prosperous since the formation of the Company. The directors attribute this success, and their consequent ability to pay such a handsome dividend, to their constant study of the requirements of architects, and to the great and ever-increasing demand for the latest improved form of the self-acting air-pump ventilator, patented in 1882 and perfected in 1887, which, though much superior in design, make, and action, is now sold at 50 per cent. less than previous and inferior forms, constituting it not only the most efficient and ornamental, but the cheapest in the market. The Company have at present some very important contracts in hand and in prospect at home and abroad. Mr. Robert Boyle recently visited Egypt, India, China, and Japan, and has surveyed and furnished plans and estimates for the ventilation of the Khedive's Palace, Cairo; the drainage of Bombay; French Cathedral, Canton; Summer Palace of the Emperor of China, Pekin; new Houses of Parliament, Japan; Imperial University of Japan; also a scheme for the improved sanitation of Pekin.

NOTES ON BUILDING PRICES.—XII.

By JOHN LEANING.

ROADS.

THE building surveyor is but rarely required to estimate the value of roads, the drives on private property being generally made by the gardeners; he should, however, possess a general knowledge of their value. When the builder does the work it is usually of a simple character, consisting of comparatively shallow digging forming the contour of the roadway, a layer of rough and another layer of finer material, and possibly rolling. It is unnecessary to enlarge upon the totally different character of such roads as these to the streets and roads of a large city, where constant traffic and heavy loads require unusual precautions and large expense. Much valuable information as to cost of roads and streets is to be found in Boulnois, "Municipal and Sanitary Engineer's Handbook" (1883); Law and Clark, "The Construction of Roads and Streets" (1887); the *Minutes of Proceedings* of the Institution of Civil Engineers; Delano, "On the Use of Asphalte and Mineral Bitumen," Vol. LX. (1880); Deacon, "Street Carriageway Pavements," Vol. LVIII. (1879); Howarth, "Wood as a Paving Material under Heavy Traffic," Vol. LVIII. (1879); Stayton, "Wood Pavement in the Metropolis," Vol. LXXVIII. (1884); *Transactions* of the Surveyors' Institution; Burrows, "The Construction and Maintenance of Country Roads," Vol. XVI. (1884); Hewitt, "The Maintenance of Macadamised Roads," Vol. XXI. (1888); Denton, "Farm Roads on Strong Soils"; *Journal* of Royal Agricultural Society, Vol. XVIII. (1857); Codrington, "Maintenance of Macadamised Roads;" the Reports to the Streets Committee of the City of London, by Mr. Haywood; the recently-published book, "Pavements and Roads," reprinted from the *Building and Engineering Record* (New York). It will be seen from the data furnished in the books above mentioned that maintenance is an important element of the cost. The builder's maintenance would terminate at the same time as that of the building—six months from completion. The paving of gateways or yards of manufactories with granite setts, wood blocks, or asphalte is the nearest approach to the conditions of street-paving that the estimator has ordinarily to deal with. The value of much of the following information lies in the variety of detail and methods of calculation adopted to arrive at the cost price; the specific prices will, of course, be modified by local considerations.

EXTRACT FROM MR. STAYTON'S TABLE OF COST OF VARIOUS KINDS OF WOOD PAVING IN LONDON.

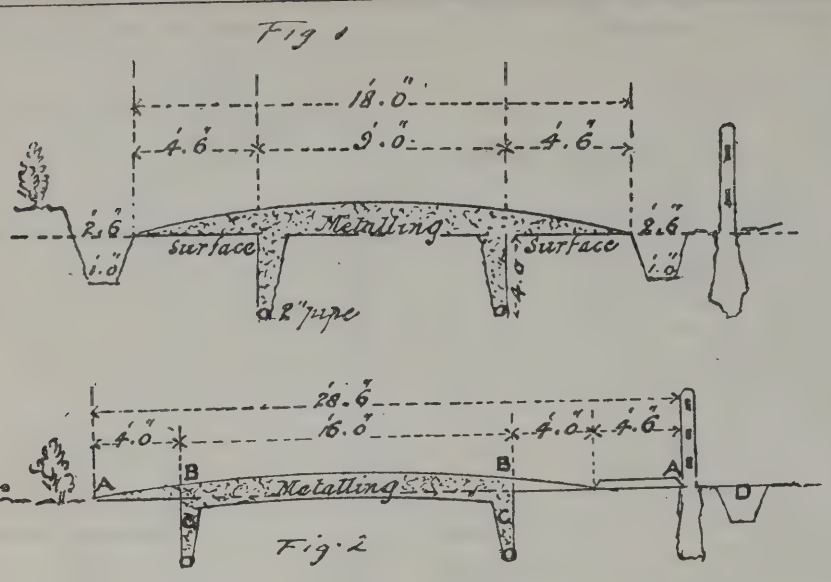
When laid.	Situation.	System.	Cost per sq. yard.	Years of maintenance included in first charge.	Remarks.
			s. d.		
1873	Ludgate-hill	Improved.	18 0	1	
1874	Aldersgate-street	,,	15 0	2	Exclusive of concrete foundation.
1876	Northumberland-avenue	,,	15 0	—	
1876	Leadenhall-street	,,	12 3	2	
1880	Parliament-street	,,	13 8	—	
1876	Oxford-street	Asphaltic.	15 6	—	
1877	Strand	,,	13 6	—	
1877	Fleet-street	,,	15 0	—	
1878	Brompton-road	,,	13 9	—	
1879	High Holborn	,,	15 4	—	
1880	Regent-street	,,	12 6	—	
1875	Oxford-street	Henson's.	16 6	—	
1875	Ditto	,,	16 6	—	On 2in. extra concrete.
1876	Leadenhall-street	,,	18 6	2	
1876	Oxford-street	,,	14 0	—	Ditto.
1877	Fleet-street	,,	16 0	—	
1878	Brompton-road	,,	12 9	3	
1880	Euston-road	,,	11 6	3	
1879	Pall Mall	Lloyd's keyed.	8 5	—	On existing concrete.
1880	Regent-street	,,	13 9	—	
1875	Coleman-street	Ligno-mineral.	13 6	—	
1874	Cannon-street	Carey.	13 6	2	
1877	High-street, Kensington	Plain.	14 0	3	
1878	Fulham-road	,,	14 0	—	
1878	High-street, Notting Hill	,,	12 6	3	
1878	Oxford-street	,,	8 4½	—	On existing concrete.
1880	Edgware-road	,,	8 4½	—	Ditto.
1879	Sloane-street	,,	10 6	—	
1879	King's-road	,,	10 6	—	
1879	Ditto	Pitch pine.	11 8	—	
1879	Ditto	Creosoted blocks and mastic joint.	14 2	—	
1879	Ditto	Ditto and lime joint.	11 10	—	
1879	Ditto	Asphalte bed.	12 4	—	
1879	Praed-street	Plain.	10 7	—	

Some Notes of Cost.—The weakness of tabulated particulars in existing books is the absence in most instances of complete information of the mode of their production—whether the men were employed piece-work or day-work, or the work done by a contractor or not, as under the last conditions the prices would include profit, and could not reasonably be compared with the results of labour employed directly by a local authority. Ellice Clark's table, frequently quoted, states comparative *cost* of carriage-ways as follows (1880):—

	Original cost per sq. yd. s.	d.
Wood pavement	15	1·5
Val de Travers' compressed asphalte	18	0·0
Granite sets 7in. by 3in. laid over a layer of 12in. of cement concrete	17	9·0
Macadam in South of England	4	9·0

Wooden Carriage way Pavings.—The wooden carriage-way paving of London and most other towns is almost universally done by companies, and it is very questionable whether any local authority can do the work at as low a price. The united profits on the materials bought separately are sure to exceed those of a contractor who supplies the whole; nor does a local board possess the appliances for either kind of paving which so largely contribute to successful results. To this rule perhaps the parish of Chelsea, and some other metropolitan parishes, are exceptions, as the prices quoted by Mr. Stayton are lower than the average of the well-known tabulated lists, but the latter include profit. Careful descriptions of the pavings in the following tables are to be found in Mr. Haywood's reports, Stayton on Wood Pavement, Clark and Law, and Boulnois, before referred to.

Mr. Stayton says (1884):—"The variations in the prices paid for wood pavement in various parts of the Metropolis has been somewhat remarkable, the maximum cost per square yard for laying a pavement of concrete foundation with entirely new materials having amounted to 18s. 6d., and the minimum to 10s. 6d.; owing presumably to competition and to the experience which has been gained, together with increased facilities, the cost has been gradually reduced to reasonable limits as compared with the charges made eight or nine years since."



The details of the cost per square yard of the plain wood-block paving in Chelsea are as follows:—

Item.	31,333 yds. in Sloane-street and King's-road in 1879.		10,573 yds. in Fulham-road in 1881.
Labour in breaking up macadam surface, and excavating	11·00d.	....	11·00
Cartage of old materials, including shoot for rubbish	9·04	....	9·80
Portland cement for concrete and grout	20·02	....	17·17
Thames ballast and sand for concrete grout and top dressing	8·56	....	5·80
Blocks	58·66	....	60·82
Studs	1·58	....	1·48
Labour in bottoming up and levelling, preparing and laying concrete, fixing studs in, wheeling and laying blocks, grouting, top-dressing, watching, and sundries	13·45	....	14·12
Labour and materials in permanently fitting margins	0·86	....	0·90
Sundries, plants, tools, superintendence, testing, cement, oil, repairs, &c.	2·92	....	1·85
	126·09	....	122·94

Labour and materials, grouting, cost 5d. per square yard; thin coating of small stones and spreading after grouting, cost, labour and materials, 2d. per square yard.

This pavement was of red deal blocks, 3in. by 9in. by 6in., with ⅜in. joints, filled with cement grout; three cast-iron studs in the side of each block, laid on concrete 6in. thick, 1 of cement to 5½ of ballast, i.e., 33c.ft. of ballast to 6·4c.ft. (five bushels) of cement.

This may be compared with Mr. Deacon

statement (1879) as to cost of wood pavement in Liverpool:—

Cost of Wood Pavements per Superficial Yard.

	s.	d.
"Improved" wood pavement, 1877, Great Howard-street	16	0
Improved wood pavement, Bold-street	15	3
Henson's wood pavement, Church-street, including bituminous concrete foundation, 3½in. deep	15	10

With Liverpool prices at the present time the actual cost per square yard of wood pavement, with blocks 6in. deep, and bituminous concrete foundations, would be as follows:—

	s.	d.
Bituminous concrete	2	0
Creosoted Baltic pine blocks, pitch grouting, and gravel, including labour	12	0
	14	0
Add for establishment charges 8 per cent.	1	1½
	15	1½

The cost per square yard of bituminous concrete foundation in Liverpool, 6in. deep, is as follows (the bitumen as described for jointing of sets):—

	s.	d.
0·153 ton broken stones, including cartage 6s.	0	11
0·041 ton pitch, 30s.	1	3
1·2 gallon oil, 2½d.	0	3
0·007 ton coke, 12s.	0	1
Labour	0	9
	3	3
Add for establishment expenses 8 per cent.	0	3
	3	6

Wood Blocks.—9in. by 3in. by 6in. red deal blocks, the commonest size, delivered in London cost £6 10s. per 1,000. Assuming the joints to be ½in. wide, we have 39 per superficial yard = 5s. 1d. nearly = 4¼d. per foot for 3in. deal. 5in. deep would involve a slightly larger proportion of sawing, but so small that paving of that depth might be valued in the same ratio.

Howarth says (1879):—

	Per super. yard. s.	d.
Red deal blocks, 6in. deep, cost	5	6
Felt for tight joint	0	6
Portland cement concrete, one of cement to six ballast	2	6
Labour, watching, lighting, and all extras, and dressing with fine grit and tar	3	0
Total	11	6

The Improved Wood-Paviug Company lay their paving in London complete, without foundation, at 7s. 6d. per super. yard; the blocks, 9in. by 6in. by 3in., of red deal, creosoted, jointed with bitumen, and top-dressed with fine sand.

Carriage-Way Paving of Granite Setts or Pitchers.—In the tabulated lists prepared by Mr. Haywood of the cost of granite paving in the City, the rates are all exclusive of foundation. The list was given as follows, in his report of 1871:—

Estimated cost of granite pavements:—

Situation.	Description.	First cost per sq. yd. complete.
Various...	Aberdeen granite 3 by 9.	16s. 0d.
	(No foundation included in the above).	

Experimental paving in Moorgate-street, 1848-56:—

Name of Granite.	Dimensions of setts. Depth.	Width at surface.	Length at surface.	First cost per sq. yd. complete.
Blue Aberdeen	9	4	8 to 12	13s. 8d.
Mount Sorrel	9	4	8 to 12	14s. 9d.
Blue Aberdeen	9	3	8 to 12	16s. 3d.
Mount Sorrel	9	3	8 to 12	17s. 0d.
Blue Aberdeen	5	3	5	10s. 9d.
Mount Sorrel	5	3	5	12s. 0d.

No foundation included in above, but laid and grouted with lime and sand.

The following table is from Mr. Deacon's paper before referred to:—Cost per sq. yd. (in Liverpool) of paving of Penmaenmawr or similar stone, in sets 5in. to 7in. long, under 3in. wide, and 7½in. deep, laid with asphalte joints, the joints partially filled with dry, clean gravel, and finished with coal-tar pitch, and oil from distillation of coal tar, known in the trade as creosote oil, exclusive of foundation and excavation.

	s.	d.
0·31 ton stone setts 7½in. deep, including cartage, at 28s.	8	8
0·064 ton gravel for bedding, ¾in. thick, 6s. 6d.	0	5
0·015 ton pitch, 30s.	0	5·25
0·6 gallon oil, 2½d.	0	1·5
0·002 ton coke, 12s.	0	0·25
0·018 ton shingle, dried and riddled, 7s.	0	1·5
Labour	0	8·5
	10	6
Add establishment expenses 8 per cent.	0	10
Total	11	4
Similar pavement with setts 6½in. deep, per square yard	10	4

Similar pavement, but with ordinary gravel joints:—

	s.	d.
0·31 ton stone setts 7½in. deep, including cartage, 28s.	8	8
0·096 ton gravel, for bedding, 1in. thick, 6s. 6d.	0	7·5
0·02 ton gravel, for joints, 6s.	0	1·5
	9	10
Add establishment expenses 8 per cent.	0	9
Total	10	7
Similar pavement with setts 6½in. deep, per square yard	9	6

In London and some of the large provincial towns the paving contractors will redress the granite setts taken up from the streets, and contract to relay them as paving of stables and in similar positions. Some London prices are as follows:—

Second-hand granite pitching, the stones about 5in. wide, 6in. deep, laid and grouted with lime grout, exclusive of digging or sand for bedding	7s. 0d.
Do. the stones about 3in. by 4in.	7s. 6d.

The increased use of asphalte and wood, and the habit of vestries of redressing and relaying granite paving in thoroughfares with less traffic than the main streets, often makes it difficult to obtain old stone.

Macadamised Roads.—The variety of methods of making these roads is productive of a great variety of prices, and the quotation of the cost of a particular road is of very little use to the estimator, unless accompanied by a careful description of such road and the cost of labour and materials.

Law and Clark say:—"An ordinary Macadamised road, constructed in the best manner, with metal (granite) laid 9in. deep, costs, at London prices, 6s. 3d. per square yard" (1877).

Burrows says (1884):—It may be stated generally that good farm roads, well stoned, can seldom be made for less than 1s. 6d. per superficial yard, and good gravel roads 2s. 6d." This appears to be based upon experiences in the county of Kent.

Mr. Grantham says (1884), referring to cost of roads on building estates, a road in districts on the south side of London would cost, for formation, metalling, sewer, surface-water pipes, and fencing, 4s. 6d. to 5s. a square yard, including sometimes the removal of a large quantity of earth. North of London it would cost more, from 5s. to 7s. per square yard, the whole width being 40ft., including the footpaths in the superficial measure. He thought £6 per chain the lowest figure for a solid and substantial road 10ft. wide, of the farm-road type.

Mr. Bailey Denton, in illustration of his remarks on farm roads (1857), using a sketch of uniform section as given, arrives at prices per chain varying from £2 12s. 5d. to £6 4s. 1½d., and makes his calculation as follows:—

	£	s.	d.
Digging side ditches 18in. deep, 30in. at top, 12in. at bottom, say 13c.yds. per chain, at 3d. per yd.	0	3	3
Digging and filling under-drains 4ft. deep, 8 rods per chain at 6½d. per rod	0	4	4
Pipes for same, 135 per chain, at 20s. per 1,000	0	2	9
Laying and treading in	0	0	6
Forming base for metalling, shifting earth, levelling and finishing side spaces, seeding same, &c.	0	3	9
	0	14	7
Add for proportion of culverts and contingencies, 10 per cent.	0	1	5
Total cost of formation per chain	0	16	0

Farm road of sifted gravel on a foundation of unsifted gravel, charging nothing for the gravel in the bed:—

	£	s.	d.
Formation as detailed	0	16	0
Foundation or lower stratum of unsifted gravel, 4½in. deep, 8¼ cubic yards, at 5½d. per cubic yard, digging and clamping	0	3	9
Filling at 1½d. per yard	0	1	0
Carting an average lead of 1½ miles at 10d. per yard per mile	0	10	4
Spreading at 1d. per yard	0	0	8½
Covering or upper stratum of sifted gravel, 4½in. deep, 8¼ yards, at 10½d. per yard	0	7	2½
Filling, carting, and spreading, as above	0	12	0½
Finishing, &c., at 2d. per yard, of covering	0	1	4
Total cost per chain	2	12	5

A sensible method of valuation of country roads is as follows, from Mr. Burrows' paper, before referred to (Fig. 2):—

A A, width of formation; B B, metalled road way; C C, under-drainage; D, side ditch.

Cost of new road per chain in a level country as sketch:—

FORMATION.

	£	s.	d.	£	s.	d.
Digging ditch on one side, D, 2ft. 6in. over, 2ft. 6in. deep, 12in. at bottom, at 1s. per rod	0	4	0			
Digging two drains, C C, 4ft. deep, laying pipes, and refilling, at 7d. per rod—8 rods	0	4	8			
140 drain pipes at 24s. per thousand, and cartage at 4s. 8d. per thousand	0	4	0½			
Formation of bed and sides	0	6	0			
	0	18	8½			
Add 12 per cent. for culverts, &c.	0	2	2			
				1	0	1

FENCING.

Corrimony wire fence on each side = 44 yards at 7d. per yard	1	5	8			
Proportion for straining pillars 1 in every 250 yards at 32s. 6d. each	0	5	8			
				1	11	

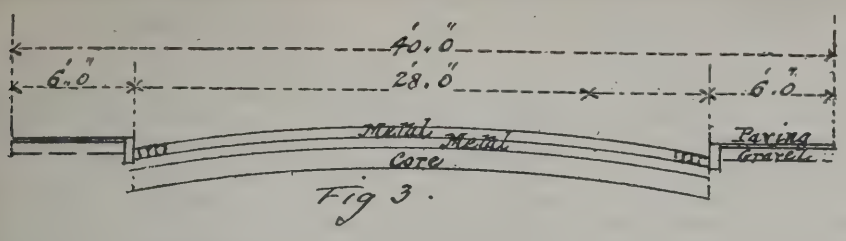


Fig 3.

METALLING.

			£ s. d.
16ft. wide laid on 16in. thick in layers of 7in., 5in., and 4in. before rolling = 52½ cubic yards of stone per chain. Cost for digging, breaking, cartage, and spreading = 3s. 52½ cubic yards at 3s.			7 16 6
Footpath 4ft. wide metalled 6in. thick will require 4⅘ cubic yards per chain at 3s. per yard		0 14 8	
Formation at 2s. per chain		0 2 0	
			0 16 8
Total cost per chain			11 5 4½

Heart of oak fencing in same locality costs as follows, for material and labour, each length :—

	s. d.
One post	2 3
Three rails	3 9
Mortising post and ending rails	0 7
Erecting each length	0 8
Cost per length	7 3

	£ s. d.
Each side 7⅓ lengths per chain = 14⅔ lengths at 7s. 3d.	5 6 4
The cost of quicksets, preparing ground, and planting at 6s. 1d. per chain = for two sides	0 12 2

An illustration of a common type of road on suburban building estates presenting some points of difference to Mr. Burrows' example, and valued more in accordance with the proposed method of these papers, is probably all that the estimator will find necessary. Valuation of road and footways, say 100ft. long, as Fig. 3.

				£ s. d.
100 0			148yds. Dig	
40 0			and cart at 3s.	
Average depth 1 0	4,000 0		per yd. cube	22 4 0
100 0			44yds. Labour	
40 0	400 0		forming surface at ¼d.	
			per yd. sup.	0 2 9
100 0			104yds. Hard	
28 0			core, and	
1 0	2,800 0		levelling and rolling at 2s. 6d. per yd. cube	13 0 0

Much of this may be obtained for nothing by giving contractor permission to shoot.

			£ s. d.
100 0		311yds. Layer of Thames	
28 0	2,800 0	ballast, 6in. thick, and levelling and rolling at 10d. per yd. sup.	12 19 2
100 0		311yds. Layer of Guernsey granite 6in. thick in	
28 0	2,800 0	2½in. cubes, and levelling and rolling at 3s. per yard sup.	46 13 0
2 100 0	200 0	12in. by 6in. Guernsey granite curb in 3ft. lengths, drafted 1in. wide on 2 upper angles, hammer-dressed on top, and 6in. down each vertical face, securely bedded in sharp sand, at 2s. per foot run	20 0 0
100 0		311yds. Layer of clean,	
28 0	2,800 0	sharp sand 2in. thick (3½d.) water (½d.) and roll (¼d.) at 4¼d. per yd. sup.	5 10 2
2 100 0		133yds. Layer of rough	
6 0	1,200 0	gravel 6in. thick, and roll at 1s. per yd. sup.	6 13 0
2 100 0		133yds. Tar paving 2½in.	
6 0	1,200 0	thick, at 2s. 3d. per yd. sup.	14 19 3
2 100 0		33yds. Paving of 6in. by	
1 6	300 0	3in. Guernsey granite setts as gutter, and grouting with Portland cement and sharp sand one and one, at 10s. 9d. per yd. sup.	17 14 9
			159 16 1

The gullies used are of various character. The distance apart being settled, they would be valued as directed in the section on Drainage.

The price per yard super. for either road or footpaths may easily be deduced from the foregoing particulars by collecting the items of either category, and dividing by the superficial quantity.

THE SEPULCHRAL MONUMENTS OF ESSEX.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

MR FREDERIC CHANCELLOR, F.R.I.B.A., has just published a record of the more interesting tombs in Essex churches, and accompanying the copious drawings, with which his folio is illustrated, will be found a comprehensive account of the families and persons connected with these county memorials. There are about two hundred illustrations, and over four hundred pages of letterpress. By the courtesy of Mr. Chancellor we are enabled to present our readers with two specimen plates. The subject is the celebrated canopied tomb (see BUILDING NEWS, April 2nd, 1886) of Henry, the first Lord Marney, who died in 1523. It is constructed of terracotta in a quasi-Italian manner, with much beauty and delicacy of detail, similar in parts, though perhaps hardly so refined, as the work shown by the tombs in Oxburgh Church, Norfolk, and Wymondham Church in the same county. Dallaway, in his notes to Walpole, suggests that the design of Layer Marney Towers was due to Girolamo da Trevize, the King's architect. This Mr. Chancellor does not refer to, but suggests that Sutton Place, near Guildford, built by Sir Richard Weston in 1525, is another example of this kind of building in which terracotta is largely employed.

The canopy of the tomb we illustrate now is located under the arch between the chancel and the Marney chapel or aisle. The recumbent effigy is of black marble, resting on a slab of the same material. The whole of this work is in excellent preservation; but the monumental pediments above the cornice on the north side are partly missing, and are here restored by Mr. John S. Corder, who made this drawing. The head of Lord Marney, which is uncovered, with the hair cut square across the forehead and descending over the ears, rests on a lozenge-shaped pillow placed upon an oblong cushion. The hands are bare, and have rings on. The body armour is hidden by the tabard; but the two tuilles, with their attachment to the taces defending the outer front of the thighs, are shown. The arms are encased in brassarts and vambraces, the elbows guarded by condières, which are developed so as to protect the bend of the arm. Cuissarts and jambarts, with genouillières similar in pattern to the elbow-pieces, encase the lower limbs, and the Garter of St. George is worn on the left leg. The feet are covered with sabbatons of five pieces, broad at the toes and armed with rowelled spurs resting on a lion. A dagger hangs on the right hip. The Garter, as worn on the leg, and as inclosing the armorials on the sides of the tomb, is treated in a manner unusual in English heraldry. The design of this tomb is so rich and unique that Mr. Chancellor has done good service in securing such careful details of it to a good scale. The canopy shows some signs of dropping, but seems to be supported upon a frame of ironwork, which through rust is now becoming unequal to the strain. The terracotta is a pleasing buff in colour, with tinges of red in parts. There is an earlier tomb in this church to Sir William Marney, with an effigy clothed in a hauberk of mail, the head resting on a large helm. The third tomb is that of John Lord Marney, second and last Baron of this family. His tomb is in the same style as that now illustrated, but it has no canopy, though at the west end are the remains of an altar which was ordered in his will to be placed in this position.

Among the other memorials Mr. Chancellor has illustrated, we find those of the De Veres, the Bourchiers, the Petres, the Maynards, the Pointz family, and the Darcys, all of whom, with their several branches and dependencies, played of course an important part in the ancient government and social associations of this part of England, dating in some cases from the Conquest. Our space will not allow us to gather more from Mr. Chancellor's wealth of material. If anything, the book is too bulky for easy reference, and as the subjects are grouped according to the families whose tombs are represented, they are not readily classified or compared. The plates vary much in merit necessarily, but as a work of record the book will have lasting value.

* The Ancient Sepulchral Monuments of Essex. By FREDERIC CHANCELLOR, Architect, Chelmsford. Edmund Durrant and Co., 1890.

AN EXHIBITION IN BLACK AND WHITE.

GLANCING through the more notable drawings at Mr. Mendoza's rooms, we come upon "Jezebel" surrounded by the dogs who devoured the woman. The Egyptian, temple-like buildings in the background hardly suggest an upper window from whence the "king's daughter" was thrown, and the steps on which her body lies indicate another departure from the text in Mr. Arthur Wardle's study. Mr. John Varley contributes three or four street scenes in Alexandria and Cairo, executed in oils, which well merit praise. The mosques, with their minarets, are brightly shown in greys and blacks, with plenty of pure whites. "The White Mill at Rye" is a somewhat hard but effective water-colour monograph in sepia, by Mr. Archibald Webb, showing the old mill by the dyke or stream running up from what remains of the ancient harbour. "Somebody's Sweetheart," by Miss F. Bramley Warren, is a study of a head rather well done. The best work of this kind, however, is Mr. James Hayllar's "Head of a boy" (No. 162), a brush drawing in sepia. The "Head Master's House and Part of Western's Yard, Eton College," by Mr. Philip Norman, has an old-world air about it which accords with the brick gables and ancient trees. The niggling, dotted pen-and-ink drawing of the great entrance to the Ashmolean Museum, Oxford, by Mr. Claude de Neuville, shows the old crumbling brickwork well enough, but the figures are bad. The view of Santa Maria della Salute, Venice is beautifully drawn, looking at the church over the water from below the fork, by Mr. H. Pilleau, R.I., in Indian ink. Mr. George C. Haité, in his pencil sketch, "A Tregetto, Venice," represents the domes of this same church in outlines which are too stilted. His drawing, however, is undoubtedly masterly in breadth and touch, as well as brilliant. The same remark is applicable to his view of "Tintoretto's House, Venice" (No. 146). Miss Sophia Beale shows us Dresden from over the bridge in pen-and-ink (No. 107), and Mr. J. Shaw Crompton draws with a masterly touch in his violet ink brush study of "Fellaheen Leaving Cairo." Mr. Wm. Gale, in red chalks, exhibits "Magnificat Anima Mea," a simple, good, lifelike female form of delicate features standing within a doorway somewhat decorative in feeling, and quite refined. Mr. Richard S. James's nude study, "After the Bath," hanging near, is a well-modelled girl modestly shown. Eton College again figures in part by Mr. Philip Norman in a photo-like sepia sketch from the Slough-road (No. 163), and Miss Marian Logsdail paints in oils a grey and black cold study of an uninteresting doorway, "Over-canopied with Clustering Leaves." The last sheet of sketches we have space to notice is one of St. John's Hospital, Canterbury, by Mr. Holland Tringham, who imitates with skill the American methods of draughtsmanship—eminently picturesque and bright with colour.

Messrs. Mellowes and Co., of Sheffield, have obtained a three years' contract from H.M. War Office for supplying and fixing their "Eclipse" imperishable glazing (tin-lead and steel bars) at the Royal Arsenal, Woolwich, also at the dockyards and other Government establishments.

A monument in granite and marble has just been erected over the family grave in Highgate Cemetery to the memory of the late Edward Lloyd (*Lloyd's Weekly News*, &c). The work has been executed by Mr. C. H. Mabey, sculptor, Westminster.

CONTEMPORARY BRITISH ARCHITECTS.—"ASHENDENE," BAYFORD, HERTS.—THE MARNEY MONUMENTS IN LAYER MARNEY CHURCH, ESSEX.—COTTAGE AT HIGHAM.—ST. JUDE'S CHURCH, HALIFAX.—SKETCHES AT THE ARTS AND CRAFTS EXHIBITION.—SWINSTY OLD HALL, NEAR OTLEY, YORKS.

Our Illustrations.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 700.)

"ASHENDENE."

"Ashendene," of which we give a view of part of the garden front, has lately been built for Mr. James W. Carlile, J.P., by Messrs. Holland and Hannen, from the designs and under the direction of Mr. Joseph H. Wallis, of The Willows, Chiswick Mall, W. The house, with stabling, gardener's cottage, and lodge, is built of red brick, roofed and weather-tiled with Broseley tiles, and cost £12,000. It is situated about four miles from Hertford. The drawing was exhibited at this year's Royal Academy.

THE SEPULCHRAL MONUMENTS OF ESSEX.

(See description on p. 679.)

COTTAGE AT HIGHAM.

This cottage has been erected on a private estate at Higham, near Colchester, with the immediate object of providing a house for the head gardener, but has been so arranged and located as to be suitable for occupation independently of the estate if so required. The walls up to first floor are hollow and faced with local red bricks. Above they are hung with weather-tiling nailed into the joints. The front and back gables are constructed of timber-work filled in with plastering faced with rough-cast. The roofs are covered with old plain tiles from a building formerly existing on the site. The cost of the building was something under the contract price of £365. The original drawings, by the architect, Mr. W. H. Atkin Berry, A.R.I.B.A., were in the Royal Academy Exhibition this year.

ST. JUDE'S CHURCH, HALIFAX.

The principal feature of St. Jude's, Halifax, lies in the tower, which is 21ft. square, and is placed on the south side of the aisle. The plan of the church is a parallelogram, with nave and aisles 72ft. long and 22ft. and 11ft. wide respectively; the chancel is 36ft. by 20ft. 6in., with vestries on the north and an organ-chamber on the south sides, separated from the chancel and aisles by deeply-moulded traceried screens. Owing to the exposed situation of the site more consideration is given to building with thick walls and in a solid manner than to ornamentation. The work is being carried out from the drawings, and under the superintendence, of Mr. W. Swinden Barber, of Halifax. The drawing herewith given was shown at the Royal Academy this year.

FURNITURE AT THE ARTS AND CRAFTS EXHIBITION.

The fireplace (No. 150) is by Messrs. Wilson and Pomeroy. The figures, especially the central one of the water-sylph "Undine," are good, while the foliage is easy and graceful. Emanating from the Guild and School of Handicraft is the oak presidential chair (No. 190), commendably free from the over-elaboration which such articles generally receive. The Band of Ornament is decidedly the best feature in the sideboard (No. 238), designed by Mr. Chas. Spooner. The wood-work, which is of English-grown sycamore, is left in its natural state, and would soon become disfigured by dirt. Mr. Lethaby's design for a walnut cabinet (No. 316) has been well executed, the workmanship, both in the inlay and the fitting of its parts, being first-class. The oak secretaire, another product of the Guild and School of Handicraft, is a serviceable piece of furniture; the back legs are left square, and look a trifle heavy; the cornice and four small panels are decorated with gesso and colour; the upper part is divided into pigeon holes, accentuated by the panels of the doors, the lower portion having a full front.

SWINSTY OLD HALL.

Swinsty Hall is beatifully situated in one of the valleys branching off from Wharfedale. The house stands on what is now the margin of one of the three large reservoirs (supplying Leeds) which have been formed by the damming up across the valley of the River Washburn, and is sheltered by the moors forming the gathering grounds of the water supply. The house dates from 1537, and is built of dressed local stone. The windows were originally filled with leaded lights in various patterns, now superseded in some cases by casements and plain squares. I am sorry to say that no information could be gleaned as to historical or other interesting facts connected with the house or family that built it. Close by, but now in the bed of the reservoir, was the site of the house in which Sir Thomas Fairfax was born and lived. Unfortunately, it was found necessary to demolish this interesting relic of the Civil War, along with many others, when the reservoirs were made. Many inhabitants of the surrounding district can still remember it, and pointed the site out to us where it used to stand on a little knoll overhanging the bed of the river. Swinsty Hall is at present in the occupation of Mr. J. Bramley, and my friend and I are greatly indebted to him for his kindness in allowing us the free run of the house, although at that time we were entire strangers to him. There is some nice oak-work inside; but we were obliged to leave it for want of time, among this oak-work being a carved overmantel in the oak room, and some antique chairs and tables.—W. W. Smith.

CHIPS.

The Prince and Princess of Wales were present at the reopening services at Sandringham Church on Sunday. The restoration and enlargement of the church have been carried out from the designs and under the direction of Sir Arthur W. Blomfield, A.R.A., and in the chancel is a medallion portrait of the late Emperor Frederick of Germany, executed by Sir Edgar Boehm, R.A.

The foundation-stone of the principal station of the electric-lighting works now being carried out by the St. Pancras Vestry was laid in Stanhope-street, Euston-road, on Wednesday week. The works will be constructed at a cost of £70,000, from plans by Professor Henry Robinson, M.Inst.C.E., electrical engineer to the vestry, and the prices charged to the public are promised to be about half those of private companies.

It was reported to the Montgomeryshire County Council on Saturday that nine candidates had been chosen by the committee of selection to come before the council for the office of county surveyor, rendered vacant by the dismissal of Mr. Swettenham. Mr. G. A. Hutchins, county surveyor of Cardiganshire, was elected. The salary is £400 a year, to include all expenses.

A window in the south aisle of Holy Trinity Church, Watermoor, Cirencester, has been filled with stained glass as a memorial. The subject is "Christ raising the daughter of Jairus," and the artists were Messrs. Hardman, of Birmingham. A lofty cover of wrought brass, the work of Messrs. J. W. Singer and Sons, of Frome, has also been added to the font of the same church.

At a public meeting held in the Public Hall, Preston, on Saturday, a resolution moved by the mayor was carried, to the effect that, in view of the importance of good plumbing in sanitary work, every possible step ought to be taken to promote the registration of plumbers.

COMPETITIONS.

Oldham.—A special meeting of the Oldham School Board was held on Saturday last, to decide upon the plans for Coppice School. The assessor, Mr. W. Landless, architect to the Leeds School Board, who was appointed to adjudicate upon the plans, was present. It was stated that thirty-eight designs had been sent in, four of them being from local architects. The whole of the designs had been carefully examined by the assessor, who had selected seven for the special consideration of the board. These were gone through one by one, after which it was decided to award the premiums as follows:—First premium of £50 to the author of the design numbered 1: Mr. G. E. T. Lawrence, Albert-buildings, 49, Queen Victoria-street, London. Second premium of £15, to the authors of the design numbered 33: Messrs. Phillips and Holdgate, Newport and Cardiff. Third premium of £10 to the authors of the design numbered 15: Messrs. Winder and Taylor, Priory Chambers, Oldham. The designs are on view in Messrs. Scott Bros., rooms, Ashcroft-street, and will be open to the inspection of the public for a few days.

ARCHÆOLOGICAL.

Fairstead, Essex.—The restoration of the parish church at Fairstead has led to several interesting discoveries. On the removal of the plaster from the walls the original mural paintings and decorations were brought to light. On the south wall were traces of a large painting, part of a scroll, four "dedication crosses," and a female head, all in dark Indian red. Remains of a scroll in blue were found on the north wall, and also three "dedication crosses" in red. In two places the plaster has been left—one at the south-east corner, having on it a "bidding prayer" for King James I., the other at the north-east corner, where there is a text in Old English characters and spelling. Over the chancel arch have been discovered five paintings illustrating (1) our Lord's triumphal entry into Jerusalem; (2) the Last Supper; (3) scene in Gethsemane of Judas kissing our Lord; (4) Christ being crowned with thorns; (5) incidents in the "Way of Sorrows."

The tender of Messrs. J. Harley and Son, of Smethwick (£9,350), has been accepted for the erection of schools at Greet for the Yardley School Board, in accordance with plans and quantities by Mr. Arthur Harrison, Queen Chambers, Colmore-row, Birmingham.

Good progress seems to have been made with the preliminary works on the Nicaragua Canal. According to an official report, the company expended during last year over three million dollars, and now has under the concession ten years in which to construct the canal. The work completed stands as follows:—Greytown Pier has been extended 700ft., and where there was dry land last May there is now 10ft. of water. The canal route has been cleared from Greytown to the divide cut. Ten miles of railway have been already completed, and a trestle bridge across the harbour is nearly finished. The right of way between the lake and the Pacific has been bought, and the clearing of the route there has been begun. The employés number 1,500.

At a meeting held at Wymondbury, Cheshire, on Friday, to consider whether the parish church should be restored or entirely rebuilt, it was decided by a large majority to rebuild it with the exception of the tower. The present edifice was erected in 1834; but the tower dates back to the 13th century, and possesses some fine architectural features and a good basis. The foundations of the church, however, show every indication of giving way, and altogether its condition is very unsafe. In a circular issued by the vicar, the cost of restoring the building was estimated at £8,000, while a new church would need an expenditure of £6,500 only.

A new Mission chapel at Murchington, near Throwleigh, on Exmoor, will be consecrated on the 25th inst. It is built of local granite, and consists of nave and chancel; the former is 30ft. 6in. by 20ft., the latter is 13ft. 9in. by 20ft. The exterior has snail-creep pointing, and the roof is covered with Broomhall tiles, by the Broomhall Tile Company, of London. The nave is floored with wood, and the chancel with encaustic tiles. All the roof timbers are open and unvarnished; the principals are of hammer-beam construction, and carved angels mark the division between choir and sanctuary, into which the chancel is divided. The windows are all of Early Decorated character, and executed in Stretten oak. The work has cost £400. Messrs. Aggett and Underhill, of Chagford were the builders.

WAYSIDE NOTES.

THAT the Society of Architects is a progressive body, without the sluggishness of corporations more advanced in years, must have been a fact patent to many on Tuesday evening last when the President, Mr. Robert Walker, of Cork, delivered his address inaugurating the new session. Times past have witnessed thin gatherings indeed in the Society's room in the St. James's Hall. Tuesday's meeting was, I believe, unprecedentedly well attended. A more tangible proof of the real life in this the youngest of the metropolitan architectural communities would be difficult to find. It waxes stronger session by session. Men of mark in the profession are joining from all quarters, and providing the Society continues in the way in which its career has begun, its lasting prosperity is now assured.

Mr. Walker's address was all I had anticipated, and from first to last was listened to with the greatest interest by an appreciative audience. Sterling advice to professional men, young and old, cautions to students, new light on the (by some) much-vexed Registration question, deeper advocacy of the demands of education—these and other subjects of every importance to architects formed the framework of a discourse so clearly and tersely and deliberately enunciated that the mere verbal delivery was a source of delight to listeners. Mr. Walker evidently learned long years ago the value of a faculty for forensic speaking, and attaches so much importance to a command of speech in professional life, that he made special and particular reference to the subject in the early portion of Tuesday's address. I would that this were duly noticed by the whole profession. We all know how sadly elementary elocution is neglected, not only by ourselves, but by English men and women generally. To all it is a matter to be regretted; to ourselves more to be regretted still. The power of speaking as a gentleman should is of inestimable value to men engaged in the duties of an architect's calling. Everyone possessing the power to speak clearly and tersely is not only himself the possessor of a gift, but a tower of strength in our midst, in that he maintains—as only the accomplished speaker can maintain—the respect and reverence of the public. Mr. Walker expressed a wish that more and new, and ever new, members of the Society of Architects should take part in the various discussions on papers read, &c., and I would add that this spirit should appear at the Institute and at the Association, that so the younger members of the profession may learn and acquire the faculty of speech, and be none the less put on their guard against that acme of bad taste—an affectation of oratorical delivery.

Anti-Registrationists might take note of the further remarks Mr. Walker has added to the literature of the Registration question. They may be regarded as an earnest of the fact that the council of the Society are not going to lose enthusiasm for one moment on this subject.

Of much interest, especially to those to whom the information is novel, are the parts of Mr. Walker's address touching the sadly small number of Chairs of Architecture at the present time established. Contrasted with the honour gained by the engineering and other professions, our own loss is especially marked. I take this evil to be referable to the one grand cause of ill and misfortune that betide architects—and that is the disbanded, unfederated, unregistered, and wholly unsympathetic (in heart) state in which, in this year of grace, we find ourselves. We have no grand bond of sympathy—no *union*—no *strength*. How, therefore, can we influence the foundation of observances and institutions that may reflect credit upon the profession? Where is the power, the strength of purpose? We do not even so order ourselves that our material well-being may be at its greatest, and can expect, accordingly, little to be done that will advance the honour of Architecture and those who practise it, as an art or science, as the case may be.

After Mr. Walker's address, and after the commentators had one and all impressed us with the—one would think—*self-evident* fact that the Society of Architects had been now fairly weaned, cut its teeth, and gone into frocks in lieu of long clothes, we adjourned, as is the wont, to the Council Chamber, and over the refreshments thoughtfully provided by the Council on such occasions, some talk turned on the patenting of plans, wherefrom I should deduce the supposition that Messrs. Flockton and Gibbs have made themselves pre-eminently unpopular. How much good they will do themselves remains to be seen. The Patent Office, we know, takes, and patents anything; but the validity of a patent is not one and the same thing with the taking out of the patent. Your own leader in last week's issue has been read, I believe, very generally and with great interest, all that is said being admirable. You have considered the matter in a clear, unbiased, impartial manner, such as it is difficult for an architect to do. He, naturally enough, has regard to the intention of Messrs. Flockton and Gibbs chiefly in the light of an attempt to prevent his employment of plans based on a certain principle. The marked animosity, therefore, to the attempt to patent, and to establish—for this is what it amounts to—an entirely new source of trouble to the profession, evidenced in all directions, is easily to be understood. No one, I may say, has any belief in the future validity of a claim of this nature. Possibly, also, Messrs. Flockton and Gibbs are themselves, at heart, as hard of faith. It may be that the advertisement and notoriety accruing from the publicity given to this case will pay them for the trouble taken. This is an uncertainty. Here, however, is a certainty: it never pays anyone, in the long run, to so act as to create unfavourable impressions in the minds of their professional brethren. I have some hope that Messrs. Flockton and Gibbs may abandon their attempt at "patent architecture," and am certain that did they know the widespread feeling in this matter, they would at once generously throw everything over. Should they continue to carry forward their proposals, then, remembering the degradation to architecture as an art, the impediment to it as a science, the certain hampering of the designers' hands, and the rapidity and certainty with which unscrupulous—on a point of loyalty to the profession to which they belong—persons will follow up with a whole galaxy of patented plans; then I confidently assert, it will be the common duty, for the common weal, to take such steps to oppose the sealing of the patent as will nip this kind of adventure in the bud.

The National Art Congress of this year has not been so successful as in years past. Such, at least, is the impression made upon me. I have seen few references or reports in the public Press, and what I have seen have not always been favourable. Nevertheless, some excellent papers have been read at Birmingham, notably those by architects. Mr. T. Graham Jackson has ever something to say worth listening to and pondering over, and if we cannot all agree on the subject of examination, we can yet accord to this admirable architect, who is an artist without being a mere "artist-architect," a full and overflowing measure of praise for unswerving persistency in his own good work, and for the calm serenity with which he preserves the even tenor of his way amid evanescent storms of fashion. Mr. Jackson continues to advocate the necessity for a bond of sympathy between architect and craftsman, and a brighter day may dawn yet in this respect. This, however, will not be brought about by mere evenings at the Arts and Crafts, after the manner of Tuesday; though, for aught I know, this visit of the members of the Institute may be a seed-sowing productive, in due season, of good fruit. Sympathy between architect and the craftsman may be compared with that between architect and builder. Some men hold the sympathies of others; and there are individuals with less lively souls who never had, and never seem capable of, sympathy. How do builders speak of architects? Of some as ravening wolves; of others as bearing, "without abuse, the grand old name of gentleman." There are great—in popular and in professional esteem—architects who have passed away, of whom builders speak hardly. Such men look upon the builder as a machine, on which the less thought and care wasted the better for the building, which may be said to have been brought into existence by main force, coldly beautiful as it may be. What bond of sympathy had such architects with the craftsmen? It would be no difficult task to point out the subtle differences between work so executed and that where the architect has been in sympathetic touch with builder and workmen, and where there has been humane sympathy for the difficulties and trials of others. The differences might be slight—mere trifles to the uneducated eye; nevertheless, out of trifles come perfection.

GOTH.

BUILDERS' BENEVOLENT INSTITUTION ANNUAL DINNER.

THE forty-third anniversary dinner in aid of the funds of this institution was held on Thursday evening, the 6th inst., at Carpenters' Hall, London Wall. Mr. Wm. Shepherd, the President, occupied the chair, and in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said it was 43 years ago since several gentlemen interested in the matter met and laid the foundations of this deserving charity. It was the bounden duty of the successors of those founders to hand it down unimpaired, and to maintain its efficiency. The tree had borne considerable fruit already, for no less than 120 male and 68 female pensioners had enjoyed the benefits of the institution. At the issue of the last annual report there were 25 men and 39 women on the roll of the charity. Those who had conducted the institution had from time to time more ambitious views than they had been able to give effect to, such as the establishment of almshouses; but such schemes had been put aside for want of the necessary funds. To pay the present pensioners about £2,000 was needed yearly, besides the necessary expenses for conducting the charity. The object of the institution was to help those who had been unsuccessful in business, and it was an astonishing thing that so many connected with the building trade took so little interest in this society. The trade was one surrounded with great vicissitudes—in fact, there was hardly another business attended with so many conflicting elements. It was, therefore, of the utmost importance that the members of the industry in the Metropolis who had been compelled to give up the struggle, through no fault of their own, should have some other resource than being declared paupers, and being associated for the remainder of their lives with persons who had never tried to make headway. It was strange that those who had always been removed farthest from such a contingency had been the greatest supporters of the institution. At the same time, he was sorry to say that a large number of firms and individuals connected with the trade, and who were doing a lucrative business in the Metropolis, had never contributed a shilling to the funds of the charity. In this institution the dangers of indiscriminate almsgiving were reduced to a minimum, as every case was personally investigated by the committee. The chairman concluded with an eloquent appeal for aid to the funds, and coupled the toast with the name of Mr. Geo. Plucknett, J.P., the treasurer. The toast having been duly honoured,

Mr. Plucknett replied on behalf of the institution, which he believed was doing its duty according to the intentions and objects of the subscribers. The great drawback was the want of sufficient money to provide for all those who sought its benefits. It was a remarkable fact that in the area which the charity covered there were something like 5,000 builders, besides thousands of others engaged in trades connected with building; yet out of all this number only 500 subscribed to the institution. At the same time, the committee were grateful to the consistent subscribers, and to the present President for his anxiety to help the charity.

Mr. J. W. Duffield gave "The Worshipful Company of Carpenters." The institution was much indebted to the Carpenters' Company for the use of their noble hall and for their substantial donations to the funds.

Mr. B. J. Jacob (Warden of the Company) replied. Carpenters and builders were so closely allied that if one trade suffered, so did the other, and as long as he had a voice in the matter he would do all that he could to aid the institution.

The remaining toasts were "The Chairman and President," "The Architects and Surveyors," and "The Vice-Presidents, Committee, and Stewards."

In the course of the evening subscriptions to the amount of £827 were announced, of which £615 appeared in the President's list.

Messrs. Baldry and Yerburgh, the contractors for the new reservoir for the Swansea Waterworks, have claimed £34,000 from the Swansea Corporation for "extras." This sum is equal to a 3s. rate.

CONTEMPORARY BRITISH ARCHITECTS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

MR. WILLIAM J. ANDERSON, who is President of the Glasgow Architectural Association, commenced his professional studies in 1877 in the ancient city of St. Andrew's, thereafter being, for a short time, in the employment of Messrs. R. Rowand Anderson and G. Washington Browne, in Edinburgh. Since then he has been for a number of years in the offices of Mr. T. L. Watson, F.R.I.B.A., and Mr. William Leiper, F.R.I.B.A., of Glasgow. He has been twice vice-president of the Glasgow Architectural Association, and in 1887 he gained the Alexander Thomson scholarship of £60 for the study of Classical architecture on the first occasion on which it was offered for competition, making a tour in Italy in 1888. Early this year he published a folio volume of measured drawings and sketches of Italian palazzi, churches, &c., under the title of "Architectural Studies in Italy." His portrait is by Mr. Walton Adams, of Reading, Berks.

Mr. E. P. Loftus Brock, F.S.A., entered the offices of Messrs. W. G. and E. Habershon in 1851, having previously been elected an architectural student of the Royal Academy Schools. He remained there until the two brothers disconnected their practices, when he became Mr. E. Habershon's managing clerk, and acted in this capacity for many years. Having acquired partnership with Mr. Habershon, the firm then known as E. Habershon and Brock carried on practice for a lengthened period, during which the large house, Normanhurst Court, Battle, now the seat of Lord Brassey, was erected for the late Mr. Brassey; also the rebuilding of Ore Place and various new houses on the St. Helen's estate, Hastings; a mansion at Bournemouth, a picture gallery at Baldstow; the village hospital, East Grinstead; masters' houses at Harrow, for the Rev. Dr. Vaughan; the laying-out of the Manor estate, Wallington; Mr. Cawston's estate, Balham; the Custom House land for Mr. Brassey; estates at Kilburn, Godstone, Harrow, Teignmouth, Highgate, &c., with most of the buildings and roads. A goodly number of churches were erected or restored, among them St. Augustine's, Highbury New Park; Park Presbyterian Church, Highbury; Hammerwood Church, Sussex; a church for Lady Sampson at Rowfant; Hethersgill Church, Cumberland; Wallington Church; St. Helen's, Ore, Sussex, where, by Mr. Brock's efforts, the ancient portions of the former church were allowed to remain as a ruin; St. Andrew's, Hastings; Ellacombe Church, Torquay; Ebernoe Church; the remodelling of St. Saviour's, Hans-place, Chelsea; St. Paul's, Carlisle; St. John's, Cotehill, Cumberland; St. Paul's, Newbarns, Barrow-in-Furness; the rebuilding of the church at Dallington, except its ancient spire, and of St. Mark's, Horsham, &c. On the retirement of Mr. E. Habershon a few years since, he left his share of the practice to Mr. Loftus Brock, who carried on the works in progress, and has erected several others. Among these may be mentioned the various homes of the National Refuges Society, including the re-modelling of the old Manor House, Ealing, and the old mansion, Fortescue House, Twickenham, to adapt them for homes for girls and boys respectively; the new buildings at Sudbury Hall, the Bisley Industrial Home, and the Shaftesbury Home, near to it. Very recently the large block of buildings, Shaftesbury House, Shaftesbury-avenue, the foundation-stone of which was laid by the Prince of Wales; the German Orphanage, Dalston, and schools at Pentonville, Felbridge, Hastings, Newhaven, and the Missionary College, Palestine-place. Churches have been built at Newhaven, Iping Marsh, St. Columb's, Notting Hill; St. Philip's, Cambridge; St. Matthias, Lincoln; and others have been repaired at Westbere, Coldred, and Staple, in Kent; Tollesbury, Essex; Preston Bissett, Bucks; St. Mary's, West Kensington, has been remodelled; Iping Church, nearly rebuilt; a new chancel erected to St. Mark's, Horsham; the old ruin, St. Botolph's, Colchester, strengthened; additions made to Broadwater Church, &c. Among general works, the Scottish Club, Dover-street, has been enlarged; Granville-chambers, New Oxford-street, erected; and also various mission halls and estates. Mr. Loftus Brock is a Fellow of the Society of Antiquaries, and also of the Royal Institute of British Architects, and he is "Architect" to the quaint club, "Ye Sette of Odd Volumes." For many years he has held the office of Honorary Secretary to the British Archæological Association, and also to the Society for the Encouragement of the Fine Arts. He is the author of a great many papers and essays on antiquarian subjects, which are printed in most of the archæological journals. Mr. Loftus Brock's portrait was produced by Messrs. Henry Webster and Son, of Bayswater.

Mr. Francis T. Dollman, A.R.I.B.A., was professionally educated in the office of Augustus Pugin, father of the eminent Augustus Welby Pugin. Welby Pugin's great powers were developed at a very early age, and the stock of office anecdotes connected with him, his father, and Mr. Dollman's fellow pupils (chief among whom were Benjamin Ferrey, Talbot Bury, and Joseph Nash, all of whom have now passed away) is almost endless. After Augustus Pugin's death Mr. Dollman entered the late George Basevi's office, where he remained till Basevi's most untimely death at Ely Cathedral in 1845. During that period of 12 years Mr. Dollman assisted Mr. Basevi at the commencement, and during the progress of his great architectural work the Fitzwilliam Museum at Cambridge, as well as numerous other buildings, of which he was the architect. After Mr. Basevi's death Mr. Dollman's own professional career may be said to have commenced (church work being his chief speciality) at Clapton and in other parts of England. Mr. Dollman has been the author of several architectural works—viz., on "Ancient Pulpits," followed a few years afterwards by a work in two volumes, on "Ancient Domestic Architecture," and subsequently by the "History and Illustrations of the Grand Old Priory Church of St. Mary Overie, Southwark." The above is a brief general summary of Mr. Dollman's chief professional labours during a period of upwards of 50 years. The portrait here given was taken this summer by Messrs. Debenham and Gould, of Bournemouth.

Mr. F. W. Stevens, C.I.E., F.R.I.B.A., A.M.I.C.E., was born on the 11th May, 1847. He was articled to Mr. Charles E. Davis, F.S.A., &c., architect and civil engineer, city surveyor of works to the Corporation of Bath, and afterwards was his assistant until he passed a competitive examination at the India Office, London, in July, 1867, for an appointment in the India Public Works Department as an assistant engineer. He retired from the Government service under Special Pension Rules in 1879, and joined the staff of the Great Indian Peninsula Railway Company. The following are among the principal public works designed and carried out by Mr. Stevens in Bombay:—Royal Alfred Sailors' Home, Post Office Mews and superintendent's residence; Great Indian Peninsular Railway, Victoria Terminal Buildings (this work is one of the most extensive of its kind in existence: the design was exhibited at the Royal Academy in 1881, and was illustrated in the BUILDING NEWS); new Bombay Municipal Buildings, now in course of erection, illustrated in the BUILDING NEWS last week. Besides these buildings, he designed proposed Bombay Exhibition Buildings in 1869, and those for 1886 in conjunction with Mr. John Griffiths, the well-known principal of the School of Art; new G.I.P. Railway Station and residences at Byculla; Igretpuri Church, residences for railway officials (comprising three large blocks of buildings three stories high), railway guards' waiting-room, &c., proposed to be erected at Boree Bunder, Bombay; buildings in connection with the Agra Water Works, and residence at Lanowli for Mr. Grattan Geary. He also executed drainage works, water supply, sea walls, roads, reclamations, and had charge of the maintenance of such works when executive engineer, Presidency Division. Mr. Stevens was specially selected by the G.I.P. Railway Company from the Public Works Department, with the approval of Government, as a salaried officer to design and carry out their Bombay Terminal Works (they having failed to obtain suitable designs from England), which extended over ten years, and the Directors of the Company, with the approval of the Government of India, presented him with a bonus of 5,000Rs. in appreciation of the services rendered by him to the Company on the completion of the works. Mr. Stevens commenced private practice in July, 1888, and is now engaged on the New Bombay Municipal Buildings and other works. He is frequently engaged on the valuation of properties, arbitrations, &c. He is a Justice of the Peace for Bombay, a Fellow of the University, and a Co panion of the Order of the Indian Empire, c ferred upon him by her Majesty the Queen January 1, 1889, for distinguished services r dered in connection with the public buildings Bombay. He was elected an Associate Mem of the Institution of Civil Engineers in Decemb 1871, and a Fellow of the Royal Institute of Brit Architects in April, 1883. His portrait v taken for our series by Mr. P. Vuccino, Bombay.

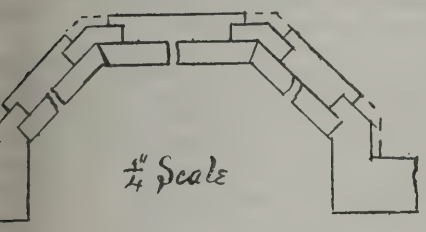
Mr. F. H. Pownall, F.R.I.B.A., was artic to the late Mr. S. W. Daukes, in whose office served his time. He has since for many ye past carried on a considerable practice both London and the country. Amongst numerc other buildings, both public and private, he h erected churches at Carleton-in-Craven, Cono ley, St. George's-in-the-East, Southboroug Whitton, Holloway, Maiden-lane, Grays, E Grinstead, Dean, near Salisbury, and elsewher besides many school and conventual building In conjunction with the late Mr. W. Youn with whom he was for a time in partnership, has been successful in several competitions, o of which was that for the Borough branch of t London and County Bank, subsequently erect under their direction. Having been elected succeed the late Mr. William Moseley as su veyor to the Justices of Middlesex, Mr. Pown has had the designing and carrying out of mar large county works, amongst which have bee the rebuilding of Coldbath Fields Prison, t alterations of, and additions to, the Session House, Clerkenwell, and the erection of th Banstead Lunatic Asylum. Under the Loc Government Act, 1888, Mr. Pownall became transferred officer, and he now holds the appoint ment of county surveyor under the Count Council of Middlesex. The portrait herewit reproduced is by Messrs. Naudin and Co., c Kensington.

Mr. E. M. Bruce Vaughan, who is a native c Cardiff, was born in 1856. He was a pupil c Mr. W. D. Blessley, and a successful student a the Cardiff Science and Art Schools, and in 188 won the medal of the Architectural Association Mr. Vaughan commenced practice in 1881, an since that time has been extensively engaged with church building in each of the four Sees o Wales, having built twenty-five churches, restored seven others, and built several parsonage houses Amongst his works executed are the following Christ Church, Llanelly (won in competition) Christ Church, Ferndale; St. John's Church Cymmer; Eglwys Dewi Sant, Cardiff; St. Luke's Church, Cwmbwrla, Swansea; St. Hiedas, Griffithstown, Newport; Morristown Church, Swansea; and Southsea Church, Wrexham, North Wales. He also restored the parish churches of Begelly, Pembrokeshire; Dwygybylchi, Pennaemmawr, North Wales, and the Parish Church of Eglwysilan. Among his public buildings are Llanelly Hospital (won in competition), Aberystwith Infirmary, "Victoria Buildings," Cardiff; Morewood Memorial Buildings, Llanelly, Grangetown Board Schools, Cardiff, for 150 children, and the Radnor-road Board Schools, Cardiff, for 150 children, the latter won in competition. Of his domestic work we may mention "Ty-to-Maen," St. Mellon's, one of the largest country residences in the district of Cardiff, and illustrated in our pages more than once, "Glyncoed, Llanelly," Pentyrch Vicarage, and the Vicarage at Llwynypia. He is a Captain of the 3rd Volunteer Battalion of the Welsh Regiment, and until the recent amalgamation commanded the 2nd Cardiff detachment of that regiment. His portrait is by Mr. W. J. Long, Queen-street, Cardiff.

A BOOK FOR BUILDERS AND TIMBER-MERCHANTS.*

WE have before us, in the above work, an old acquaintance in a new dress—a useful trade manual which has, in its size, far outgrown its former representatives or early editions. It deals with various treatises, tables, rules, problems, methods, and notes, some of which are altogether new, others freely extended or developed. It is a pocket-book of notes and cuts, ready ways and methods, memoranda, and useful table, framed to suit the timber-merchant or dealer, the clerk or assistant, the architect, and the general builder. It is framed to meet

* The Timber Merchant's and Builder's *Vade Mecum* (5th Edition). By GEO. BOUSFIELD. London: W. Rider and Son.



times, when men of business, to keep in line, vell up to the requirements of the day, need ave every calculation made for them, and y detail that can possibly be scheduled, lated, or codified placed ready to them. Mr. . Bousfield, who is the patentee of the *vade m* slide-rule, which has been before the trade er most favoured conditions for some time, s a treatise, by way of addenda to this pub- tion, on this mathematical instrument—a tise in which he has done his best to drive theory and practice of this rule home to the plest mind. There can be little doubt that cost of the entire work will be amply repaid the fund of knowledge imparted on this detail ne.

ARPENTRY AND JOINERY.—XXXIV.

NDOW FINISHING (*continued*).—BAY WINDOWS.

HESE form a very important feature in "domestic architecture," as both externally internally they are capable of a great variety treatment. Any window which from its plan

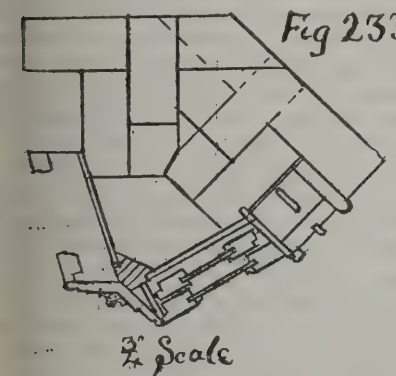


Fig 232

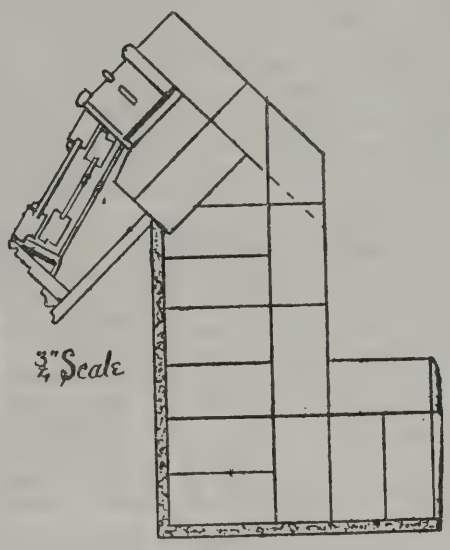
uses a distinct *bay* or recess in the room may be yled a *bay window*; but there are, it is probable, ore of this class of windows, *octagon* in plan, an in almost any other outline, and they will be rst dealt with.

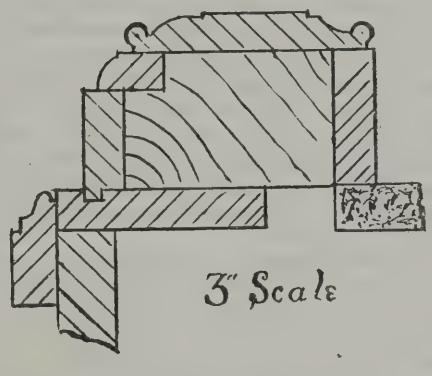
Fig. 232 gives a skeleton outline of the plan of ie piers, between which the sash-frames are laced. The sash-frames would be put in in the rdinary way, although in some of the common lass of houses in which bay windows often occur ie three sash frames are fastened together at the roper angles by pieces nailed upon the heads and ills (top side) of the frames, so as to connect ach two together, and when the under structure f the window up to the sill has been built, the

Fig 233



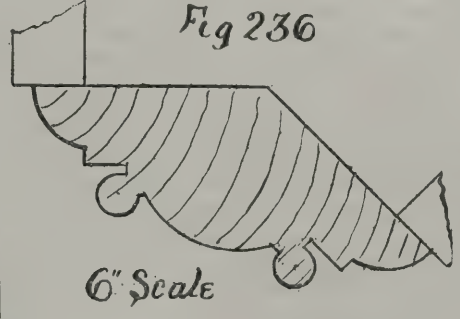
three frames thus connected are set upon it, *plumbed and levelled*, and then what forms the brick reveals just built against them; no brick-work occurring between the frames.

Of course this is a very flimsy construction, but it is allowed to pass muster by the authorities. The bay window may be carried up two stories, or as high as the house is reared, and its eave level with the house eaves, or it may be stopped at the first story, when it may be roofed against the side wall, diagonals occurring at each angle, or it may be flagged and cemented so as to be water-tight; or joisted, sheeted, and leaded with a low parapet round it above this leaded floor; a pipe conducting the water from this covering to the sewer or grating provided, a little box (leaded of course), and into which the water flows, is arranged between the joisting, and it is from this box the aforesaid pipe carries off the water. It need hardly be mentioned that a slight fall should be arranged to this box in order to keep the covering of the bay window dry; pieces differing in thickness will be nailed on the top edges of the joist before the sheeting is nailed down.



Thus much by way of introduction to the internal work. One more remark had better here

Fig 234



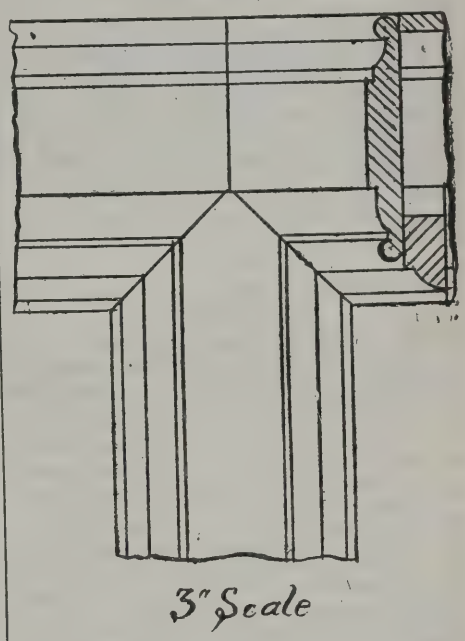
be made. A beam, either of wood or iron, reaches across the opening formed in the side-wall for the window recess or bay; the height of this varies according to this finishing of the window as compared with the room in which the window is situated, as it is not unusual to have the ceiling of the bay window level with and forming part of

Fig 235

the ceiling of the room, the plaster cornice being carried round the bay. In other cases, again, the squareness of the room is preserved so far as ceiling and cornice are concerned, and the beam referred to is shown as a distinct beam, being panelled, &c., and the ceiling or soffit of bay

Fig 236

window being treated as a separate feature. Of course the finishing of the wood-work of the window is more particularly to be treated of here.



Now it will be readily seen from Fig. 232 that the window there shown, if required to have shutters, may be treated as formed of three separate and almost independent windows, and be finished to suit this.

Fig. 233 gives the plan of one of the central brick or stone mullions, and shows the plan of sash-frame and shutters, also joining of architraves, which, as is seen, is by a *mitre*. These should be fitted and fastened together, and then set up in their places and firmly fixed. In such case the outer moulding and capping of the architrave occur on the two outer architraves only, and are carried round along the top architraves, being mitred in the angles occurring at the mullions similar to the architraves.

These windows forming the bay would have backs, elbows, and soffits similar to an ordinary "full trimmed" window.

Fig. 234 gives the plan of the outer jambs or piers of bay window, which will, of course, be

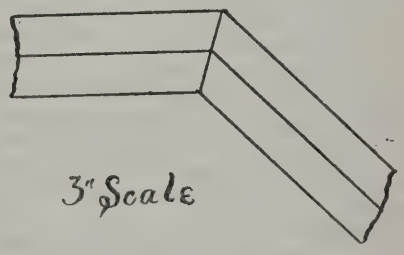


Fig 237

right and left hand, but it is the right hand one which is shown. It is expected there will be no difficulty in understanding these drawings.

It may be, however, that it is desirable to have lighter mullions, and no shutters, in which case a narrow jamb-lining, say 2½in. wide, may be substituted for the shutters; the jamb-lining will serve for provision for sun-blinds, and an architrave will form the completion of the finishing

Fig 238

above or upon these jamb-linings, which architrave may have upon its outer edge a similar moulding to that which occurs or is wrought upon the skirting of the room, and of course in such case the moulding referred to will continue up the architraves of one side, and down the architraves of the other side, and along the skirting and round the various architraves to door-jambs or other windows in the room.

This style of continuing this moulding is very fashionable with some architects nowadays.

Fig. 235 gives a section of part of sash-frame, stile, jamb-lining, architrave, &c., such as has been mentioned above, and taken from an actual case in the writer's neighbourhood.

Fig. 236 gives the section of the moulding which was fixed so as to cover the jamb-linings of the centre mullions of the bay window.

It will be seen that this moulding may be

divided in the centre, and each half is the counterpart of the other; it will also be seen that it exactly conforms with the architrave as far as it extends. The result of this is that this moulding occurring at the mullions continues up and forms intersections with the head in elevation, as shown in Fig. 237. It will be found that the mitres of the moulding up mullions are of a double kind, on account of the side lights of the bay window forming an obtuse angle with the centre light, and the top architrave, from the point where the two intersections of the mullion moulding terminate upwards to the outer edge of each respective head, meet together at the angle of the intersection of front and back faces of the architraves, shown in Fig. 238.

This window had rather a neat and effective appearance when finished; the window-backs fitting in between the jamb-linings, the capping of backs extending out to within $\frac{1}{4}$in. of the back of the architrave, and a skirting similar to that of the room being fixed against each back. The outer architraves were *grounded* for, as the line of the plaster was continuous with that of the inner face of side sash frames. In Fig. 235, at the back edge of the architrave, is shown the lining piece to cover the grounding, and reaching to the plaster, which is shown, as stated, in line with the inner casing. A bead occurs on the lining piece to *break joint* with the plaster. Section lines are drawn across the grounding piece of Fig. 235, showing fully how the whole arrangement is got up.

THE LONDON COUNTY COUNCIL AND CONTRACTS.

THE special committee appointed by the London County Council on the question of contracts will present to the next meeting of the Council a report on the subject. The committee have received a deputation from the London Building Trades' Committee, and inquired into the matter of fair contracts. The committee had an interview with the London Building Trades' Committee, and also received deputations from the Amalgamated Union of Street-Masons, Paviors, and Stone-Dressers, and the London Amalgamated Trade Society of Upholsterers. The representations made by each of these deputations were in the main of similar character, and may be briefly summarised as follows:—That contractors were in the habit of driving their workmen to scamp their work, and also of employing inferior workmen at low wages; that sub-contracting was a common practice; that sub-contractors were unscrupulous in the means they adopted to insure a profit; and that the workmen and the quality of the work alike suffered in consequence. The deputations urged that the Council should exercise a rigorous supervision over all work done for it under contract; that sub-contracting should be absolutely prohibited; that a scale of the wages to be paid to the workmen should be attached to every contract; that all contractors should be compelled to observe the trade union rules in relation to hours of labour and rates of wages; that the Council should impose heavy penalties upon contractors offending in these respects; and, further, that all the Council's contracts should only be let to London firms, and the work under them be executed by London workmen. The deputations were unanimous in the desire that the Council should employ its own workmen, and should carry out its own works, without the intervention of contractors.

The committee can find no positive evidence that inferior work has been done for the Council or for its predecessor, the Metropolitan Board of Works. They are, however, alive to the importance of keen supervision being exercised over works of construction, and are of opinion that the clerks of works employed by the Council should be highly trained specialists, who should be capable of promptly detecting inferior materials or bad workmanship.

With the allegations as to sub-contracting the committee found it difficult to deal, having regard to the impossibility of defining the real meaning of the term. Workmen apply the term sub-contracting to any other form of labour than day work. Piece work, task work, bonuses to foremen, or any arrangement made of a special kind is, in their opinion, sweating or sub-contracting. The clause usually inserted in the Council's contracts with reference to this subject appears to the committee to be sufficiently stringent for the protection of the workmen employed, and the London Building Trades Committee concurred with this view. The committee are of opinion that certain cases should be provided for by an addition being made to the clause, and they recommend:—

"(*a*) That the following words be added to the clause now inserted in the Council's contracts with reference to sub-letting or sub-contracting:—'But the Council retains power to allow the contractor to sub-let such special portions of the work as would not be produced or carried out by him in the ordinary course of his business.'"

If the letting of the Council's contracts could be limited to London firms only, and the work were carried out by London workmen exclusively, the committee are of opinion that the adoption of this course would inevitably add materially to the cost of the works carried out by the Council.

With regard to the suggestion that the Council should employ its own workmen and carry out its own works without the intervention of a contractor, the committee think this could not be done without involving a very large outlay for plant, which the Council would not be justified in incurring. They recommend, however—

"(*b*) That all work of a continuous nature, which does not involve a large outlay for plant, &c, such as the cleansing and watching of the bridges and embankments, &c., under the control of the Council, be executed as far as possible by men directly employed by the Council, or without the intervention of a contractor."

In conclusion, the committee propose that a copy of their report be sent to the London Building Trades Committee, the Amalgamated Union of Street Masons, Paviors, and Stone-Dressers, and the London Amalgamated Trade Society of Upholsterers.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ARCHITECTURAL ASSOCIATION ADVANCED CLASS OF CONSTRUCTION AND PRACTICE.—At the meeting on Wednesday evening, Mr. Francis Hooper read a paper on "Artisans' Dwellings," dealing chiefly with the principles governing their arrangement. The discussion was opened at some length by Mr. Owen Fleming, and the points raised by him and Mr. Hooper were of such importance that the further discussion was adjourned until November 26th. The interest which a competition can excite is thus forcibly illustrated, the members of the class being mostly young architects just starting practice. It is hoped at the next meeting to secure the attendance of several representative officials.

BRADFORD ARCHITECTS' AND SURVEYORS' ASSOCIATION.—The first meeting of the second winter session of this association was held on Tuesday. An address was given by the President, Mr. J. Ledingham, A.R.I.B.A., who suggested that students should give more attention to the small and practical details of their profession, in order that they might become thoroughly versed in all modern building appliances and their method of application and use. A feature of interest in the meeting was the examination and criticism of the various drawings sent in for the Architects' and Surveyors' Competition, and which were exhibited in the room. Messrs. E. Milnes, T. H. Healey, and C. H. Hargreaves, architects, were the adjudicators of the former competition, and the successful competitors were Messrs. W. E. V. Crompton, who obtained the President's prize, and Mr. J. E. Taylor, to whom was awarded the second prize. The prize for the Surveyors' competition was obtained by Mr. H. Pyrah. A unanimous vote of thanks was passed to the adjudicators of the competitions, and for the practical nature of the report they had given. A cordial vote of thanks was also awarded to the president, who, in reply, again offered to give a prize as an incentive to the work of the members during the coming year.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.—The winter session of this institute was inaugurated on Wednesday, the 5th inst., by a *conversazione* in the Victoria Gallery, Dundee. An address was given by Mr. Ower, the President, who, after congratulating the members on the growth and success of the Institute, suggested that if Dundee was to be made an art centre it would not be by sending everything worth doing to Mr. London, R.A., or Mr. Edinburgh, R.S.A. They ought as citizens to give their own fellow townsmen a first chance, and their most kindly thoughts, and should see that in any competition the designs were adjudicated on by properly qualified persons. If this had always been done they would not have had to deplore the fact that many of the best artists in various branches of the fine arts had had to leave the city.

EDINBURGH ARCHITECTURAL ASSOCIATION.—A special meeting of this association was held on the 6th inst. to consider the schemes of the North British and Caledonian Railways. Mr. Archibald Macpherson, architect, presided, and after much discussion, two resolutions were passed—the first urging the city town council to oppose any encroachment on the Princes-street Gardens unless such was proved to be absolutely essential for the public convenience, and the second submitting that any operations which would involve the possibility of injury to public buildings in Princes-street or elsewhere should be strenuously resisted. Another motion, protesting against any embankment or tunnel in Princes-street, was carried by 18 votes to 10. A fourth resolution was adopted in favour of having plans, sections, and elevations of the alterations at the Waverley Station and of the changes contemplated on the architecture of the city by the Caledonian project laid before the town council and the public.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The inaugural meeting of this society will be held on Tuesday evening next, when the President, Mr. William H. Thorp, will deliver an address and the distribution of prizes will take place. The syllabus for the session is as follows: Monday, Dec. 3, social evening with "Descriptive Notes on Normandy," by Mr. F. Clibborn, of Birkenhead; Thursday, Dec. 18, "At the Cathedral Door," by Mr. Wyke Bayliss, P.R.S.B.A.; Monday, Jan. 12, "Decorative Art in its Relation to Architecture," by Mr. Heywood Rider, head master of the Leeds School of Art; Jan. 26, Sketching Club evening; Feb. 16, "The Timber-framed Buildings of East Anglia," by Mr. John Shewell Corder, of Ipswich; March 2, Sketching Club evening; Tuesday, March 17, "Recent Practice in the Designs of Ironwork for Buildings," by Mr. G. F. Charnock, A.M.I.C.E, Bradford Technical College; Monday, April 13, "Mahogany and other Fancy Woods used for Constructive and Decorative Purposes," by Mr. F. Tiffany; April 27, Annual Meeting for Election of Officers.

MANCHESTER ARCHITECTURAL ASSOCIATION.—The 16th annual report of this Association states that the progress previously recorded has been fully maintained. The membership now shows a total of 91, being a net increase of seven, and of these 91 members no fewer than 46 are practising architects. During the session papers were read by the President (Mr. J. H. Woodhouse) and Messrs. F. M. Simpson, W. H. Bidlake, F. B. Smith, Lawrence Booth, F. R. L. Edwards, J. A. Gotch, F. R. Farrow, T. Chadwick, and W. E. Potts. The negotiations between the Association and the Manchester Society of Architects, with a view to reconstruction as one body, begun in October 1889, were finally broken off without action being taken, and while the committee still considered it desirable to have one local society, they regretted that at present the new rules of the M.S.A. did not seem to offer conditions for the work of the Association as favourable as those under which it was now carried on. The syllabus for the session, which was opened on Tuesday week with an address from the newly erected president, Mr. T. Chadwick, is as follows:—November 18 (Tuesday next) "A Three Months' Tour in Belgium and Northern France," by Mr. P. E. Barker. December 2, "Terracotta: its Advantages Relative to Town and City Buildings," by Mr. G. H. Willoughby. January 6, "Paving Stones," by Mr. S. S. Platt, Borough Surveyor, Rochdale; January 20, "Some Typical Greek Buildings," by Mr. R. Elsey Smith, London. February 3, "Houses for Working Men," by Mr. Henry Ross, of Accrington; February 17, "The Renaissance in Northamptonshire," by Mr. J. A. Gotch, of Kettering. March 3, "The Late Paris Exhibition," by Mr. Banister Fletcher, jun., of London; March 18, paper by Mr. Edgar Wood, Oldham.

At the last meeting of the Glasgow City Council, Mr. Councillor Gray was elected master of works.

Building Intelligence.

HADDINGTON.—The internal renovation of the parish or Abbey Church will be commenced in January. Some weeks ago a committee appointed Messrs. Hay and Henderson, architects, Edinburgh, to prepare plans and specifications for reflooring, reseating, and heating the church, taking down the side galleries, and other improvements, and these have been approved. The contribution by the heritors towards the proposed improvements has been fixed at £850, and the congregation have raised about £2,300 by subscription. Under the plan as presently approved, the pulpit is to be removed from the middle of the church to the east end, and accommodation will be provided for an organ. In connection with the renovation of the church, the Earl of Wemyss has intimated his wish to restore the south end of the transept, filling in the tracery of the window, with a suitable doorway underneath, as a memorial to his late father. His Lordship has further submitted a sketch of the proposed doorway and window, which has been prepared by Mr. Young, architect, London, the designer of Gosforth New House.

MANCHESTER.—A crematorium is about to be built on land adjoining and practically forming an extension of the Southern Cemetery. The architects are Messrs. Salomons and Steinthal, of Manchester, and the work is to be proceeded with at once. The building will consist of a hall or chapel containing the furnace, with columbaria for the reception of the urns and memorial tablets. The hall will be about 50ft. by 25ft., and of proportionate height. In the centre of one end against the wall will be placed the furnace, concealed in an ornamental marble shell. A door on each side of the furnace will give access to the vestry and record room, and on the other side a corresponding passage will lead to the room for the gas generator, from which in turn the descent will be continued to the engineer's room and the basement. On each side the hall will be flanked by an open arched colonnading, raised three feet above the level of the ground, and forming a columbarium. Recesses for the urns will be provided in the exterior of the walls of the hall, and should more wall space be required for this purpose in the future the colonnading may be extended either at the sides or to the rear of the main building, forming an open cloister, or, if found necessary, a series of cloisters. Dignity is given to the main entrance by the introduction of an arched and lofty porch. A tower containing and masking the flue from the furnace is a feature in the design. The directors intend not only to provide columbaria for the reception of urns, but also to make provision for the burial of urns in the soil, after the style of Milan and other cemeteries, where many of the graves in which cremated bodies have been deposited lend themselves to floral decoration and have the same appearance as ordinary burial grounds.

MILFORD HAVEN.—The reopening of Dale Church, Milford Haven, after careful restoration, from designs and under the superintendence of Messrs. Kempson and Fowler, architects, Llandaff, took place on the 4th November. The works consist of the repair of the modern roofs, which have been strengthened with boarding and moulded ribs. The rotten old boarded floors have been relaid with blocks. The tile floors have been taken up and relaid. All gravestones are left in position or relaid as they were, but on solid concrete. There are new seats, choir benches, and desks. The pulpit is of oak on a stone base. Three old wooden windows have given place to stone ones, which are glazed with beautiful glass in patterns. The ground round about the church has been excavated, so that the floor of the church is no longer under the ground-line. The tower is opened out to view by the removal of the plastered partition which filled its arch. In all cases where stone has been required, either Forest or local stone has been used. The font, which is a modern marble one of Classic design, remains in position.

NEWCASTLE.—On Saturday, the 1st inst., new business premises for the Swalwell Co-operative Society, near Newcastle-on-Tyne, were opened by the president, Mr. W. Fletcher, who was presented with a silver key. The buildings, which are of Queen Anne design, have a frontage of 90ft. into Market-lane, and comprise large millinery and drapery shop, butcher's shop, and flour store, with offices and lecture hall over, and adjoining are two dwelling-houses to be used for further business premises when required. They are built of Choppington pressed bricks, with Nunriding stone dressings. The masonry and brickwork have been executed by Messrs. Moorhead and Arkle, of Benwell, and the joinery work and remainder of the trades by Mr. Richard Wood, of Swalwell, from designs by Mr. J. W. Taylor, architect, Newcastle.

TREDEGAR, MON.—The new Church of St. James, at Georgetown, near Tredegar, was dedicated on the 6th inst. The church, which will accommodate 500 persons, is in the Early English style. The plans were prepared, and the commission was gained in competition by Messrs. James and Morgan, MM.S.A., of Charles-street Chambers, Cardiff, and the work has been carried out by Mr. Edward Morgan, of Tredegar, whose contract price was £2,200. The building is divided into nave and aisles by arches, supported on Corsham stone columns, with moulded caps and bases, clerestory windows being inserted over the arches to light the nave. The clergy vestry is situated on the north, and the organ-chamber on the south, side of the chancel. The walls are faced externally with blue Bedwellty stone, with grey Forest of Dean stone dressings to the doorways, windows, copings, &c. The west end gable is surmounted by a bell-cot, worked out of Forest stone, containing two bells. The roofs are covered with blue and purple slates in alternate courses. Internally the roofs are open to the ridge, and are of pitchpine, sized and varnished. The seating is also of pitchpine. The pulpit is of Corsham stone and pitchpine, moulded and carved, and the font is of Caen stone.

CHIPS.

The Somerset County Council decided on Friday to purchase Cotford Farm, midway between Bishop's Lydeard and Norton Fitzwarren railway stations, as a site for a new asylum. The farm has an area of 116 acres, and the price agreed on is £10,075, or £84 per acre. A committee was instructed to obtain plans and estimates for building on the farm a lunatic asylum for 450 patients, and capable of extension.

Mr. W. H. Radford, C.E., of Nottingham, has just been appointed consulting engineer for the new waterworks at Newcastle, Natal.

Mr. F. Newman, of Ryde, was last week elected county surveyor to the Isle of Wight County Council, from among eleven candidates.

An organ, built by Mr. Johnson, of Bristol, at a cost of £340, was opened in Christ Church, Barton Hill, near that city, on Friday.

The rural sanitary authority of Ardee have instituted Mr. Gaskin, C.E., of Dundalk, to prepare plans for the sewerage of Castle Bellingham.

The clerestory windows of the chancel of Wallasey parish church have been filled with stained glass given by various donors. On the north side are four saints more or less connected with the neighbourhood—viz., Kentigern, Chad, Hilda, and Werburgh. Facing these are figures representing SS. Agnes, Perpetua, Chrysostom, and Gregory the Great. The whole series has been produced by Messrs. Shrigley and Hunt, of Lancaster.

A stained-glass window has been placed in the chancel of All Saints', Harbury, in memory of the Rev. M. H. Hole, for twenty-two years the vicar. The window is in two lights, representing "Paul Preaching" and "Paul in Prison." Messrs. Powell and Sons, of Whitefriars, London, were the artists.

Messrs. Malkin, Edge, and Co., of Burslem, are issuing a new and well-printed specimen sheet of their manufactures, comprising tiles, slabbed hearths, panels, mounted and framed, for hanging in architects, and builders' offices, which will be very useful. They will send a mounted one to any reader on application.

The Society of Merchant Venturers have given their sanction to a scheme for connecting the Hotwells-road at Bristol with Clifton by means of a lift. The engineers are Mr. G. Croydon Marks, of Birmingham, and Mr. P. Munro, of Bristol. The scheme provides not only for a lift, but for the erection of a spa, pump-room, and promenade, adjoining Prince's-buildings. It is proposed to cut a tunnel under the present garden-grounds, and up this tunnel to lay lines of rails for the purpose of carrying the cars for the conveyance of passengers. The cars to be worked are upon the principle of the lift now in operation at Lynton, and to be worked also at Torquay and elsewhere.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

THE R.I.B.A. ASSOCIATES' EXAMINATION.

To the Editor of the BUILDING NEWS.

SIR,—Now that the R.I.B.A. Kalendar for 1890 has been published, and in it the questions set at the examinations held last March, I should feel obliged if you would allow me to indulge in a few words of criticism, not in any carping spirit, but with the hope that they may lead to the adoption of improvements. The examinations are already good, but they might be better, and, as one who may be said at times to be pitted against the examiners, I may be able to point out some of the weak spots.

With the questions upon the History of Architecture I have little fault to find. They are well set, covering the whole ground, and testing the knowledge of the candidates thoroughly; but there is too great a sameness between questions 4 and 12, showing want of proper consultation between the examiners—which has been noticed occasionally in former years, and which is further exemplified by the similarity between question 1 of this paper and question 4 of the paper on Mouldings, Features, and Ornament. This latter question—"What do you understand by Byzantine and Romanesque Architecture"?—should, it seems to me, have occurred in the History rather than in the Ornament paper, and yet, strange to say, it is one which all candidates, when being examined in Ornament, were expected to answer! Unfortunately, there was no single question upon Mediæval Mouldings—an omission of a serious nature—while that about stone-gable crosses, dealing with a minor detail, might well have been omitted.

The subject of Sanitary Science is treated as it

should be—exhaustively. It is only doubtful whether the time allowed for it be sufficient, for all will admit its extreme importance.

It is the paper upon the Strength of Materials, however, with which I have most fault to find. I contend that the subject, if it form part of the syllabus at all, should be treated as comprehensively as any other—as I am accustomed to find it treated in Civil Service examinations for architectural draughtsmen and surveyors. Instead of this, the questions set, without being truly elementary, dealing with the elementary principles of mechanics and their applications to building, are of the "catch" variety, leading to cramming of the very worst form, the learning by rote of a few formulæ, which the examiner uses year after year, without any pains being taken to understand the principles which underlie them. With these questions before them as examples of what have been set in former years, I find it most difficult to persuade students to do more than "get up"—*alias* "cram"—sufficient to meet the examiners' requirements. The formulæ employed, too, have mostly long been discarded by engineers for the purposes to which the examiner applies them, while many of the questions are so set as to reduce what might have been made good test questions of a candidate's knowledge of his subject to the level of simple algebraical problems which any well-educated boy could work out.

The question upon Planning is also open to criticism. To begin with, the area to be covered is stated to be 78 by 66 *square* feet, thus giving a cubic dimension. But, putting this slip aside, the plan is so clearly described that the important—most important—element of planning is scarcely touched upon. If there be anything which the embryo architect should be able to do rapidly and well, it is to make a satisfactory plan, and his ability to do this is scarcely tested. I would suggest, as an improvement upon the present system, that two papers instead of one be set upon the Wednesdays, the morning being devoted to getting out the *plan* of a building, from open instructions such as a client would be likely to give his architect, and the afternoon to designing elevations to suit lithographed plans supplied to each candidate.

Save that a great many—too many—questions were set upon Materials and Construction, they were sensible enough. By too great a choice being allowed, the candidate would be able to select those which could be answered from book-acquired knowledge alone, and to avoid the really valuable questions which are set to test his constructive ability—his capacity for getting satisfactorily over constructive difficulties when they arise.

As far as the portion of the Thursday afternoon paper dealing with Specifications is concerned, all is right enough; but certainly the fourth question upon Professional Practice—and it is a good one—should have appeared rather under the head of Estimating, a subject which in former years has scarcely had attention paid to it commensurate with its great practical importance to all architects in general practice.

With apologies for trespassing so largely upon your space—I am, &c.,

G. A. T. Middleton.

PATENTED PLANS.

Sir,—As an architect of some fourteen years' standing, and a practising patent agent, I am much interested in your article upon "Patenting Plans," called forth by Messrs. Flockton and Gibbs invitation to oppose the grant of letters patent upon their application, No. 19624, '89. As, however, there can be no doubt that those gentlemen actually designed the arrangement they seek to patent, practically no opposition can be entered by anyone except "on the ground that the invention has been patented in this country on an application of prior date," and that is very improbable. No doubt their application will be sealed; but whether their patent, when granted, will be valid, is another matter. It is rarely that architects in this country patent their plans, and as the competition which occasioned this case excited much attention, the matter is of great interest to the profession, and merits some attention.

You state the case fairly as "that of grouping the departments of a public building, each complete and separate in respect of its entrances, round one public hall," and the title applies the invention to "Government, county, municipal, and other public offices and courts." Let us see if this has not been anticipated.

In Mr. Waterhouse's Natural History Museum there is a central hall for the public, from which radiate three great departments—each complete and separate in respect to its entrances—and to which the public can only gain access from the central or public hall. This is the arrangement upon the ground floor; and a visitor to any department entering it from the central hall can traverse the whole of that department and return without entering upon one of the others. The public staircase in the hall is the only means of public access to the similarly isolated departments on the first and second floors above, and thus it conforms to the conditions laid down by Messrs. Flockton and Gibbs.

A somewhat similar arrangement obtains at the New Law Courts; the entrance to the several courts being from the central hall, or from a public passage way above; but this example is complicated by other entrances for the judges, lawyers, and witnesses, apart from the entrance to the main hall. The two opposite wings, which lead by two separate staircases from the entrance hall of the National Gallery, is another example, but is imperfect for want of a large central space. A much better example is that afforded by the separate arrangement of the House of Lords and the House of Commons, which, with their distinct libraries, committee rooms, and offices, are respectively entered from the large octagonal space under St. George's Tower, and to this latter only the public enter from the exterior. If my memory serves me correctly, there are similar entrances to separate departments from a domically covered room in the Bank of England: while at the British Museum, the King's Library and Roman Sculpture Gallery leading from the public hall is another good example.

The above instances are sufficient to prove that the radial principle (as it may be called) of grouping separate departments of a public building around a hall, to which only the public have access, is by no means new, and I have no doubt many examples will be found amongst French municipal buildings. But if it be objected that in the examples given the separate wings are not divided up into separate rooms, such as are shown in the Sheffield plan, the answer is that there is no patentable novelty therein, either alone or in combination with the public hall.

You truly say that every design is more or less of an invention, and ask, "Why should not the architect avail himself of the Patent Act, as well as any other inventor?" There is first the restrictions due to building regulations, in which so many things are reduced to rules, and this always hampers that free play of fancy which is required in invention. When these regulations are amended and consolidated, as mentioned by Mr. Waterhouse, it is hoped that many of them will be swept away, and more scope thus left for invention. Secondly, when an architect accepts a commission from a client, he virtually contracts to design and invent to the best of his ability, according to the circumstances of the case. But any invention thus called out is not worth the cost of patenting, as it is seldom, if ever, repeated; and, therefore, is not a marketable commodity like a machine, process, or a new manufacture. Thirdly, few architects are sufficiently familiar with the manufacturing arts to venture upon improving articles or materials which are largely repeated—except in an artistic direction—and therefore leave these to be improved by the manufacturers. A few architects do invent and patent fireproof floors, sanitary or heating devices; but they are rare exceptions. It is a pity there are not more; but I do not advocate patenting plans only, apart from special construction.

Several architectural patents have been obtained in the United States for special arrangements of buildings, principally those for city dwellings, which bear repetition, and for fire-escape construction, in addition to the copyrighting of designs such as you mention. I have myself copyrighted at Washington the drawings of my second design for the International Exhibition at Philadelphia of 1876. It was made a condition of the competition that the premiated architects should again compete amongst themselves, and that their second designs should be copyrighted, and the copyright assigned to the Commissioners. This I did, in accordance with the conditions, and I may point out as a warning that, if patenting plans become at all general, similar means are sure to be taken to protect themselves by competition committees.—I am, &c.,

J. Sinclair Fairfax.

ISLINGTON BATHS COMPETITION.

Sir,—Having had an opportunity of seeing the selected designs, I desire to point out some of the defects overlooked by the assessor, or considered by him as merits deserving award. "Comme-il-Faut," placed first, has second-class bath 72 × 27 (figured 72 × 37), a mere duck-pond, considering that 90 × 40 was the size required: this great difference ought to have excluded the design. To obtain even 72ft. length, a diving-stage is raised above the bath, and, although only 2ft. 6in. wide, is the only means of access to the w.c.'s. The stairs to the public gallery are of wood, only 3ft. wide, *with winders*—fortunately for public safety, the County Council will not permit this. When bath is used for public entertainment, the artistes have only one small dressing-room, and no means of access to that except by passing through the audience. The women's private baths are on the first floor, other designs properly showed them on ground-floor as being most convenient for supervision. Three pay-boxes are provided, thus increasing cost of management; but since the competition an amended plan shows two, and the miserably poor elevation made a little better by the addition of a tower with clock face. The laundry has but 26 washing compartments and horses, and a disinfecting chamber, a most objectionable feature, for every outbreak of illness in the neighbourhood would be attributed to the foul infectious linen, &c., at the public wash-house. No private bath is provided for superintendent's residence: one certainly should be. In selecting the above design, the assessor has ignored a design with both baths 90 by 40, another both baths 90 by 30, another first-class bath 94 by 39, and second-class bath 110 by 32, considering they are of bad proportion (?) and premiates a plan with a bath only 72 by 27! Most astonishing idea, when swimmers desire a good length of bath above all things.

"Cleanliness," the second premiated design, is full of faults, showing plainly enough the author never had erected public baths. No private baths are provided for women, although required by the conditions. The laundry and washhouse are badly arranged on first floor, and these are only obtained by providing a girder 56ft. long over the second-class swimming-bath, and placing upwards of 20ft. by 42ft. of the water-surface in deep shadow. No retiring-rooms are provided for artistes during an entertainment. Other defects of plan and design are apparent; but I will only mention the position of coals, which are at the back of the boilers, so that every time stoking is done, many journeys to and fro would be necessary: and yet, with all this, the assessor affirms that this design deserves the highest praise. How such nonsense came to be written it is impossible to say.

"Soap and Water," the third premiated design, has the dressing-boxes on one side only, a badly-proportioned second-class bath, seven first-class men's baths, six second-class men's baths, and 16 women's baths on first floor. No such apportionment can be found in any public establishment in London, and I may add elsewhere. I have called attention to these designs so that the competitors may be able to form an opinion of the award, and to express the view that in every competition the whole of the designs should be exhibited, and if two-thirds of the competitors petition the Institute, the council is to form a court of appeal to hear evidence and uphold or reverse the award as may be deemed equitable.—I am, &c.

Observer.

ISLINGTON BATHS COMPETITION.

Sir,—The award in the above competition is another remarkable instance of Professor Roger Smith's adjudication. In the instructions issued by the commissioners to architects competing, it was specially set forth, among the other particulars, that two swimming baths were required, each with a water area of 90·0 × 40·0.

Professor Smith has placed first a design which shows one bath 70·0 × 27·0. It is, however, figured 72·0 × 37.0, just 10ft. wider than it actually is, and if drawn as figured, it would be impossible to obtain the accommodation which the plan shows on the ground-floor. Moreover, Professor Smith makes no mention of this dis-

repancy in his report, but gives the size of the ath as figured, which clearly shows that, in warding the premiums, he did not give that ttention to the designs which an assessor should lo. Why he should have ignored the instruc-ions in this and other respects is a mystery; ut he should, I think, have given greater ttention to the designs that conscientiously endeavoured to follow the instructions issued by he commissioners.

There are several other points in the design which one would have thought an assessor, with a knowledge of the subject he was adjudicating upon, would have looked more clearly into before giving the award he has done; but as the commissioners, I understand, have appointed Mr. Tiltman as the architect, it is useless to refer to them, more especially as Mr. Tiltman has very considerably altered and modified all the drawings except sections.—I am, &c.,

A Competitor.

CHIPS.

The new City and South London Electric Railway will be opened to the public on Wednesday week, the 26th inst.

An action for libel, brought against Mr. J. Passmore Edwards, the proprietor of the *Echo* newspaper, was tried by Mr. Justice Vaughan Williams and a jury on Wednesday. The plaintiff, Frederick George Helmore, formerly an architect and surveyor, who started the Investors' Protection Society, complained that he had been ruined by the alleged libels. In cross-examination he admitted having been in prison and a bankrupt, and said that, after leaving prison, he invited the public to subscribe £43,000 to establish a home for waifs and strays, and went about dressed like a monk, with a cowl, and with an organ, to advertise the scheme. The jury found a verdict for the defendant, with costs.

The Hollingworth Memorial Wing, which has been added to the Church Institute at Maidstone, was opened by the Bishop of Ripon on the 5th inst. It includes a gymnasium in the basement, with recreation rooms and library on the ground floor, and a hall seated for 300 persons above. The builders are Messrs. Wallis and Sons, of Boxley-road, Maidstone.

Dunblane Hydropathic Establishment, which is said to have cost £60,000, has been sold for £16,000.

Alderman James Fowler, F.S.A., F.R.I.B.A., has been elected Mayor of Louth for the fifth time.

The recent report that a new railway was to be cut from King's Lynn, on the east coast, to Liverpool, on the west, passing through Cheshire, is confirmed. The scheme will be carried out by an independent authority. In Cheshire, the line from Buxton will cross the border and enter Macclesfield at Higher Hurdsfield, and then proceed to Sutton and Brooklands, and the railway will be carried on to Mobberly, and thence to Knutsford and Warrington. The line will cross Lincolnshire, Derbyshire, Cheshire, and Lancashire. The engineer is Mr. Cooper, of Westminster.

Messrs. E. Appleton and Son, Torquay, have been instructed to prepare schemes for the drainage and water supply of Hatherleigh.

A contract has been concluded between the Rio de Janeiro City Improvements Co., Limited, and the Government of the United States of Brazil for the drainage of the districts of Eugenho Novo and Lagoa, being suburbs of Rio. Mr. Frederick Beesley, C.E., of Westminster, is the engineer to the undertaking. The estimated cost of the works is £275,000.

The new schools, York, for the York School Board, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

The Alexandra School, Earlsfort-terrace, Dublin, which was recently erected at a cost of about £5,000, from the designs of Mr. W. Kaye Parry, M.A., Dublin, with accommodation for 250 pupils, is about to be enlarged from plans by the same architect, as the rapid increase in the number of students renders an extension of the premises absolutely necessary.

On Sunday week special services were held to celebrate the completion of the restoration of the tower of All Saints' Church, King's Bromley, near Lichfield, carried out under the superintendence of Mr. Basil Champneys, B.A. The parapet has been rebuilt, and the pinnacles restored and made higher, in accordance with the original design. A new roof has been put on the tower, and the bells have been rehung on a massive oak frame, and quartered. The general contract was placed in the hands of Mr. R. Bridgeman, sculptor, Lichfield.

Intercommunication.

QUESTIONS.

[10429.]—**Smoke from Kitchen Flue.**—Will some practical reader kindly say how I can effect a cure of the smuts emitted from top of flue of kitchen? They come out and smother the whole of roofs, and are a great nuisance in the garden.—Reader.

[10430.]—**Surveying.**—Will any experienced reader kindly give me the name of a really good, but simple, book upon surveying? Desired particularly to assist one who is engaged in making complete the set of maps of a borough where several districts have been laid out and built upon since the last Ordnance Survey of that borough; also showing best method of taking out the area (in acres, feet, or anything desired from a map or plan) of a piece of land which can, or cannot, be broken up into triangles, as the case may be.—Doubtful.

[10431.]—**Cements.**—I would like to know if there is any article, pamphlet, or book containing detailed information about the manufacture of patent cements, such as Keene's, Martin's, Parian, &c.?—Potash.

[10432.]—**Filtering Rain-Water**—Filtered rain-water is required for drinking purposes, and I should be glad if some of your correspondents could find out from experience how a filter can be constructed and renewed in a simple way. The rain water from a building (standing away from a town) covered with tiles is to be carried by stoneware drains into a tank containing about 800 gallons, and, after being purified, is to be pumped into the house. The filtering must thus take place in or adjoining the tank.—S. W.

[10433.]—**Wet Rot.**—A joisted and boarded red-wood floor of a school, erected three years ago, is completely destroyed with wet rot. The joists were placed about 18in. above ground level, and were laid on sleeper walls, and the floor had good through ventilation, with air grids on each side. As this floor is about to be renewed, will anyone give me some practical hints to prevent wet rot attacking the proposed new floor?—Z.

[10434.]—**Surveying.**—Will some experienced reader kindly state which is the best textbook on town surveying and plotting details of streets?—Young Student.

[10435.]—**Architect's Charges.**—Would someone kindly inform me what an architect is entitled to charge for completing houses partly finished? Can he charge a fee for making plan of old erections, and also 2½ per cent. for measuring up extras from contract, in addition to his 5 per cent.?—R. H. H. H.

[10436.]—**Vibration.**—Can any reader give recipe to prevent the vibration of a room during the progress of either singing or speaking? Size of room 70ft. long, 20ft. wide, 14ft. high.—C. D.

[10437.]—**Hoffmann Brick Kiln.**—Can anyone inform me where I could get full particulars for erecting a "Hoffmann" brick kiln with the latest improvements, and if you know of any work published on the subject? The interesting description in your paper some six months since does not give details of construction.—E. W. W.

REPLIES.

[10333.]—**Reredos and Rood Screen.**—I have just noticed in your issue of Oct. 3, in Replies, a letter from "G. H. G.," headed "Reredos and Rood Screen." He is wrong in stating that the screen is a recent erection. That is not so, for it formed part of the original church, and before the rebuilding of the church (except the tower) in '53 used to support the Fishermen's Gallery, as may be noticed in old engravings of the interior of the church. The cross, or rood, was put up in '87. The screen has recently been redecorated by Mr. Kewell, under the superintendence of Mr. Somers Clarke, architect, and this has, doubtless, caused your correspondent's mistake.—Charles Lynn, Churchwarden, St. Nicholas', Brighton.

[10424.]—**Book-keeping.**—If "Enquirer" will write to me, I can let him, or any other reader, have worked examples of a good system to suit contractor or jobbing builder.—F. J. W., Eastbourne House, Ryde, I.W.

The local board of Bedlington, Northumberland, have elected as their surveyor, engineer, and waterworks manager, Mr. C. A. Copland, for the past six years surveyor to the local board of Loftus-in-Cleveland.

A carved oak reredos has recently been placed in the chancel of Boylestone Church. It consists of a massive oak panel carved in very high relief, with a representation of the Lord's Supper, the canopy inclosing it comprising three depressed arches divided by elaborately-carved pinnacles, each section of the cresting being varied in treatment. The whole is in the Late Decorated style. The work was executed by Messrs. Jones and Willis, of Birmingham and London, under the personal superintendence of Mr. J. L. Naylor, diocesan architect, of Derby.

On Saturday the foundation stone of the new church of St. James was laid at the corner of Frederick and Whitehead roads, Aston. The church will consist of a nave and aisles, transept, chancel, and baptistery, together 128ft. by 51ft., and a cross nave and aisles. It is proposed to erect the chancel, vestry, and chancel aisle first, the body of the church to be a temporary arrangement of wood and iron, accommodating 700 people. The permanent portion will be executed in white bricks, relieved with red bands and stone tracery to windows, with tiled roof. The first contract is being carried out by Mr. Thomas Collins, of Tewkesbury, from plans of Mr. J. A. Chatwin, of Birmingham.

WATER SUPPLY AND SANITARY MATTERS.

Completion of the Sewerage of Heswall.—The system of sewerage at Heswall is completed. The total length of the sewers is about 4¼ miles, and they are composed of stoneware pipes of the best quality, supplied by Messrs. Doulton and Co., of St. Helens, and laid with Stanford's joints. The several sewers discharge into a large brick tank-sewer, 260ft. long by 7ft. deep, and 4ft. 8in. wide, which will serve as a reservoir to hold the sewage while the tide is up. On the ebb tide the sewage will be discharged into the river Dee through a line of cast-iron pipes, 9in. in diameter, which are carried to low-water mark, and are supported on strong timber piles firmly driven into the shore. The amount sanctioned by the Local Government Board to be expended on these works is £4,700, and it is not expected that this sum will be exceeded. The whole of the works have been designed and carried out under the personal supervision of the engineer to the authority, Mr. Charles H. Beloe, M.Inst.C.E., of Liverpool, and the contractors for the work were Messrs. Thomas and Co., of Daulby-street, Liverpool.

Dublin.—An entirely new system of drainage and sewerage is about to be undertaken at the Institute for the Deaf and Dumb, Cabra, near Dublin. The plans and specifications have been prepared by Mr. W. Kaye Parry, M.A., civil engineer, Dublin. The estimated total outlay is about £1,300 exclusive of the main outfall sewer.

Hythe, Kent.—The inauguration of the new reservoir at the Black Rock Spring at Seabrook took place recently. The new reservoir is 25ft. in diameter, 9ft. deep, and capable of containing 27,000 gallons of water. A heading has been driven into the side of the hill, at a distance of about 36ft. from the reservoir, with a branch to the north, picking up a subsidiary spring in intercepting the main spring; the heading has been filled in with a 12in. perforated pipe. The water is conveyed into a brick reservoir 3ft. square, from whence it is led by a 6in. cast-iron pipe into the reservoir. The length of the main from the reservoir to the fountain is 820 yards. There will be a sufficient fall from the reservoir by gravitation to supply the houses along the Sandgate-road and High-street to the sea front. The quantity of water now going into the tank is 20,000 gallons in twenty-four hours, but 12,000 more gallons will be supplied daily. The contract for the construction of the works has been carried out by Mr. E. R. Palmer, Wickham-road, Beckenham, Kent, at a cost of £870. The whole has been designed and personally superintended by Mr. Alec R. Stenning, F.R.I.B.A., Cannon-street, London. Mr. E. S. Wilks has acted as clerk of works.

Wirksworth Waterworks.—The Local Board of Wirksworth have called in Mr. W. H. Radford, C.E., of Nottingham, to report on the best method of increasing the supply of water. The springs supplying the present works have run down to 52,800 gallons per day; and the local board wish to obtain an increased supply of from 24,000 to 36,000 gallons a day.

The foundation-stone of a memorial church for the outlying district of Tonna, Neath, South Wales, was laid on the 6th inst. The building will be a cruciform one, with lofty tower and spire on the N.W. side, and a semicircular apse. The stone for the walls will be raised on the property, and the total cost will probably be about £3,000. The architect is Mr. E. H. Lingen Barker, of Hereford.

Mr. A. G. Greatorex, of the City Surveyor's office, Manchester, has been appointed Assistant Borough Surveyor of Southampton. Mr. Greatorex served his articles under Mr. J. Price, A.M.I.C.E., Engineer and Surveyor to the Toxteth Park Local Board, near Liverpool, and for the past four years has been hon. sec. of the Association of the Manchester Students of the Institution of Civil Engineers.

In our report of New Scotland Yard last week we stated incorrectly that the paving of the court-yard is being laid in granolitic pavement. We ought to have said that Messrs. W. B. Wilkinson and Co. have laid the whole of the concrete paving to courtyard, basement, and other floors, &c., throughout the building. They have also put up the principal staircases in their granite concrete, the whole being formed *in situ*, with solid close outer string, the same being moulded in Keene's cement, and with panelled soffite, and other work.

An action to recover damages for injuries sustained through the fall of a hoarding in Stoke Newington-road was tried on Saturday by Mr. Justice Smith and a jury. The plaintiff was Mrs. Fogden, a professional singer, and the defendant was Mr. T. Lewis, a builder, of Stoke Newington, who denied that there was any defect in the hoarding, and attributed the accident to a severe storm then raging. The jury awarded the plaintiff £273 damages.

STAINED GLASS.

BIRMINGHAM.—The great hall at the Victoria Assize Courts, designed by Messrs. Bell and Webb, has just been completed by the erection of the series of stained-glass windows, which, together with the effigy of the Queen over the porch, have been provided out of the £2,000 set aside from the local Jubilee fund. The windows are the work of Messrs. Heaton, Butler, and Bayne, of London, from designs by Mr. Lonsdale and Mr. P. H. Newman, who sought to illustrate local history and local industry. The windows are eight in number. A considerable portion of the glass has been filled with architectural ornament *en grisaille*, and the pictorial subjects have been restricted in size, so as to admit as much light as possible. The east window contains in the upper portions of the principal divisions full-length figures of William de Bermingham, Shakespeare, and Edward VI., while below them are similar portraits of Boulton, David Cox, and Priestley. In the lights at the side, and underneath the full-length figures, are medallion heads of other local worthies. The west window is devoted to the illustration of local industry. The six full-length figures are those of an armourer, a goldsmith, and a brassfounder, a smith, an electroplater, and an iron-caster, each represented in his working clothes. In the upper portions of the five front windows are allegorical figures, the centre one enthroned and those at the side standing. The centre window of the five depicts the Queen on her throne in 1837; while the north window opposite to it shows her Majesty in 1887. The lower portion of each of the four full-front windows have pictorial records, in three lights each, of the Queen opening Aston Hall; the Prince Consort laying the foundation-stone of the Midland Institute, the Queen performing a similar function for the Victoria Courts, where, among the portraits, that of Mr. Aston Webb is distinguishable, and, lastly, her Majesty's drive through Victoria Park.

EDINBURGH.—A series of six stained-glass memorial windows have just been completed for St. Andrew's parish church, by Messrs. J. Ballantine and Son, of Edinburgh. The windows occupy an oval wall space behind the pulpit. The four large windows represent the Four Evangelists, each exhibiting within a niche a standing life-sized figure of the Saint. Beneath the main subject is a lesser subject, giving one of the outstanding incidents in the life of the Saint. In the case of St. Matthew, this scene represents the Call of St. Matthew. In the case of St. Mark, Peter is represented being delivered from prison, and coming to the house of Mark. St. Luke is shown inditing epistles to St. Paul; and the scene beneath the figure of St. John is the Saint seeing the vision of the Holy City. The two smaller windows represent seated figures of David and Isaiah. The church being a building of Classic design, the windows have also been treated so as to harmonise with their surroundings.

STATUES, MEMORIALS, &c.

WORCESTER.—The formal unveiling of a Jubilee statue to the Queen took place on the 6th inst., in the space in front of the Shire Hall. The statue, which is the work of Mr. T. Brock, A.R.A., is of white Carrara marble, rather larger than life size, and stands on a plinth and pedesdal, also of white marble. Beneath are a sub-base, and the granite foundation, rising in three steps. The highest point of the statue stands 23ft. above the level of the ground in front of the Shire Hall. Her Majesty stands crowned and wearing a robe of State which falls to the ground behind, and is open from the neck downwards in front, showing the dress beneath. In her right hand the Queen holds the sceptre, and in her left she supports the orb. Resting against the plinth at her feet is a shield bearing the Royal arms, surmounted with a laurel wreath. On the front panel of the pedestal is an inscription. On the sub-base is the word "Progress," with a pair of wings; on the side panels of the pedestal are figures in bas-relief of boys representing "Art" and "Science." The panel at the back bears the arms of the county.

A new theatre, to be known as the Prince's, is about to be erected in Leake-road, Landport, from plans by Mr. Frank Matcham.

The Warwickshire County Council have appointed Mr. Francis Willmott and Mr. John Willmott, of Birmingham, and the survivor of them, surveyors of county roads, bridges, and buildings, at a salary of £1,050 per annum, which is to include all expenses of staff, travelling, and office and all other remuneration, except printing, and except a commission at the rate of 5 per cent. on any expenditure on every new work in one place in excess of £500 on any bridge or county buildings, in respect of which they may be employed as architects or engineers. £350 was voted to Mr. Willmott for extra services as county surveyor up to the 29th September last. It was also decided to appoint four assistant surveyors, at £150 a year each.

LEGAL INTELLIGENCE.

RE LOGAN AND SMITH.—A sitting for public examination, adjourned from the Aberystwith County Court, was held in this case at the London Bankruptcy Court on Monday. The bankrupts, W. G. Logan and Harriet E. Smith, were owners of slate quarries at Merioneth, Wales, carrying on business under the style of G. A. Walker and Co. Mr. Logan had also a separate business as an auditor and accountant at Surrey House, Victoria Embankment. He returned his separate liabilities at £90,096, of which £36,349 were unsecured, and assets £41,767. In the partnership affairs of G. A. Walker and Co., the accounts show gross liabilities £57,332, of which about £16,000 are unsecured, and an estimated surplus in assets of £39,305. An adjournment for further accounts was ordered till Wednesday, when another adjournment took place.

A WARNING TO SURETIES.—In the Southwark County Court on Friday, before His Honour Judge Holroyd, a case of considerable interest to builders and builder's merchants, was decided. The plaintiffs were Messrs. Eastwood, brick merchants, who claimed from the defendant, Mr. Hansell, architect, the sum of £15 for 7,000 stock bricks supplied to Messrs. Wood and Burrage, and for the payment of which sum the defendant became surety. A jury had been summoned, but at the last moment, by agreement between counsel, the case was left in the hands of the judge. Mr. D'Eyncourt, instructed by Messrs. Hugh, Davies and Co., appeared for the plaintiffs, and Mr. Edwards, instructed by Mr. Alpe, for the defendant. The case for the plaintiffs was that prior to February last they had been supplying Messrs. Wood and Burrage with bricks for some houses they were erecting for defendant at Sunbury. More goods were required, which they were not prepared to supply for credit to that firm. In consequence, Mr. Hansell, the defendant, wrote to plaintiffs a letter, which was put in, asking them to supply the 7,000 bricks ordered, and consenting to himself being liable for payment one month after delivery if Messrs. Wood and Burrage had not settled with plaintiffs in the mean time. At the end of the letter was a request that plaintiffs would supply him with a copy of the invoice. Messrs. Wood and Burrage did not pay plaintiffs for the bricks, which were duly supplied, and plaintiffs in June wrote to defendant informing him of this fact, and demanding payment from him. Defendant replied that he did not remember becoming surety, and asked for a copy of his letter to plaintiffs. This was supplied, and defendant's solicitors afterwards wrote to plaintiffs denying liability on the ground that their client had never been supplied with a copy of the invoice for the goods as required in the letter he sent to plaintiffs on becoming surety; hence the present action. For the defence, it was urged that as in the letter defendants sent to plaintiffs there was a request that a copy of the invoice for the bricks should be sent him, the sending of such copy was one of the conditions on which he became surety. Plaintiffs, it was admitted, never did send him an invoice, and, in fact, he had no knowledge that the goods were not paid for till June, at which time he had settled with Wood and Burrage for their work. Plaintiffs' failure to comply with the terms of his letter had deprived defendant of the opportunity of deducting the amount for which he became surety from the builders' account, and therefore he was not liable. His Honour, in summing up, pointed out that the request for an invoice in the letters sent by defendant to plaintiffs was not made by him a condition on which he became surety. If he had desired to make the sending of the invoice a condition, he could easily have so worded his letter. With regard to the contention that defendant had settled with his builders before he knew that the 7,000 bricks were unpaid for, it was not His Honour's experience of business men to come to such settlements without inquiring first how they stood with regard to money for which they had made themselves liable. He gave judgment for plaintiffs, with costs.

IN RE PLUCKROSE AND OLDREY.—The debtors, who were builders and contractors carrying on business at Westbourne-park and Kensal-road, under the style of William Oldrey and Co., have passed their examination. In November, 1888, a building on which they were engaged collapsed, several workman being killed and others injured. Actions for the recovery of damages were afterwards commenced, and one of them, which was treated as a test action, resulted adversely to the debtors. To these circumstances they attributed their failure. The receiving order was made in July last, and the statement of affairs showed liabilities £12,793, of which £4,702 will probably rank, with a surplus in assets, subject to realisation.

The new police-court for Wandsworth will be built by Messrs. J. Mowlem and Co., their tender having been accepted at £13,574.

The session of the Surveyors' Institution was inaugurated on Monday evening by an address from the President, Mr. Driver.

Our Office Table.

WHILE the members of the Art Congress were protesting in the Council Chamber at Birmingham on Thursday last against the unsightliness of sky signs, the gale was demonstrating the danger of that modern advertising medium, for during the day four of the letters used by Messrs. Harris and Sheldon, shopfitters, for their sky sign in Stafford-street became detached, and fell into the roadway below. The sign was fixed 74ft. above the building, and at a total height of 120ft. from the street. The letters were composed of wood, iron bound; measured 6ft. in height and weighed about 30lb. each. The letters were suspended on a galvanised iron frame, which was rendered extra strong by a large number of guide-ropes of stranded wire. The letters swung in gun-metal bearings, attached to a substantial iron crossbar, and withstood the strain during the earlier part of the morning. When the gale however, was at its height, attention was called to the fact that the initial letter "H" was only suspended by one bearing, and that in consequence it was being blown against the other letters of the word. An employé tried to lash the letter to one of the bars of the framework, but his efforts were only partially successful, and shortly afterwards three of the letters fell. No one was hurt, but one of the letters struck a portion of an old sign-frame, and rebounded on to the roof of some houses that join the manufactory, smashing the tiles. A superintendent of police, fearing that the other letters might come down in a similar fashions, sent for Mr. Till, the borough surveyor, who ordered the street to be barricaded against traffic, and also gave instructions that the sign was to be removed as soon as the weather permitted. We are glad to see that the London County Council will seek power next session to regulate or prohibit the erection in the Metropolis of these disfiguring and threatening signs.

THE death is announced of Mr. James Platt Holden, one of the oldest architects and surveyors in Manchester. Mr. Holden, who was 84 years of age, served his time as a journeyman bricksetter, and emigrated to the United States, where he first worked as journeyman, then as builder, and ultimately as architect and surveyor. Returning to England, he entered into partnership as an architect with his brother Isaac in Manchester from 1838 to 1852, when they separated by mutual consent, each continuing on his own account. Mr. Isaac Holden died six years ago. Mr. James P. Holden held the office of surveyor to the Dean and Chapter for 38 years, and of architect to the cathedral for about 28 years, during which time a considerable portion of the fabric was restored and the tower rebuilt. He retired from practice in 1879.

THE opening meeting of the 137th session of the Society of Arts will be held on Wednesday evening next, when an address will be delivered by the Attorney-General, the Chairman of the Council. Among the papers to be read during the session are "The Chicago Exhibition, 1893," by Mr. James Dredge; "Methods and Processes of the Ordnance Survey," by Col. Sir Charles Wilson; "Electric-Lighting Progress in London," by Mr. F. Bailey; "Sgraffito," by Mr. Heywood Sumner; "Glass-Painting," by Mr. H. Arthur Kennedy; and "Illustrated Journalism," by Mr. Carmichael Thomas. A course of four Cantor lectures on "The Decorative Treatment of Natural Foliage" will be delivered by Mr. Hugh Stannus on the evenings of April 13, 20, and 27, and May 4.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Business Meeting. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "Steam on Common Roads." Paper on "The Vibratory Movements of Locomotives," by J. Milne, F.R.S., and J. McDonald. 8 p.m.
Manchester Architectural Association. "A Three Months' Tour in Belgium and Northern France," by P. E. Barker. 7.30 p.m.
Leeds and Yorkshire Architectural Society. Inaugural Address by the President, W. H. Thorp. 8 p.m.
Glasgow Architectural Association. "Art in Our Homes," by T. Robertson. 8 p.m.

WEDNESDAY.—Society of Arts. Opening Address by the Attorney-General, M.P. 8 p.m.

AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1872.
FRIDAY, NOVEMBER 21, 1890.

EVELOPMENTS OF CONSTRUCTION.

THE leading addresses given before members of the various architectural cieties have all dwelt upon the one subject professional education and examination. r. Leonard Stokes, in his comprehensive ldress, spoke of the importance of providing chitectural teaching, which he thought the ssociation ought to do. Mr. Alfred Water-use, in his able address at the Institute, scussed the same subject in a thorough siness-like manner. Mr. Robert Walker, esident of the Society of Architects, has id before its members some good answers the opponents to Registration. Several ovincial societies have been discussing ndred subjects. The profession have mainly keep pace with what is going on outside eir own domain. The progress and de-lopment of electricity in its numerous plications, the labours and results of perimentalists and scientists with re-ect to materials, the improvements going in structural types and details, are estions that call for immediate attention the part of architects. It is not sufficient w, as it was fifty years ago, to cast an different eye on inventions, and to repose the quieting thought that architecture nnot change if we are only true to the ditions of the past, and that one who serves the canons of Classic proportion d knows how to build need not trouble nself about any branches of science out-e his own sphere. The rules of Vitruvius d the principles of Mediæval art were no ubt considered in those days the only alifications an architect ought to have, in dition to his knowledge of the building des. The two former will remain for all ne, and embody the dogmatic creed of the ; but the capacities of design have been larged to a degree which the architect fifty years ago could never have con-nplated; that is to say, design in the stract has been extended to purposes l materials that were unknown half a tury ago. Not only has a wider application the principles of design taken place, but extension of the trades and crafts of lding. Some trades more than others re been completely revolutionised—such the trades of the founder, smith, and nmonger; those like the mason and cklayer and plasterer have not altered ch. Let us note, for example, the struc-al developments of iron, to what a variety different purposes it is now applied; how it changed building construction in such ngs as roofs and floors. The literature of n construction forms an entirely new nch of the architect's education; yet it is in which he trusts largely to the engineer. rms of trussing columns, girders, roofs, and rs are so numerous and varied that very few e entered further than the threshold of the ject. The chemistry of iron and steel is a y large subject in itself, and can only be stered by experts in its manufacture. at the architect wants to know are the ults of experiments, the effects of mical and mechanical action, and how d wrought-iron and steel may be made to st vibratory shocks or suddenly applied ins. The superiority of old-fashioned to steel for structural uses has been ntained by some; carbon confers greater dness and resistance to steady tensile in, besides adding to the homogeneous lity of the iron. The modes of annealing , the softening and toughening it, have not yet been clearly demonstrated, though it has been proved that bars immersed in boiling water bear a greater bending test than when cooled slowly in the ordinary manner. All these points require a larger and more extended experience. Beyond this kind of information respecting the qualities of iron, the question of protecting it has not been answered satisfactorily. Paints and varnishes, bitumen, electro or chemical deposition of metals, coating with lead, the Bower-Barff process, and other methods are used; but the architect requires to know which is the best. Scientific men tell us that the linoleine or linseed oil is the most valuable part in oil-paint protection; it combines with oxygen and expands, is adhesive and impervious to water, and difficult of solution—all valuable properties for a protecting film; that in varnishes the medium is volatile, and as it evaporates the varnish and coating shrink; but both paint and varnish are subject to the undermining action of iron rust, and even the linoleine film ultimately peels off. A solution of pitch or asphalte makes a very good adhesive film for iron; but it is soluble in water, and the film is gradually removed. The attempts to protect iron by electro-deposition have failed, as the copper peels off, so that they cannot be relied upon. We know the merits of tinning and galvanising. In this one branch of knowledge the architect has yet to learn much by his own experience as to which is the most desirable kind of protection. Chemical research will alone solve the question how to protect large surfaces of iron. For small decorative work, the film of magnetic oxide produced by the Barff plan is of undoubted value.

But it is chiefly outside the domain of building that the revolution in methods and manufacture has most affected architecture. Scientific discoveries have very materially altered the modes of construction. The architect's specification must now take recognition of inventions, and patented materials and fittings; he is required to know every new and improved material, what the ever-extending discoveries have added to his stores. To one or two of these external influences on architectural development we may refer. The application of science to practical wants has been a great cause of development. A few years ago sciences were taught without any reference to things; all was theory, and *applied* science was unknown. The teaching in our science and technical schools has mainly been to give prominence to the application of principles to various arts. Chemistry is now taught in reference to such matters as the composition of rocks, limestones, gas manufacture and lighting, the physical properties of stone and metal; mechanics is no longer merely a collection of theorems and mathematical demonstrations, but is applied to a variety of practical questions bearing on construction, while other branches of physics have practical reference to the construction of the hydraulic engineer—to chimneys, the acoustics of public buildings, the effect of heat on materials, and later branches of physics, like electricity, have been chiefly directed to the requirements of lighting and locomotion.

The result of all this has been that the art of construction has greatly enlarged its boundaries; that it is no longer gauged by such treatises as Nicholson's, but that it has extended beyond bricks and mortar, carpentry and joinery; includes within its domain the scientific arrangement of materials, how they should be combined to produce the desired results; the principles of sanitary building, fireproof arrangements, acoustical principles of building, and the scientific evolution of forms best adapted for every class of structure—in a word, the application of modern science to architecture. Look, for example, how the sciences of sanitation and hygiene have changed the plan and construction of hospitals and infirmaries. The pavilion is an embodiment of a scientific conception in which isolation, sunlight, and air are essential. So, too, science has dictated the form and construction of details, even down to drain-traps and intercepting chambers. The construction of dwellings for the poor, schools, and libraries, have been materially modified during the last quarter of a century. Legislation has enforced rules and regulations respecting the building of workhouses and infirmaries, places for public resort, and theatres. But, apart from sanitary and official regulations, science has been shaping and modifying architectural design; the form of an auditorium is now a matter controlled by acoustics and vision; in the construction of galleries, roofs, and boxes science has taught how they ought to be formed, and in what material to resist fire, and the number of entrances and exits, passages, and staircases have to obey a law almost as certain as that of hydraulics.

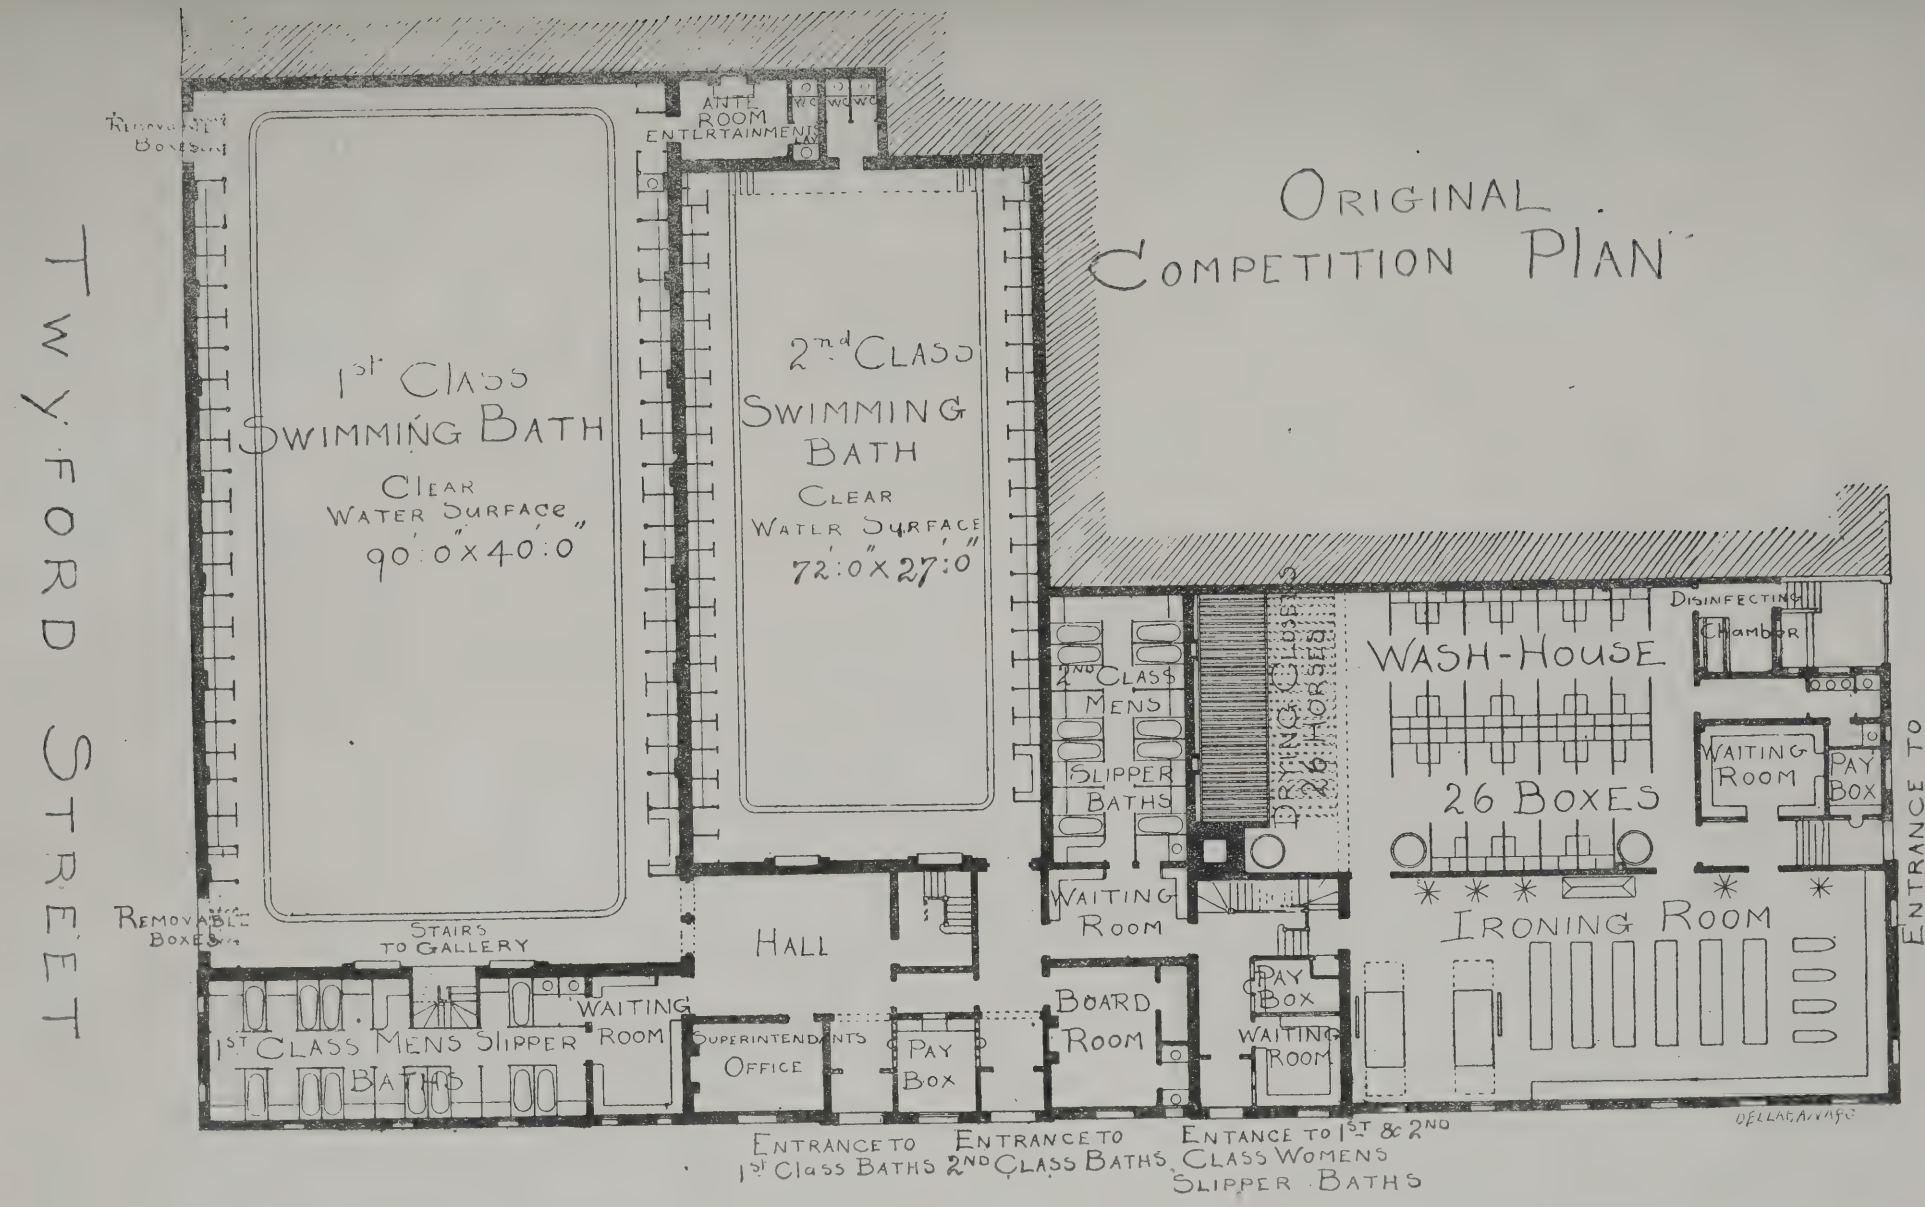
Materials about which little was known a few years ago have considerably affected the design of details. Two of them are worth notice—concrete and asbestos. The former by itself or in connection with iron has materially extended construction in nearly every branch, and has called for a special knowledge of both. Considerable ingenuity has been called for, as the numberless patented and other improvements in floors, roofs, staircases, and details testify. These materials have created quite a new treatment or idea, unlike anything in timber, stone, or other material, and we have yet far from reached the possible combinations of concrete and iron. Another material—a mineral—has of late forced its way into notice by the valuable properties it possesses as a useful boiler and pipe packing, as a valuable fire-resisting material, and as a non-conductor of heat and sound. The fine and tenacious fibres of Italian and Canadian asbestos are now applied to a large variety of uses, not only as a packing for boilers and pipes, but for structural purposes as a non-transmitter of heat and sound, and therefore valuable for partitions, floor and roof construction. This property of asbestos has been utilised in various ways. In New York and elsewhere buildings for cold storage of meat and provisions, with double walls having asbestos as a filling, are erected. As a covering, or as a paint, to render wood uninflammable, the material is extensively used, and Bell's Aquol paint is not only a fire-resisting, non-conducting, impervious paint, but can be used for decorative painting, and is susceptible of very delicate treatment. We believe that, as a covering for woodwork, asbestos has a future which architects must recognise, and we shall probably see before long moulded casings of the material for iron and wood columns, girders, and floors. It possesses great tensile strength, and so can be employed in situations exposed to strains or shocks. It is capable of being used for composition mouldings and decoration, for stove pipes of moulded shape and of great lightness. As it can be woven or applied in moulded forms, it is adaptable to almost any architectural purpose.

For ceilings asbestos seems capable of a very extended application, as it can be moulded to represent panels and painted decoratively. As a woven fabric it is useful for walls. "Slag wool," or silicate cotton, is another material having many of the valuable properties of asbestos as a non-conductor of heat and cold and fire-resisting agent, extremely light, and a valuable deafener of sound. Floors, roofs, and walls are now fitted with slabs of this material. Wire netting and plastering of silicate cotton and plaster are also largely employed in the States; so before long we may anticipate that, by improvement of manufacture, the material will enter more largely than it now

does into the construction of walls, floors, and roofs, and that it may even become a substitute for woodwork to some extent. These are only a few instances of how competing forms, structures, and materials are, by a process of extinction and survival of the fittest, making a new development of architecture possible.

OWNERSHIP OF PARTY-WALLS.

THE frequent inquiries made respecting the ownership of party-walls, and the questions constantly arising between building and adjoining owners, show the great uncertainty existing as to such matters. Professional men are called upon to advise their clients; but very often their experience does not enable them to give any reliable advice; and it must be confessed the law itself is not very explicit as to what a party-wall is, though the four definitions given by Judge Fry are the most scientific, and are now generally accepted. The question that most concerns the owner of house property divided by party-walls from his neighbour is, what rights he has in the case of any proposed alteration, repair, or raising which one of them may desire to make. Generally very few owners know anything about how the houses have been built. When a man purchases or takes a house on lease, one of the last points that occur to him is that of his rights in the party-walls, or whether any express agreement exists or not. Very seldom indeed anything of the kind does exist, though it would be most desirable if purchasers or builders made inquiries on the question of the party-walls, and their legal advisers insisted upon some evidence or conveyance granting or reserving the right. We will suppose the most ordinary case, that which Mr. Justice Fry places first, where the party-wall is the "property in common" of the adjoining owners. In this instance there is nothing to show on whose land or in what manner the wall was built, the only evidence being what lawyers term "evidence of common user." This evidence is important to be adduced. We have very often to give advice to a correspondent under circumstances such as these. A. and B. are adjoining owners, A. thinks of raising his wall or making some alteration to his house, and claims the wall as his private property. He has always considered the wall as his own. B. claims also a right, and denies to A. the right of making any alteration. It is not difficult under these circumstances to prove a "common user," and this evidence is sufficient for a jury to say such a structure is a party-wall. Or, we may imagine B. to pull down his house and rebuild it, using A.'s side wall as a party-wall. A. thereupon brings an action, alleging that the wall is his, and was a distinct wall on his own side. In such a contention evidence is required to prove that A.'s wall was separate and was built on his own land; if this cannot be shown, it is presumed by evidence of common user that the wall is a party-wall and the owners hold the property in common. Such a case was that of "Wiltshire v. Sidford," a precedent generally quoted in legal textbooks. If an adjoining owner pulls down his house, and there is no evidence to prove that it had a distinct side wall, it is difficult for the adjacent owner to claim a sole right to the wall which adjoins him, or to prevent his neighbour from using it to support his structure. Therefore one very necessary point, when an owner contemplates rebuilding of his premises, is for his neighbour to ascertain if there are two walls or only one. An architect or a surveyor will be able to ascertain this in some cases where the party-wall is carried through the roof; but in localities where there are no by-laws in force, and in old houses, the only way to ascertain this is to make a very careful plan on accurate dimensions of the party-wall between the two houses, so that the adjoining owner may know whether he has any right to interfere or raise any objection to the rebuilding. If there are two private walls between the adjoining houses, or, in other words, if the divisional wall is divided longitudinally into two strips or halves (the second variety of party-wall described by Mr. Justice Fry), such a division is not properly a party-wall; but the owner of each half has a right to do as he likes with his own. He can take down his half, even if the wall has no joint and is bonded through; or he can raise it, or build upon or against it as he pleases. But this rule may lead to encroachment. Now, in the raising or rebuilding of old premises, there is a risk of overlooking the exact circumstances. The owner of one house, A., takes down his house, and rebuilds it. B., his neighbour, does not trouble to make inquiries as to the nature of the wall—whether it is a dividing wall, half on A.'s land and half on his own, built originally at the joint expense of their predecessors, or a simple party-wall having common rights. It is possible that A. may take down his half, and utilise the space it stands on up to B's wall, using the said wall as a party-wall for his new premises, and thus adding to the width of his building. B., of course, would have a good ground for complaint at such an encroachment, but may never find out the real facts of the case. We have known old premises rebuilt and increased in width in this way. Imagine a thick wall built jointly at the expense of two owners on each other's land. It is 14in., or two bricks thick. The owner A. on one side makes alterations and cuts off his half of the wall, but does not interfere with the other owner's part, B. The question occurs, Has B. a ground of complaint, or can he bring an action against A. for making use of his wall as a party-wall? Certainly; for such a use of the wall would make it in time the property in common of the adjoining owners. There would be an obvious injustice in such a proceeding. Yet there is nothing to prevent it if B. looks on passively and does not guard his rights by taking a course open to him, and we have ground for believing that very often advantage is taken of thick walls built in this manner. We may suppose a further case. A. wishes to build an additional story, and raises the division wall, or walls, the whole thickness—a very frequent case. He may do this with the very best of intentions, and to prevent damp from coming through the exposed portion of the wall above the roof of his neighbour. But B. is entitled, if he so desires, to pull down the half so raised on his own moiety.



There is a third case in which the party-wall belongs entirely to one of the adjoining owners, say to A.—that is to say, the wall is built on his own land. B., the adjoining owner, has a right acquired of using the wall as a party-wall. In other words, it is subject to an easement, and A. could not pull it down, or deprive B. of its use. But this is not so common as the descriptions previously given. In building houses the party-wall is generally built equally on the land of adjoining owners—it belongs in common to them. Each party is entitled to a full enjoyment of the wall in every part, so that if one owner raises a portion of the wall or fence wall, the other is justified in pulling it down, as no action for trespass can lie against a joint owner. We often hear of an owner rebuilding a party-wall, or raising it for his own convenience, giving much offence and annoyance to his neighbour. The remedy the neighbour has is against the raising, and by law (see case of Cubitt v. Porter) he is justified in pulling the wall down to the original level. Sometimes an owner will take upon himself to pull down a joint wall of this description, and rebuild it higher so as to place a lean-to roof against it, which covers the top of the wall. This, in the case of "Stedman and Smith" was held to be sufficient evidence to justify a jury in finding ouster of the plaintiff, and enable him to sustain an action of trespass a the ousted tenant in common. It is not, therefore, so easy to tamper with a wall of this description, though with the sanction of the adjoining owner, a story can be raised if the wall is sufficient t bear the increased weight. We often see houses raised in this manner. The adjoining neighbour is the sufferer in many cases, and it rests with him to see that the raised wal does not obstruct or injure his property Raising the party-walls of a house may no be so objectionable as adding to the heigh of a garden wall in the manner jus described.

Of course, the rights of owners can b made a subject of agreement, as by a instrument defining those rights. In lease covenants are sometimes inserted, providing that the lessee is to build walls or fence adjoining other plots, which are to be deeme party-walls or fences, and if these proviso are inserted, as they always should be very little dispute or disagreement i likely to arise between the owners o adjoining houses. Any of the kind of party-walls described can be created b express agreement. Thus when an owne claims under a conveyance that the yar walls of his house are to be party-walls, an his neighbour holds under a similar covenant the walls dividing their yard or grounds be long to them as owners in common, an neither of them has any right to raise th wall between them. It may be also o importance to remark that there is n obligation legally on either owner to repai a party-wall of either kind, and if one repai he cannot claim any share of the cost fro his neighbour. The effect of this law certainly detrimental to property, and w see its effects in the very dilapidated stat of party-walls generally. However, the la does not prevent one or the other of th owners from repairing; either of them entitled to do so, and also to rebuild necessary. The statutory rules as to th subject, as those under the Metropolita Building Acts, impose distinct obligations a to party structures to which it is unnecessar to refer.

PUBLIC BATHS AND WASH-HOUSE ST. MARY'S, ISLINGTON.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

WE publish to-day the perspective view a key plans of the design selected by the co missioners in the recent competition. The author Mr. A. Hessell Tiltman, F.R.I.B.A., of 70, To rington-square, London, who supplies the follo ing particulars:—Swimming-baths, respectivel 90ft. by 40ft. and 73ft. by 27ft., together wi 11 first-class men's slipper baths, 10 second-cla men's slipper baths, and 12 first and seco women's private baths (accommodated on t first floor). A public wash-house, having washing-boxes, with a like number of dryin horses; ironing-room, a disinfecting cham (for the destruction of vermin in the clothi only), and the requisite waiting, cloak-roo lavatory, &c. The establishment laundry a the boilers, &c., for heating, are the o portions of the establishment accommodated the basement. It should be stated that pay-box has been omitted, and the e trance to the wash-house placed alongside the women's entrance in the Caledonian-roa in accordance with the suggestion of the assess and as the key plans upon the perspective sh show the original competition ground-plan a the amended plan, it will be seen that no mate alterations have been made. In our correspo ence column of to-day Mr. Tiltman has sa factorily explained that the discrepancy, poin out by two of our correspondents in our issue, as to the width of the second-class ba was a purely clerical one.

THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting for the present session took place on Friday evening, the President, Mr. Leonard Stokes, in the chair. The following new members were elected:—T. D. Adshead, R. G. Rendle, E. White, C. C. Brewer, P. P. Cotton, C. E. Sadler, K. M. Vining, F. Thompson, W. Maclelland, F. H. Willis, F. Taylor, G. Lucas, G. E. Martin, and H. Legg. Mr. C. H. Brodie called attention to the passages in the address of Mr. Waterhouse, as President of the Royal Institute of British Architects, suggesting that a closer relationship might subsist between the Institute and the Association, and asked if the A.A. committee had as yet taken any steps in the matter. The President replied that at present the committee had not given the question any consideration.

THE LAST FOUR A.A. EXCURSIONS.

Under the title of "The Work of the Hon. Amateur Photographer," an amusing and instructive lecturette was delivered by Mr. John L. Robinson, A.R.H.A., of Dublin, as a running commentary upon an exhibition of oxy-hydrogen lantern-slides of some three hundred photographs taken by himself during the summer excursions of the Association in 1887-8-9-90. We have each year* described these views, which depict the buildings visited from the standpoint adopted by an architect skilled in the use of the pencil and quick to select piquant or characteristic "bits," and, as in former years, reproduce to-day as samples four photographs, illustrating the excursion to Oxford and neighbourhood last August. At the outset Mr. Robinson alarmed the members by the innocent remark that he had proposed to bring before them over six hundred slides, which, with a minute or so's comment on each, would occupy, it would be seen by an easy calculation, a good evening. He explained, however, that he had reduced the number of views by more than one-half, and should similarly cut down his comments thereon. Beginning his illustration of the Wilts and Somerset excursion with the west front of Bath Abbey, the lecturer showed the views of Great Chatfield Manor House, the cloisters at Lacock Abbey, Steeple Aston Church, to which a chancel has been added by Mr. Henry Chalton, and a corner of the George Inn at Norton St. Philip—all four reproduced in our issue of Sept. 30, 1887—and proceeded to exhibit the old bridge at Bradford-on-Avon, with its chapel or lock-up, the cruciform church at Edington, and the Hungerford Almshouses at Corsham. The Matlock excursion of 1888 was represented, among other views, by Lichfield Cathedral (reproduced in our pages at the time), many of Haddon Hall, Ashbourne Church, the chimneypieces at Bolsover Castle, Lord Vernon's seat at Sudbury, South Wingfield Manor House, and John Thorpe's *chef d'œuvre*, Wollaton House, near Nottingham—a building which had little merit in the lecturer's eye. The King's Lynn excursion was recalled by a number of fine photographs of the immense Marshland churches; the Custom-house, town-hall, and St. Margaret's Church at Lynn; the 13th-century church at West Walton, with its detached tower; Castle Acre Priory and the Littlebury Tomb at Holbeach (both reproduced in the Building News for Oct. 25, 1889); Oxburgh Hall and Church, Walpole St. Peter's, Tilney All Saints', and the churches at Wiggenhall, the series closing with Ely and Peterborough Cathedrals. Of the excursion of last August, the colleges and churches of Oxford furnished a large proportion of the views. Wadham, New, Magdalen, and St. John's Colleges were fully illustrated, as was the High-street and Iffley Church. Mr. Robinson's photograph of the north aisle and well-proportioned tower and spire of the church of St. Mary the Virgin, which is reproduced at the top left-hand corner of our photo-lithographic sheet, was taken, he explained, four years since, before the twisted pillars of the famous Italian porch, added by Archbishop Laud's chaplain, were concealed as at present by wreaths of Virginian creeper. The church is a noble specimen of Perpendicular work, having been rebuilt in 1488 by Sir Reginald Bray, and is the subject of one of Sir Gilbert Scott's restorations. The noble pinnacled tower and south transept of the chapel of Merton College (forming the upper right-hand view on our photo-lithographic plate) is a portion of a former parish church, dedicated to St. John, the nave of which has been destroyed. The chapel consists of choir, transepts, ante-chancel, and central tower, rebuilt about 1440, and was restored by Blore in 1838, and again by Mr. Butterfield in more recent years. Below, to the left, we give an interior view in Christ Church Cathedral, looking from the Lady or Latin Chapel, the outer of the three north aisles, to the choir. The pulpit in this chapel was illustrated by a drawing by Mr. Thomas MacLaren in our issue of Aug. 22nd last, and the groined vaulting to nave in the following number. The last view we have re-reproduced is the interior of Minster Lovell Church, remarkable on account of the central tower, which on plan is smaller than the space formed at the intersection of the cross, while the chancel is narrower than the nave. Four piers, two entirely detached and two partially engaged, support the tower inside the main walls, with which they are connected by a small, diagonally-set arch, in each case forming four hagioscopes between the nave, transepts, and choir. The central space is groined. The church was restored by Mr. J. L. Pearson, R.A., who added the pulpit and reredos seen in the background of our view. A sketch of the exterior of the church, with plan, was given by us from Mr. Pite's drawings in the Building News for August 15th of this year. The church and Abbot's kitchen at Stanton Harcourt, the quaint little church at Coggs, that at Asthall, and Burford manor-house and church, all illustrated by us in the issue just mentioned, were also shown and described by Mr. Robinson. The great parish church of Witney, the tower and lofty spire of Kidlington, Ewelme school, almshouses, and church, and Water Eaton manor-house were also illustrated. Dorchester Abbey, with its famous Jesse window in the north side of sanctuary, formed the subject of several plates, including one of the leaden font, to which a perfectly plain cylindrical base has been added, from Mr. W. Butterfield's designs, on which—as Mr. Robinson remarked—"not much detail was wasted." (See illustration in our issue of August 15th last, p. 209, and other details of the church in the same number.) The series closed with some views from Evesham and Stratford-on-Avon. In conclusion, Mr. Robinson said these excursions were of great value to the members who took part in them, and he could name several members whose talents in rapidly picking out and sketching the best parts of buildings had been greatly developed during the weeks thus spent in successive years, while their powers of draughtsmanship had been greatly improved at the same time. He trusted that the next excursion would be attended by larger numbers than was that of this year, especially by the younger men.

Mr. H. O. Cresswell proposed a vote of thanks to Mr. Robinson.

Mr. H. L. Florence seconded the motion.

Mr. R. Elsey Smith and Mr. Maurice B. Adams having spoken, the President, in putting the vote, remarked that Mr. Robinson was by no means the "simple showman" that he had claimed to be, but was well qualified to act as their leader, and was a real benefactor to the Association.

Mr. Robinson briefly acknowledged the vote of thanks, which was carried by acclamation.

* See the Building News for September 30, 1887, p. 527 (Wiltshire excursion); for September 28, 1888, p. 422 (Matlock); for September 27, 1889, p. 414 (King's Lynn); and for September 26, 1890, p. 450, current volume (Oxfordshire).

THE SURVEYORS' INSTITUTION.

THE inaugural meeting of the present session of the Surveyors' Institution was delivered on the 10th inst. by Mr. Robert Collier Driver, the President. In his opening remarks he lamented the growing tendency to invasion of what had been thought to be established amenities of property, and instanced as illustrations of the aggressive tendency of the age the Tenancies Rating Bill of last session, which proposed a forced division of the rates between landlord and tenant, and the Agricultural Tenants' Improvements Bill for giving tenants' claims for compensation priority over the claims of mortgagees. As to the Strand Improvement Bill, the President pointed out that its proposals were not so fortunate as to attract the supporting evidence of a single practising surveyor, and in the result the so-called "Betterment" clauses failed to approve themselves to Parliament. The President continued: The Public Health Acts Amendment Act contains some important conditions relating to drain-connections and made-up sites, to which members of this institution practising outside London will do well to give attention. One of the most important Acts, from a surveyor's point of view, is what is known as the General Powers Act of the London County Council, which received the Royal Assent on the 18th of August. The sections of this Act which specially concern us as surveyors are the 27th to 30th, 32nd, 33rd, 35th, and 36th. The council of the institution urged that as regards section 27 the sittings of the tribunal for the approval of plans should be continuous throughout the year, and that the points objected to and the reasons of adverse decisions should be stated; but their representations as regards this point did not commend themselves. As regards section 28, which concerns the fixing of the general line of buildings by the superintending architect of the County Council, it had long been felt to be a grievance that no right of appeal existed against a decision which might prejudicially affect valuable building sites; therefore it speaks well for the London County Council that a tribunal of appeal has been voluntarily conceded. The council of the institution were not of opinion that it was desirable to fix a new limit for the cubical contents of buildings in place of the 216,000ft. prescribed by the Building Act of 1855. Although the limit has now been extended to 450,000c.ft., the concession is guarded in the Act by conditions which remove some of the objections which the council entertained to the proposal. It was felt very strongly that the original proposals of what is now section 33 of the Act might result in serious injury and loss to the owners of corner plots. There was no objection to the proposal that in the laying out of new streets the line of frontage should be continued through until it met the lines of frontage of adjoining streets; but the council felt that where buildings already exist at the corners of streets, the application of such a rule, however desirable, would cause such injury to the owners that it should only be carried out on giving compensation. Words have been introduced specially exempting existing rights from the operation of the clause. The proposal to limit the height of new buildings to 70ft. was modified in committee to 90ft. from the level of the ground to the level of the parapet. This is probably a reasonable compromise, and will save London from a multiplication of the monstrosities which threatened to invade the skies, without putting too much restriction on building owners. The London Streets (Removal of Gates) Act was a measure which can hardly fail to considerably affect large masses of property in the central districts of London. The Act makes provision for compensation to the freeholder for "injuriously affecting," but no compensation is given to those persons to whom quiet is a special object, on the strength of the exclusion of traffic, and who have taken many of the houses in those secluded streets. The Housing of the Working Classes Act is one of the most important measures of the session. It is a consolidating Act, and proposes to deal in a very comprehensive manner with so-called insanitary areas and unhealthy dwellings, both in towns and in the districts of rural sanitary authorities. The rehousing provisions, which formed the principal obstacle to the carrying out of Cross's Acts, are re-enacted; but, on the other hand, the law relating to the assessment of compensation is modified by making evidence receivable that the rental of the property was enhanced by its illegal use, that it is a nuisance within the meaning of the Acts relating to nuisances, or that it is not capable of being made fit for human habitation. The arbitrator is authorised to award compensation under either of the first two categories, on the basis of the lower rental obtainable if the premises were legally and properly used, and, in the case of the third category, on the value of the land and the mere materials of the buildings. No surveyor worthy of the name will find fault with provisions which prevent unscrupulous persons from obtaining compensation on rentals swollen by a disregard of the principles of humanity and common decency. As local authorities are not empowered by the Act to re-cover the cleared sites without the special approval of the confirming body, it is to be hoped that the effect of the diminished compensation paid will be to enable them to offer the sites on such terms as will induce improvement societies to engage in the work of reconstruction. But with every desire

to see many of the acknowledged evils of overcrowding promptly remedied, I have great doubts whether much will be achieved under this ambitious measure. The fatal weakness which underlies all this class of legislation is the assumption that the rates are an inexhaustible fund on which to draw for every purpose that may be in the abstract desirable, whereas, as a matter of fact, the ratepayer is already saddled with an almost intolerable burden. I do not, however, imply that there has been any sensible addition to the burden of local taxation in country districts during recent years, although there has been a steady increase in the total amount of rates levied in England and Wales during the past eight years, representing a rise of 22¾ per cent. between 1880 and 1888. Within the last few weeks we have witnessed a revival of the project for the purchase of the London water companies. I may venture the opinion that London will never again get so good a bargain as was placed within its reach by the ability of our late distinguished colleague, Mr. Edmund James Smith, whose proposals fell a prey to political exigencies, and who may be said to have died a martyr to the cause. The Select Committee of the House of Commons on Town Holdings continues to drag along its path of inquiry. During the present year its investigations have dealt with the proposed special taxation of ground-values, but the evidence bearing upon the subject is not yet complete. Eleven witnesses, however, have been examined, of whom eight are in favour of a change in the law of rating, and we may assume that the case against the present system has now been stated in its strongest form. An examination, however, of the published evidence shows that the representatives of the party of change are by no means in agreement among themselves as to the principle on which the proposed taxation should be based, or of the scheme by which it should be carried into effect. Having alluded to the great development in the Metropolis of the system of collective occupation of dwellings in flats, although, oddly enough, it is now falling into disfavour in Scotland, and having expressed an opinion adverse to the establishment of a National School of Forestry, the President concluded: The session upon which we enter to-night will introduce an epoch most interesting as regards the future of the institution. We stand committed to what is virtually a revolution in our constitution. It was assumed that ten years was sufficient notice to the profession of the impending compulsory examinations, and, speaking generally, we have secured the complete adhesion of the rising generation of surveyors, which has, in large numbers, been making its way into the institution through the examination system applicable to the younger men. During the last seven years we have also been so happy as to draw into our ranks most of the leading surveyors of all classes in England and Wales. Any of our professional brethren, possessing the requisite qualification of five years' practice, not yet on our roll, have still for a few months the option of applying for admission without the ordeal of examination, and their applications will receive all due consideration at our hands. It is to be earnestly hoped that the institution will find itself completely representative of the whole profession before the advent of the important change to which I have alluded.

THE WHITEFIELD CHAPEL COMPETITION.

AT a business meeting of the Royal Institute of British Architects, held on Monday evening, the President, Mr. Waterhouse, R.A., in the chair, Mr. William Woodward was about to bring forward the subject of the Whitefield Chapel Competition, of which he had given due notice and which was placed upon the agenda, when Mr. Lacy W. Ridge rose to order and objected that the matter was a private one, and could not be discussed at the meeting—that it was one which under the by-law must only come before the Council. The President said that he and some members of Council were of the same opinion, and that there had been some error in placing the matter on the agenda. Mr. Charles Barry supported this view, and suggested that it should be put to the meeting to strike out the subject from the agenda of the evening. Mr. William Woodward asked leave to explain, and said that beyond the general interest which he took in seeing fair play in all matters, and in the desire to uphold a high standard of professional practice, he had not the least personal concern directly or indirectly in this Whitefield Chapel Competition—it was with him a question of principle. Has an assessor discretionary power to award the prize to a competitor who has ignored or disregarded the instructions; if so, to what extent? Then how are competitors to guide themselves, and to what extent, in also ignoring the instructions? Further, Mr. Woodward said, he considered that the subject was essentially one to be discussed at that meeting. First, it was one affecting seriously matters of professional practice; secondly, it was a subject connected with competitions, and competitions were officially recognised by the Institute as coming within its cognisance, as shown by the recommendations to competitors, to assessors, and to those about to engage in competitions, printed in the Institute Calendar; and thirdly, that, as he (Mr. Woodward) understood, Professor Roger Smith had been nominated by the Institute as assessor, and surely the members had a voice in the result of that nomination—At this point Mr. Octavius Hansard, filled with enthusiasm, and exhibiting a little timely theatrical display, said that he could stand it no longer—that Mr. Woodward had somehow or other "done it," and that the matter must be stopped. Mr. Woodward urged that it was only due to the meeting and to Professor Roger Smith that he should be allowed to state his case. Professor Roger Smith said that he would be quite willing to attend any committee to which the subject might be referred, and to explain to it and to Mr. Woodward the reasons for his decision. It was then proposed by Mr. Lacy W. Ridge, seconded by Mr. Charles Barry, "That the motion in the agenda relating to the Whitefield Chapel Competition be erased," and upon a show of hands it was found that 23 voted for the resolution and 16 against it. The President then said that, if Mr. Woodward desired it, he could bring the subject before the Council of the Institute. Mr. Woodward replied that, with all due deference to the President, to the members of the Council present, and to the meeting, he absolutely declined to bring the subject before the Council, and thus the matter dropped.

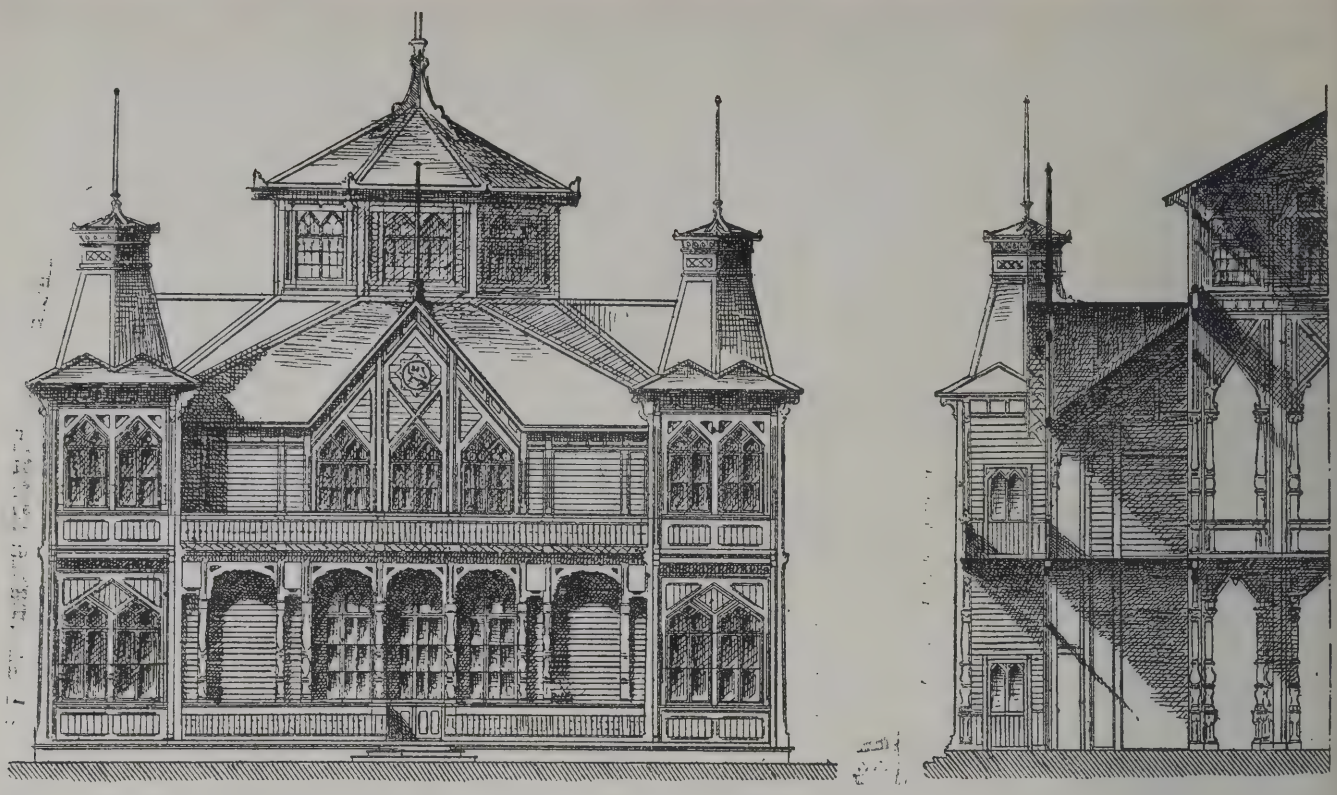
NOTES FROM EDINBURGH.

RUMOURS of great changes are in the air affecting the whole of the valley which lies between the ancient and modern city. The remodelling of the N.B. station and the extension of the limits hitherto assigned the railway for its passage to and from the west; the purchase of the gas works and construction of a goods station; the acquisition by the company of the Waverley Market; suggestions for another North Bridge, in one or two spans, and another at a lower level between the Calton and Jeffrey-street—these, with other and somewhat rival proposals by the Caledonian Railway, to utilise the Waverley Market as a side station on their line to Leith, by tunnel along Princes-street, so making, at least for passenger traffic, a central station at the Waverley, are all, as they have been for some time, still matters of discussion. Ward meetings have shown strong partisan leanings in favour of the respective proposals of the two great rivals. The Architectural Association have also sat upon them. The Town Council have received deputations from the railway managers, and as yet no definite conclusion seems to be arrived at. The Architectural Association recommended neither scheme, but strongly urged on the council to see that the amenity and architecture of this portion of the town were not needlessly sacrificed for the convenience of the railways.

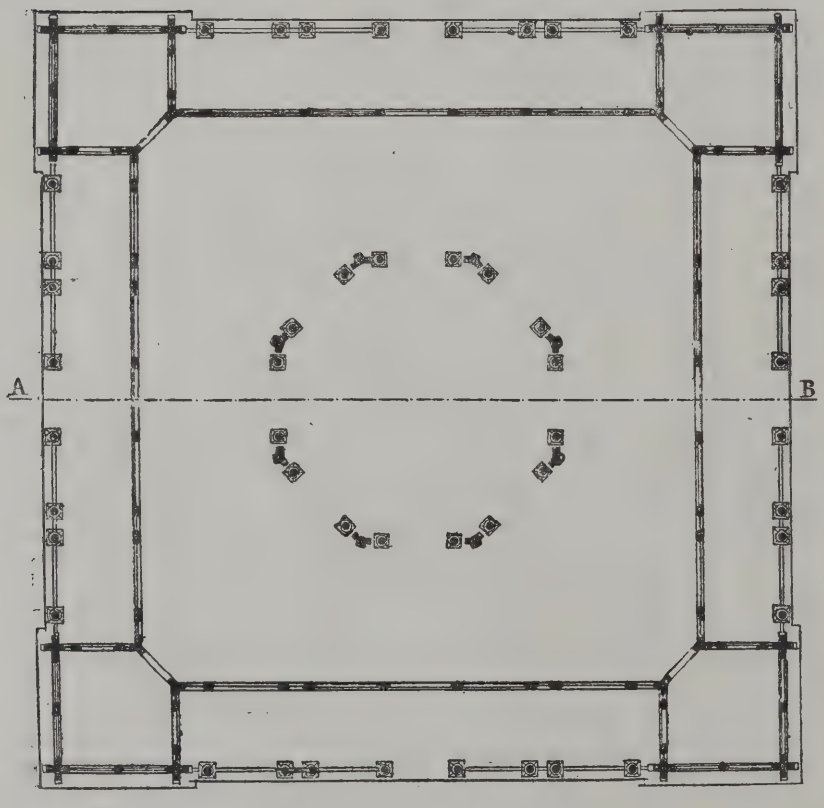
The matters at issue will be finally disposed of by Parliamentary Committee. But some things are quite intelligible to the outside public, whose mouthpiece is, or ought to be, the Town Council. Assuming that the goods and passenger traffic of the N.B.R. must in any case be separated now, owing to the vast increase of traffic occasioned by the opening of the Forth Bridge, it seems an unnecessary requirement to ask a greater breadth of station room than that already occupied. Anyone looking over the North Bridge can see at a glance over the expanse, stretching eastward and westward even beyond the Waverley Bridge, that there is ample space in width and abundant length for the through trains arriving from east and west. The local and suburban trains are of less consequence, as far as regards contiguity to the main platforms, and it seems to most people that a little better arrangement could provide for all the passenger trains in less than the space that will be available when the goods traffic is disposed of further east.

Another principal consideration, equally obvious to all, is the immense advantage to travellers by either railway of immediate connection, or easy access, or of what would be a central station for the passenger traffic, or make up, in some means, for the want of it. At present the whole length of Princes-street has to be traversed, with luggage possibly to book at both stations; delays are occasioned, and generally much inconvenience is felt. The late Sir James Gowan gets credit for suggesting this as an improvement on the Caledonian Railway proposals of last year. It commends itself as really the only practical solution of the difficuty of providing a central station. If carried out, the Caledonian would run by tunnel along Princes-street into the Waverley Market, which is to retain its present exterior, and a flight of steps would lead at once to the Waverley platform. The engineering difficulties for the tunnel are less than by any other route, and consist not so much in getting into the Waverley Market, as in getting out of it to Leith.

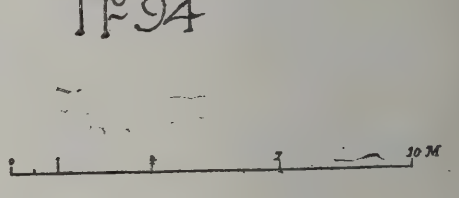
Another, but more roundabout and defective, method of providing for easier access from the one railway to the other has been proposed, by making the tunnel in the line of George-street, and a station in St. James's-square. This, however, would be little better, and not much more suitable, as far as delay or inconvenience of changing are concerned, than the present arrangement is, and will not likely be promoted by the railway.



The alarm about shaking foundations by construction of a tunnel has no grounds to rest upon, in the opinion of competent engineers. The Scotland-street tunnel is not a case in point, as it was made on a steep gradient and through varying strata. It is not possible that a tunnel in or near the centre of the wide thoroughfare of Princes-street could injuriously affect the growth of the trees, as it would, if anything, throw any moisture to the roots, and the piles on which the Royal Institution and Scott Monument are built are far beyond the reach of any disturbance by works so much above their level.



The station for the terminus of the Caledonian Railway, as it is to be erected shortly in the west end of Princes-street, will not add any very important architectural feature to the locality, which for so many years has been something little better than a vacancy. The idea of building a large station hotel having been abandoned, there remains only the passengers' shed and accessories to provide for. In the design, now to be seen in many shop windows, the architectural detail is apparently confined to a somewhat narrow frontage, brought farther forward than formerly. The elevation to Lothian-road is vastly greater in its length, and over it are visible the tops of the carriage and platform sheds. The front has three entrances for cabs and passengers, and is surmounted by a lofty Mansard roof, the Lothian side elevation consisting of a range of semicircular-headed windows between Classical piers, and the usual entablatures. Nothing better probably could be devised without treating the whole as a piece of engineering iron construction, and there will always be the incongruity between the little bit of architecture and the monster sheds—a defect which goes far to mar the appearance of the large Industrial Museum. The arrangements for convenience of the public, however, are excellent.



The City is waking up to the conviction that it has made a bad bargain with the Gas Company, and complaints are general of the bad quality of the gas. The present gasworks, with the chimney, it is to be hoped, will ere long be removed, and a better bargain concluded.

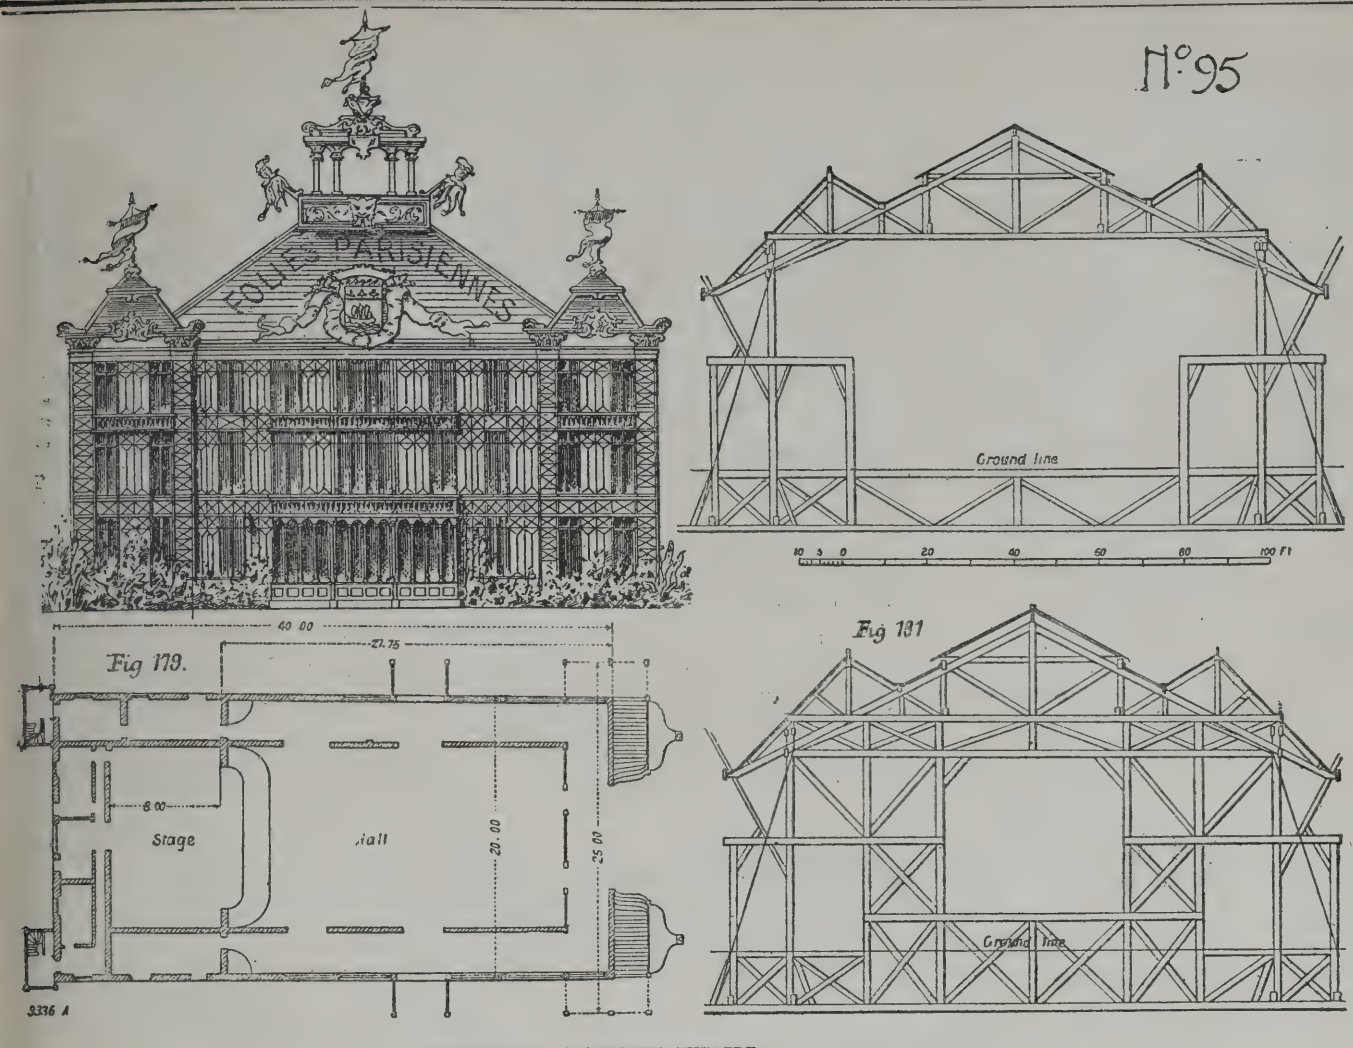
The Chapter House of St. Mary's Cathedral is well advanced, and will be a great addition to the cathedral, in as far as its eastern elevation is concerned. The appearance of this end from the east end of Melville-street has never been much admired. The addition of the Chapter House and other buildings to be erected will make the whole much more cathedral-like.

The foundation-stone of the north-western extension of the General Post Office, occupying the site of the Money Order Office and Queen's Hotel, was laid by the Postmaster-General yesterday (Thursday).

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XIX.

By Banister Fletcher, Jun., A.R.I.B.A.

THE TELEPHONE PAVILION.



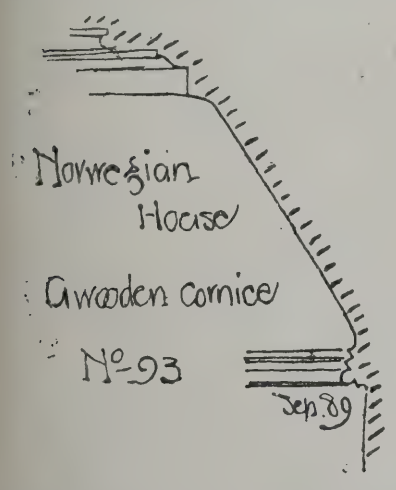
THE architect is M. André. The building is an example of wood-and-iron construction; but in this case the iron is put in as flitches. The uprights and horizontal frames of the building are of wood, joined by iron flitches, and filled in with wood panelling.

A tower is carried up in the centre on wood flitch uprights, and bound together above by circular iron girders. The wires for the telephones are connected to the drum of this tower. The floors are carried by iron joists. Eight of the principal posts to the front are carried up as shown, and utilised to carry the wires.

THE FINLAND PAVILION

Is constructed entirely in wood, square in plan, surrounding an octagonal court 23ft. across, roofed over, and lighted below the eaves. There are four angle turrets, of the form shown, about 10ft. by 10ft. The design is founded on a Scandinavian house. The angle turrets are joined at the ground floor by open galleries. The internal pillars carrying the dome are joined to the angle turret by wooden beams carrying the first floor. In consequence of the snow, glazed roofs are unknown in Finland, and the light, therefore, comes in at the sides below the roof of the dome, which is in zinc. The heads of all windows, it will be noticed, are ⌒ shape. (See above.)

The Norwegian and Swedish pavilions are really reproductions of modern houses there, built entirely in wood and of the Châlet type of construction, of pitch pine, varnished, and were sent over in pieces and put together in Paris. The undersides of the staircases, the ceilings, the



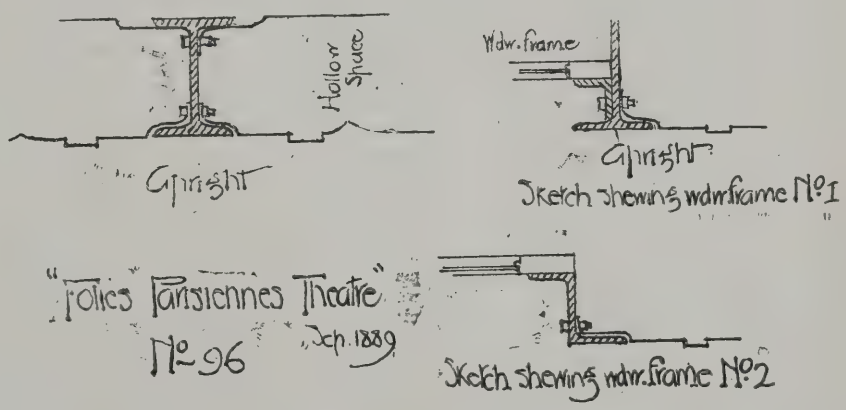
THE FOLIES PARISIENNES THEATRE.

walls and cornices to the rooms are also board (the walls, &c., in match-boarding). The Swedish Exhibition contains a large variety of Swedish doors.

THE DUTCH DIAMOND-CUTTING PAVILION,

by M. Niermans, architect, in the style of the Dutch Renaissance. It is constructed to look

like brickwork and stonework, and the deception is complete until you tap it and hear a hollow sound; it is in pan-de-bois, or wood framing filled in with brickwork and plastered in front. In this case the building is supposed to be constructed in brick and stone, as so many Dutch buildings are, and the colouring of the bricks and the brick joints are performed with such an exactitude to nature that it is with difficulty you can persuade yourself it is not really brickwork and stonework you are looking at. It is a splendid example how the Parisian workmen can use their native material.



The roof is covered with slate. Above the window openings and under the semicircular inclosing arch are beautifully-imitated plaster panels of old delf ware, and over the central entrance are the iron ties one meets so often in Holland. Altogether this pavilion is one of the most satisfactorily-designed and executed in this part of the grounds.

The "Folies Parisiennes" Theatre merits consideration. The architects are Messrs. Daubray, Scipion, and Richard. It covers an area of 151ft. by 65ft., and in consequence of its extreme lightness no foundations are necessary.

The building is divided into two parts, the auditorium and the stage. The auditorium presents no special features, being constructed entirely of pan-de-bois (or brick-nog walling) and plaster face, and with painted canvas in parts.

I should say, before proceeding, that the building rests upon a V-iron framing, simply resting on the ground. The first-floor joists also rest on a frame of the same description.

It is the stage, however, and the parts connected with it which present a new method of construction. It is entirely constructed of iron uprights and horizontal irons, between which are fixed, by means of screws, externally and internally, embossed steel plates, ·04in. thick; the embossing is performed to add strength to the plates, and also for ornamentation. There is thus a hollow wall tending to equalise the temperature within. The roof is also formed with thin steel plates. It is known as the "Danby" system, and is patented. The builders were Messrs. Schryver and Co.

Between the principal framing are the light T-irons, to which the panels are bolted. The ceiling is formed also of steel plates between the iron joists. The angles of the building are strengthened by standards from top to bottom of the building.

At the parish church of Laisters, near Hereford, last week, two stained windows, both the work of Messrs. Ward and Hughes, of Frith-street, London, were unveiled. One occupies the east end of the church, and represents the Resurrection; the other is in the south wall of chancel.

"FOUR FAIR WOMEN": DRAWN BY HENRY HOLIDAY.—SELECTED DESIGN FOR THE NEW PUBLIC BATHS AND WASH-HOUSES, ISLINGTON.—NEW BANKING PREMISES, LLANELLY.—WALLHURST MANOR, COWFOLD, SUSSEX.—PHOTOGRAPHS FROM OXFORDSHIRE, ILLUSTRATING MR. J. L. ROBINSON'S PAPER READ BEFORE THE ARCHITECTURAL ASSOCIATION.—NEW WESLEYAN CHAPEL AND SCHOOLS, BOULOGNE.—A PEARWOOD CABINET.

Our Illustrations.

"FOUR FAIR WOMEN," FROM THE ROYAL ACADEMY EXHIBITION.

These four figures are from Mr. Henry Holiday's series of decorative cartoons shown at Burlington House last summer, in illustration of Tennyson's "Dream of Fair Women." We propose at an early day to give the two remaining characters, Joan of Arc and Fair Rosamond, to a larger scale. Iphigenia, the first figure on our sheet to-day, was the daughter of Agamemnon, King of Argos, who was offered in sacrifice to satisfy Artemis when the Greek fleet was windbound at Aulis. Artemis, being appeased by the submission of the Greek maid, carried her off to Tauris, and substituted a hind on the altar in her place. Jephthah's Daughter comes next, and then Cleopatra, pointing to the bite of the asp. The last figure is that of Helen, whose disastrous beauty led to the Trojan War.

PUBLIC BATHS AND WASH-HOUSES, ST. MARY'S, ISLINGTON.

(For description and sketch plan see pp. 708, 709.)

BANK PREMISES, LLANELLY.

This building is situated in Stepney-street, Llanelly, Carmarthenshire. The stone used for the portion of the building is red Runcorn sandstone. The projecting gable is covered with red tiles, and the bricks are of red Ruabon, the roof being covered with Broseley tiles. The bank is being built by Messrs. Randell and Sons, Llanelly, for The South Wales Union Bank, Limited, the contractors being Messrs. B. Howell and Son, of Llanelly. The whole has been carried out from the designs of Messrs. J. Buckley Wilson, F.R.I.B.A., and Glendinning Moxham, M.S.A., architects, of Swansea and Llanelly.

WALLHURST MANOR, COWFOLD, SUSSEX.

This ancient Sussex Manor-house, situate in the parish of Cowfold, is believed to have been erected in the time of Charles I., on the site of an older building. John de Walhurst made the return for the parish at the Nona Inquisition in 1345. It is mentioned in the will of Roger Agate, 1530, whose brass is in Cowfold Church. The early part of the 18th century it belonged to the Lintotts, and descended with Shermanbury to the Challens, and was subsequently sold to Mr. Wood, whose descendants sold it to the present owner, Mr. Herbert Addington Rigg. The house, which had evidently been a place of some importance, had of late years been used as a farmhouse; it has been restored and added to under the superintendence of Mr. F. Wheeler, F.R.I.B.A., 22, Chancery-lane, W.C., and 50, Carfax, Horsham, Sussex. The exterior is executed in Bolney stone, and the roofs are covered with Sussex stone tiles removed from the old roofs. The barge-boards, &c., are of oak, the casements throughout are of wrought iron, lead glazed. The old work, to be seen from the drawing we illustrate to-day, extends from the ivy-covered chimney to the porch, the latter, with the remainder of the work shown, represents the additions. Internally, the fittings are generally of oak, care having been taken to preserve the detail of the old work. The entrance hall, which faces the north, is open to roof, all the old oak beams having been utilised as far as possible. There is an oak minstrel gallery at one end looking into hall, and a massive carved stone chimney corner. The whole of the works have been executed by Mr. Peters, of Horsham, who has also, under Mr. Wheeler's superintendence and from his designs, erected the lodge, stabling, cottages, and farm buildings on various portions of the estate.

PHOTOGRAPHS FROM OXFORDSHIRE.

See page 710, for Mr. J. L. Robinson's paper, read before the Architectural Association.

WESLEYAN CHAPEL AND RESIDENCE, BOULOGNE.

This building, from the designs of Mr. Charles Bell, F.R.I.B.A., is now in course of erection at this French watering-place, and comprises a minister's house, as well as the usual accommodation for preaching and services attended chiefly by English visitors.

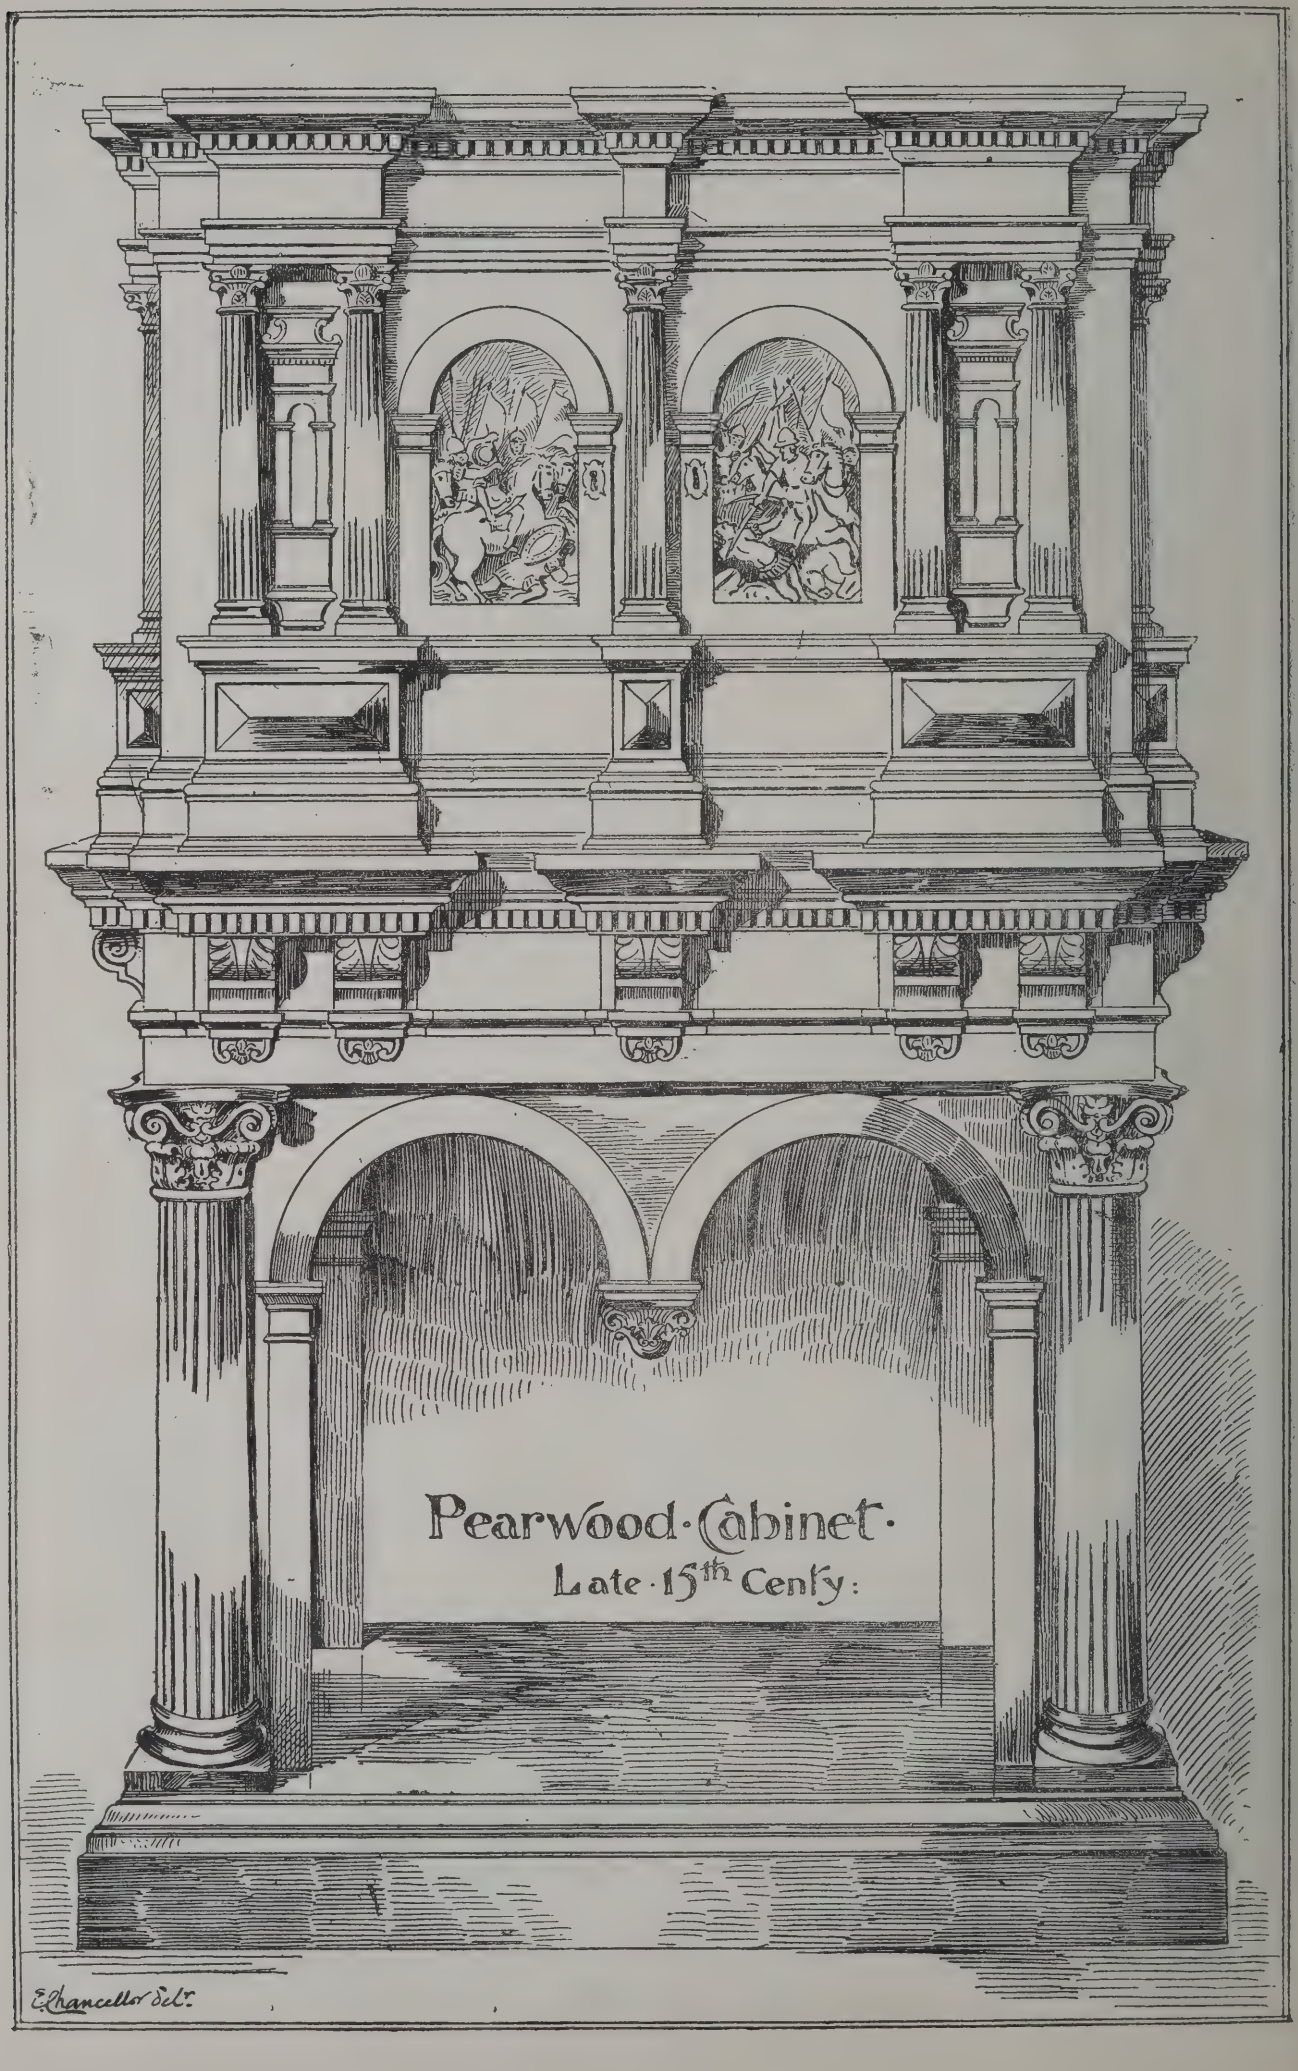
PEARWOOD CABINET.

This cabinet, illustrated on another page, is made principally of pear-tree wood, and is inlaid with marquetry of various coloured woods. It may be attributed to the 15th century, and seems of Flemish origin. The upper part opens by means of two doors, and is supported by arch-work and angle-columns. The original is at the South Kensington Museum.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Master Builders' Association.—The annual meeting of this association was held on the 13th inst., at the office of the secretary (Mr. E. J. Bigwood), Colmore-row, Mr. C. H. Barnsley presiding. The annual report stated that the improvement in the state of trade mentioned in the last report had been fairly maintained. At the commencement of the year the committee had to deal with notices from the bricklayers, carpenters, masons, and plasterers, demanding an advance of wages and other alterations in the working rules. Subsequently letters were received from two societies representing the labourers asking for a code of rules and an advance in wages. The usual counter-notices were sent to the bricklayers, carpenters, masons, and plasterers, and in framing them every effort was made to secure a uniform set of working rules in all branches of the trade. Conciliation meetings were held, and the association offered to the operatives an advance of halfpenny per hour either for one year or three years. This was accepted for three years by the carpenters, plasterers, and stonemasons, but the bricklayers declined to accept less than their full demand of 1d. per hour increase. In April the bricklayers accepted the advance offered—viz., ½d. per hour for one year, as did also the labourers, and no cessation of work occurred. Notices had just been received from the plumbers and from the general labourers asking for an advance of ½d. per hour. An invitation was given to the National Association of Master Builders to hold its next meeting in Birmingham. This would take place in January, 1891. The schedule of daywork prices had been revised and circulated among the members of the association and of the architectural profession. On the motion of the Chairman, seconded by Mr. W. Sapcote, the report was approved. Mr. Barnsley was re-elected as president, on the motion of Messrs. J. J. Moffat (vice-president) and Sapcote. Mr. Moffat was re-elected vice-president, Mr. W. J. Whittall treasurer, Messrs. T. Surman and W. Sapcote auditors, and Mr. Bigwood secretary.

Bradford Architects' and Surveyors' Association.—The following is the syllabus for the present session of the association, which was opened on Tuesday week by an address from the President, Mr. James Ledingham: Nov. 25 (Tuesday next), "Fifty Years of Sanitary Progress," by Mr. T. Preston; Dec. 29th, "Where to Spend a Bank Holiday," by Mr. W. Hoffman Wood; Jan. 6th, 1891, social evening; Jan. 20th, "Strains on Iron Roofs," by Mr. W. H. S. Dawson; Feb. 4th, "House Building," by Mr. William Longley; Feb. 18th, "Natural and Artificial Concrete," by Mr. J. J. Black, and "Gothic Traceries," by Mr. T. E. Taylor; March 4th, "Mouldings," by Mr. W. E. V. Compton; and March 18th, Address by the Vice-President, Mr. J. H. Cox, borough surveyor.



The Edinburgh Association of Science and Art.—The executive committee of this association has made the following among other awards for papers read before the association last session:—Diplomas of merit to Mr. A. D. Mackenzie, the president, for his paper on "The Principles which Govern the Circulation of Water in Pipes"; Mr. T. R. Procter, for his paper on "Cold and Hot Water Supply in connection with Dwelling-Houses"; Professor Gerald Baldwin Brown, for his paper on "The New Town of Edinburgh." A bronze medal has been awarded to Mr. James M'Donald for his paper on "The application of Lead to Building Construction"; and a book prize to Mr. Simon Slater, for his paper on "A New Method of Slapping Openings for Shop Fronts."

Glasgow Architectural Society.—The architectural branch of the Glasgow Philosophical Society commenced the winter session on Monday night, when the president, Mr. James Thomson, F.R.I.B.A., delivered the inaugural address, in the course of which he alluded to the erection of picture galleries and museums in large cities, and while advocating the maintenance of these institutions, he thought that more might be done in the direction of providing people's palaces and recreation halls. As to the housing of the working classes, he considered that a great deal had been done in that direction, but what was now wanted seemed to be better accommodation for the lower orders, at a rental which would not be prohibitory.

Leeds and Yorkshire Architectural Society.—The fifteenth session of this society was opened on Wednesday evening by the presidential address of Mr. W. H. Thorp, F.R.I.B.A. The president briefly traced the history of the society, and alluded to several matters of detail in which improvement might be brought about, and said it was desirable that they should keep abreast with others in the advancement of technical education. He regretted the present condition of the society's sketching club, and urged the members to revive it, and avail themselves of the undoubted advantages which it possessed. He expressed his pleasure that during recent years there had been a wider recognition of native talent in Leeds than previously. In several instances important works had been given to local architects. He hoped that the new post-office would be worthy of its conspicuous position, and take its place among the finest buildings in the town. His opinion of the building, formed upon seeing the sketches in the newspapers, was not altogether satisfactory, and it seemed to him that the architect to the Post Office Department had not risen to the height of the situation. He said he was glad to notice that an attempt was to be made to improve the streets of the town. Subsequently the silver medal and £5 5s. offered by the President for set of measured drawings of the King's Manor, York, was presented to Mr. Walter Peters.

Sheffield Society of Architects and Surveyors.—At the monthly meeting of this society on Tuesday night, Mr. J. R. Wigfull read a paper on "Domestic Sanitary Fittings." The subject was, he observed, one of special importance to Sheffield architects now that the town council were contemplating the system of sewerage disposal by water-carriage. The new by-laws would tend, moreover, to improve sanitary work in the homes of all classes of the community. The various kinds of w.c.-apparatus were noticed, and the different ways of constructing and jointing soil-pipes described; with the systems of ventilation, sewer-disconnection, &c.

Mr. Thomas Collins, the well-known contractor, has been elected Mayor of Tewkesbury.

WESLEYAN CHURCH, SCHOOL & MINISTER'S HOUSE
BOULOGNE SUR MER FRANCE

WAYSIDE NOTES.

IN the reorganisation of the London water supply there would seem to be difficulties over and above those connected with the engineering works and practical matters. It appears that the persons interested in this subject may be broadly arranged in two parties—one dealing with the water supply and its possibilities of improvement both as to quality and quantity, and the other occupied with questions concerning the management of affairs at what time the Metropolitan water and its distribution are handed over to the public. A meeting of members of the latter party was holden on the 18th at 33, New Broad-street, and consisting of the sanitary authorities of Essex whose districts are served by the East London Water Company, representatives of local authorities in Middlesex, Essex, Herts, Surrey, and Kent being also in attendance. Thereat it was resolved that the London County Council be objected to as the governing body, and that opposition should be made to any scheme that does not give the sub-metropolitan districts full representation in proportion to their population.

With the spirit of this resolution we shall entirely concur. The County Council has quite enough work on its hands, and is likely to have in the future, especially if it is going in for pupil-farming. When, as sooner or later it must be, the water supplies of the Metropolis are taken over and placed in the hands of public servants, a huge concern will be created, which will need for its administration a special governing body, with its own staff of engineers, &c. We know that the County Council are anxious to acquire Parliamentary powers to gain this post for themselves; but if things go as they should, Parliament will take care that nothing of the sort happens. Imagine for one moment the vastness of the corporation, were all the water companies supplying Metropolitan and "sub-Metropolitan" districts rolled into one, and we see the folly of the attempt of the Council to gain this extra business for itself and its successors. In my opinion, the water supply should be in the hands of specially-appointed Commissioners with a staff housed with dignity in becoming offices. Words cannot exaggerate the importance of the water supply of a great city; which being so, I observe that a municipal body with already as much, or more, work in its hands than it can get through, is willing to take it on as another odd job.

It has yet to be shown that, taking the water out of the hands of private companies and placing it in the care of public officials, will be of benefit to the community. Every public "department"—hateful word this, somehow—is not managed so admirably as the Post Office. But people think the good is to come, and, properly managed, the benefit should be very considerable, for it is to be hoped that a change in administration will be coincident with a determined attempt to improve the average quality of the water supplied to London citizens and suburban residents. The worst supply should be raised to at least the standard of the New River water, or, ahead of this, the Kent Company's. To do this there seems nothing to fall back upon but the old Roman system of aqueducts, and bringing the water from distant hills, mountains, or table-lands. The Welsh mountains, or Dartmoor, have lately been suggested, and the mere distance of these sources need not dismay. At the same time, it would be unwise, should it be determined to have resource to this method of bringing water from afar, to decide on the source of supply till a scientific commission had inquired fully into the subject. The construction of aqueducts, a hundred miles or so in length, leading to exhaustible supplies, would be a costly blunder, even in these days, when, I take it, erections of ironwork will supersede the masonry devices of antiquity.

Little have I had to do with ordinary competitions, and nothing at all with that peculiar species where the inaugurators announce that a certain sum is to include both the cost of building *and the architect's commission*, the said sum to be in nowise exceeded. It puzzles me to think how the thing is managed. Does the lucky architect agree to go on short commons should the hard-and-fast sum be exceeded? If so, then he is to be pitied, not to say despised. Possibly the majority of competitors go on the principle that it is as well to be on the safe side, and put a design in for a low figure. Some, doubtless, trust to chance to set matters right, and subsequently boast that they have led the town council of Pettytweedleum into paying some 25 per cent. more than they had anticipated. An architect sends in his estimate at £4,590 3s. 10d., exclusive of tower, but including pointing and the glazing of sashes, and the lowest tender comes out £5,840 0s. 11½d., the building committee anticipating that £4,999 would clear building and commission, not to say the bill of extras. I notice—in fact, I am prompted to make these remarks by noticing—one of these *commission-including* competitions. The Huyton-with-Roby Local Board require new offices, and have advertised for plans to be sent in, Jan. 1, 1891. The amount stipulated is £5,000, and this is to include the architect's commission. Why not a little respect for the architect, and say the building is not to exceed £4,760 odd? Advertisements in the "lumping" fashion read so crudely, and do not go to the credit of the parties issuing them.

Much correspondence lately carried on in your columns goes to emphasise the necessity of what I have before said as to the demand for some more careful selection of assessors. It is a great thing to have gained, as architects have done, by reiterating its desirability, the very general appointment of referees or assessors. But the fact that we have thus gained solid ground constitutes no reason why we should not still strive to advance. The next step will be to see that the assessors appointed have special knowledge that will *enable them to appreciate* the studies and labours of competitors in a given branch of design. Of what use is it for a man to be a specialist, or to devote special attention to a branch of design, only to find when he incorporates the ideas and improvements resulting from his studies in a competition plan, that the assessor appointed has not even the knowledge to enable him to appreciate them? This is indeed labour in vain. I hold that an assessor should be specially selected for his task. Hitherto it has been enough that a man should have made something of a name, in a general way, as an architect. We have been so thankful to have an assessor at all, that we have been glad of anyone to come between us and the crude architectural tastes of the cheesemonger and publican. Now we must advance beyond this, the system of assessing must be improved and refined. It is true that the assessors put before the profession are, with the rarest exceptions, architects of known ability; but what the competing architect requires is *special knowledge*, which will be a guarantee that his work will be appreciated to the full.

Competing architects will bear me out as to the need for this reform. It is not, as they will be quite ready to show, in rare instances, that the grievance is legitimate. Every year it would be possible to point out competitions where competitors have had to labour under this disadvantage. How, then, is the reform to be made? Only, so far as I can see, by reiteration of demands. It was a policy of this nature that brought the assessor into general employment. A continuance of agitation will call general attention to the subject, and sooner or later we may hope that competing architects may be spared the galling experience of a kind with which, at the present time, many such are only too familiar.

In the matter of contracts and sub-contracts, thinking men tell us that it is useless in a competitive state of society to patch up both the principles of Socialism—*true Socialism*, that is to say—and not *gutter Socialism*. Viewing matters in this light, which in the main is doubtless the correct one, we shall be of the opinion that socialistic patches on a competitive garment will not wear well. Nevertheless, it is also correct to hold that sweating is a demoralised form of competition, and to be met and combated. Competition, after all, may be, in spite of contrary arguments, an excellent institution; but there is such a thing as riding a good horse to death. Competition there must be till the world wakes up one fine morning all of a socialistic turn of mind. Whether such a day can ever arrive, with human nature as at present constituted, is a question in debate that we will leave for other minds to grapple. Suffice it for us to recognise that in our day competition is, and that men will underbid one another in the struggle for existence. So far, so good, or bad—according to our particular views. These things must needs be till the regeneration of man hoped for by the true Socialist.

The existence of competition, however, is no excuse for its demoralised form—"sweating." It becomes a totally different affair when sharp-witted men—or fiends incarnate—seek, of this very fierceness of competition that the Socialist deplores, to make fortunes out of the straits and difficulties of honest folk. We may lament the principle of competition, and be powerless to alter its laws; but by humane measures and consideration for others—by an exercise of charity—we can see to it that unscrupulous men do not trade on the misfortunes of others. This, I think, is the pith of what can be said for and against contracts and sub-contracts, which must exist under the present order of things. The power to check the demoralisation known as "sweating," however, is in the hands of all principals and managers, whether in public or private life, and it is a moral obligation on such to exert this power to the best of their ability, and thus protect the poor and needy from oppression.

GOTH.

CHIPS.

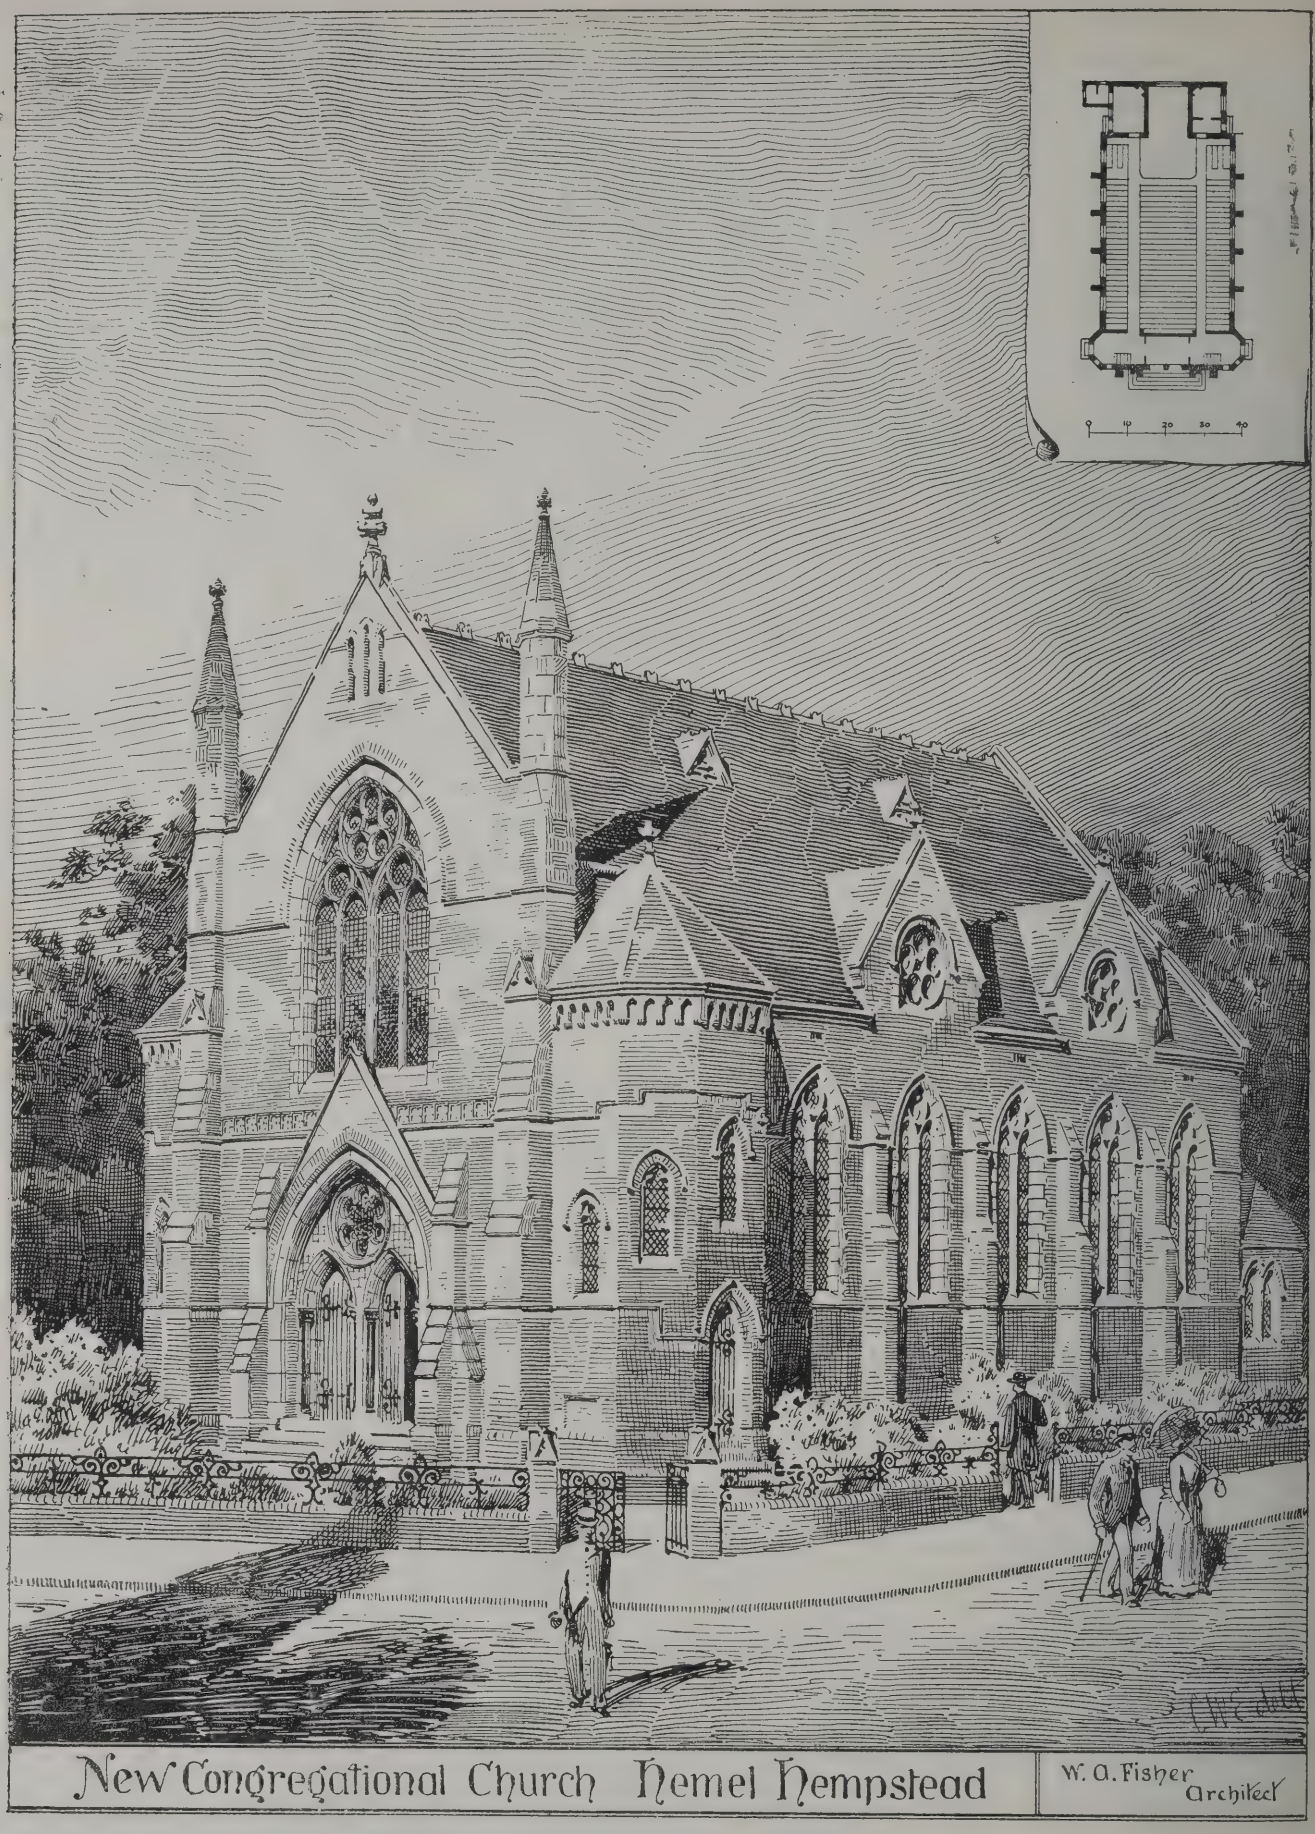
The foundation stone of St. Anne's Memorial Church was laid at Aberdulas, near Neath, Glam., on Thursday in last week. The church will be Late Gothic in style, and will be seated for 300 persons. Mr. E. H. Lingen-Barker, of Hereford, is the architect, and Mr. Walter Dowland, of Abergavenny, is the builder.

The slender spire and tower of Ashbourne Church are about to be restored in accordance with a report by, and under the direction of, Mr. William White, F.S.A., of London. The foundations of the tower are supposed to have been injured by various excavations for vaults.

Buckingham Chapel, Clifton, Bristol, was re-opened last week after restoration. Messrs. Lewis and Edbrook, of Clifton Vale, were the general contractors; Messrs. Edkins and Sons the decorators, and Mr. W. L. Bernard, of Broad-street, Bristol, was the architect.

The heritors of Earlston, N.B., have adopted plans by Messrs. Hardy and Wight, of Edinburgh, for rebuilding the parish school on the present site. The cost is estimated at £2,800, and the number of sittings will be increased from 570 to 720.

A south aisle, which has been added to the parish church of Western-super-Mare, was dedicated last week. It follows the lines of the north aisle, and in the walls are inserted the windows from the south side of nave. 200 additional sittings are provided by the extension, which has cost £1,600. Messrs. Hans Price and Wooler were the architects, and Messrs. Hawkins and Co., of Glastonbury, were the contractors.



The foundation-stone of Sauchieburn House, near Stirling, was laid last week. The new mansion is being erected by Sir James Maitland, Bart., on the site of old Sauchie House, and is in the Scottish Baronial style, having a square, keep-like tower 90ft. high, with corbelled balcony and bartisans round the top. The house will be one of the largest in Stirlingshire, and the internal arrangements will include hydraulic lifts, electric light, &c. A picture-gallery nearly 50ft. long runs across the house from east to west. The architects are Messrs. Sydney Mitchell and Wilson, Edinburgh.

Toft-by-Newton Church, which has been described as "unique in ugliness and decay," is now in course of restoration, the architect being Mr. Hodgson Fowler. The work, which is estimated to cost £750, has been intrusted to Mr. Bell, of Bridlington.

The Kent County Council, at its last meeting, voted a gratuity of £250 to the county surveyor, Mr. F. W. Ruck, of Maidstone, in recognition of his extra services in the maintenance of main roads, and decided to increase his salary to £650, inclusive of an allowance of £130 a year for clerk's office and stationery, and £120 for travelling expenses.

A new Wesleyan chapel was opened at Talskitty, near Redruth, last week. Mr. Sampson Hill was the architect, and Messrs. Odgers and Lee, of Redruth, were the contractors.

The new City Hospitals, Liverpool, which are nearing completion, are being warmed and ventilated throughout by means of Shorland's patent double-fronted Manchester stoves, supplied by Mr. E. H. Shorland, of Manchester.

CONGREGATIONAL CHURCH, HEMEL HEMPSTEAD.

THIS building occupies a prominent corner site in an improving part of the town, and was opened on the 4th inst. The plan consists of an interior, 60ft. by 33ft., with organ-chamber and vestries extending 14ft. in the rear. The height from floor to ceiling-tie is 34ft., and from floor to slope of roof boarding 22ft. A gallery 15ft. wide extends over the entrance lobbies and vestibule, and is approached by two stone staircases leading therefrom. The roof is constructed on the hammer-beam principle, and with Gothic ribs and piecings, and is, with the whole of the wood-work, executed in pitch-pine. A plain but effective design in the Early English style has been adopted. The materials used are Bath stone jambs, mullions, and quoins for the door and window openings, &c., red and grey local bricks for the exterior, and Bearts for the interior, relieved by red strings and quoins. A feature has been made of the entrance doorway, which is in a buttressed and deeply-recessed porch, and the main buttresses terminate with stone pinnacles and carved crockets. The artificial lighting is by three 18-light coronæ. The contract was taken in April last by Mr. E. Horn, of Hemel Hempstead, for £1,893, which sum includes a provision of £250 for seats, heating,

id lighting. Accommodation is provided for 00 persons. The architect is Mr. W. A. Fisher, Marlowes, Hemel Hempstead, who has per-onally superintended the works.

HE LONDON COUNTY COUNCIL AND CONTRACTS.

THE report on the question of contracts prepared by a special committee of the London ounty Council, and of which we gave a ummary last week, p. 702, was presented to that ody on Tuesday. The chief recommendations f the report were: (*a*) That the following words e added to the clause now inserted in the ouncil's contracts with reference to sub-letting r sub-contracting:—"But the Council retains ower to allow the contractor to sub-let such pecial portions of the work as would not be pro-uced or carried out by him in the ordinary ourse of his business." (*b*) That all work of a ontinuous nature, which does not involve a large utlay of plant, &c., such as the cleaning and atching of the bridges and embankments, &c., nder the control of the Council, be executed as ar as possible by men directly employed by the ouncil, without the intervention of a contractor.

Mr. Arthur Arnold, in moving that (*a*) be eferred back to the committee, contended that he effect of the present clause was to restrict ompetition among contractors, and the conse-uence had been that they received no tenders or a great contract issued some time ago, and in nother case only two. Not only was compe-ition restricted, but contractors did not like this air wages declaration, because they might have ix or eight contracts going on in different parts f the country, in reference to which they had no uch obligation. No benefit had accrued to the abourers of London under the clause.

The amendment was seconded by Mr. Howell Williams, and opposed by Mr. Burns, who declared that the result of the restrictive clause hey put in their builders' contracts was to obtain he best brickwork in their sewers, and work which obviated the expenditure of money in epairs such as had cost the School Boord £80,000 n two years, equal to an addition of 2d. to the ates. Colonel R. W. Edis urged that, whilst it was most desirable to pay fair wages, it was absolutely impossible to prevent sub-letting, for in nearly all large contracts there were special kinds of work which must be sub-let. The amendment was lost, and the report of the committee agreed to.

CHIPS.

The Islington Vestry have appointed Mr. T. Ridyard Roscoe (chief outdoor assistant in the surveyor's department, Hammersmith) assistant surveyor for the northern portion of their district.

The official gazette of the Salvation Army says that the new Wellington Hall, recently opened at Islington, is "the brightest, happiest, and best-contrived thing turned out up to date." The architect was Mr. J. Williams Dunford, M.S.A., of 100c, Queen Victoria-street, E.C.

The dissolution of partnership is announced as between A. C. W. Hobman and W. R. Hawkins, trading under the style of A. C. W. Hobman and Co., of Stockholm-road, New Cross, tar-paving manufacturers.

Two groups of statuary, executed in black basalt, have just been found in some ruins at Maheswar, Rungpore. They represent mythological deities with features of a Græco-Buddhist type. The chief peculiarity of the discovery is that on the base of one of the group is an inscription in the Landsa character, a mixed form of Devangiri and Thibetan. The relics have been built, by order of the authorities, into the wall of a Hindoo religious hall.

Mr. Onslow Ford, A.R.A., visited Canterbury on Tuesday to inspect the sites that have been proposed for the Marlowe Memorial. He recommended as the most suitable spot for the memorial the vacant space near Christ Church-gate, where formerly stood the old Butter Market. The memorial, for which only £400 has as yet been subscribed, is to take the form of a drinking-fountain, surmounted by a bronze statue of a Muse, to be surrounded by statuettes representing leading characters from Marlowe's plays.

The City Commissioners of Sewers instructed its sanitary committee, on Tuesday, to consider the best means of abating the smoke nuisance.

A new organ, built by Messrs. Wadsworth and Brother, of Oxford-street, Manchester, has just been placed in St. James's Church, Gatley, and was opened on Sunday.

Building Intelligence.

BIRMINGHAM.—A meeting of the Buildings Sub-committee of the Corporation was held at the council-house on Friday, at which the subject was discussed of the alterations necessary at the town-hall. It has been decided to undertake the redecoration of the hall; but the Estates Committee favour a more simple scheme than that which was carried out upon the occasion of the last redecoration, which was of a very elaborate character, and was designed by the late Mr. J. H. Chamberlain. Among the subjects under consideration are the improvement of the exits and the seating of the hall, the present condition of the roof, the ventilation, and the arrangements necessary for the future illumination of the hall with the electric light. The substitution of slate for the leaden roofing has been suggested; but, happily, the committee think this would not be desirable. The sub-committee held a consultation with Mr. J. A. Cossins, architect, who was instructed to look thoroughly into the matter, and to report to a future meeting. Mr. Arthur H. Macmurdo, the President of one of the sections of the Art Congress held a fortnight since in Birmingham, writes:—"No one can enter the town-hall in its present condition without seeing that every principle of architecture, of form, of colour, and of harmony is violated. The result is disastrous to the architecture, and ineffectual in its æsthetic effect. There are examples of halls in Italy most superb in their decoration which might serve as models for the treatment of this hall, and the money the committee proposes to spend is amply sufficient to produce a very grand result. Though the wall-spaces suitable for frescoes are limited, there is yet room for some fresco painting, space for which might be reserved in the scheme of decoration for monumental works in sculpture and painting, illustrating the great achievements of the town or of its individual citizens. Birmingham, therefore, has at this moment a grand opportunity."

EDINBURGH.—To the Free Church Hall erected last year at the corner of Braid-road and Cluny-drive, a permanent church is to be added. This has been designed by Dr. Rowand Anderson, and consists of nave, 98ft. by 33ft., passage aisles on each side, and also transepts. At the north-west corner is to be a tower 30ft. square and 83ft. high, surmounted by a lead-covered spire 65ft. high. A gallery will extend over the west end of the nave. Adjoining the tower are provided vestry, session room, and ladies' room. The church will accommodate 800. The style of architecture adopted is Third Pointed. There are no lights in the aisles, the church being lighted by large windows in the east and west gables, and by the clerestory windows. The framework of the roof is of steel, covered on the inside with wood, and divided longitudinally into compartments by large moulded ribs, these being subdivided into panels by smaller mouldings. Each compartment of the clerestory has two square-headed traceried windows between the buttresses. The total outlay will be about £8,000.

SMITHFIELD.—The modern roof and walls which which have taken the place of the south transept in the church of St. Bartholomew the Great having become greatly dilapidated, it has been resolved to proceed with this portion of the restoration without further delay. A shallow transept is being erected under Mr. Aston Webb's direction, so as to form a buttress to the great arches of the crossing, and this will also open up some fine Norman work, which has until now been concealed by modern internal alterations. The operations have brought to light a Norman triforium arch on the north side, which hitherto has been filled with a firegrate and flue for the vestry, and on the south side a Transitional Norman arch, which was previously hidden in a plastered wall. Adjoining the arch on the south side, the column of the next bay, much weather-worn, has been discovered in the brickwork; but otherwise the original transept has entirely disappeared. There will be a south door in the shallow transept, also a baptistery. On the north side of the church the removal of the benefactions board has revealed a stone screen, of two arches, Early Decorated in character. In consequence of this transept's being still blocked by the blacksmith's forge, these arches are scarcely visible. The Charity Commissioners propose to grant £8,000 towards the cost of the restoration.

WINDSOR CASTLE.—The renovations that have been carried out at Windsor Castle, under the supervision of Mr. Leonard Collman, of the Lord Chamberlain's department, during the absence of the Queen, have been completed. The works include the restoration of the private chapel at the north-east corner of the Castle, the south corridor between the Queen's dining-room in the Victoria Tower and the gateway facing the Long Walk, and library overlooking the north terrace. The Royal pew in the gallery facing the altar of the private chapel is approached from a narrow ante-chamber panelled in white and adorned with historical portraits by Holbein, and on a bracket stands a small gilt clock, said to have been given to Anne Boleyn by Henry VIII. On the walls of the chapel are hung bronze medallion portraits of the late Deans Wellesley and Stanley, and memorials of the late Hon. C. Grey and Sir Thomas Biddulph. The panelled ceiling of the south corridor has been decorated in cream and gold and wainscoted with sage colour, and the costly furniture, and the ebony and ivory cabinets, filled with Sèvres and other valuable porcelain, have been replaced in their customary positions. The appearance of the Royal library, which had not been touched for years, has been greatly improved, and the electric light has been introduced.

Engineering Notes.

BIRMINGHAM BRANCH OF THE INSTITUTION OF CIVIL ENGINEERS.—A meeting of this branch was held at the Midland Institute on Friday, the president (Mr. E. Pritchard) in the chair. Mr. A. D. Greatorex, of Manchester, read a paper upon "House Drainage." A discussion followed, in which the following gentlemen took part:—Messrs. E. Kenworthy, of Handsworth; E. Newdigate, of Leamington; G. L. Till, of Birmingham; E. R. Marks, S. R. Lowecock, R. Godfrey, of King's Norton; and P. G. Parkman.

COMPETITIONS.

KENSINGTON INFIRMARY.—The selected architect for this big work is Mr. T. W. Aldwinckle, F.R.I.B.A., and the second premium has been awarded to Mr. Delissa Joseph, F.R.I.B.A., both architects practising in the City of London.

OSWESTRY.—For the proposed new municipal buildings twenty-six sets of plans have been sent in, and are now under consideration by Mr. T. M. Lockwood, of Chester, the assessor appointed by the corporation. When his recommendation has been considered, the plans will be exhibited in the old British School at Oswestry.

PRITTLEWELL.—A special meeting of the Prittlewell School Board was held on the 3rd inst. to decide upon the plans received in a selected competition for new schools in the Brewery-road, designs having been submitted by Messrs. Charles Bell (London), E. Wright, Walter J. Wood, and J. Taylor, of Southend-on-Sea. The board unanimously selected the plans of Mr. Walter J. Wood in preference to any others submitted, and instructions were directed to be given to the architect to proceed with the work.

Two errors appear in the account of Mr. E. M. Bruce Vaughan's work given in last week's issue. The Grangetown board school provides 1,050 school places, not 150 as stated, and the Radnor board schools 1,120, and not 150 as printed.

A new lecture hall has been erected at Bristol, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator.

The Paddington Vestry has referred the Housing of the Working Classes Act, 1890, together with the whole question of dwellings of the labouring classes, to the sanitary committee, with instructions to consider specifically the following points—viz., (a) single water supply, cisterns uncovered and in proximity to w.c. or dust-bin; (b) faulty connections with sewers; (c) overcrowding; (d) houses unfit for human habitation; (e) Committee on Housing of the Working Classes as provided by section 81 of the Act of 1890.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. J.—G. and W.—C. R. T.—H. H. and Co.—W. D.—M. R. C.—L. of C.—C. of Y.—R. S. B. and Son. W. L.—P. P. and Co.—N.—G. L. and Co.—E. T.—E M. V.

Correspondence.

ISLINGTON BATHS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—Two writers in your Correspondence columns in your issue of to-day's date draw attention to a discrepancy that has been discovered recently between the *figured width* and the *drawing* of my second-class bath in the original ground plan sent in to the above. This error admits of a simple, and, I think, acceptable, explanation. In the preparation of my plans, I myself pencilled in all notes and figured dimensions upon the drawings; but by some means or other the assistant who generally does the printing to my plans mistook the "2" of the 27ft. for a "3," making the figured width 37ft., instead of what it should have been, 27ft. In the report, however, accompanying my design the dimension was correctly given—viz., 72ft. by 27ft. This fact, taken in conjunction with the extent of the error (10ft. added to a width of 27ft.), precludes the possibility, I think, of any imputation of unfairness on my part in the matter.

It should, I think, be borne in mind, in criticising plans for the building in question, that the site was inadequate for the *proper* accommodation required by the Commissioners, and that therefore some compromise had to be made by the several competitors in attempting to solve this problem. I, myself, did this at the expense of reducing the size of my second-class bath, and I was enabled thereby to properly provide on the *ground floor* every part of the establishment that should be so accommodated. The provision of slipper baths and the public laundry was so moderate in its requirement as to admit of no reduction in this part of the establishment, and I was of opinion that one of the swimming baths might better bear being reduced in size. A clause of the "conditions" issued to the competitors clearly gave them the right of effecting any such compromise of the conditions that might suggest itself to them. This clause was as follows:—

"*It is suggested that the following accommodation should be provided; but the architect is at liberty to vary and adapt his plan and design to what he may consider more suitable accommodation.*"

This explanation is, I think, due to myself, and I hope you will kindly insert it in your next issue.—I am, &c., A. HESSELL TILTMAN.

70, Torrington-square, W.C., Nov. 14.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS AND THE WHITEFIELD CHAPEL COMPETITION.

SIR,—Your prophecy that the Institute would do nothing in connection with the Whitefield Tabernacle competition question has been fulfilled. Mr. Woodward gave notice that he would raise a discussion on Professor Roger Smith's award at the meeting on the 17th inst. The subject for discussion was on the agenda; but the meeting cancelled the agenda by vote. Of course, the agenda had been drawn up by the authority of the council, and in cancelling it the Institute has virtually passed a vote of censure upon its council.

At the meeting referred to there was manifested a good deal of anxiety to stifle debate. The question was raised whether the subject announced in the agenda was a proper one to be discussed. Mr. Woodward contended that it was a professional subject, and was proceeding to define its nature, when he was stopped by the President, Mr. Waterhouse, on the ground that he was discussing the forbidden subject upon its merits. Of course, it would not have been in order to challenge the ruling of the chair; but we may venture to criticise it now. Mr. Woodward said, in effect, that he wanted to discuss the question whether an assessor was justified in doing so-and-so. He was not entering into the case, he was only giving an abstract definition of the nature of the question which he wished to discuss; and he ought not to have been silenced.

I acquit Mr. Waterhouse of any intention to act unfairly, but I fear he was influenced by a spirit too prevalent in the Institute—a spirit which leads men to shrink from discussing questions of importance, merely because they are of a contentious nature.

The conclusion reached at Monday's meeting was well summed up by Mr. Waterhouse. He said that questions affecting the professional conduct of individuals could not be discussed at meetings, but might be brought before the council. But I believe it is an accepted doctrine that societies which hold business meetings should follow the precedent of the House of Commons, as far as possible, in matters of order and procedure; and when the personal conduct of any M.P. is in question it is discussed in the House, not referred to a Cabinet Council. The secret procedure of the Institute finds its parallel only in the committee transactions of a private club.—I am, &c., GEORGE H. BLAGROVE.

29, Montague-place, Russell-square.

SIR,—To the acknowledged ability and usefulness of the BUILDING NEWS must be added the gift of editorial prophecy.

In the BUILDING NEWS of October 31 last, in reply to several competitors who had expressed the desire to have the Whitefield Chapel Competition brought before the Institute, you said:—"But do any of them really believe the Institute will move in the matter? Did it ever do so in any case of the kind?"

On Monday last, when, in accordance with the agenda paper, I was about to open the discussion on this competition, Mr. Lacy W. Ridge rose and succeeded, on some curious point of order, in shifting the discussion, and sending back the clock of the Institute fifteen years.

In this supreme effort to bring back the Institute to its old character of a Mutual Admiration Society, Mr. Ridge, it should be known to the profession at large, was vigorously and ably supported by Mr. Charles Barry and Mr. Octavi Hansard.—I am, &c., WM. WOODWARD.

7, Duke-street, Adelphi, W.C., Nov. 19.

SWEDISH FONTS.

SIR,—I have only just seen the BUILDI NEWS of October 24, with the interesting seri of sketches of Swedish Fonts, by Mr. Taven Perry. I am very glad to learn that ancient for in Sweden are cared for and safely preserved museums. Here in England they often g placed on lawns as receptacles for geraniums, &c or are put to even more ignoble uses.

I have long been interested in the subject fonts, and as I have notes of many Swedi examples, possibly your readers may like a sho account of some of them.

Skredswik, sketched by Mr. Perry, was figur by M. G. Brusewitz in "Elfsyssel" (p. 32 published in 1864. The following is a transl tion of his account of it:

In the tower-room (of Skredswik Church) preserved an ancient baptismal font, but it is bad condition, and of clumsy workmanshi I have been only able to see and make a drawing its one side, which, as I opine, represents the drago at Babylon, and the princess who was to be ca to it. Holmberg, in his time, was only able get at the opposite side, which he describes follows: "The font represents the figure of woman (St. Catherine?) lying on a saw, or oth dentated instrument, upon which two men a pressing her down with pikes (?) (*Handspake*. Above you see a human head, carefully examinin something above the prostrate figure. On th other three sides of the basin are figures of Saint On the base a human figure recumbent and dragon."

Kareby, sketched by Mr. Perry, is also figure by M. Brusewitz in "Elfsyssel," pp. 91, 9 All four sides are given, the runes slightly vary ing from Mr. Perry's version. They are on band in the centre of one side of the bow occupying about a third of its width. Abov them is a floriated scroll, and beneath them a interlaced ribbon ornament. The third side this font is ornamented with a scroll-like patter below which stand two animals facing eac other, with protruding tongues. The fourt side is occupied by a tree-like ornament wit four branches on each side, terminating i trefoils.

Prof. G. Stephens reads the runes thus:—"Rede sa as can owns me nor church—las gare in acre," and conjectures from them that this for was originally made for the church at Nor, nov Norum.

Mr. Brusewitz figures a font from Norun Bohüslan, which is also now in the Nationa Museum at Stockholm. It is similar in shape t the Kareby example; but the ornamentatio differs considerably. On one side is a figure c a man with his arms tied behind his back, wh seems to be standing on a harp; he is surrounde by four serpents, and above these figures i incribed in runes "Sven made" (the font) The second side bears a bold interlaced ribbo pattern, the third a scroll-like pattern, and th fourth two Latin crosses under arcades.

In the South Kensington Museum are full sized casts of three fonts, the originals of whic are now in the National Museum at Stockholm The beauty of their workmanship is very great and well worthy of notice.

The first of these came from Gällstad; it is o square shape, and is inscribed in runes, whic have been read: "Andreas made the bowl." Abov this inscription is a curious ornamentation o five grotesque heads, placed alternately in natural and reversed position. On one side o the bowl are a lamb and flag and an eagle unde arcades, and the whole of the rest of the font i covered with diverse patterns very similar i design to those on the cross at Gosforth, Cum berland. A cast of this cross is placed nea these fonts in the South Kensington Museum, s that it is easy to compare them. (The numbe of the cast of the Gällstad font is 1885, 200.)

The second font of which there is a cast (Soutl Kensington, 1885, 201), is of very differen design; it is of circular form, and stands on circular base, ornamented with large grotesqu heads of massive appearance; the bowl has graceful pattern of foliage-like ornament carved on it. The third font (South Kensington Museum 1885, 202) is also of circular form; the bowl i ornamented with animals standing under arcades they are placed face to face, and have long pro truding tongues. The lower part of the bow

and the stem is covered with elaborate patterns of scrolls and foliage combined.

In "Elfsyssel," p. 192, Mr. Brusewitz figures a very beautiful font at Björland; the bowl has in the centre a crowned head, from the mouth of which proceeds a scroll-like pattern. It has a peculiarity which Mr. Brusewitz thus describes:—

"In Björland's church there is an ancient stone font 39in. in height, 27in. in diameter above, which is distinguished by an unusual feature, and one which I have hitherto met with only in the font of the neighbouring Säfve—viz., a little vessel placed in the base loosely, so that it can be taken out. As regards the purpose of this vessel, it might possibly have been intended to hold the consecrated water, for though, of course, the baptismal water was consecrated, we find in certain ancient laws a prohibition against 'taking from the font'—*i.e.*, dipping the finger-tips into it, as in other consecrated water. It is also possible that it contained the salt which it was an old custom to put into the child's mouth; but in this case I do not understand why it should have a hole in the bottom."

In a paper entitled "Bohuslänska Dopfuntor," published in 1878, Mr. Brusewitz has, at p. 14, figured the Säfve example. It has a circular bowl ornamented with a bold curving pattern. It stands on a round stem, at the base of which is a small basin-like vessel, which, however, does not appear to be movable; this basin is ornamented with a leaf-like pattern. On page 13 of the same paper is a sketch of a font at the church of Uklums of very similar shape to the one at Säfve, but it has no secondary basin. On page 11 is figured a fragment of the round bowl of a font at Valla; this is ornamented with a very bold design of four interlaced ribbons.

In 1887 Professor Dr. L. F. A. Wimmer published a small folio on the curious font in the Island of Bornholm, and figured it and five other Scandinavian fonts—viz., those of Bjersjo, Soder, Viddinge, Sallerup, Brendum, and Skyum, all of them inscribed with runes. I suppose, however, the earliest-known Swedish font is that from Ottrava, Sweden, of which Professor G. Stevens published an account in 1878, entitled "Thunor the Thunderer, carved on a Scandinavian font of about the year 1000."

Two fonts of Scandinavian origin exist in England—one is at Bridekirk, Cumberland: it has been figured many times in archæological books, and a full-sized cast of it is in the South Kensington Museum, close by the Swedish casts. It is inscribed in runes, which have been read thus:—

"Richard he me i-wrought,
And to this mirth (beauty)
Gern me brought."

In the lower corner beneath the inscription is the figure of the sculptor (Richard?), with mallet in hand, and I would observe that the figure on the Ottrava font, which Professor Stevens considers to be Thunor, with mallet in hand, bears so strong a resemblance to this figure on the Bridekirk font, that I think it may also possibly be meant for the maker of the font.

The second English example was found at Bingley, in Yorkshire. It is inscribed with runes which have been read in several ways, and it is doubtful if it has been the font or the socket of a cross. It has a hole or drain, and Professor Stephens reads one of the words as dip-stone, which would seem an equivalent to the Swedish *dop funt*.

In "Runic Monuments," by Professor G. Stephens, Vol. II. pp. 654-5, is figured and described a curiously inscribed Scandinavian font from Barse, Sealand, Denmark, the bowl is of circular shape and "is divided by simple pillars into sections 10in. broad, all but one which is 14in. Three of these contain the inscriptions, the others have leaf ornaments" (geometrical designs).

"All the work is a rough risting on the stone, and is not in relief."

"The letters are twofold—first two lines of Roman Gothic, and then the Scandinavian Futhork, 19 runes.

"'+ BONDO FRISO ME FECIT ESGERVS ROT HOC (or perhaps) HOCCE FECIT FIERI.

"'Bondo the Friser (Frislander) me made.

"'Esger the Red this let make.'"

This is followed by a row of runes, the "Runic Scandinavian staverow." The forms of some of these runes are unusual.—I am, &c.,

EMMA SWANN.

Walton Manor, Oxford, Nov. 10.

WOOD PAVING IN LONDON.

SIR,—Anent your notice a few weeks back of Jarrah-wood paving in Oakley-street, Lambeth, it may be of interest to note that the New Cut at the present moment is being paved with wood, all as far as the back entrance to the Lambeth Baths being done with Jarrah wood, and from there to the Westminster Bridge-road laid in ordinary yellow deal.

As the foundation is exactly the same, this should be an excellent test. There are no turnings at the point where the different woods join, so it is obvious that exactly the same traffic must pass over the one as the other.

Another very good experiment in Jarrah wood is going on now in the same parish, for while Westminster Bridge is paved with creosoted deal, that portion of Westminster Bridge-road from the foot of the bridge to York-road is laid with Jarrah wood. The Stangate and Belvedere-road take a portion of the traffic from the bridge; yet Westminster Bridge-road is much narrower, and the proportion of traffic to width of road will be found to be about the same in both cases, slightly heavier on the Westminster Bridge-road—that is, on the Jarrah wood. Both these pavings were laid in May last year (1889), at exactly the same time.—I am, &c.,

Norwood, Nov. 18. C. ANSELL, Jun.

CHIPS.

A gymnasium added to the Y.M.C.A. building in Ogle-road, Southampton, was opened on the 13th inst. It has been built by Mr. A. Doggrell, from plans by Mr. W. H. Mitchell, of Southampton, from whose designs the main building was erected five years ago.

The opening meeting of the session of the Royal Meteorological Society was held at 25, Great George-street, Westminster, on Wednesday evening, when the president, Mr. Baldwin Latham, delivered an address on "The Relation of Ground Water to Disease."

Eldon Wesleyan Chapel, Woodhouse-lane, Leeds, was opened last week. The chief contractors were Messrs. Myers, and the architect was Mr. G. F. Danby, of Leeds. The building is in the Gothic style, and will eventually have a tower and spire. The interior has been entirely fitted up in pitch-pine. There is a gallery at one end, and it is proposed to have side galleries at some future time. The chapel has cost up to the present time about £8,000.

A Local Government Board inspector has reported to the Birkenhead health sub-committee that, in his opinion, the present Infectious Diseases Hospital is not adequate for the requirements of a town of the size of Birkenhead. The sub-committee have recommended to the town council the erection of a new hospital.

New National (R.C.) Schools situated on the Green, at Cashel, were opened on Tuesday week. The contractor was Mr. Patrick O'Brien, of Cashel.

The new transept which has been added to Iwerne Minster as a memorial to the late Lord Wolverton was consecrated last week by the Bishop of Salisbury. Messrs. Bayne and Co., of Westminster, were the builders.

During a discussion by the Croydon Town Council on the epidemic of diphtheria, now prevalent in that borough, Dr. Alfred Carpenter, who is a member of the council, attributed the outbreak to leakage from faulty house-drains, which have lost their accuracy of delivery through being made upon the mere ground without a bed or coating of concrete, and in too close proximity to trees. Until these are remedied, he predicted that similar outbreaks will occur.

Professor Ewing, of University College, Dundee, has been elected to the professorship of Mechanism and Applied Mechanics, vacant by the resignation of Mr. James Stuart, M.P. The value of the professorship is £700 per annum.

A number of labourers' cottages have just been built in Dundalk and Ardee Unions, from plans by Mr. Cahill, C.E. The buildings cost about £150 each, and include a kitchen and two bedrooms. The members of the two boards of guardians by whom the works have been carried out, formally inspected the cottages on Wednesday week.

An inquiry was held on Tuesday at St. Mary's Hall, Coventry, before Colonel Walter Mardon Ducat, R.E., one of the inspectors under the Local Government Board, into an application of the City Council to borrow £1,560 for the purchase of Mr. Dalman's property for the extension of the municipal buildings.

Mr. Glenister, head of a well-known firm of chairmakers at Wycombe, has been re-elected mayor of that borough.

Intercommunication.

QUESTIONS.

[10438.]—**Deep Well Pump.**—Could Mr. W. P. Buchan or any of your numerous readers inform me as to best pump for a well 70ft. deep, with a side draught at surface of 15ft., the mode of construction, and the approximate cost?—COUNTRYMAN.

[10439.]—**The Painting of Asphalte.**—I am the possessor of an asphalte tennis-court in the open. When first laid, seven or eight years ago, it was of the usual dark slate colour, very pleasant to play upon, but got rapidly very much lighter by the bleaching action of the elements. This interfered so much with the sight of the balls, which soon become soiled and grey in London, that I cast about for some means of restoring the original colour, but without success. None of the asphalte companies could help me at all; but at last a chemical friend suggested a solution of pitch in naphtha. I have tried this, but it will not do. It is very difficult to put on evenly, because the naphtha evaporates so rapidly; and it thus makes a streaky job, and soon wears off. I dare say others have the same trouble, and if anyone can tell me of a suitable painting material, I shall gladly see it made public. The asphalte people say it must not contain either oil or turpentine, as these would injure the asphalte. My court is laid with Val de Travers mastic. The paint must not be shiny, but flat; it must not make the surface slippery, and it ought to last in good condition for several years. I think the best colour would be a darkish neutral tint; or the colour of asphalte when just wet all over. I am having a number of 4in. squares of asphalte made, on which I can try the material in case any makers send me samples of what they recommend. I shall be much obliged for information.—J. M., 5, Victoria-street, Westminster.

[10440.]—**Sanitary Institute.**—I am anxious to pass exam. as assoc. of above. Would some kind reader give me a little information about same—1st, how to proceed; 2nd, what books required; 3rd, is it very difficult?—E. O.

[10441.]—**A.S.I.**—Can any reader say what books are best to study in order to qualify for Associate of Sanitary Institute.—QUARO.

[10442.]—**Public Health Act.**—Under section 158 of the Public Health Act, urban authorities are to give notice of approval or disapproval of plans within a month. After the expiration of 28 days, can they disapprove of the plans and summon the builder if he carries out the deposited plans? I believe a case dealing with this point was tried some years ago, but cannot trace it. Can any reader enlighten me?—J. T. M.

[10443.]—**Down-draught to Chimneys.**—Can any reader give me advice how to cure the following? Two projecting fireplaces with stacks well above roofs, built on the outside walls of a house, smoke very much, caused no doubt by down-draught, as to make the rooms almost uninhabitable. The back of fireplaces and flues up to roof are built of 9in. brickwork, and the flues are curved. I have tried all sorts of experiments, such as cowls, high pots, hoods over flues, air gratings, &c., but all seem of no avail. I am now thinking of cementing the projections and shafts. Any advice how to cure the defect will be most acceptable.—ENQUIRER.

[10444.]—**Decoration.**—Will some reader kindly give me some ideas for colouring and painting of rooms, say, for a dining-room, 14 by 17, and drawing-room, 16 by 13—what colours to put to harmonise on walls and ceilings with colours for woodwork?—E. B.

[10445.]—**Brickmaking.**—Would a correspondent kindly inform me which is the best method of constructing drying shed, also what super. area of flooring can be heated by the exhaust steam from an 8H.P. steam-engine?—ENQUIRER.

[10446.]—**Fireproof Flooring.** — Will someone, who is thoroughly acquainted with the construction of these floors, tell me if in constructing a floor with rolled joists at 15in. or 18in. centres and a thickness of 7in. of concrete, assuming the bearing to be 20ft., whether there is any recognised percentage to allow for weight carried by concrete; or if the weight the floor has to carry should be calculated upon the iron joists only? I have ascertained that it is not usual to consider the concrete as a weight upon the joists, because it is assumed that it carries its own weight; but I cannot find anyone who can tell me how much it adds to the strength of the floor. Also, I should like to know if 4½in. by 3in. iron joists are sufficient to carry a load of 10cwt. per yard super.?—L. J. H.

REPLIES.

[10430.]—**Surveying.**—I have never heard of any book restricted to town surveying. The best and most modern work on surveying with which I am acquainted is Usill's "Practical Surveying" (Crosby Lockwood), which is, as its title implies, a really practical book, and contains excellent instructions for town surveying and the computation of areas. It is easily understood, and not expensive.—NEVILLE DAVIS.

[10430 and 10434.]—**Surveying.**—The best book on this subject is undoubtedly Usill's "Practical Surveying," published by Spon.—G. A. T. MIDDLETON.

[10433.]—**Wet Rot.**—In all cases where damp soils are covered over with joists and boarded, the soil should be first levelled and well rammed, then covered with, say, 2in. in depth of concrete, and then apply ½in. thickness of Claridge's patent asphalte. This would be found a "perfect cure" to "Z.'s" complaint.—S.

[10433.]—**Wet Rot.**—It is difficult to advise you, considering the meagre information you give. Are you sure the timber was sound and free from sap when put in? I need hardly say that all the walls (including sleeper walls) must have proper damp-proof courses below the level of joists, and the surface of ground between them should be covered with a layer of Portland cement concrete. If the ground level outside the building is above the damp-proof course under joists, the outer face of

external walls should be protected in some way from the damp soil in contact with it. The ends of joists are better not built tight into the external walls, but should be kept from contact with the mortar and damp brickwork, and exposed to the air, either by resting on oversailing courses or otherwise.—N. D.

[10434.]—**Surveying.**—See answer to 10430. On page 167 of Usill, instructions—which should be quite full enough for any student of ordinary intelligence—are given on the question of details. Do not confine your attention to the chapter on Town Surveying, but read up the whole subject, as the most important points are common to both field and town surveying; and remember that proficiency is not gained without much outdoor practice, and the exercise of a considerable amount of judgment.—N. D.

WATER SUPPLY AND SANITARY MATTERS.

The Condition of the Thames.—Mr. Alexander R. Binnie, the chief engineer to the London County Council, and Mr. W. J. Dibdin, the chemist, having inspected the river Thames, have issued a report to the Council. The engineer and chemist stated that above bridge the quality of the water is good. Downwards, on a falling tide, below bridge and as far as Limehouse, the water was as good as they had often seen it in the Thames above Teddington. Downwards from Greenwich it became discoloured in places in rounding bends of the river, although the main stream was fairly clean. In the neighbourhood of the Woolwich Ferry it was also discoloured, and considerably so off the Barking and Crossness outfalls. Returning on a rising tide, they were able to trace the discoloration almost as far as the Tower, but in no case was any smell, except slight effluvia near Woolwich, perceptible. The banks and foreshore of the river were, comparatively speaking, remarkably clean and free from muddy deposit. They are not inclined to attribute the discoloration which they did observe to any sewage matter recently poured into the Thames, but rather to the accumulation in its bed of deposits of former years from various sources, as well as those due to the main drainage works. Among the former are the discharge from the river Lea and the various docks on the Thames. On the whole, they consider the river to be improved by the works carried out during the current year, and which was to be expected, as some 366,300 tons of sludge have been sent to sea since the 1st of January; and when the Crossness works are brought into action, a still further improvement will be the result.

CHIPS.

Mr. Rowand Anderson, LL.D., architect, of Edinburgh, has received from the jury of the Munich Annual Exhibition a gold medal for his design for the National Portrait Gallery and Museum of Antiquities, Edinburgh. On the obverse side of the medal is a seated figure of Minerva plucking an olive branch, the background being the façade of a Greek temple. On the reverse side is a wreath of olive with a small panel containing the name Rowand Anderson.

The Court of Queen's Bench decided on Friday the application for a mandamus to compel the Bishop of London to hear a representation of the parishioners concerning the reredos at St. Paul's. Mr. Justice Stephen thought the parties were entitled to a mandamus. Mr. Justice Hawkins thought they were not, and as he was senior judge his decision was final, and he ordered the rule to be discharged, without costs.

A new mission church at Pease's West, in the Crook parish, was formally opened on Wednesday week by Dr. Westcott, Bishop of Durham. The building is a stone structure, will accommodate 250 persons, and cost about £600.

The section of the new extension of the Midland Railway system between Saxby and Bourn, Lincolnshire, is now in active progress. Two shafts have been sunk in connection with the tunnelling of Stamford Hill. Several miles of the line are already constructed near Wymondham, and at Bytham active progress is being made. Messrs. Mousley, of Manchester, are the contractors for this section.

The funeral of Mr. William Ford, J.P., of the Holyrood Glassworks, Edinburgh, took place on Friday, the interment being made in the graveyard of Canongate Parish Church. The funeral was largely attended.

A meeting of the district council of the National Registration of Plumbers was held in the University College lecture-hall, Cardiff, on Saturday, Mr. E. Seward in the chair. Lord Aberdare attended and distributed the certificates awarded by the Council during the year to those plumbers residing in the district who had successfully passed the annual examination. Lord Aberdare delivered an address on the value of technical instruction in all professions. Mr. E. Smith, of the Worshipful Company of Plumbers, London, spoke on the advantages arising from a federation of competent workmen.

LEGAL INTELLIGENCE.

Ex Parte Lodge—in the Matter of the Kirkheaton Local Board.—This action, heard in the Queen's Bench Division on Monday, before Mr. Justice Stephen and Mr. Justice Vaughan, raised for the first time the question whether an inhabitant ratepayer, owner, and occupier of a residence within the district of a Local Board can have *mandamus* against the Board to compel them to exercise their powers under the Public Health Act, 1875, for the purpose of providing proper sewerage and drainage. Though these powers have been in force in one form or another for half a century, no case has arisen in which a *mandamus* has been allowed in such a case; but as there was a *dictum* of Lord Justice James to the effect that this was the proper remedy if a public board refused to exercise their powers, the Court, after some hesitation, granted a rule *nisi* to have the question argued and determined, and if the *mandamus* is granted it will be a most important precedent. Mr. Lodge, the applicant, is owner and occupier of a residential property within the district of the Kirkheaton Local Board, near Huddersfield, and a ratepayer; the site is on a rising ground. A natural stream runs through the property down into a stream bounding the district. The affidavit on applicant's part showed that sewage was poured into the stream which runs through the applicant's property, and so produced a pollution of the stream injurious to health. Applications had been made to the Local Board to remedy the grievance, but they declined.—Mr. Cook, Q.C., now moved for a rule *nisi* for a *mandamus* to the Board to keep in repair all sewers belonging to them, and cause to be made such sewers as may be necessary for the effectual draining of the district. In "Glossop v. the Heston Local Board" it was said by Lord Justice James that in such a case where a public board refused to exercise their statutory powers a *mandamus* was the proper remedy. He cited also "The Attorney-General v. Dorking."—A rule *nisi* was granted.

Brasier v. Shepart.—This was an action tried before Judge Molyneau, at the Redhill County Court, on November 12, to recover the sum of £16, being extras claimed upon building a house for the defendant by contract. It would appear that the amount claimed consisted for the most part of sums disallowed by the architect, Mr. Frederick Rogers, of Bromley, being in his opinion not justly due to the plaintiff; these amounts were therefore specially mentioned in the final certificate. His Honour, having read the contract, which contained the usual clause that the architect should be sole judge of the value and quality of all material and labour used in the erection of the building, characterised the action at once as an attempt to set aside the award of an arbitrator whom both sides had appointed, and pointed out that such award could not be set aside unless fradulent practices could be alleged against the architect as arbitrator. The plaintiff then agreed to accept a nonsuit, with costs, against himself.

London Board School Contracts.—School Board for London v. Wall Brothers.—This case, which was heard by Mr. Justice Day and a special jury, was concluded on Tuesday. It was brought by the London School Board against a firm of builders to recover damages for alleged breach of contract in respect to the building of a school in Kilburn-lane, N.W. The defendants denied the alleged breaches; but said if there had been any deviations from the contract, they were made by the orders and direction of the clerk of the works in the employ of the plaintiffs. Sir Henry James in opening plaintiff's case, said that on August 15, 1884, defendants contracted with the board to build the Kilburn-lane schools for a sum of £17,397. One of the conditions in the contract was that "no final or other certificate shall, under any circumstances, cover or relieve the contractor from his liability for any fraud, default, or wilful deviation from this contract and the works described in the drawings and specification; but he shall remain responsible for four years from the time of completion of the works for such fraud, default, or wilful deviation and for the consequences thereof." The schools were completed in August, 1885, and the architect gave his certificate. Three years later, however, while some pipes were being repaired under the playground it was discovered that instead of there being a "6in. layer of hard, dry, well-rammed débris" under the tar paving, there were only clay, ashes, and burnt ballast two or three inches deep. The result of this discovery was that the whole premises were overhauled, and it was found that inferior mortar and concrete had been used, that mortar had been substituted for cement, that drain pipes had been improperly jointed, and that in the foundations the lower strata of concrete were soft and not of as good a quality as the upper strata. Other deviations were discovered as to the tiles, roof-timbers, laths, and lead gutters. In fact, the whole building was found to have been in many places scamped, and £5,000 would be required to put the schools into some sort of order. Mr. W. H. Strudwick, surveyor to H.M. Board of Works and War Office, who had been called in to report on the state of the schools, gave evidence as to the matters complained of, and the probable cost of putting them in good order. He put the general depreciation in value of the buildings at £2,000. Mr. E. R. Robson, F.S.A., late architect to the London School board, denied having given defendants any authority for the deviations made from the specifications. A Mr. Coombes, since deceased, was inspector under him, and should visit and report to him any reports from clerk of works at the schools. Coombes had no authority to allow any deviations whatever. Cross-examined: He had never personally visited the schools until they were completed, and then only to gather ideas for future schools, and not to examine the work done; but he had given his certificate on the report of others.—Mr. Bradfield, an assistant architect to the School Board and others, gave confirmatory evidence as to the quality of the materials used.—Mr. Channell, Q.C., in defendants' behalf, relied on the fact that the late Coombes had given defendants his authority to do all they had done. He practically acted as the architect, as Mr. Robson did not appear to have taken any part in the building of the schools. If the defendants had followed Coombes' instructions, it could not seriously be contended that they had been guilty of any fraud, default, or wilful deviation, unless it were suggested that there was collusion between Coombes and the defendants. So far from defendants having made large profits out of the building of these Board schools, there had been none; they being, in fact, bankrupts.—Mr. H. H. Bridgman and Professor Banister Fletcher, architects and surveyors, gave evidence in support of the defendants' case as to the quality of the mortar and concrete used, and as to the thickness of the layer below the playground. It was not unusual or improper to use ground bricks in the mortar, or to put marble chips and bricks in the concrete. The soft mortar between the bricks was due to the effects of the weather, the defendants being obliged, by their contract, to leave the "pointing" of the walls until the buildings were finished.—Mr. George Wall, the defendant, and his son, who had actually been in charge of the works, having been called, witnesses were called from Messrs. Hobman's, who had laid down the tar paving in the playgrounds, to prove that they had found a proper layer of *débris* to work on. They had not, however, tested it to see what the thickness was. Mr. Jefferson, late clerk of the works to the Board at the Kilburn-lane Schools, was called, and said that while he was engaged there he had three other schools to look after in a similar capacity. In fact, when he left he had seven other schools to attend to. The result was that these schools were practically without supervision. When he had a chance, he examined anything which might be going on. He had occasionally looked at the mortar and concrete. He did not see much harm in stone chips or bricks being put into the mortar-mill, as, when ground, they made very good sand. When the playground was being rolled he was occupied with another school, so he did not examine the thickness of the layer of *débris*, though he should think it must have been 15in. in places. The use of burnt clay in the mortar was against his instructions and the specifications.—Mr. Justice Day, in summing up, said that the real issue for them was, Had there been any deliberate violation of the terms of the contract by the defendants? The contract contained conditions, some of which he had never seen before. One condition of the contract was that the contractor should remain responsible for four years from the completion of the works for fraud, default, or wilful deviation from the contract. The first two words were well understood in courts of justice, but "wilful deviation" was more vague, and he understood by it a deliberate violation of the contract—not a mere oversight or mistake. To require the defenants to pull down the schools and rebuild in accordance with the specification would be unreasonable: it would involve penalties of a too outrageous character. Where the defects could be remedied, the plaintiffs were entitled to the expense of remedying them. With regard to non-compliance with the contract as to portions of the building which could not be remedied—as, for instance, the foundations and the mortar and cement used—the plaintiffs were entitled to whatever profit the defendants had put into their pocket by using inferior materials. Then, when the defects were remedied as far as they could be, a question would arise whether the building would be of the same value as it would have been if the contract had been complied with. Having regard to the system which existed, he made no reflection on the management of the London School Board; but having regard to the way in which the business of the architect's office was transacted in 1884-5, he thought the defendants had not taken advantage of opportunities which, to his mind, were opened to them by the School Board. It was scarcely conceivable that a public body should have conducted its business in such an extremely lax manner as they did conduct it in those years. They had an architect who actually told them that from the time he prepared the plans he never went near the school until it was completed, and then he went, not to

see whether the building had been properly built according to contract, but for a purpose connected with his own education—to study the plans, with a view to designing future schools. And who represented the interests of the School Board? They had before them the clerk of the works. He made no imputation on him: he was, no doubt, a most excellent clerk of the works; but what had he to do? At the time he had no less than four schools under his supervision, one being at Walham-green and another at Bow. At the time he left the Board, so satisfactorily had he discharged his duties, that the Board had actually intrusted him with seven schools. Every possible temptation was thus presented to the builders and their servants to take a liberal view of the specification in their own favour. It was true there was somebody else, now deceased, who was said or supposed to have authorised a great many things that were complained of. Coombes, who was an inspector, was to overlook the work in the place of the architect, and it was said he authorised these things. He, however, excluded what Coombes had said on the subject, not because he was dead and could not be called to contradict, but because there was no evidence whatever to show that he was in the position of the architect, or was authorised by the Board to sanction deviations from the contract. No doubt this action might be said to be a bad speculation on the part of the Board, as the defendants were bankrupts; but the Board were justified in bringing it because they wished it to be understood that if contractors violated their contracts, they should not do so with impunity. The jury returned a verdict for the plaintiffs, damages £2,141. The Foreman: The jury desire, without absolving in this case the defendants, to express their strong condemnation of the state of things in the architect's department disclosed by this inquiry. Judgment, with costs, was accordingly entered for the plaintiffs.

Important Sanitary Prosecution.—At Marylebone police-court, Mr. Cooke has given his decision in the case of the "Vestry of Paddington v. Hunter," argued by barristers a few days since. It was a summons by the Vestry of Paddington against Mr. H. Hunter to recover a penalty under the 7th section of the Metropolitan Local Management Act of 1855, and the Amending Act of 1862, for not having obeyed a notice to abolish the present system of combined and defective drainage, and to separately drain his house, No. 148, Westbourne-terrace, Bayswater, into a public sewer recently made by the vestry in front of a block of houses, of which No. 148 was one, and which sewer was made to join and fall into an existing sewer at Orsett-terrace. The facts of the case were in a great measure undisputed. The vestry, the magistrate said, had altered the system of drainage, and had required the defendant to alter his drains so as to fall into the altered and extended sewer. He thought the case strictly came within the 69th section of the Metropolitan Local Management Act, which provided that where the vestry or district board altered any sewer or provided a new sewer, they might construct or otherwise alter the private drains communicating with the sewer so altered, and might close up such private drains and provide drains in lieu thereof. The case of "The Vestry of St. Marylebone v. Viset," was a case in point, where it was decided that it was not compellable to the occupier to make a new drain or bear the cost of constructing it on the ground that the facts brought the case under section 69. He should dismiss the summons; but was willing, however, to grant a special case if desired.

Notices are again out for the Central London Railway scheme, by which, as last session, it is proposed to construct a subway under Oxford-street, from Queen's-road, Bayswater, to the City.

The foundation-stone of a new Roman Catholic school-chapel was laid last week in Fairfax-street, Prestwich, Manchester. The building will cost about £2,000; Mr. Oswald Hill, of Manchester, is the architect, and Mr. Robert Nield, of the same city, the contractor.

Mr. Hopkins gave his decision at the Lambeth Police-court on Wednesday on the summons taken out by the London County Council against the City and South London Railway Company. The point in dispute was whether the Company had the right to build two of their stations as far only as the line of houses, as the Council contended, or, beyond that line, to the end of the gardens abutting on the roadway. The magistrate decided against the Company, but granted a case for a superior Court, the buildings to remain in the meanwhile.

It was announced, at a meeting of the Cork, Bandon, and South-East Coast Railway Company on Wednesday, that the Government proposes to spend seventy thousand pounds in railway extensions at Skibbereen and Bantry, for the purpose of affording employment to the people. The Company approved the grant for fifteen thousand pounds given them to extend their line to the deep water quay at Bantry, to facilitate the fish traffic.

Our Office Table.

Notice has been given, on behalf of a committee representing a majority of the vestries and district boards in the Metropolis, of a Bill to be introduced into Parliament next session dealing with the London water supply. The Bill will propose to transfer the undertakings of the eight water companies now supplying the Metropolis to the London County Council or some other representative body, on terms to be fixed by a board of arbitration, and to empower the new water authority to supplement the existing supply by taking water from Rickmansworth and Leatherhead. It is also intended to insert clauses relating to the rates of charges. The London County Council have referred the subject of the Bill to their Parliamentary Committee, and would, it had been expected, accord active support to the measure. The City Corporation have, however, since given Parliamentary notices for a Bill somewhat similar in scope, under which a London Water Commission would be created, having powers for improving and regulating the water supply, and for securing an independent or alternative supply, as well as the right to purchase existing undertakings. The commissioners to be appointed under the Bill would be representatives of the Corporation, the County Council, and all other local authorities concerned, and of the supply companies and conservancy boards.

The city engineer of Liverpool, Mr. Percy Boulnois, has reported to the sanitary committee of the corporation of that city that the number of insanitary houses in Liverpool at the present moment is no fewer than 16,000. It is roughly estimated that of these not more than 14,000 houses are inhabited; that an average of five persons per house would be a fair computation, giving a total population of 70,000 persons living under conditions highly dangerous to the public health. Some members of the Liverpool Corporation are opposed to any wholesale scheme of demolition unless it be accompanied by a fair and adequate attempt to erect new dwellings for the working classes in the same neighbourhoods, at rentals of about 3s. or 4s. per week. The engineer has been instructed to prepare plans for new dwellings to meet the circumstances.

From Boston, U.S.A., are announced the deaths of two architects of high reputation, both practising in that city, and both natives of New Hampshire. Mr. William Washburn, the senior of the two, had attained the age of 82 years. He began life as a builder, at a time when architects were nearly unknown in the United States, but gradually gave up practical building to devote himself to planning and superintendence. He possessed great natural ability, and was particularly successful in the arrangement of hotels, of which he designed many, the most noted ones being the Fifth Avenue and Victoria in New York, and the Parker House, Tremont, Revere, Adams, Young's, and the American House, in Boston. He also designed the Tremont Temple in Boston, the Charlestown City-hall, and many other public and private buildings. The second death is that of Mr. Charles Edward Parker, who died at the home of his son in Virginia, a fortnight since. Mr. Parker went to Boston when a young man, and had lived and practised there ever since. He was the architect of many public and private buildings throughout Massachusetts, and was for several years superintendent of construction of the Boston Post-office and Sub-Treasury. After the resignation of Mr. M. E. Bell, he was one of the most prominent candidates for his position (which Mr. Parker failed to obtain) as supervising architect to the Treasury Department.

The Darwen town council have decided to purchase the Pickup Bank and Daisy Green reservoir from the Blackburn Corporation for £50,000. The agitation for an increased water supply has now extended over two years, the alternative schemes being a supply from either the Thirlmere reservoir of the Manchester Corporation or the Roddlesworth reservoir of the Liverpool Corporation.

The London, Chatham, and Dover Railway Company are contemplating promoting a Bill in Parliament for a competitive line, viâ Tunbridge Wells, to Eastbourne. It is rumoured that the Duke of Devonshire will support the Chatham and Dover Company in their endeavours to get an independent line from London.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Arts. "Gaseous Illuminants," Cantor Lecture No. 1, by Professor Vivian B. Lewes. 8 p.m.

Tuesday.—Society of Architects. "The Society's Excursion into Kent" (illustrated by oxy-hydrogen lantern views), by G. A. T. Middleton. St. James's Hall, Piccadilly. 7.30 p.m.

Institution of Civil Engineers. "The Vibratory Movements of Locomotives," by Professor J. Milne and J. McDonald. 8 p.m.

Bradford Architects and Surveyors' Association. "Fifty Years of Sanitary Progress," by T. Preston. 8 p.m.

Wednesday.—St. Paul's Ecclesiological Society. "The Abbey Churches of England" (illustrated), by J. Grimshire. 7.30 p.m.

Society of Arts. "Physical Tests in Competitive Examinations," by Francis Galton, F.R.S. 8 p.m.

Friday.—Architectural Association. "Arts and Artists, in Former Times and To-day," by W. H. White. 7.30 p.m.

Architectural Association, 9, Conduit-street, W.—November 28. The 4th Ordinary Meeting, 7.30 p.m. Paper by Mr. William H. White, Secretary of R.I.B.A., on "Arts and Artists, in Former Times and To-day." December 12. The 5th Ordinary Meeting, 7.30 p.m. Special Business Meeting, 7.45 p.m. "To receive the Report of the Special Sub-Committee appointed to revise the Rules, and to make alterations to the Rules."

Fred. R. Farrow, Ernest S. Gale } Hon. Secs.

CHIPS.

The model of his Burns statue for Ayr has just been finished by Mr. George Lawson, and the casting of the bronze will take place immediately at Thames Ditton.

The name of Mr. Thomas Hindle, timber merchant, Browfield House, Baxenden, has been placed on the commission of the peace for the borough of Accrington.

A large block of business premises is being erected in the Hayes at Cardiff, from plans by Mr. J. P. Jones, of that town. It consists of a series of shops and warehouses, with offices and show-rooms above, and also, on the first floor, a Masonic hall 60ft. by 44ft. and 24ft. high.

The reopening of church bells at St. Mary's, Hayes, Middlesex, took place last week. The work of rehanging the bells has been carried out by Messrs. E. and H. Rogers, of Maidenhead, Berks. The recasting of Nos. 1 and 2 was undertaken by Messrs. Warner and Son, London.

Mr. W. J. McKenzie, who had been for thirty-two years employed at York as surveyor in the architect's office of the North-Eastern Railway Company, has just died, at the age of 57 years.

The corporation of Devizes have instructed Mr. Laidlaw to prepare plans for the disposal of the sewage of the town. The estimated cost of the scheme is about £3,250.

A new Baptist chapel has been opened in Deacon-road, Widnes. It has sitting accommodation for about 200 persons, and in addition there are three classrooms at the rear of the building. The building has been erected by Messrs. Sayce and Randle, Widnes, under the supervision of the architect, Mr. Richard Owens, of Liverpool. It has cost £1,250.

Mrs. Pullan, widow of Mr. R. Popplewell Pullan, F.S.A., F.R.I.B.A., and sister to the late Mr. William Burges, A.R.A., died on Wednesday at her residence, 9, Melbury-road, Kensington, the well-known 13th-century house designed by Mr. Burges, and built for his own occupation.

Mr. Lawrence Marr, contractor, of Lodge-lane, Liverpool, died on Sunday. Besides his son, upon whom his business devolves, he leaves a widow and two daughters. Among the many contracts the deceased carried out were the excavations in connection with the Lime-street tunnel, the Exchange Station works, and roadmaking on a large scale under the Liverpool Corporation and various suburban boards.

At the last meeting of the Malmesbury town council applications for the post of surveyor and inspector of nuisances were read from Mr. Jacob Angell (the present surveyor), Mr. Jabez Emery, and Mr. Frank Price. The first two made application on the same terms as advertised—namely, £60 per annum. Mr. Frank Price offered to devote his whole time to the duties for £50 a year, or the whole of the winter and as much as was requisite in the summer for £40 per annum. After some discussion it was decided to issue fresh notices, with the understanding that the person elected should devote *the whole of his time* to the work at a yearly salary of £50! It was resolved to hold a special meeting for the further consideration of this lucrative appointment.

Holloway's Pills give potency to the nervous system, which is the source of all vital movements, and preside over every action which maintains the growth and well-being of the body. They are the most unfailing antidotes to indigestion, irregular circulation, palpitation, sick headache, and costiveness, and have therefore attained the highest reputation.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W

DOULTING FREESTONE.
THE CHELYNCH STONE—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

ELECTRIC LIGHTING.
COMPLETE INSTALLATIONS OR WIRING ONLY { ESTIMATES GIVEN.
STRODE & CO. 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. **LONDON**
New Branch Showrooms:—188, PICCADILLY, W.
Telephone No. 3958.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Audenshaw.—For painting the lamp-pillars, frames, and street name plates, within the district of the Audenshaw Local Board. Mr. J. H. Burton, Ashton-under-Lyne, architect:—
Burgess, J., and Son, Stalybridge (accepted).
(Five tenders were received.)

Barking.—For the erection of a block of buildings in New-street, Barking, for Mr. E. L. Clifford. Mr. J. W. Dunford, M.S.A., 100c, Queen Victoria-street, E.C., architect:—
Barclay, R., Chelsea (accepted) ... £750 0 0

Bradninch, Devon.—For alterations and additions to the Mansion House, for Mr. J. Webber, sen. Mr. W. H. Taylor, C.E., Queen-street Chambers, Exeter, surveyor:
Labdon, Cullumpton £343 0 0
Wicks, W. A., Bradninch 330 0 0

Burnley.—For alterations to engine-house, boiler-house, offices, and alterations to Finsley Mill, Burnley, for Messrs. Witham Bros. Mr. V. Dunkerley, Bank Chambers, Burnley, architect:—
Masons:—

Wiseman and Son	£1,670	0	0
Heap, T., and Son	1,300	0	0
Parker, A. and R.	1,295	0	0
Parker, J. and A.	1,210	0	0
Read and Son...	1,200	0	0
Smith Bros.	1,125	0	0
Smith, T.	1,120	0	0
Laycock (accepted)	1,036	0	0

All of Burnley.

Camden Town, N.W.—For rebuilding the Marquis of Camden, Camden Town, including bar and other fittings:

Pocock, J.	£4,834	0	0
Killby and Gayford	4,404	0	0
Patman and Fotheringham ...	4,394	0	0
Harris and Wardrop	4,320	0	0
Allen and Sons	4,305	0	0
Oldrey, H. B....	4,291	0	0
Mark, F.	4,113	0	0
Gould and Brand	3,943	0	0
Toms (accepted)	3,915	0	0

Chester-le-Street.—For further additions to Chester-le-Street Jamworks, for Mr. J. W. Luccock. Messrs. Plummer and Burrell, Newcastle-on-Tyne, architects:—
Contract No. 6:—
Norman, W. (accepted) £155 0 0
For sundries:—
Norman, W. (accepted) 51 10 0

Colchester.—For alterations and additions to Mr. H. L. Griffin's work and show-rooms in Culver-street, for Mrs. M. Benham. Mr. T. W. Start, F.S.I., Cups Chambers, Colchester, architect:—

Orfeur, C. E.	£570	0	0
Ward, T. J.	538	0	0
Shead, F....	535	0	0
Diss, A.	495	0	0
Dupont, F.	493	0	0
Dobson, G.	488	0	0
Beaumont, R.	469	0	0
Chambers, W. A. (accepted) ...	447	0	0

Colchester.—For the erection of thirteen cottages at Colchester, for the Salvation Army. Mr. W. G. Scott, A.R.I.B.A., 25, Bedford-row, London, W.C., architect:—

Hall, A. J., Brixton...	£3,400	0	0
Everett, H. A., and Son	3,190	0	0
Coe, A., Ipswich	2,867	0	0
Bowles, G. W	2,774	0	0
Purton and Johnson, Greenwich ...	2,700	0	0
Coxhead, F. J., Leytonstone ...	2,597	0	0
Chambers, Leytonstone	2,504	0	0
Dupont, F.	2,375	0	0
Oldridge	2,250	0	0
Dobson, G. W.	2,189	0	0
Dois, A. (accepted)	1,790	0	0
Thoday, F., & Son, Cambridge* ...	1,750	0	0

Rest of Colchester.
* Withdrawn.

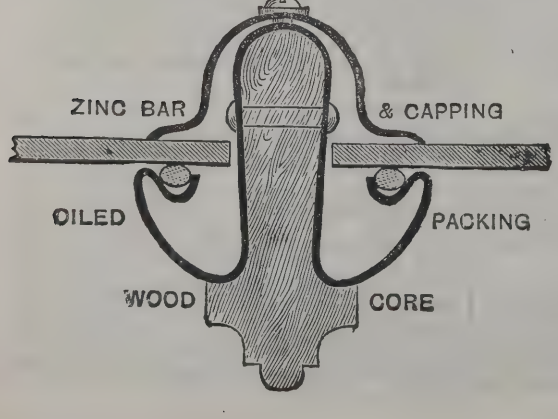
Dundalk.—For laying kerbing in Wellington-terrace, for the town commissioners:—
M'Evoy, J., and Son, Dundalk (accepted).

Exeter.—For general repairs, new bath-room, &c., at 12, Belmont-place. Mr. C. Cole, Queen-street Chambers, Exeter, architect:—
Soper and Son (accepted).

JENNINGS' PATENT "TIP-UP" LAVATORIES

Are fixed in all the principal Mansions, Clubs, Hotels, Railway Stations, Hospitals, Asylums, Schools, &c., throughout the World.

By an **IMPROVEMENT** in the construction, the Basin can be **"LIFTED OUT"** and replaced without **THE SLIGHTEST TROUBLE**, which permits of cleaning the receiver beneath. Many other **IMPROVEMENTS** have also been effected, which stamp it as being the **SIMPLEST, CLEANEST**, and **MOST EFFICIENT** Lavatory ever produced. Made to suit any position, with Tops of **PLAIN SLATE, ENAMELLED SLATE**, or **MARBLE**, and with or without Wood Enclosure.



AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

To prevent disappointment and trouble, the public are respectfully requested to see that the Basins bear the NAME and ADDRESS of the Patentee,

GEORGE JENNINGS, SANITARY ENGINEER, STANGATE, LONDON.

As a guarantee of **QUALITY, DURABILITY**, and **EFFICIENCY**. Illustrated Price Lists Post Free.

F. BRABY & CO.'S PATENT GLAZING.

GLASS SET FREE,
ALLOWING EXPANSION AND CONTRACTION, AND PRECLUDING BREAKAGE.
Absolutely Watertight. Painting & Putty Superseded.
OVER THREE MILLION FEET FIXED.
Drawings and Prices on application. Models and Sections on View.
Special) AM 26a.

London: 352 to 362, EUSTON ROAD.
Liverpool: 6 & 8, HATTON GARDEN.
Glasgow: 47 and 49, ST. ENOCH SQUARE.

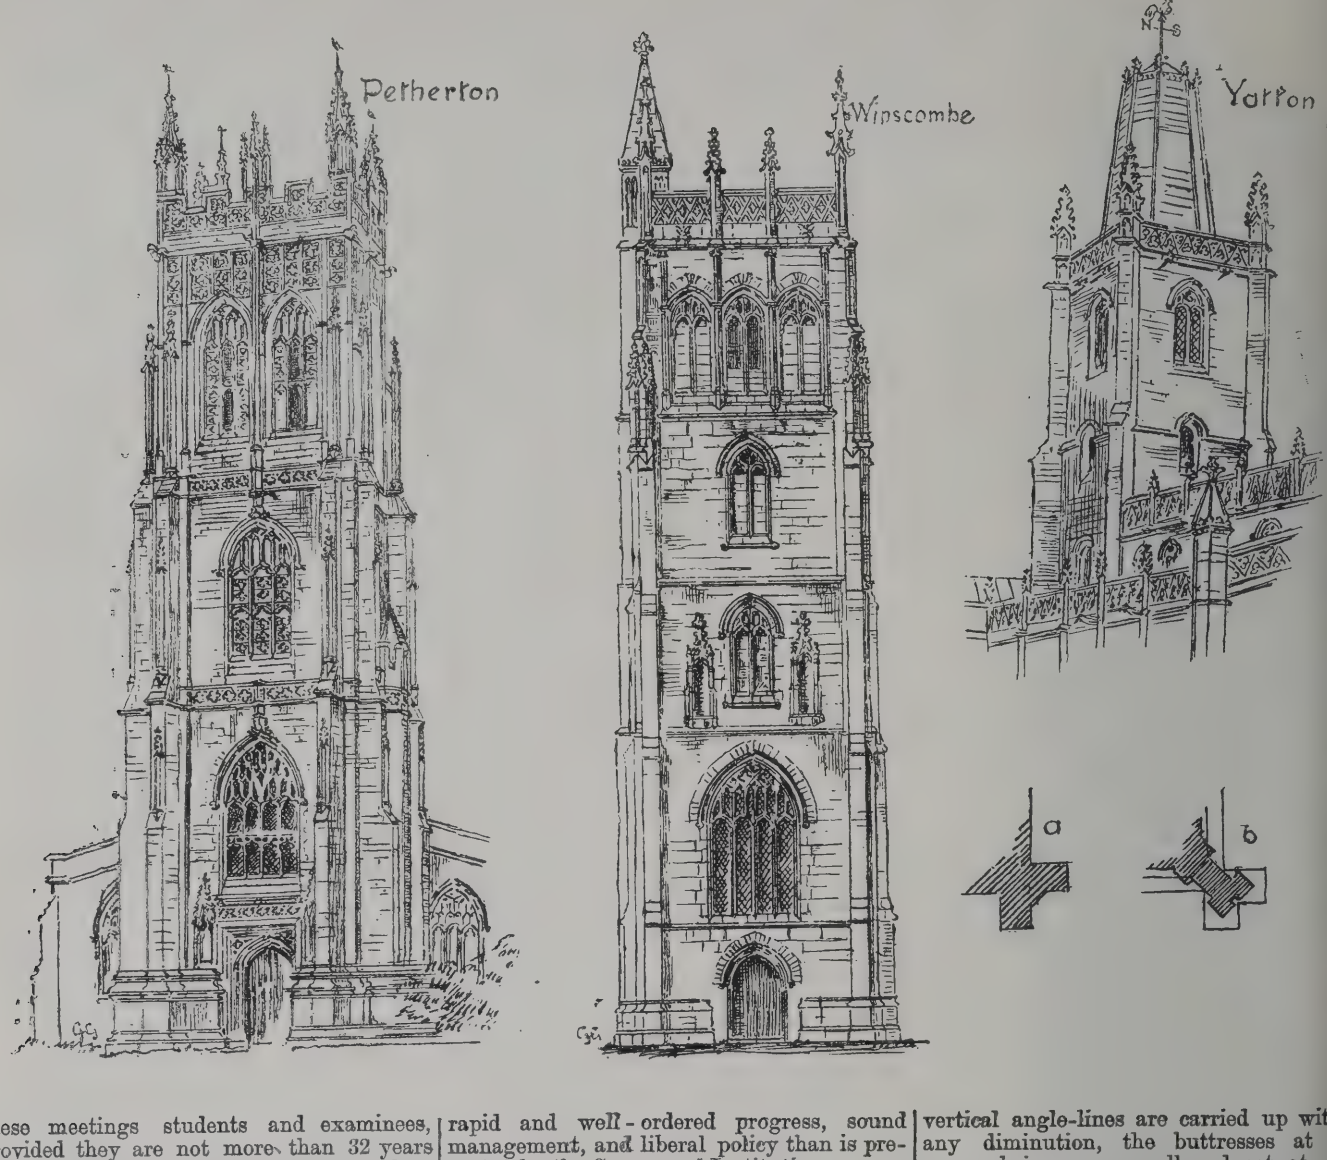
E BUILDING NEWS
ND ENGINEERING JOURNAL.
VOL. LIX.—No. 1873.
FRIDAY, NOVEMBER 28, 1890.

E SURVEYORS' INSTITUTION AND TS PROVINCIAL COMMITTEES.

a true appreciation of the real needs of its members, both senior and junior, the eyors' Institution has long taken the of the Institute of Architects, and has n itself more far-seeing and progressive. as not only the first institution to listen e reforms which the present state of the ession demanded, but it has accomplished ng the 22 years of its existence what the tute, with a history of 56 years, has promised, and has yet failed to do. But Surveyors' Institution has gone farther. ouncil, with characteristic wisdom, have seen the desirability of strengthening its ion from the outside, of infusing into Institution new life, and of establish- a closer relationship between provincial bers and the council. For this pur- the system of "Provincial Committees" been framed, the objects of which are in words of the constitution, "To establish stem of succession to the standing com- ees, and, as far as possible, through them he council, on the basis of local selection of services rendered to the Institution; to re a fuller representation of the members n the standing committees; to bring the bers into closer touch with the council, to assist the council in ascertaining their l wants and wishes; to give the country bers an extended influence over the ission of new members from their own icts; to provide machinery for holding l examinations and country meetings of Institution, and for generally increasing interest of all classes of members in its fare." These, it will be admitted, are chief objects for which any professional ety exists at all.

s we shall show, the Surveyors' Insti- on has accomplished these objects. eady 17 provincial committees have been ped out and are in working order, resenting in all over 700 country mem- , and comprising all the counties of land and Wales. Both in conception and ils the scheme of the Institution com- ds itself to notice. While extending the esentation of the profession of surveyor its many special branches, it avoids nomy, and removes the reasons for the tence of outside or local societies. Other essional bodies, like the Institute of ish Architects, have neglected to use their ns, and have abdicated their powers. Its nches and allied societies have till quite ntly remained in local segregation, ob- sly to the weakening of the Metropolitan re, and the regulations and restrictions le by the council have been prejudicial. constitution and rules of these pro- ial societies are subject also to the trol of the council. The branches have, fact, to come into existence or alliance n the Metropolitan body as best they can, to gain recognition by their own influ- e or energy; but the Surveyors' Institu- extends a hand of fellowship: it has ually formed provincial committees, each extensive with a county or portion of a nty, or a group of counties, the members which are all non-Metropolitan Fellows he Institution who practise in the dis- t. Those who practise in the provinces thus have a direct voice in all matters cting them as local practitioners; those, act, who live outside the Metropolis, or e their offices beyond a distance of ten miles from Charing Cross, who are not members of the council, will be members of the provincial committee and be engaged in promoting the welfare of the institution. Distant parts of the country are thus brought into close relations with the council and its secretary. The chairman of every provincial committee is able to collect all opinions of any value to the general body of practitioners. The principal men in every locality are brought to the notice of the council, and the whole system, by a species of automatic election, insures a succession of new competent men on the council-board and on the standing committees. Promotion is the key-note of the new organisation.

The provincial committee will form a nucleus, and become a centre of organisation in the locality, very much more effective than a provincial society which is trying to attach itself to the central body of the profession in London. The machinery which the Surveyors' Institution has already in work in its new scheme is simple, and is briefly as follows:—The county, portion of the county, or group of counties constitutes the unit of area in each case, and the council have powers to enlarge, sub-divide, or vary the area represented by a provincial committee as may appear desirable. All present and future Fellows of the Institution not being members of the council, or included among Metropolitan members, will be members of the committee of the district in which they practise. The powers and duties of the provincial committee will be derived from the council, who reserve the "right of revoking, limiting, or varying such powers"; each committee will be a separate unit "empowered to engage itself with such questions only as are directly relevant to its own district or to the distinctive interest of its own members, but will have no authority to enter into relations with any other provincial committee except through the channel of the council." The procedure of the committees is regulated by instructions annexed to the scheme: each is empowered to appoint a provisional chairman; the voting may be by ballot or by proxy, as the members may determine, the election being approved by the council; the committee to meet at least once a year, though oftener as they desire. They may make a collective representation to the council upon points of professional practice or matters of special local concern, through the chairman. Every application for membership of the Institution will be referred to the committee of the district before it is considered by the council, who will be guided *mainly* in dealing with it by the advice of the committee as communicated by the chairman. Applications from candidates for examination other than persons already connected with the Institution, or students at a place of professional instruction approved by the council, will also be referred to the committee of the district before they are considered by the council. For these purposes a provincial committee may appoint a sub-committee, which is to comprise not less than one-fourth of the whole committee, and not more than one member of any firm. The provisional chairman of each provincial committee is nominated by the council to conduct the election of the first chairman of each committee, or in the case of vacancy in the office arising by election to the council, by resignation, ill health, or death, the election of a successor, each chairman to be elected for one year, and will be the medium of communication with the council for his district. If, and when, elected a member of the council of the Institution, a provincial chairman is to vacate his office as such. Provincial chairmen will be members of and have seats in one or more of the standing committees of the Institution.



The special-certificate examinations for members in the three branches of forestry, sanitary science, and land surveying and levelling are destined to be highly valued by surveyors who have become specialists in these departments. With the object of giving a diploma or certificate that will be of great value to its holder, the council have instituted these special examinations. The origin of these special examinations is embodied in a clause of the Board of Agriculture Act by which the Government have power to aid any system of lectures or instruction connected with agriculture or forestry, and to inspect and report on any examination in them. The council of the Institution justly assert that forestry is peculiarly a land-agent's question, and that the Institution is identified with it, and therefore have taken measures to specialise the subject by granting a forestry certificate. The other subjects are the effect of light, the diseases of trees, the collection and testing of seeds of conifers and hardwoods, sowing, propagation by layering, slipping and grafting, site and aspect, soils, preparation of site, fencing, selection of trees for certain soils and aspects, nurseries, planting operations, and management, measurement, and valuation. In sanitary science, the examination comprises the arrangement and ventilation of buildings, water supply and drainage in town and country; also with relation to all kinds of public buildings, details of plumbers' work, surface and rain-water disposal, storage, composition of sewer-gas, and tests. The student will be required to show how an imperfect plan of drainage to a house can be put into an efficient state; how to drain farmsteads, building estates, and dispose of sewage and refuse; and to know the laws, liability of owner and occupier, of authorities, and adjoining owners.

Lists of textbooks are given under each subject, and the work actually carried out by the candidate in this subject will be taken into account. The rules and syllabus contain example-papers of the questions put in each subject.

Sanitary science and land surveying are equally special branches of the profession, and of particular value to those who are seeking public appointments under municipal, urban, and other authorities. But these special examinations are quite independent of those in the same subjects required for the ordinary qualifying examinations. That these special examinations are extremely difficult is shown by the fact that only three members have won certificates. The forestry examination is held in June of each year concurrently with special examinations in sanitary science and surveying. The indoor work will consist of written papers dealing with some or all of the subjects of the syllabus, besides a *vivâ voce* examination as to the identification of various timbers, seeds, foliage, and manifestations of disease. A *vivâ voce* examination will take place in the woods, in timber valuing and measuring, modes of felling, fencing, &c. This examination will include the physiology and anatomy of trees.

The examinations of the Institution are conducted in such a manner as to produce the most thorough test of practical knowledge. There is no board of examiners. To every subject more than one examiner is appointed, and to insure a selection of new and well-thought-out questions a very efficient and methodical system is put into operation, by which the independent opinions and questions of two or three examiners are obtained, and these are sifted by expert members till a reduced number of efficient questions—the *crême* of the whole submitted—have been collected for the purpose.

The establishment of "junior meetings," which has recently been introduced, already shows promise of admirable results. At

these meetings students and examinees, provided they are not more than 32 years of age, read and discuss papers, and to avoid interference with the ordinary general meetings they are limited to four during each session. The subjects are submitted to the council for approval. Two very important ends are insured by these junior meetings. The first is, that the council are able to discover the latent talent amongst the younger members, and assist in bringing them forward. Many diffident and retiring young men who shrink from reading papers or discussing questions before the elder members of the Institution have the opportunity of doing so before those of their own age and experience, and some of these papers are printed in the "Professional Notes." Another advantage of the junior meetings is that they supply an incentive to the younger and ambitious members to further the welfare of the Institution which gives them an opportunity of meeting. If the Architectural Association had been so affiliated to the Institute of Architects, or if the latter had seen fit to have provided an organisation for its younger members, we should not have seen so many attempts at disruption; isolated schemes and new societies could not have found a breathing place, and the independent do-the-best-for-yourself policy could not have endured. The Surveyors' Institution has set a wise example of anticipating the wants of the profession in every part of the country by a spirit of wise foresight, and by a conciliatory policy has rendered unnecessary rival societies. Hence the rapid development of the Institution, and the perfect harmony which exists between its members and the executive. On the whole, it may be doubted whether a better example could be found of rapid and well-ordered progress, sound management, and liberal policy than is presented by the Surveyors' Institution.

TYPICAL CHURCH TOWERS.—IV.

ANGLE-BUTTRESSING was carried to a high degree of perfection by the architects and masons engaged on the towers of Somersetshire. One of the many beauties which distinguish these structures from those of its class in other districts is due to the manner the belfry stage, and sometimes the whole tower, was, so to speak, "entasised" by the treatment of the angles. Diminution and graceful outline are, without doubt, two of the leading attributes of tower design. The diminution may take place by, first, a series of successive in-sets or set-offs of the faces of the tower by means of weatherings or stringcourses, which exhibit themselves at the outer angles in some cases, as at St. Mary Magdalene, Taunton, where the angles of the tower show themselves beyond the buttresses which project on each side. These set-offs are weathered at intervals, and are four in number, the upper or last one occurring just below the belfry story. Secondly, the outer angles may be carried up perpendicularly without any visible set-off; but the sides or faces of the belfry are set back. In this last form the outer angles are preserved vertical by means of angle-piers or pilasters which assert themselves above the first set-off. The towers of Wrington, St. Cuthbert's, Wells, and Evercreech show this last treatment. The set-off in the thickness of the walls occurs at the sill of the belfry windows (see sketches). At the fine tower of St. Stephen's, Bristol, the vertical angle-lines are carried up witho any diminution, the buttresses at ea corner being very small and set at so little distance from the outer angle on ea face. The same arrangement occurs on t smaller tower of Columpton Church, Devo shire, in which the outer angles of the tow are quite independent of the buttres which project on each face a few inch from the angle. We have a few instanc where the buttresses meet at a square an coincident with the angle of the tower-wa —that is to say, if we suppose the outer lin of the tower-walls are prolonged on pla they would form the true outer sides of t buttresses. A very remarkable instance making the buttresses on each front proj beyond this occurs in the fine tower Chewton Mendip. Here the axial lines each buttress on plan would meet at t same point as the external angle of tow walls; the re-entering angles are, howev filled up by small splays. These diversit amount in other words to this: that wher in many towers the angle of tower is m visible, as at Wrington and Evercreech, buttresses not joining at the angle; in ot examples, as at Chewton Mendip, the an of tower is lost by the buttresses, which j themselves at a right angle.

Another peculiarity is worth notice connection with the diminution of the bel stage. The buttresses at this story on e face are reduced to the size of pinnac which stand on the weatherings of the lo buttresses, and are connected by pierced w or buttresses to the angle of belfry as St. Mary's, Taunton, and at Huish Episc Both at Huish and at Banwell a solid angu buttress projects from the belfry corner, at the outer angles of this buttress

aged pinnacles, resting on the buttresses ow, which project at right angles to each er.

The fine tower of Winscombe Church, of ich we give an elevational view, shows arrangement of angle. The pinnacles are aged to the solid angular buttress behind, sufficiently distinct to show their outline and *b*). The pleasing treatment of the le window tracery, which fills up the ire side of the belfry between the splays uttresses, and the arrangement and pro- tions of the lower stories, are elegant. least satisfactory details are the parapet pinnacles, which, not being continuous h those below, look as if the parapet was addition. The corner pinnacles, which set square on the diagonal buttresses, ear somewhat awkward.

The tower of North Petherton is an example an undiminished structure quite unique its design. The angle of tower is carried in one vertical uninterrupted line; the ner buttresses, in fact, project from a y slightly pronounced pier through the ee lower stories: they are then weathered below the belfry, and from each a gonally-set pinnacle springs detached m the belfry wall, but connected by a short ing buttress at the top. The division of belfry by narrow pilasters, one at each gle and three intermediate, dividing the ace into unequal panels, and the surface richment of the upper portion of wall ove the belfry windows by diapering, are ticeable features of this beautiful tower. ese features add much grace and elegance the upper portion. We notice the skilful aking up of the wall surface by the narrow asters. At the corners the pilasters are aced so as to form a narrow panel and die derneath a cornice moulding. These rner panels carry up the lines of the lower ers in a very pleasing manner. The apering, consisting of three rows of quatre- ils divided by fine mullions, relieve the ll space above the belfry windows, and, in nnection with the panelling of the parapet, ves lightness to the upper part of the wer. A plain band of masonry between e parapet and the cornice enhances the fect of this diaper-work. The recurrence the quatrefoil panel in the bands between e stories adds to the richness of the tower, d gives it an exceptional interest. The adation of the buttresses and the engaged nnacles at each stage are points to which tention may be drawn. The diminution is ry gradual, the set-offs being small, add- g much to the grace of the outline.

Among the enriched examples of towers to e found in Somersetshire, we may name ose of St. Mary, Taunton, Huish, North etherton, as illustrating these varieties of rnament. The introduction of panelling and racery is very commonly met with, especi- lly in the upper stories, the belfries, and arapets; but the employment of quatrefoil iaper-work is less usual. On this ground, the xample of North Petherton is of particular nterest. We may here sum up the varied ethods which have been adopted in the reatment of the angle buttresses, especially t the belfry stage; but it will be of more alue to show them by plan.

THE SOCIETY OF ARCHITECTS.

THE second ordinary meeting of the past session was held on Tuesday evening at St. James's Hall, Piccadilly, Mr. Edward Tidman, F.S.I., member of council, in the chair. The following were elected as members:—John Cox Dear, 117, Great Russell-street, Blooms- bury, W.C.; Joseph Arthur Pywell, 8, Sylvan- Grove, Old Kent-road, S.E.; and Francis Ambrose Robert Willey, 66, Ludgate-hill, E.C.

THE SOCIETY'S EXCURSION INTO KENT.

An interesting address, descriptive of the excur- sion of the society last August through Kent, was delivered by Mr. G. A. T. Middleton, member. It was illustrated by numerous photographs taken by the lecturer and Mr. William Allport, member of council, and shown by the oxy-hydrogen lantern. The excursion was more largely attended than any previous one arranged by the society. Beginning at Rochester, the author mentioned that Mr. G. Payne, F.S.A., hon. secretary of the Kent Archæological Society, here met the members and conducted them over the cathedral, where work of all kinds was seen, from a rude coffin formed of simple slabs of stone, to the screen now in course of erection from the designs of Mr. J. L. Pearson, R.A. The fine mansion known as Restoration House, the Castle, and Eastgate House, a picturesque timber structure, immortalised as the Ladies' Seminary in the "Pickwick Papers," and as the Nun's House in "Edwin Drood," were also seen in Rochester. In the evening of the first day the members went on to Maidstone, and their next day (Tuesday) visits were paid to the Museum, the nucleus of which is a timber building dated 1540, to which additions have been, and are being, made from designs by Mr. Hubert Bensted; to All Saints' Church, a fine specimen of Early Perpendicular work, carefully restored by Mr. Pearson, and St. Augustine's College, a slighter later building. In the afternoon, Leeds Castle—of which the exterior is far more interesting than the modernised rooms within—and Detling Church, with its broach spire and carved lectern, were visited, *en route* to Tonbridge. From this centre, on the Wednesday, the church and a little known timber-built farmhouse, late 15th century in character, were seen on the way to Penshurst Place, one of the most beautiful, as it is also one of the largest country seats in England. The quaint village of Chiddingstone, Hever Castle, and the picturesque modern hamlet of Leigh, were the chief features of the afternoon's drive. On Thursday Knole House was the chief attraction, Lord Sackville having given special permission for the members to visit it. The reception did not appear to be of the character usually enjoyed by architects, for, according to Mr. Middleton, his lordship, although in residence, did not come forward to receive his guests, who, after paying 2s. each for admission, were kept waiting in the banqueting hall until the housekeeper arrived to show them over the building. The Elizabethan decoration had much of it unfortunately been spoiled by inartistic colouring; but such of the woodwork as had been left untinted, the plaster ceilings, and the stone and marble mantelpieces, are still as quaint and rich as anything of the kind that is to be found in England. At the time it may have been somewhat wearisome, passing through room after room, barely furnished, and with walls covered with pictures by artists, well-known and otherwise; but to look back was a different matter, and now none could be sorry for the time thus spent. The most interesting room perhaps was that which was specially furnished for James I., and which still contains the original heavy bed tapestry worked in silver and gold threads, and much embossed silver-ware. Leaving Knole House, the members next walked over Oldbury Camp, the largest British encampment which remains in existence, and thence to Ightham, where the Town House, a unique 15th-century cottage, the parish church, and the Moat having been seen, the party proceeded to Ashford and so on to Canterbury. The Friday seems to have been the busiest day of the whole hard-working week, and was devoted to the city. The pilgrims' hostlery, known as Eastbridge Hospital, the cathedral, St. Augustine's College, St. Pancras' desecrated church, and St. Martin's Church were all visited, the day closing with a formal meeting of the society in the Guildhall. The Saturday was spent at Dover, the Roman Pharos, the Oratory in the Castle Keep—a rich specimen of Transitional work—and the Armoury within the Keep having been viewed, St. Mary's Church was described by the Vicar, Canon Puckle, while the very interesting outing concluded with an inspection of the remains of St. Martin's Priory, now adapted to the use of Dover College and the Town-hall, in which are incorporated remains of the Maison Dieu, an Hospitium for all nations. Thus, said Mr. Middleton in closing, ended the most successful excursion which has yet been undertaken by the members of this society. It is now evident that these excursions have become exceedingly popular. Architects from all parts have an opportunity of meeting together in a most friendly way and of discussing, informally and without restraint, many points of mutual interest, and they return home feeling that they have not only enjoyed a week of recreation and amusement, but have added to their store of knowledge, and have added to the number of their friends.

At the close a vote of thanks was proposed by Mr. William Woodman, seconded by Mr. J. Hamilton, of Brighton, and having been supported by Messrs. W. Allport and A. Wallace Rimington, was carried by acclamation.

THE SURVEYORS' INSTITUTION.

AT the ballot for admission to the various classes of membership in this institution, held on Saturday last, the following new members were elected:—

As Fellows.—Stephen Bailey, R. Buck Broster, George Buckley, Henry Philip Chalk, William Clarkson, George Radcliffe Cobham, Samuel Hood Cowper Coles, Brian B. Hird Cowgill, Henry Brook Dransfield, Edward Fillingham, George William Finn, Thomas Hills Forsyth, Edwin Fox, jun., Arthur Richard Gradwell, M.S.A., Thomas Thornton Green, William Benjamin Hebditch, Isaac Matthews Jones, John Kidwell, Edward Osmond, William Henry Parker, William Parkin, Albert Woodward Parry, Frederick Cecil Parsons, Frederick Atkinson Powell, Arthur Stirling Pridmore, Peter Purves, Henry Adair Rawlins, Ithel Treharne Rees, Richard George Scriven, William Scroggs, Harry Samuel Senior, Harry Russell Smith, Edward Tidman, M.S.A., Joseph Harling Turner, Edward James Turton, John Allen Waddington, Francis Elliot Walker, Albert Mellor Walsh, Herbert Fuller Waring, Herbert Walter Williams, Stephen Woodbridge, jun., Lionel Burnet Woodforde, William Booth Woodhead, and Robert Walter Wordsworth.

As Professional Associates (all having passed the qualifying examination).—Francis Reginal Armytage, Cecil Hugh Aylen, Frederick Herbert Bancroft, Thomas Arncliffe Barclay, Maurice Frederick Beadel, Arthur Body, Frederick Edward Boulting, Frederick Henry Brackett, George William Cobham, Frank Minshull Elgood, Francis Ellis, William Forrest, Arthur Norman Garrard, Alexander Goddard, Alexander Ernest Green, James Henry Hodgkinson, Gilbert Plantagenet Mitchell Innes, Walter Robert Kay, Graham Harley Mould, George Osenton, jun., Edward John Partridge, Joseph Perkins, Richmond Pinder, Herbert Edward Prall, Frank J. Ruddle, Edwin Savill, Charles Frederick Slater, James Frederick Kemp Smith, Walter Wadman Snailum, William Wilton Rix Spelman, Ernest George Verity, Hugh Calthrop Webster, and Charles Bruce Wood.

As Associates.—Reginal Ward and John Wrightson.

NOTES ON BUILDING PRICES.—XIII.

By John Leaning.

ROADS—(*continued.*)

AVELING AND PORTER are the principal manufacturers of steam-rollers. A 15-ton roller burns 5cwt. of coke per day (in London, 11d. per cwt.); requires stoker, at 7d. per hour (in London); labourer with flag, at 5¾d. per hour (in London); two labourers spreading sand, 5¾d. per hour (in London); two men watering and sweeping, 5¾d. per hour (in London).

Mr. Boulnois says:—"The quantity rolled varies from 500 to 3,000 yards per day, the average for 42 towns being 1,105 square yards. The cost per square yard rolled, including all charges, may be assumed to be between ½d. and 1d. per yard, and the cost of binding material about 3d. per square yard."

Sir John Burgoyne, in his paper on "Rolling New-made Roads," after advocating the breaking of the stones to pass a 1½in. or 1¼in. ring, says:—"For the purpose of filling up the interstices of the broken stone and not to cover it, about three cubic yards in the whole per 100 square yards (equal to about 1in. in thickness if spread over the whole surface) will be required."

Burrows, in his paper on "Construction and Maintenance of Country Roads," says:—"Much good may be done with horse-rollers up to three or four tons' weight; but steam-rolling is preferable, if too great a weight be not applied at first. Some of the best work has been done by Aveling's roller, covering a width of about 7ft., and weighing not much over seven tons, this, worked at a cost of 22s. to 25s. per day, thoroughly compressing 2,000 yards new road surface."

The Paris trials gave the results: 1d. per square yard cost of horse rolling, ¾d. per square yard cost of steam rolling.

Tar Paving.—This is much used for footways in suburbs of the Metropolis and other towns; the price varies from 1s. 9d. to 2s. 6d. The present price paid by the School Board for London for 2½in. paving of the the best quality, made with broken limestone, is 1s. 10d. per yard.

It is almost always done by persons who, like the asphalters and wood-paving contractors, do

nothing else, so possess facilities for the doing of such work, with which the average builder cannot profitably compete.

Mr. Boulnois prescribes for footpaths 2½ pitch to 1½ tar, or 3¼ pitch to ¾ creosote oil.

Stone broken to the necessary size, about 1½in. cubes or gravel stones of equal size, the interstices filled with the bitumen and then covered with sharp sand or shell sand does very well. Sometimes the gravel or other stone is mixed with the bitumen on a board, as concrete is mixed, but generally it is boiled.

Broken Kentish rag is convenient for London work, and makes a paving superior to that made with gravel stones; the difference in value of the two is about 3d. per yard.

Some of the tar-paving contractors will maintain for five years at a small increase of price—about 2d. per yard.

The mixtures used for tar paving are various, see Boulnois and Hurst's "Architectural Surveyor's Handbook."

Asphalte Paving.—This is almost always done by the specialist, except damp-proof course (see Bricklayer). The builder never attempts it, and, if he did, could not do it so cheaply. As a consequence, the trade is confined to a small number of men who possess the necessary apparatus and employ workmen accustomed to the work.

Mr. Haywood's report to the Streets Committee of the City of London Commission of Sewers gives some valuable information as to the various manufactures, some of which have now entirely disappeared from the market. From this report we select the following particulars:—

LIST OF MATERIALS IN LONDON.

	Per yd. exclusive of freight.	Barge freight per ton.	Barge freight at 1·2 ton per
ROAD METAL.—	s. d.	s. d.	s. d.
2in. broken Kentish rag alongside wharves, below Westminster (cubic feet, 13·5 per ton)	4 8	2 0	2 2½
1½in. Do. Do.	6 6	2 0	2 2½
2in. broken Porthgain granite, alongside wharves below Westminster, including freight	11 9		
2in. broken Guernsey granite, and ditto as last	13 9		
A recent tender for this alongside at Chelsea	13 9	lowest offer.	
Mountsorrel granite delivered in trucks at St. Pancras or Camden railway stations:—			
2½in. broken for macadam	11 10		
2in. Do.	12 1		
1¾in. Do.	12 4		
1½in. Do.	12 10		

		Railway rates per yd.		
		King's Cross.	Mint-street and Farringdon-street.	Popl Black
FLINTS.—	s. d.	s. d.	s. d.	s.
Luton field flints, exclusive of freight	5 6			
Do. broken to a 2in. guage	6 3	3 11	— 4 6	— 5
Faversham field flints	5 6	delivered alongside to wharves		
Do. broken to a 2in. guage	6 3	Chelsea.		
Plymouth granite alongside wharves below Chelsea:—				
2in. broken for macadam, per yd.	19 0			
1½ Do. Do.	21 0			

stone, its weight, allowing 12c.ft. of solid granite to one ton, is approximately $1 \times \frac{13 \cdot 5}{12} = 1\frac{1}{8}$ ton."

Boulnois says: "55 per cent. of ordinary road metal is solid." Returning to Law and Clark. "Again one cubic yard is equivalent to 36 square yards 1in. deep, and one ton of metal laid without compression to a depth of 1in. covers an area of $(36 \times \frac{1}{1\frac{1}{8}} =)$ 32 square yards. When the metal is laid and rolled, the primitive volume is reduced by one-fourth, and one ton of rolled metal laid to a depth of 1in. covers an area one-fouth less than 32 or $(32 \times \frac{3}{4} =)$ 24 square yards." Boulnois says "a cubic yard of ordinary broken road metal will cover 30 square yards of surface."

To find the area of surface that can be covered by one ton of broken granite when the thickness of the layer is given, divide 32 by the thickness of the layer in inches unrolled, or divide 24 by the thickness of the layer in inches when rolled. The quotient is the area in square yards. To find the area of surface that can be covered by one cubic yard of broken granite when the thickness of the layer is given, when the metal is not rolled, divide 36 by the thickness in inches; the quotient is the number of square yards that can be covered. When the metal is rolled, divide 27 by the final thickness in inches to give the required quotient.

To each of the foregoing items must be added wharf charge (see article 9) and the cost of delivering into carts. When brought by barge, it would be either carted or sent by rail to its destination from one of the riverside railway wharves. The railway companies charge 6d. per ton for the transfer, from barge to truck about 6½d. per yard.

If thrown direct from the barge into a cart (as Article 9), a man should throw about 15yds. in a day of ten hours; constant ·66 at 5¾d. per hour = 3¾d. per yard. Observe that half the cargo will require a second throw, and that if the driver helps, and does an equal quantity of throwing, the cost will be reduced by one-half, as his time is charged in that for carting.

For throwing from a truck into a cart ma taken at the same price. A cart will take 1½ tons.

Notes of Cost of Road Materials and Labo the Country.—Mr. Burrows says (1884) i district, Kent, exclusive of cartage, gravel 2s. 5d. per cubic yard, flints 1s. 6½d., bea shingle into railway trucks 2s.

"The actual average cost per yard of sto the highway districts around me is:

Delivered on roads	4s. 2d. per
Breaking	1 1 ,
Spreading, raking, &c. (say, in forming new road)	0 2 ,
	5 5

"Breaking of rock and flints averages 1s per yard to pass a 2½in. ring. Spreading depend upon the system adopted in laying o stacking." With large heaps in depots, more than 100yds. apart, a man will dispo from 6 to 7 cubic yards per day. The ave cost of spreading in the highway districts all is to is 7d. per yard (about).

For cartage of materials, an average pric 7½d. per yard per mile.

Breaking up to a depth of 4in. may gene be done for 1d. per superficial yard.

Digging and Quarrying in the Country.— Mr. Burrows says (1884):—"The average of digging rock in four different highway tricts (Kent) I find to be 1s. 4d. per yard stone)."

Mr. Bailey Denton says (1857):—"Red s stone can be quarried to suitable sizes for " ford' foundation at 1s. 3d. per cubic y millstone grit, quarry, break to two sizes foundation and covering and clamp, 1s. per cubic yard; oolite and lias rocks, do. 1s. per cubic yard; digging chalk, including ba 1½ yards, clamped at pit ready for carting, per yard; digging gravel (with a baring 2 yards of soil) clamped at pit ready carting, 5½d. per cubic yard; raising chalk shaft and buckets not exceeding 20ft. deep, per cubic yard."

Codrington says:—"Maintenance of m adamised roads. Quarrying stone for r metalling usually costs, at ordinary rates wages, 6d. to 1s. per cubic yard, according the difficulty of the work, and stacking the st for measurement 2d. per cubic yard. Igne rocks are sometimes difficult and costly to quar and can then be broken at a comparatively ch rate, owing to small size of fragments. Thus s hard basalts and traps cost no more than 1s. per cubic yard to break, after having been rai from the quarry at 1s. per cubic yard or more.

Hurst says:—"A quarryman will be able turn out from 5 to 8 tons of limestone or ot stratified rock per day, and from ½ to 1 ton granite."

Rankine says:—	Consta Per y
Quarrying rock of moderate hardness with wedges	
Quarrying rock of moderate hardness by blasting	
Loading barrows with stone	
Unloading do.	
Wheeling one cubic yard of stone 100ft. horizontal; if on an ascent, allow 6ft. distance for each foot rise	

Generally, in the stone districts, each par

COST, EXCLUSIVE OF FOUNDATION.

Lime concrete per yard super. Thickness.	Situation.	Description.	First cost per sq. yd.	Years of maintenance included in first charge.
			s. d.	
9in. .. 1 9	Cheapside	2¼in. Val de Travers compressd.	16 3	2
9in. .. 1 9	Poultry	2¼in. ditto	16 3	2
6in. .. 1 9	Old Broad-street	2in. ditto	14 3	2
6in. .. 1 9	Moorgate-street	2in. ditto	14 3	2
3 0	Ditto	Barnett's liquid iron asphalte	10 6	3
	Ditto	2in. Limmer liquid asphalte	13 4	2
9in. .. 2 8	Lombard-street	Ditto	13 4	2
6in. .. 1 9	George-yard	1½in. Val de Travers liquid	10 3	10

This may be compared with the following list of tenders for street paving for the Board of Works for the Westminster District, July, 1890. Per superficial yard:—

	Compressed asphalte, 1in. thick on 3in. concrete.	Compressed asphalte, ¾in. thick on 3in. concrete.	Mastic asphalte, 1in. thick on 3in. concrete.	Mastic asphalte, ¾in. thick on 3in. concrete.	Mastic asphalte, ¾in. thick, overlaid with compressed asphalte ¾in. thick on 3in. concrete.	Compressed asphalte, 1½in. thick on 6in. concrete.	Compressed asphalte, 2in. thick on 6in. concrete.	Years of maintenance included in first charge.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	
Val de Travers	7 0	5 9	6 6	6 0	7 0	10 6	12 6	2
Limmer asphalte	6 0	5 0	5 9	5 3	6 6	10 0	12 0	2
French asphalte	6 6	5 6	6 3	5 6	7 0	10 6	12 6	2

The charge for asphalte work in the country is generally about 5 per cent. more than in London. Increase in the quantity modifies the price in some such ratio, as follows:—

	1in.
250ft. to 500ft. per superficial foot	11½d.
500ft. to 2,000ft. ,, ,, ,,	11¼d.
2,000ft. to 3,000ft. ,, ,, ,,	11d.
3,000ft. to 5,000ft. ,, ,, ,,	10½d.
5,000ft. to 10,000ft. ,, ,, ,,	10¼d.
10,000ft. to 20,000ft. ,, ,, ,,	9¾d.
And upwards ,, ,, ,,	9¼d.

But in large works it is always best to obtain a price from one of the asphalte companies.

Weight of Road Metal.—In calculating the value of cartage, knowledge of the weight of road metal will be necessary. Multiply the weight of a cubic foot of any stone by 27 to bring it to a cubic yard. Multiply the product by 0·55. The result will be the weight of a cubic yard of the same stones when broken for metalling (Boulnois).

A cubic yard of Guernsey granite broken to pass through a 2½in. ring gives an average of	Ton.	cwt.	lb.
	1	1	3
Flint	1	1	3
Pit gravel	1	4	3
Limestone	1	3	0

The following ready rules for the calculation of weights and quantity of road metal are extracted from Law and Clark's "Construction of Roads and Streets":—

"Since a cubic yard of loose broken stone contains only one half of its volume, or 13½c.ft. of solid

a quarry. The contractor for the repair and intenance of the roads obtains the rubble stone n it without charge, but he quarries, breaks, veys, and spreads it. Residents in such ishes may usually obtain stone for mending vate roads or building from the same quarry, ing a Royalty of 4d. to 6d. per cubic yard, doing their own quarrying. A common rate vages for a quarryman is 18s. per week; but is more commonly employed at a price per ic yard for quarrying the stones, which he ks with an ingenious looseness for measure- nt. The baring—the removal of the earth ve the beds of stone—would be extra. The t of quarrying ranges from 1s. to 1s. 6d. per ic yard, according to the compactness of the ne. Mr. Bailey Denton's prices above men- ned, although cited so long ago, are still, in main, correct.

Burnt Clay.—Mr. Burrows (1884) says: "I have ned it out ready for bottoming at a cost of less n 2s. per cubic yard, including digging the y, clamping, burning, and the necessary fuel. e digging, wheeling, and burning cost 1s. 1d. cubic yard, and a chaldron of breeze costing burnt from 9 to 12 cubic yards, according to size of heap.

Granite Curbs.—Guernsey curb, alongside in ge to wharves below Chelsea.

10in. by 6in., 1s. 2d. per ft. run.
12in. by 6in., 1s. 5d. ,, ,,

Mountsorrel Curbs.—In trucks at St. Pancras Camden.

in. by 12in. Mountsorrel edge curb, 1s. 5½d. per. ft. run.
2in. by 6in. Mountsorrel flat curb, 1s. 7½d. per ft. run.

Aberdeen and Norway Granite are about equal value, alongside in barges to wharves below elsea.

6in. by 12in., 1s. 9d.

Add on any of the foregoing curbs, if circular on n, 2d. per ft. run.

Plymouth.—

6in. by 12in. edge curb, 1s. 3d. per f run; circular 6d per ft. extra.

Kentish Rag.—Alongside in barges to wharves low Chelsea.

6in. by 9in. curb, 10¾d. per ft. run.
4in. by 8in. ,, 8¾d. ,, ,,

At Bricklayers' Arms Station add ½d. per ft. foregoing; add, if of circular plan, per ft. n 1d.

Guernsey.—Granite setts alongside in barges wharves below Chelsea:

	s.	d.	
3in. by 7in.	28	0	per ton.
4in. by 7in.	25	0	,,
5in. by 7in.	23	0	,,

Mountsorrel.—In trucks at St. Pancras or mden:

	s.	d.	
3in. by 5in.	25	3	per ton.
3in. by 6in.	28	3	,,
3in. by 7in.	28	3	,,
4in. by 4in.	25	3	,,
4in. by 9in.	24	3	,,

Plymouth.—Alongside in barges to wharves low Chelsea:

	s.	d.	
3in. by 5in.	28	6	per ton.
3in. by 6in.	26	6	,,
3in. by 7in.	28	6	,,
4in. by 4in.	40	0	,,
4in. by 9in.	25	6	,,

To the price of setts and curb add 6d. per ton r landing, and the cartage according to distance, suming a cart load at 1½ ton.

Boulnois says:—A ton of granite setts will ver, varying with specific gravity of stone 'or weight of stone, see "Notes on Building nstruction," Part III. Rivington)—

5in. by 3in.	4½ sq. yds.
6in. by 3in.	3⅔ ,,
4in. by 4in.	5⅓ ,,
7in. by 3in.	3 ,,

Lynde says (Institution of Civil Engineers, 79):—The average cost of repaving in Man- ester with Carnarvon granite setts was for—

4in. setts	10s.	per superficial yard.
5in. ,,	11s.	,, ,, ,,
6in. ,,	12s.	,, ,, ,,
7in. ,,	13s. to 13s. 6d.	,, ,, ,,

The details of the 6in. paving were as follows, per superficial yard:—

	s.	d.
Welsh granite setts at 27s. 3d. per ton delivered	7	5¼
Grouting with asphalte and granite chippings	1	2
Forming bed and laying setts	1	0
Carting	0	5
	10	0¼
Superintendence and plant, 10 per cent.....	1	0
Total	11	0¼

Forming contour of road bed. A man should do about 70 superficial yards in a day of 10 hours, this at 5¾d. per hour = ¾d. per yard. Constant ·014.

Spreading road-metal, shot in heaps at convenient distances, a man should spread in 6in. layers 30 cubic yards per day of 10 hours. This at 5¾d. per hour = 1¾d. per cubic yard. Constant ·033.

Picking up macadamised roads to a depth of 4in., a man should do 40 superficial yards per day of 10 hours. This at 5¾d. per hour = 1½d. nearly. Constant ·025.

Laying granite setts, including gravelling the bed and grouting: Paviour, per hour 9d.; labourer, 5¾d.

	Paviour and Labourer, Yards per day of 10 hours	Per yd.	Cnstnt.
Setts 5in. deep and under	11	1s. 1½d.	·09
,, 5in. to 7in.	10	1s. 2¾d.	·10
,, 7in. to 9in.	9	1s. 4½d.	·11

	Feet cube.	Per ft. cube.	
Setting curb in mortar, including preparation of gravel bed	36	4d.	·027

The foregoing may be applied by the comparison of the inches of section, a 12in. by 6in. curb being 72 sectional inches compared with a cubic foot, 144 sectional inches, we have $^{72}/_{144}$ = ½ of 4d. = 2d,

Laying wood-block paving, including grouting with bitumen (prepared by other men), and top-dressing with sand:

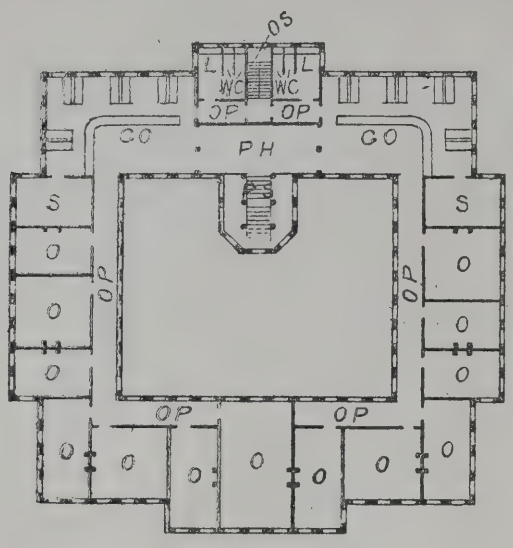
	Paviour and Labourer, Yards per day of 10 hours.	Per yd.	Cnstnt.
9in. by 6in. by 3in blocks	13	11¼d.	·077

Tar, Pitch, and Creosote.—These would be used for tar paving, for grouting granite-pitcher paving, and for making bituminous concrete.

Coal-tar can be obtained in small quantities at any gas-works. It costs, for 21 gallons and under, 4d. per gallon; above that quantity 3d. per gallon. The contractor may conveniently carry it in old paraffin casks purchased of oilmen. If required in large quantities, it is better to purchase it of a tar distiller, who will supply casks at 3s. 6d. each, the full amount returned if the cask is sent back undamaged.

At tar distiller's, coal-tar pitch (in blocks) cost 40s. per ton; Stockholm tar, in barrels costs 22s. per barrel of 28 gallons; Stockholm tar, second quality, in runlets, 33s. per runlet, 40 gallons—Stockholm tar varies in price, according to the condition of the market, as much as 20 per cent.

At tar distiller's, creosote oil, in barrels, 2¾d. per gallon, in casks at 3s. 6d., returnable.



If a load is purchased, the manufacturer will generally deliver without extra charge. Smaller quantities must be fetched.

Jarrah Wood.—This wood is likely to be extensively used for paving, and for that purpose is imported of convenient size, 9in. by 3in., for sawing into blocks; 9in. by 5in. by 3in. (the orthodox dimensions), so as to be laid with the ends of the grain exposed. It may be bought in lengths of 3ft. to 20ft., at £6 15s. per load at docks; to this must be added cartage. The sawing costs 25s. per thousand blocks, usually done by saw-mills, who will fetch the timber from docks at as low a rate as the builder can do it. The waste will not exceed 5 per cent.

THE LABOUR QUESTION AS REGARDS AGRICULTURE.

At the meeting of the Surveyors' Institution, held at 12, Great George-street, on Monday evening last, the President, Mr. R. C. Driver, in the chair, an interesting and well-considered paper on the above subject was read by Mr. T. A. Dickson, F.S.I. It may, at first sight, appear that the theme of the paper is one which but little affects the interests of our readers; but when it is remembered that the state of the labour market in towns is, to a great extent, governed by the prevailing conditions of agricultural labour, it will be seen that the subject is one in which all employers have a very real concern. After setting forth the very large proportion of the farmer's profit which is swallowed up by the item of labour, and the, nevertheless, very frequently unprosperous condition of the labourer himself, Mr. Dickson proceeded to explain that this had been very largely due to the unsatisfactory working of the Poor Laws, especially in the matter of outdoor relief. He quoted figures which showed that, where more effective administration had been adopted, whether in rural or urban districts, the result had been invariably an improvement in the status of the labouring classes. By a series of elaborate historical statistics, based on the researches of Professor Thorold Rogers, it was shown that, although the condition of the labourer, so far as the purchasing power of the average wage was concerned, had steadily declined until about the year 1834, there had since been a marked improvement in this respect; and the author pointed out that ever since the 14th century legislation for the agricultural labourer had been on wrong lines, tending rather to pauperise and degrade him than to help and elevate. A natural result of this was clearly shown in the Registrar-General's report on the last census, in which it is stated that "in no less than fourteen counties—all agricultural—there has been a decrease in the population, many of the inhabitants having migrated to the manufacturing and mining districts." The profit-sharing system propounded by Mr. George Livesey for the stokers and others employed by the South London Gasworks, and the superannuation scheme of the Great Eastern Railway Co. for its employés, could not, the author of the paper thought, fail to draw men from the country to the town. After considering and comparing the different ways of paying wages in the country, whether partly in money and partly in board and lodging, or perquisites, or wholly in money, each system affecting differently the comfort and prosperity of the labourer, while making but little ultimate difference in the wages bill per acre, Mr. Dickson went on to consider how best the present state of matters could be improved, the migration from the country into the towns checked, and the existing scarcity of labour in the rural districts, and its undue preponderance in the urban markets, remedied. For these purposes he proposed first, the encouragement of thrift, by a reform in the administration of out-door relief and by the establishment of greater facilities for insurance and investment of savings, and the easier acquisition of allotments. A great want was felt in the country of a scheme of assurance and sick relief large and solid enough to remove all doubts of its permanence and stability, and to reduce working expenses to a minimum, yet sufficiently sub-divided and local to prevent imposition. An amplification of the present Post Office Assurance and Savings Bank system would probably meet this want, and by making the benefits derivable to accrue at an age when a man might reasonably wish to realise the savings of his youth, Mr. Dickson contended that not only would thrift be encouraged, but the evils of early and improvident marriages would also be reduced. The teaching to the more intelligent of the labourers of some one of the many handicrafts useful on the farm would also improve the scale of wages, and a co-operative scheme, somewhat on the lines of that adopted by the South Metropolitan Gas Company, or the Parisian firm of painters and decorators originated by Leclaire, could not, if as ably worked as these, fail to do some good. Better provision for recreation, for night schools, and for some system of agricultural technical education were also advocated, although the author was careful not to give his sanction to any scheme which proposed to tax the whole community for the exclusive benefit of agriculture. The last suggestion was for the improvement in cottages, in which anyone who compared the wretched hovels of some few years ago with the comfortable dwellings which in many parts of the country were superseding them must recognise a very important factor towards the attainment of the end sought. Mr. Dickson concluded with a hopeful allusion to the improvements in this direction which, he thought, could not but follow from the operation of the Housing of the Working Classes Act of last session.

MANSFIELD AND MANSFIELD WOODHOUSE DISTRICT HOSPITAL.

MANSFIELD AND MANSFIELD WOODHOUSE DISTRICT HOSPITAL.

THE new Accident Hospital, of which we give a sketch, and which has just been completed, was formally opened on Monday, the 27th ult., by the Duke of Portland.

The building is centrally situated. The accommodation provided is two wards for three and two beds respectively, general or committee-room, doctor's room, bath-room, ward store, and general store. In the administrative department are kitchen, scullery, pantry, good cellar, three bedrooms, and store-room. The outbuildings comprise mortuary, wash-house, and the usual offices. Additional accommodation can easily be provided by the erection of another ward, as indicated in the architect's plans. The walls are of brick (built hollow), relieved with stone dressings used sparingly, and the roof slated. Internally the woodwork is in yellow pine, stained and varnished. The floors of wards, general room, doctor's room, and bedrooms are of red deal in narrow widths; the floors of corridor, bath-room, and w.c. are of cement concrete. The windows have deep bottom rails, which allow of the lower sash being opened and fresh air admitted at the meeting rails without draught. The upper part of the windows in the wards (above transome) opens inwards. The contractors for the building are Messrs. Evans and Woodcock, of Nottingham, and the architect, Mr. R. Frank Vallance, M.S.A., under whose superintendence the works have been carried out.

CONDITIONS OF SAFETY IN THE USE OF GEYSERS.

A LECTURE on this subject was given by Mr. George Ewart before the Balloon Society on Friday evening. In his opening remarks he confessed that manufacturers, including the firm whom he represented, did not at first understand the danger that geyser baths involved, and even now there was great difficulty in gaining the attention of those who already possessed geysers. Having explained the principle on which geysers are constructed—that of absorbing heat from gas by flowing water—Mr. Ewart pointed out that the danger arose from the small size of the bath-room, owing to the production of carbonic-acid gas. It was useless to warn people to keep the door or window open whenever a bath heated by gas was used, for sooner or later the precaution would be forgotten, or the bath used by someone ignorant of the necessity. It was, therefore, imperative that the products of combustion should be conveyed outside the bath-room by self-acting apparatus. This could be partially done by fixing a hood over the top of the geyser, in which the products might collect, and if the hood was of greater diameter than the geyser, and was connected with the outer air by a pipe not less than 6in. in diameter, the danger would be greatly diminished. There remained, however, a possibility of michief being done by stopping up the pipe to prevent down-draught. A much easier as well as safer plan was to gather the whole of the products into a copper cap, which formed a part of the geyser itself, and had a fixed socket of sufficient diameter. A "vent" pipe of the same or larger size connected with this socket conveyed the whole of the products outside the room. He pointed out that if every geyser were fitted with a vent-pipe, there would be no more fatal accidents. There was the risk of inconvenience from down-blow in the vent-pipe; but this would be obviated by shielding it. To the geysers made by his firm an enamelled label was so affixed over the spout that it could not be removed without disfigurement, stating that the geyser must not be fixed without a vent-pipe, and that the bath must not be entered while the geyser was alight. As the public were careless, and plumbers and gas-fitters frequently obstinate and conceited, as well as sometimes ignorant, he recommended that it should be made a penal offence for any maker to sell an instrument capable of consuming more than a certain quantity of gas per minute without the enamelled warning as to vent-pipe, and also for any fitter to fix any such apparatus in any room containing less than a certain number of cubic feet of air. The machine should also be so constructed as to admit of the vent-pipe being easily attached to a socket specially arranged for the purpose.

A cottage hospital at Kirkcaldy, built at a cost of £3,000, was formally opened on Saturday.

Our Illustrations.

CONTEMPORARY MUNICIPAL ENGINEERS AND SURVEYORS.

(See description on page 771.)

GRAND HOTEL, LITTLESTONE-ON-SEA, KENT.

The design we illustrate to-day is by Mr. Percy Burnell Tubbs, of 77, Fore-street, City, E.C., who has been retained by the directors of the Littlestone-on-Sea Hotels Co. to act as their architect. The scheme, although at present comprehensive, is capable of extension, and when the building is complete it will compare most favourably with hotels at other sea-side resorts. It contains large coffee and smoking-rooms, billiard-room, reading and drawing-rooms, private dining-rooms, and golf club-room. A restaurant is also arranged, so that while distinct from the hotel it is capable of direct supervision. Ample bed accommodation is provided in 60 large and lofty rooms, with baths and lavatories on each floor, and the hotel is fitted throughout with electric bells and every other modern appliance, including a passenger lift. The construction is of brick, faced with Portland cement, the roofs being covered with Welsh slates in ornamental bands. The style chosen has proved suitable for the position of the building on the marine front. The bay windows afford extensive views of the English Channel. The tower, which forms a good central feature, is easily accessible from the main staircase, and from it a fine view of the surrounding country and coast-line to Hythe and Folkestone may be obtained. The estate on which the hotel stands adjoins the ancient Cinque port of Romney, and the neighbourhood is full of antiquarian and historic interest. It is rapidly developing, and one of its attractions are the extensive golf links, which extend for upwards of three miles in length.

A CORNER OF A BOUDOIR.

Our illustration is from a coloured drawing which appeared in the Royal Academy Exhibition of this year. The chimneypiece, arch, and panelling of the room were finished an ivory white, door and furniture of dark mahogany. The frieze was an embossed paper, cream with gold background; draperies, pale steel blue, and carpet background a darker shade of same colour. The design and drawing are by Mr. J. Armstrong Stenhouse.

BRANDESBURTON CHURCH, YORKSHIRE.

Before the work of reparation was commenced last year the church was most forlorn. Deal "loose box" pews, flat plaster ceilings, windows walled up, whitewash everywhere, western gallery, and the superior parishioners accommodated in the chancel. During the alterations some very interesting discoveries have been made, and are now in evidence. One of the most successful works has been the straightening of the north and south nave arcades, which were alarmingly out of the perpendicular, and this was done without removing the present nave roof. There are some good brasses now exposed to view, one belonging to the St. Quintin family, the founders of the chantry chapel, which stood on the north side of chancel. The contractors were Messrs. H. and W. K. Barr, of Hornsea, who have carried out the whole of the works, except the marble pavement and the nave seats, the former supplied by Messrs. Farmer and Brindley, of London, and the latter made by Mr. J. Robinson, of Brandesburton. The stone is from the Whitby Crag Moor Stone Quarries. The tower and nave roof remain to be dealt with when funds permit. The work has been carried out under the superintendence of Mr. W. S. Weatherley, architect, of 20, Cockspur-street, London, no clerk of the works having been employed.

NEW HEAD-QUARTERS FOR THE ST. GEORGE'S RIFLES (SIXTH MIDDLESEX).

The new head-quarters of the St. George's Rifles (hon. colonel: Col. C. Washington Eves, C.M.G.; Col. Stanley George Bird, commanding) occupy an important site in Davies-street, Grosvenor-square, W. The land has been granted to the regiment by His Grace the Duke of Westminster on a long lease at a peppercorn rental, and occupies part of the site of old Shepherd's Market. The building has been erected to provide the regiment with a suitable drill hall, armoury, gymnasium, Morris tube gallery, recreation room, colonel's and officers' rooms, &c.; also the requisite accommodation for the regimental staff. The drill hall is about 90ft. in length and 57ft. in width, and has an open roof, with lantern light in centre. The front elevation is faced with red pressed bricks, and the dressings and masonry are of Portland stone. The porch has polished red Peterhead granite columns. The roof to the front portion is covered with Broseley tiles, and the turret and cupola with copper, by Messrs. Ewart and Son. The general carving was executed by Mr. A. Bradford, but the figures in the pediment of the porch—viz., St. George and the Dragon—will be sculptured by Lieut. G. E. Wade, one of the officers of the regiment, and will be presented by him. The floors are of fireproof construction throughout. The drill hall and principal rooms have pitch-pine flooring on fir joists, and sleepers above the concrete. The corridors and entrance hall are paved with marble mosaic and terrazzo. The works have been carried out under the superintendence of the architect, Mr. Charles Herbert Shoppee, F.R.I.B.A., of 22, John-street, and 61, Doughty-street, London; the general contractors for the works being Messrs. E. Lawrance and Sons, of 14 and 16, Wharf-road, City-road, N. Her Grace the Duchess of Westminster will open the head-quarters on Saturday in next week, December 6th.

SKETCHES IN SHROPSHIRE.

This sheet of pencil studies represent some of the most characteristic specimens of old timber building combined with stonework to be found in Shropshire. Much Wenlock Priory, the more famous of these, is drawn from the quadrangle, and the entrance front is given of Ludford Hall,* near Ludlow. The Blue Bridge Inn at Much Wenlock figures below, by the side of some more old timber houses at Ludford. Mr. George P. Bankart, of Leicester, is the author of these exceedingly interesting drawings.

THE FOX INN, KESTON.

The Fox Inn is very picturesquely situated at one corner of Keston Common, in the county of Kent, with charming views and walks in the immediate vicinity, while close by is the famous Cæsar's Well. The old house, which had been in existence for the last two hundred years, was pulled down and entirely rebuilt in 1889 on a much larger scale, so as to accommodate the ever-increasing number of pleasure-seekers who betake themselves here during the summer and autumn months. The hotel accommodation is ample, and there is a spacious club-room for cyclists, &c., on the first floor, and the stabling is utilised to its full capacity on a fine summer's day. The Fox was rebuilt for Messrs. H. and V. Nicholl (Limited), by Mr. Thos. Knight, builder, of Sidcup, Kent, for the sum of £2,000, from the designs and under the superintendence of Mr. Albert L. Guy, A.R.I.B.A., 78, High-street, Lewisham, S.E.

* See Building News April 15, 1881, for another view and particulars.

FOUR CHAIRS FROM FLORENCE.

These examples of a branch of furniture which is always useful, are not only good in themselves, but are also valuable as being suggestive of ideas which may be of service in modern chair design. The subjects of our sheet of sketches are all of Italian origin, and are located in the National Museum at Florence. They belong principally to the 15th and 16th centuries. The first and fourth seats in the illustration resemble earlier Roman examples, and are usually known as such. The last chair shown is a form which was in general use in Venice in the 16th century. In this the seat is fastened into two planks—the one in front being shorter, and the one behind being long enough to form a back rest. The parts are often stout, and admit of massive carving, grotesques seldom being absent. The chair at the right-hand top is of a more ordinary form, with leather seat and back, but made folding, which latter feature is rather unusual. The two shell-like ornaments at top, too, are curious.

CHIPS.

A fresh appeal for funds to complete the restoration of Croyland Abbey has just been issued by the rector of that parish. It is stated that the work of reparation was begun on the 28th of September, 1888, and six out of the ten sections (into which he originally divided the work) have been accomplished at the small cost of £1,400. He now desires to secure the steeple and north wall of the north aisle. A sum of £2,000 is still required.

An oak cope chest, with semicircular cover, designed and executed on the premises of Messrs. Criddle and Smith, Truro, has been placed in the crypt of Truro Cathedral.

A monument has been erected in the churchyard of St. Michael's, Tenbury, over the grave of the late Rev. Sir Frederick Gore-Ouseley. It is a recumbent tomb, executed in polished red granite, with a cross in white marble resting upon it.

At a meeting of the Dartford Local Board on Friday it was proposed that the salary of the board's surveyor, Mr. Harston, be increased from £200 to £250 per annum. The motion was carried, an amendment that the increase be £25 a year obtaining only one vote.

The Native Guano Company have converted a portion of the riverside ground adjoining the sewage precipitation works at Kingston-on-Thames into a promenade and pleasure resort. The first completed section of the new recreation-ground, which will be known as Canbury Gardens, was formally opened last week.

The parish church of St. Mary, Stamford, has been reopened after restoration from plans by Mr. Sedding. The nave floor has been lowered and the seating improved, while in chancel new altar, choir-stall, rood screen of oak, and a sanctuary floor of white and black marble in squares have been constructed. The contractors for the work in the nave were Messrs. Roberts, of Stamford, and for that in the chancel Messrs. Trask, of Norton, Somerset. The outlay has been over £2,500.

The funeral of Mr. Stephen Ballard, M.I.C.E., of The Winnings, Colwall, near Malvern, took place on the 20th inst. Mr. Ballard was engaged with Mr. Brassey in the construction of many lines of railway at home and abroad. He left instructions in his will that he should be buried on a spot of ground belonging to the Great Western Railway Company, on the hillside, and contiguous to the ventilation shaft of the tunnel which passes through the Malvern Hills. The spot is a secluded and picturesque one, and is surrounded by trees. Mr. Ballard was the contractor for this tunnel.

At St. Michael's Church, Broadway, Worcestershire, services to commemorate the jubilee of the church, which was consecrated Nov. 3rd, 1840, and to celebrate its reopening after the provision of new seats and other improvements, were held last week. By the expenditure of £350 the church has been re-seated. Eighty new sittings are provided. The seats are of pitch pine, and they take the place of narrow, uncomfortable pews with upright backs. There are now four rows of seats in the place of three. Under the seats a flooring of 1½in. deal boards, with oak curb fixed on oak joist, has been laid down. The stone flooring is replaced by encaustic tiles both in the church and porch. The general work of reseating has been carried out by Messrs. Espley and Co., of Evesham.

WAYSIDE NOTES.

RESTORERS generally open their mouths so wide when they ask for funds, that one feels the greater pleasure in giving prominence to the modest appeal of the rector of Croyland for the comparatively small amount still required to put the old Fenland abbey church in decent repair. The rector, in a letter to the *Times*, says that from the commencement of operations on September 28th, 1888, up to the present time, the sum of £1,400 has been expended, and that the repair of the north wall and spire—the rev. gentleman uses the good old English word *steeple*—necessitates a further outlay of £2,000. A grand total of three thousand four hundred pounds sterling is not a vast sum to spend on an old building as things go nowadays. Moreover, since what remains of the abbey of Croyland is architecturally beautiful, historically interesting, and invested by Kingsley in his "Hereward the Wake" with something of romance, it has claims on the charity of English men and women which ought not to be ignored. It is much to be hoped that many able and willing persons will generally loosen their purse-strings, and contribute towards the requisite £2,000, which, indeed, is a modest sum enough. Further, I believe that in this case the *restoration* is rather such a work of *reparation* as I have long argued is what nine out of ten old buildings require.

In further elucidation of the manner in which ancient Egyptian monuments are destroyed, I note a letter from "Traveller"—a *Times* correspondent—stating the fact that he has been an eye-witness for one whole month to an operation concerning which we from time to time have rumours. I allude to the removal of blocks of stone from the base of the Pyramids. Quite a trade seems to be carried on in this way—the Arabs breaking up the large stones, so laboriously wrought into shape some 4,000 years ago, and disposing of the fragments as building material. I have no doubt, considering the great mass and bulk of the Pyramids, the lethargic nature of modern building, and the absence of our friend, Mr. B., from the land of Egypt, that this process might be carried on for some time with little visible effect; but this makes the operation not one whit less criminal. The Arabs, who make a veritable stone-quarry of the Pyramids, have had, however, many precedents set them in this country. What so common as to find stones from old ecclesiastical edifices built into cottage-walls, not as re-worked blocks, but with cusp, moulding, or carving in all its pristine glory unblushingly displayed? And there are not a few buildings in England wholly constructed of material purloined from neighbouring abbey, church, or castle.

On Saturday last there happened an accident in New York of a kind of which we have had many examples in this country since the days when the homogeneous construction of the past gave place to the system of building with iron skeletons, as now in vogue. A new brick building was being constructed for the firm of Wells, Fargo, and Co., and, without any available warning, one of the walls fell into a heap, burying some fifty workmen under the ruins. The report of the occurrence said that it was "understood that the iron girders that were being put into the building were too heavy for the brickwork," and that it was "believed that their weight, under the high wind which prevailed, was the cause of the accident." As throwing some further light on the cause of the disaster, I read that the wall fell in a "vacant lot." From the latter fact, one might conclude that it was a long wall with little or no "tie." Such, at any rate, has been the case in a great number of instances where a collapse of this nature has occurred, and it is only by a good fortune that many more walls of this kind do not fall in, if we may judge from the frequency with which builders will put up structures offensive to every eye imbued with a sense of constructive fitness.

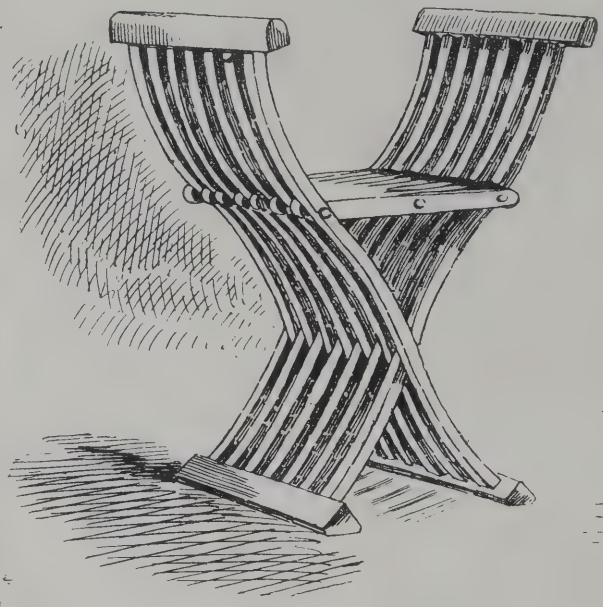
Half a gale turned on at the right moment would bring down walls of this description like wind-falls from an apple-tree. In an exposed seaside situation I have seen walls thus turned over like nine-pins, in which place I remember it was the custom of Buggins and Co. to *prop the green walls*, when without sufficient tie, *with scaffold poles*. The other cause to which the New York accident is partly attributed—viz., the weight of girders on a weak wall, is also familiar enough, unfortunately, in this country. Designers may be seen sometimes to concentrate a load on the end of an iron girder, and place it anywhere and anyhow on the walls—both in plan and in practice—with as much suaveness of manner as though placing a hat-peg on its rail. Stanchions are treated with superior contempt, and the idea of thickening the wall a little where the girder bears, never, apparently, occurs—at least to some planners.

I believe there are many architects who have a mortal hatred of stanchions. I have myself, and regard them as leading to constructive shams, though they are at least honest, hard-working members of a building, while the granite, stone, or terracotta pilasters before them are rank impostors. At the same time, if great loads are to be concentrated on one spot, the iron skeleton must be made complete in all its parts. Fully carried out with stanchions, girders, and columns, properly designed so as to admit of a perfect system of bolting and riveting, the iron framework method of construction, fatal, though it may be, in our present state of knowledge*, to true architectural progress, yet affords an unrivalled means to bracing a building. When employed in a half-hearted manner, however, the tie is incomplete. In stating, therefore, as I have above, that accidents have happened, in these days of mixed construction, unknown in the era of timber, brick, and stone simply employed, it would be an injustice to lay the blame directly on the new system itself. Accidents are solely to be referred to its abuse, and to its use by persons ignorant of the principles of iron construction. What may happen where iron is unskilfully employed was well shown some years back at Sidcup, when a passing traction-engine literally shook down a couple of shops, nearly completed. The marvel of this extraordinary incident may perhaps be somewhat lessened when I state that, from personal inspection of the débris some hours subsequent to the collapse, I can vouch for the fact that there were not two bricks adhering the one to the other, such was the nature of the "mortar" employed.

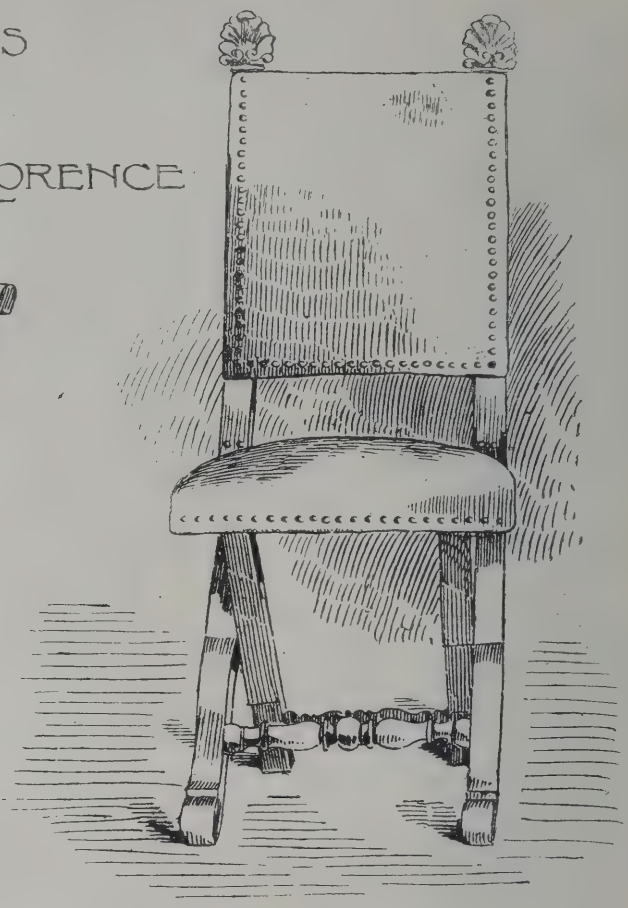
"Débris," or "hard, dry rubbish," in a specification? Personally, I have had nothing to do with the former word in any specifications of my own or those of other parties with which in former years I may have been concerned. From the reports of the case of "School Board for London v. Wall Brothers," I gather that some years back, if not at the present time, the architect to the department employed the word "*débris*." I put the two terms forward impartially, but must confess, judging by the result associated with the use of the shorter and more compact, if alien, expression, that the good old words "hard, dry rubbish" are to be preferred.

One of the best things I have heard for some time is that Mr. Waterhouse will be the president of the Art Congress for 1891. Under the presidency of so able an architect, the Congress of 1891 should be a vast improvement on that recently held at Birmingham, which has generally been voted dull. For an assembly like the N.A.A. no one should be a better president than an architect, who is, of necessity, interested and, so to speak, in touch with all the arts. This cannot be said of everyone serving the ends of art. It is too much the tendency to run in grooves, and become absorbed in the contemplation of one side of a question only. An architect, I think I may venture to say, takes generally a broader aspect of affairs than artists pure and simple, as a confirmation of which there is the fact that the education of an architect is the best possible beginning for artists in almost every branch of art work. I have, moreover, often moralised with myself to the effect that an architect gets better hold of broad principles of design than others. That an architect, then, should preside over a meeting of art-workers in every walk of life, and over a public interested in the productions of such persons, seems only natural and proper.

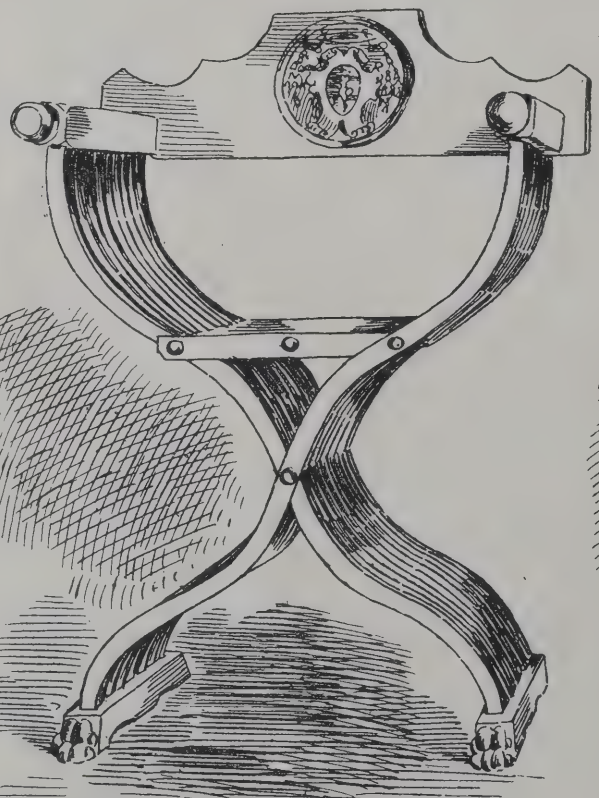
A discourse descriptive of holiday touring possesses a special charm to the architect, reminding him as it does of quite the pleasantest side of his architectural life. Meetings whereat papers of this nature are read are generally well attended. I understand that Mr. Robinson's entertaining description of the Association's tour was much enjoyed by the members who appreciated Irish humour, and were quite prepared to believe that "This abbey is now a farmyard," &c. It was a great disappointment to me not to be able to attend the meeting of the Society of Architects on Tuesday, when Mr. Middleton gave what must have proved a most enjoyable address on the Society's tour in Kent. From all I have heard from members of the Society who joined the excursion, this was one of the most successful undertaken by any body of architects on old-building hunting intent. A recounting of things done and seen by Mr. Middleton must have given great pleasure to all his hearers, and particularly to those who have the memory of the excursion fresh in their minds. Features of the evening, a friend tells me, were the large attendance of ladies—the most numerous he remembers seeing at a meeting of the Society—and the heavy onslaught on to the tea and coffee in the Society's council chamber afterwards.



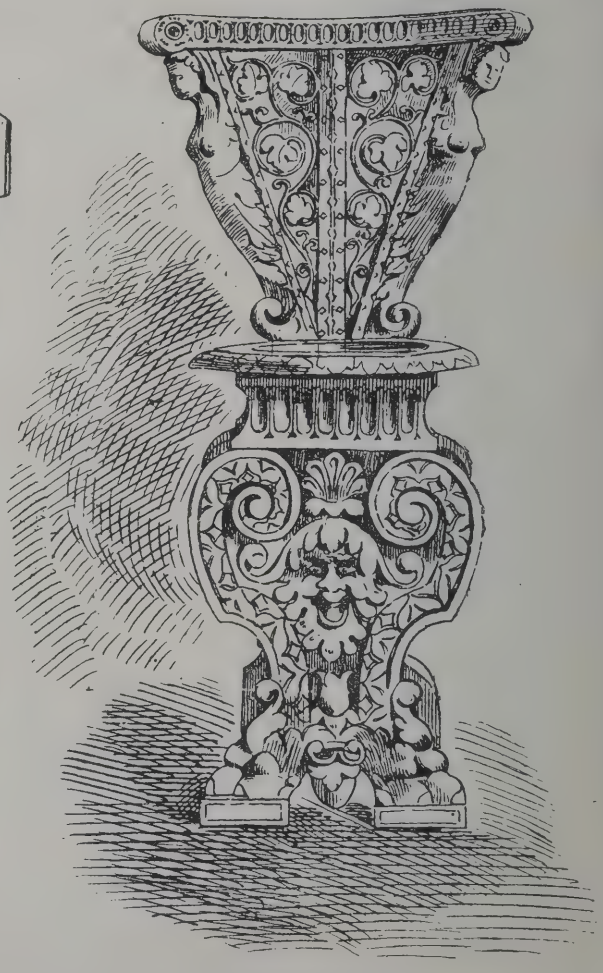
Concerning the Huyton-with-Roby competition, "One who Thought of Competing" writes from Birkenhead, and kindly incloses cutting from the Liverpool *Courier*, which he thinks may interest me. It certainly does; but I rather fancy it would vastly more interest intending competitors. *They* might feel a little indignant to learn that, whilst preparing sketches and racking their brains to supply the building for £5,000, *including their own commission*, many of the ratepayers of Huyton are up in arms against the Local Board, and intend to do their best to prevent the job coming off; one speaker at a public meeting stating his conviction that "the £100 already offered (in premiums) was simply thrown away." Our correspondent says that the particulars issued to competitors are of a very meagre description. "A large site is shown, out of which, apparently, you may take any piece that suits you without question of economy of space." This should be noted as somewhat unique in its way. No professional referee is mentioned, nor is it stated whether the plans are to be sent in under motto or not. It would further appear, from the cutting from the *Courier*, that even the members of the Local Board are divided among themselves as to the site. Anyone going in for the competition after these statements will be of a decidedly hopeful disposition. I award the palm in this respect, however, to our correspondent, who concludes his letter with "This seems a case for the intervention of the Institute Competition Committee." I fear the matter will stay at "seeming." Anyhow, my best thanks to "One who Thought of Competing," and may his next adventure be more successful. His comment on this curious Huyton-with-Roby affair, taken in conjunction with the newspaper report of the ratepayers' meeting, are a confirmation of what I hinted last week, and go to the support of what I said, in a general way, as to these commission-including competitions. GOTH.



On Saturday last, the old chime of musical bells of St. Giles' Cathedral, Edinburgh, which have been replaced by tubular bells, were sold by public auction in Edinburgh. The chime consisted of nineteen bells, cast nearly two hundred years ago by Meikle, Castlehill. They were sold singly, and, judging from the briskness of the bidding, there was a desire on the part of many to possess a memento of Old Edinburgh. They fetched from £2 15s. for the smallest, a bell 8in. high by 6in. in diameter, to £36 for the largest, measuring 23in. by 19in., the total amount realised being £202 10s.



A stained-glass window has been erected on the staircase leading from the town hall to the council-chamber at Wednesbury. The base is occupied by a large panel covered with oak and mistletoe, and two large shields with ribbons. One shield contains the seal of the late Local Board of Health, and its garter bears the date "A.D. 1851," when the Board was formally constituted. The other shield bears the borough arms, with the date "A.D. 1886," when the new municipality was formed. The chief portion of the window is occupied by two full-length figures. One represents the god Woden, from whom the town was named, and the other Ethelfreda, daughter of Alfred the Great. The Princess's left hand supports the model of a castle, in allusion to the many strongholds she erected, including Wednesbury Castle. The work was designed by Messrs. Wood and Kendrick, the architects under whose direction the improvements at the hall have been carried out.



* Terracotta seems to be improving the outlook in this direction.

NTEMPORARY MUNICIPAL ENGINEERS AND SURVEYORS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

HE success attending our series of portraits of Contemporary British Architects, ilders, Surveyors, Art Manufacturers, Decorae Artists, and Sculptors has induced us to range for a further series, which will include me of the leading Borough Surveyors and City ngineers throughout the country. The import-t works and large contracts which constantly e supervised and designed by those holding the sitions we have indicated necessarily bring em into contact with a large number of our aders, and the interest in their portraits will, e know, be very general. In not a few instances ecial photographs have been taken for our ges, so as to bring the portraits chosen for ustration up to date. In arranging the subcts on our sheets we, of course, disclaim all ideavour to group them in any order of precence.

The present accompanying double-page plate mmences with the portrait of Mr. Edward ice Sweet Escott, M.Inst.C.E., borough engieer of Halifax, who was educated at Foyle ollege, Londonderry (under his father, the ev. Wm. S. Escott, principal of the college om 1854 to 1862). He served his articles ith Messrs. Frazer and Campbell, architects nd surveyors, of Londonderry. Mr. Frazer the time was county surveyor of North onegal. On leaving the firm in 1861, Mr. scott was engaged for nearly three years n the survey of the Grocers' estates in the unty of Derry, for Mr. Henry Wiggins, the gent of the company. In 1864 he was assistant rveyor under Mr. Richard Davids, the sureyor to the Corporation of Carnarvon, N.W. n October, 1865, he was appointed an assistant n the town surveyor's office at Birkenhead, nder Mr. Thomas Thorburn, C.E., where he emained three years. In August, 1869, Mr. Escott was engaged to check the trigonometrical rvey of the Borough of Halifax, which at that me was being carried out by contract, in four ections, under Mr. Peter Borvise, the borough ngineer, the contracting surveyors being Henry Roper, Dudley; William Brown, Newcastle; John Eddison, Leeds; and Daniel Kershaw, Halifax. The survey was completed about 1871, when Mr. Escott was appointed one of the district surveyors f the borough. At Christmas, 1872, he obtained he appointment of borough surveyor of Burnley, which he held for six months, and returned to Halifax in July, 1873, on being appointed borough urveyor to the Halifax Corporation, a position e still enjoys. Many important municipal vorks have been designed and carried out under his direction. He was elected a member of the Institution of Civil Engineers on December 6th, 1881. He has a seat on the Council of the Municipal and Sanitary Engineers and Surveyors' Association, of which society he has been a member from its commencement. Mr. Escott's photograph is by Messrs Maull and Fox.

Mr. E. G. Mawbey, Assoc.M.Inst.C.E., is the borough engineer of Leicester. He has of late been engaged carrying out the unfinished contracts of the very extensive sewerage, sewage disposal, floods prevention works, and bridges, designed by the late Joseph Gordon, C.E., whom he succeeded when that gentleman was appointed chief engineer to the London County Council, and in the preparation of the contract drawings, &c., for the remaining sections of those schemes yet to be carried out, involving a further expenditure of about £60,000. He has also himself, for Leicester, designed a storm outfall drainage scheme, estimated to cost about £70,000, and other works, including the refuse destructors, an iron highway bridge now being erected over the new flood channel, and a borough extension scheme to include the surrounding parishes to the extent of about 7,000 acres. From the year 1869, subsequent to his early training, Mr. Mawbey was engaged seven years by Messrs. Parnell and Son, of Rugby, superintending important engineering and architectural works at Birmingham, Birkenhead, Derby, Oxford, Rugby, and Reading, designed by some of our leading engineers and architects. He was next appointed an assistant to Mr. John Shaw, sanitary engineer and estate agent, of Derby, and after 18 months in this post he acted as resident engineer to the Brampton and Walton Local Board (Chesterfield), for their main sewerage and sewage disposal works, at the same time superintending also the erection of the George Stephenson Memorial Public Buildings at Chesterfield, and other works in that district and at Nottingham. In March, 1880, he was appointed engineer and surveyor to the Market Harborough Great and Little Bowden Local Board, and prepared and carried out main sewerage and sewage disposal schemes (Mr. J. B. Everard, C.E., of Leicester, acting as consulting engineer), also a floods prevention scheme, &c. In August, 1883, he became borough and water engineer of King's Lynn, and engineer to the Port and Harbour Committee of that town, and designed a new water-supply scheme, the new main sewerage for the borough, an iron bridge, the restoration of the old Town-hall, and other works. In May, 1887, Mr. Mawbey was appointed city engineer and surveyor of York, where he was specially associated with the eminent engineer, Mr. James Mansergh, assisting him in preparing the sewerage and sewage disposal scheme now adopted at a cost of over £100,000, and himself designed other important works, mostly carried out, including new municipal offices, restoration of the city walls and bars, alterations to the theatre, new covered market, a new lock for the River Foss, &c., and acted as professional assessor for the competitive designs for the York New Law Courts, police and fire stations, his awards being adopted and generally approved. Mr. Mawbey's portrait is by Messrs. J. Burton and Sons, of Leicester.

Mr. Arthur Brown, M.Inst.C.E., the borough engineer of Nottingham, is a native of that town, and was born in the year 1851. He was educated at the Nottingham High School, and in 1867 was articled to the late Mr. M. O. Tarbotton, who then held the office of Borough Engineer. Mr. Brown was in 1874 appointed deputy Borough Engineer, and, while serving under Mr. Tarbotton, was engaged upon a number of important works such as are usually carried out by large boroughs; among others may be mentioned a new bridge over the river Trent at Nottingham, and one over the same river at Gunthorpe; intercepting and outfall sewers and works generally connected with the utilisation of sewage, including the laying out of a sewage farm. On the retirement of his predecessor, Mr. Brown was promoted to fill the office of borough engineer in the year 1880. The extraordinary and abnormal growth of the town about this time rendered necessary the carrying out of many works. Among others may be mentioned an extensive system of street improvements in various parts of the borough, including, in one case, the laying-out and construction of a new road nearly four miles long and 60ft. wide; the extension of the sewerage system to provide drainage for the new property which was at one period being built at the rate of 3,000 houses per annum; the laying out of a new cattle-market; a scheme for preventing floods in a district of the borough; construction of depots, wharves, stabling, and other works to accommodate stock, plant, and horses; the extension of the system of subways in the town, in which are placed the sewers, gas and water pipes, and telegraph wires. Mr. Brown is now engaged upon the building of the new epidemic hospital, which will contain accommodation for about 90 patients. His portrait is produced from a photograph by Mr. A. Neale, of Nottingham.

Mr. J. H. Cox, M.Inst.C.E., was born at Bradford in 1848, and served his pupilage with Messrs. Gay and Swallow, architects and civil engineers, of Bradford, under whom he was employed on several works of importance, including the City Cemetery at Manchester, the Eccleshill and Bolton Gas Works, and the extension of the gas works at Shipley. In 1869 he was engaged under Mr. P. C. Lockwood, M.Inst.C.E., borough surveyor of Brighton, on the survey and drainage of that town, and in 1870 he became an assistant to Mr. Charles Gott, M.Inst.C.E., borough surveyor and waterworks engineer, Bradford. In the following year Mr. Cox was appointed deputy borough surveyor. In 1874, on the resignation of Mr. Gott, the appointment of borough surveyor was given to Mr John Allison, now city surveyor of Manchester, and the post of waterworks engineer was filled by Mr. A. R. Binnie, M.Inst.C.E., now chief engineer to the London County Council. On the resignation of Mr. Allison in 1879, Mr. Cox was appointed borough surveyor of Bradford, a position which he still retains. During his long service under the Bradford Corporation, the town has nearly doubled its population, and municipal works of a most important character have had to be undertaken in order to keep pace with its rapid growth. Street improvements have been carried out on a most extensive scale, involving an expenditure of more than £1,250,000, and the construction of several large bridges both in stone and iron. During the last 10 years the Bradford Corporation Tramways, 20 miles in length, have been constructed by Mr. Cox. These are leased to tramway companies and worked by steam traction. The following works, amongst others, have likewise been carried out by Mr. Cox, viz:—new cattle market, extension of wholesale market, extension of public abbattoirs, district baths and branch free library, four depots for the purification of town's refuse by fire, laying out Bradford Moor Park and Forster-square, stabling for 100 horses, and private street improvements amounting to upwards of £350,000. In 1882 the boundary of the borough was considerably extended; it now covers an area of 10,776 acres. The present population is estimated by the Registrar-General at 240,515, and the rateable value is £1,025,106. The portrait is from a photograph by Messrs. Appleton and Co., of Bradford.

Mr. John Parker, Associate Inst.C.E., the city surveyor and waterworks engineer of Hereford, is a native of Burnley, in East Lancashire, in which town he was twice elected a member of the town council in 1869 and 1872. In early life he was associated with the firm of Dent and Parker in the construction of railway works and buildings at Warrington, Manchester, Southport, Blackpool, Crewe, and elsewhere, for the L. and Y. and L. and N.W. Railway Companies. He was, in 1875, elected borough engineer of Bridgwater and waterworks manager, where, in addition to his ordinary duties, he designed and carried out the Albert-street Board Schools for 750 children, at a cost of £4,500, and other works. Since he received his present appointment in 1881, a water tower has been built and high-level water service has been installed under his supervision, considerable additions have been made to the markets, and some miles of new streets constructed to his plans. He has also been the acting engineer for the new outfall sewers and works (Mr. Cousins, of Westminster, being the consulting engineer), which have been recently completed at a cost of £40,000, and were formally opened by the mayor in May last, in the presence of the Association of Municipal Engineers and Surveyors, who held their district meeting in Hereford for that purpose. Other works contemplated, for which plans have already been prepared by Mr. Parker, consist of flood prevention works, new magistrates' court, filter beds and pumping machinery at the waterworks, &c. He is a Fellow of the Surveyors' Institute, and certificated by examination as a surveyor by the Sanitary Institute. The portrait is by Messrs. Maull and Fox, of Piccadilly.

Mr. R. Read, Associate Inst.C.E., the city surveyor for Gloucester, is a member of the Association of Municipal and Sanitary Engineers and Surveyors, a member of the Sanitary Institute of Great Britain, and a member of the Society of Arts. For the last eleven years he has filled the offices of Surveyor and Chamberlain of the City of Gloucester, and in addition to the ordinary duties of surveyor, has had charge of the city waterworks, and as chamberlain has had charge of the markets, park, cemetery, and corporation estate with a rent-roll of £4,200 per annum. Since his appointment, in 1878, the death-rate of the city has been steadily reduced from 24 to 14 per 1,000. In 1881, in order to avoid the necessity of an intermittent water supply and its attendant evils, he recommended the adoption of the Deacon Meter System for the detection of waste, as an alternative to a scheme for additional water-supply, estimated to cost £10,000. After considerable discussion, the suggestion was carried out in 1883, at a cost of £2,000. Besides the above, he has carried out a great many street improvements, a large amount of sewerage work, and the ventilation of the sewers. Mr. Read has relieved a portion of the city from frequent flooding, which caused great damage to a large number of houses, and threw nearly 1,000 men out of work for three days on each occasion. He also prepared plans, &c., for a new city quay and river wall adjoining the river Severn, for public baths, an infectious diseases' hospital for the city and port, and other works. Before coming to Gloucester he was for nearly three years—1876-1878—chief engineering assistant in the borough engineer's office, Salford,

partly under Mr. A. M. Fowler, M.I.C.E., the late borough engineer, and afterwards under Mr. Arthur Jacob, B.A., M.I.C.E., the present borough engineer. During this time the corporation were probably doing more work than any similar town in England, they having borrowing powers of upwards of one million sterling. Mr. Read took a leading part in designing and constructing bridges, 140ft. span, and 60ft. wide, over the river Irwell; a large intercepting sewer, from 5ft. to 8ft. 6in. in diam., seven miles in length, running right through the borough, crossing the river Irwell twice in its course, with a gradient of 3½ft. per mile; also a service reservoir to hold ten million gallons of water, the Salford tramways, street improvements, parks, and public baths; also plans for the precipitation and purification of sewage, since carried into effect. He was for nearly three years—from 1873-76—principal assistant in the office of Mr. S. B. Worthington, M.I.C.E., Victoria (now Exchange) Station, Manchester, Engineer of the Northern Division of the L. and N.W. Railway, comprising at that date the whole of the railway between Crewe and Carlisle, and Liverpool and Leeds. During that period he did a great deal of work in connection with the widening of the railway, and the enlargement and improvement of the stations, and other property of the Company at Warrington, Wigan, Widnes, Preston, Huddersfield, Liverpool, Leeds, Lancaster, Oxenholm, Carlisle, and other places. Previous to this he was fifteen years in London, part of the time as a pupil, and afterwards as assistant to Mr. C. P. B. Shelley, M.I.C.E., of Parliament street, Westminster, who, before commencing business for himself, was chief of the staff of the late celebrated firm of Fox, Henderson, and Co., of Birmingham, during the construction of the Great Exhibition of 1851, the Crystal Palace, Sydenham, and other large works. During this period Mr. Read gained considerable experience in connection with plans, &c., for engineering work of various kinds, both in England and abroad. Messrs. Maull and Fox, of Piccadilly, executed this portrait.

THE PROPOSED DETACHED BELL-TOWER FOR SAINT MICHAEL'S, COVENTRY.

ON Thursday in last week, Mr. Alfred Waterhouse, R.A., Mr. Norman Shaw, R.A., and Mr. Ewan Christian, who had been consulted as to the æsthetic effect which the proposed erection of a detached campanile to carry the peal of ten bells of St. Michael's Church, Coventry, would have on the famous group of spires in that city, paid a visit of inspection to Coventry. The visit had been postponed for a fortnight, it will be remembered, owing to the ill health of Mr. Christian. The following letter from Mr. George Woodcock had previously been addressed to Mr. Waterhouse, and a similar letter to his colleagues:—

"Having restored this church and steeple, in the course of which the lantern in the latter has been opened up, and the stone vaulted ceiling replaced therein at a height of 98ft., the vicar and churchwardens have been strongly advised that it would not be safe to replace the heavy peal of bells which formerly were hung in the tower. A project is now on foot to build a campanile for the purpose of carrying such bells, together with the clock and chimes, but a rather influential body of citizens, who were subscribers to the Restoration Fund, strongly object to a campanile on the ground that it would detract from the steeple of St. Michael's, and also from the tower and spire of the adjoining church, Holy Trinity. Under these circumstances it has been suggested that three eminent architects should be asked to act as assessors or experts, in conjunction with a committee of parishioners, such committee consisting of the vicar as the freeholder, two gentlemen opposed to the bell-tower, and two in favour of it, to decide—

"1. Whether a suitably designed campanile would detract from the beauty of the existing towers and spires.

"2. If thought not, then to select the site for such campanile, and

"3. To settle the terms of the proposed competition which it is intended to limit to five of the leading ecclesiastical architects of the present time, and subsequently to judge the designs.

"I have been requested by the vicar and churchwardens, who are in favour of the campanile, to ask whether you would, under the peculiar circumstances of the case, agree to act as an assessor or expert in conjunction with Ewan Christian, Esq., and R. Norman Shaw, Esq., R.A., provided these gentlemen will consent to do so, and I am writing in similar terms to each of them by this post. It would be necessary for you to attend at Coventry and inspect the *locus in quô*, which you could do either separately or in conjunction with the other gentlemen, but the remaining business could be transacted in London. I believe that in such matters it is usual to leave it to the decision of one assessor, but so strongly is the opinion in Coventry divided upon the subject that it has been thought advisable to obtain three eminent gentlemen, if possible, to act on this occasion. The two churches are close together, and it is very important not to erect in proximity to these a campanile which would not be in unison with the existing style of architecture, and which could in any way detract from the beauty of the existing towers."

In the afternoon, after visiting St. Michael's Church, the three architects were taken by Mr. Woodcock for a drive into the country around Coventry for the purpose of viewing the spires from a distance. Among the points from which views were obtained were Stivichall Hill and the Warwick-road, the London-road, and the Stoke-road. From the latter place the party drove along Payne's-lane, Lower Ford-street, and Priory-street to the churchyard, and from the churchyard back again along Ford-street and Hales-street, and round to the churchyard again. Priory-street, where the view is particularly open, they traversed several times, viewing and re-reviewing the churches and their surroundings with great care and thoroughness. They afterwards met the vicar and the churchwardens in company with Mr. Woodcock, and communicated to them the opinion they had formed. This was unanimously in favour of a new bell tower, which they considered would enhance rather than detract from the beauty of the existing towers and spires of St. Michael's and Holy Trinity. As to the site, they expressed themselves in favour of a point on the north side of the church and avenue somewhat to the east of the north door. The exact spot was, however, not determined upon, and awaits the formal report. The new tower, it was suggested, might be connected with the church by a dwarf building and an archway over the avenue. Under the archway it was suggested that an extra door on the north side should be provided, the architects considering that the means of entrance and exit on that side were inadequate. They also recommended that the tower be kept plain in the lower stories, all ornamentation to be put on the upper stories, and the bells to be hung at a height of about 80ft. Mr. Woodcock intimated that whatever the cost of the tower, he would only ask the citizens to subscribe £5,000; if it cost £10,000 he would contribute half; if it cost £14,000 he would contribute £9,000, and so on.

CHIPS.

The death is announced of Michael Stolz, the well-known Tyrolese sculptor, at the age of 70 years. His best work is a group in marble in the chapel of the cemetery at Innsbrück, representing the Crucifixion.

A new Roman Catholic Church at Middlewick, Cheshire, will be opened at Christmas-time. It is being built from designs by Mr. Edmund Kirby, of Liverpool.

Mrs. Webster has applied to the Archbishop of Canterbury for a faculty to erect a memorial in St. Dunstan's Church, Cranbrook, to the memory of her late husband, Mr. Thomas Webster, R.A.

To perpetuate the memory of the late Sir William Pearce, M.P., the naval architect, who was a native of Old Brompton, Kent, a massive tomb has just been raised over the family vault in Gillingham Cemetery, in which his remains lie. It is Roman in character, is of Scotch granite, and weighs over thirteen tons.

New premises have just been completed in Penzance for the Cornish Bank, on the site of the old one in Queen's-square. The style adopted is Ionic, and the front has five granite pilasters. Mr. J. W. Trounson, of Penzance, was the architect; and Messrs. W. Winn and Son, of Helston, executed the contract.

On Tuesday week an inquiry was held at St. Mary's Hall, Coventry, by Colonel W. M. Ducat, R.E., Local Government Board inspector, into the proposed purchase by the corporation of property in Earl-street and St. Mary's-street for municipal buildings. The clerk (Mr. Thomas Browett) and the city surveyor (Mr. E. J. Purnell) gave evidence as to the necessity for improved municipal buildings and the eligibility of the site sought to be acquired.

A new steam roller mill has just been built at Alford, Lincolnshire. It is four stories in height, and has cost, with the detached chimney, 75ft. high, but without machinery, £4,000. Messrs. Hasnip and Clayton were the builders.

The Broomhill Board School at Sheffield was reopened last week after having been enlarged for the fourth time. The building was the second school erected by the Sheffield Board, and, with the addition just made of 192 school places, accommodates 711 children, the total cost having been £8,521, or £11 19s. 8d. per head.

Building Intelligence.

IPSWICH.—Additions have recently been mad to the already numerous business premise belonging to Messrs. R. and W. Paul, of thi town. The malthouse is situated on a portio of the site of the old Eagle Foundry, and extend 190ft. back from the public quay. It consists o a five-storied building, for 150 quarters steep with two kilns at its eastward end. An elevato is provided from the barley stores on dock front also skip-lifts from the cistern and for loadin the kilns, all of which, with Boby screens, &c. are driven by a 10H.P. gas-engine. On eac story of the malthouse there are several lines o hanging skip tramways for distributing the we grain upon the floors. The grain-cleaning fac tory is a four-storied building, about one-thir of which is occupied by steam-driven machinery effecting thirteen separations of the grain an removing foreign matters. The whole of th buildings were designed by Mr. Thomas Miller M.Inst.C.E. and engineer to the Ipswich Doc Commission, and the contractors were Mr. Fred Bennett for the malthouse, Messrs. Cocksedg and Co. for the machinery, and Mr. R. Girlin for the grain-cleaning factory.

LEITH.—On Saturday a new board school, t be called Couper-street Public School, wa formally opened at Leith by Lord Young. The site of the building lies between Couper street and North Junction-street, and measures ¾ of an acre, being the largest school site in the town. The school, which is built of red and white sandstone, will accommodate about 1,88 pupils, and the cost will be about £14,000, exclusive of the site. The main building measures about 127ft. by 75ft. 6in. deep, and consists of three floors, the roof being quite flat. On the ground floor, which is reached by short corridors, is a central hall 82ft. by 22ft., and on the same floor are nine classrooms for infants and the junior department. On the first and second floors are similar central halls, each having ten classrooms branching off. The building externally is finished with a deep cornice and an iron cresting, while the dressings are of red sandstone, and the rubble of white sandstone. There are two playgrounds and a janitor's lodge. The architect was Mr. George Craig; the builder, Mr. William Baxter, Leith; the carpenter and joiner, Messrs. Drysdale and Gilmour, Leith; and the plumber, Mr. Thomas M'Pherson, Leith.

LEWANNICK.—The parish church of Lewannick, some miles from Launceston, a large Late Perpendicular structure, was gutted by a fire in January. The only portions not destroyed were the external walls, portions of the columns which divided the nave from the aisles, the font, an ancient cresset stone, the roofs of the two porches, the vestry, and a part of the reredos. All the rest of the timberwork, the internal fittings, and the timberwork and bells in the tower were consumed. The instructions given to the architect, Mr. Otho B. Peter, of Launceston, were to rebuild as near the original design as funds would permit. Tenders were invited, and that of Mr. W. Burt, contractor, of Launceston, accepted. The four-centred moulded south aisle arcade columns of Polyphant stone, which the fire had cracked and split in every direction, and the injured granite columns of the north arcade, have been reproduced by Mr. Nicholls, of the Polyphant quarry, which quarry is within the parish. While digging the foundations of the south columns the base stones of circular columns of the 12th century were discovered. The new roofs follow the lines of the old ones, being waggon-shaped; they have at the intersections carved bosses, executed by Mr. Hems. The old oak seats, which had carved ends, have been replaced by plain ones of pitch pine. In the western end of the north aisle is placed the well-known cresset stone, which escaped injury, and in the tower are hung six new bells cast by Messrs. Mears and Stainbank.

SALFORD.—The Salford Borough Council at their last meeting accepted the tender of Messrs. R. Neill and Sons for the general contract, amounting to £7,897, for the new Regent-road Baths, Salford. The designs are by Messrs. Mangnall and Littlewoods, architects, Manchester, and were selected in a competition. The land is a rectangular plot situate at the corner of Regent-road and Derby-street, and is well

adapted for its purpose, being in a populous neighbourhood. Broughton is also having new baths erected by the same architects, which are situated in Great Clowe-street, and are advancing rapidly towards completion.

Engineering Notes.

Bristol.—The town council of Bristol received, on Tuesday, a report from the Fixed Bridge Committee, stating that they had employed Mr. Francis Fox, C.E., to prepare the Parliamentary plans and sections necessary to be deposited on or before the 29th instant, in order to obtain Parliamentary powers to erect a fixed bridge in lieu of the drawbridge and to cover in the water space above the bridge. Mr. Fox, in his report to the committee, explained that the works for which powers would be sought would include a fixed bridge 100ft. in width between the parapets, of which 10ft. on either side would be allotted to footways. The span of the arch would be 130ft., and the height near the level of the floating harbour would be 8ft. 6in. in the centre. The plans also provide for the construction of an archway for the conveyance of the waters of the Froom from the stone bridge to the archway of the fixed bridge, and the filling in of the present water space above the drawbridge to the general level of the adjoining quays. Mr. Fox's estimate for the two works is £24,090.

COMPETITIONS.

London County Council Municipal Lodging House for 320 Men.—In this competition 75 designs have been received, and the drawings are now being arranged for the inspection of the assessors, Mr. Ewan Christian and the architect to the Council.

Oswestry Municipal Buildings.—In this competition, in which Mr. T. M. Lockwood, of Chester, acted as assessor, twenty-six plans were sent in. The plan by Mr. Henry A. Cheers, 32, Waldegrave Park, Twickenham, was awarded the first premium of £50, and that of Mr. Thomas E. Pryce, V.P.A.A., 35, Bedford-row, W.C., the second of £20. At a meeting of the Oswestry Town Council, held on Monday, the plan of Mr. Cheers was definitely adopted, the premium in that case, as laid down in the condition, merging in the architect's commission of 5 per cent. The limit of cost, including fittings of court and council chambers, lavatories, and gas, was set in the conditions at £6,200.

CHIPS.

A marble mosaic pavement is being placed in the entrance hall of the town hall at Warrington. The work is being carried out by Messrs. J. and H. Patteson, of Manchester.

At a meeting of the Leeds Corporate Property Committee, held on Monday, a report was presented from the Sanitary Committee with reference to the state of the drainage of the town hall. Dr. Cameron reported to the committee that the sanitary condition of the town hall was most unsatisfactory. A lengthy discussion ensued, and it was ultimately decided to refer the matter to the Corporate Buildings Committee.

Ten more stalls, making 24 altogether, have been given to the new choir of Peterborough Cathedral. Double the number will complete the set of the Benedictine plan.

Messrs. A. Lethbridge and Son, of the Tracey Building Yard, Plymouth, have obtained the contract for the erection of the Private Patients' Hospital at Woodside, Plymouth, a company for the building of which has recently been formed. The work will commence immediately.

The city council of York have obtained the sanction of the Local Goverment Board for borrowing £89,000 for the purposes of the new municipal offices and other works of improvement.

The parish church of Clifton-on-Dunsmore, near Coventry, is about to be restored. The church, which is of the Early English and Perpendicular periods, will retain its architectural features externally, but internally it will be entirely remodelled, and provided with new seats and fittings. It will also require a new roof. The lay rector undertakes the restoration of the chancel at a cost of £500, and a new vestry and organ chamber will be built on the north side. Messrs. Bodley and Garner are the architects.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

THE NEW YEAR'S DOUBLE NUMBER

of the Building News will be issued on Jan. 3, 1891. The space for extra advertisements is very limited this year, and insertion cannot be guaranteed after Dec. 14, by which date at latest it is respectfully requested all orders may be forwarded.

Free Classic. (Yes, Mr. Norman Shaw, R.A., won the Royal Academy Gold Medal in 1853, when his design for a Wellington College was published in the *Illustrated London News* for Dec. 31st that year.)

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received.—"S. Edmond," "Black Prince," "Granite City," Obbiks," "Etudiant," "Minerva," "Snowball," "M.P.," "Sine Nomine," "Ancient Lights," "Venice," "Brook," "Ate," "Sol," "Light," "Spider and Fly," "Camera," "I. C. Y.," "Albyn," "Juno," "Horseshoe," "Hope," "Aries," "Æneas," "No Cards," "Bladud," "Marmion," "Flint," "Organist."

SECOND LIST OF SUBJECTS.

B.—A small detached country house fronting the S.E., suitable for a City man, comprising a dining-room, 22ft. by 17ft., or thereabouts; a drawing-room, 20ft. by 18ft.; a library, 14ft. square; a roomy, but not wasteful, entrance hall and porch lobby. The kitchen and offices to be in proportion to the requirements of such a house, and their position in reference to the gardens is to be considered. A small two-stall stable with small coach-house and loft to be provided adjoining the house, with a stable yard measuring, say, 20ft. square. Upstairs the accommodation of the house is to provide six bedrooms, a bath-room, with w.c., and housemaid's closet. Two extra bedrooms may be on a second floor with a box-room. Scale, 8ft. to the inch for elevations and sections, and 16th scale for plans. Sketch to be provided. Style suitable for a stone district.

Received.—F. A. L.—J. M. and Co.—A. W. G.—R. T.—Inquirer.—N. G. and W.

Correspondence.

FORGOTTEN AMERICAN CITIES.

To the Editor of the Building News.

Sir,—Rather more than two years since I visited a once swampy district on the shores of one of the great fresh-water lakes of North America, scarcely above the level of which a dismal morass extended for many miles. Skunk cabbage and wild garlic then abounded, a sluggish stream struggled into the lake; but the neighbourhood had attractions upon account of its great hunting and fishing facilities; beyond these, however, there could have been no inducements for any settler to take up an abode in so wretchedly uninviting a locality.

About 150 years ago a venturesome European erected a log hut in this unwholesome place, and then commenced a struggle not only against unsavoury conditions of existence, but also a contest against the Red Indian. In course of time two or three other log huts followed, to provide for a few further residents. Later on the military strategical advantages of the spot were observed by the American Government, a fort (also of logs) was erected, and a few soldiers held this solitary position; but upon one occasion, at least, suffered massacre and defeat at the hands of the savages.

It has been stated that the selection of this site for the fort was the result of a misunderstanding, and that a wholesome and pleasant locality not very far away had been intended; probably the dangers and difficulties of travel in the old days led up to the error.

The above is a brief description of the site of the great city of Chicago until within a comparatively recent period.

If Chicago had not already been described as "The Garden City" it might now well be called the "City of Palaces," for few modern cities can excel it in the extent of its parks or the magnificence of its buildings, yet in the year 1773 a large tract of land (including the site of the present city) was purchased for five shillings and "certain merchandise" from its red proprietors!!

Inquiries into the early history and past civilisation of the red races of America lead to a strong presumption that the partially civilised nations and tribes inhabiting these regions at the period of the arrival of the Europeans were generally not a people emerging from a state of barbarism and slowly working up in the social scale, but that, on the contrary, they were descendants of a more civilised race gradually sinking from a high position, while some, having outsped the others in their downward career, had already sunk into the condition of savages.

The American tribes appear, indeed, to be singularly strange, and to stand at a vast distance from the rest of mankind, yet their traditions, tongues, manners, and customs, and the remains of their buildings present many positive and incontestable points of analogy with Asia and its people; but the civilisation now flourishing in most parts of America is in no way connected with its past history or the ancient inhabitants. It has, on the contrary, proved the most inveterate foe of both—with contemptuous superiority, leaving the first almost unheeded until of late years, while, with relentless cupidity, it has persecuted the latter almost to extermination in some districts. At the same time, it may be considered doubtful whether these races generally are disappearing so fast as is popularly believed. Colonel Garrick Mallory, of the United States Army, recently read a paper before the American Association for the Advancement of Science, in which he defended the opinion that the Indian population, as a whole, has not greatly decreased since the earliest occupation of the country by Europeans.

Of late years, a few American architects have given considerable practical attention to ancient American remains of buildings, and amongst the various ruins of Central America (particularly in Mexico, Peru, Honduras, Guatemala, and the peninsula of Yucatan) old cities exist, often richly decorated with sculpture, affording appropriate American precedents for modern American architecture, and including very much of great interest upon ground that has not been trodden so much as might have been the case had the localities been easy of access.

At present the question of the first appearance of the human race in America is beyond the limits of history, and extremely hazardous as is the desire to explain everything or to supply gaps (and there are many points which appear obscure, or which we must leave unexplained), yet we may not unreasonably suspect that a portion of the old civilisation of America was derived from Phœnician pilots driven from their course during voyages of discovery around Africa, or who were induced to attempt the passage of the Atlantic for similar reasons to those advanced by Columbus.

Amongst certain ruined cities in Mexico sculptured tablets have been discovered; these exhibit figures apparently making offerings to a hideous mask. The objects offered are infants, and are

presented to the mask seated on the palms of men's hands. Now, the rites of the heathens were intended either to propitiate the malignant powers of darkness or to obtain by their agency assistance or some supernatural power; or, on the other hand, to conciliate the favour and appease the anger of the deity, and for this object the heathens shrank from no expedient, deemed no price, no victim, too costly, as the existence of human sacrifices, and especially the sacrifice of children, sufficiently proved; and it is a curious coincidence that this species of human sacrifice was most widely diffused among all the Phœnicians, for with them the idol Moloch, heated from below, grasped in his glowing arms the infant victim. Even in Carthage this cruel custom is said to have long prevailed.

Amongst American ruined cities no remains exist of the dwelling-houses of those classes which in all periods have formed the bulk of the population of a city; what are left being chiefly the palaces of princes, or temples of the gods, or works of fortification and water supply.

An ancient American civilisation has utterly passed away, and although its numerous ruins are scattered in various parts of the continent, little else is left to inform us that a great people existed; the new and magnificent civilisation of the America of to-day may in its turn be as obliterated and forgotten as the ancient cities of Mexico; Chicago again a nameless swamp, with, perhaps, a few ruins exhibiting those strong and indisputable evidences of antiquity which nature may raise as monuments to the memory of past architectural greatness.

GEORGE H. BIBBY,
Nov. 24. F.R.Hist.S., F.R.I.B.A.

CHIPS.

At a meeting of the St. Paul's Ecclesiological Society, held on Wednesday evening at the Chapter House, St. Paul's, a paper was read by Mr. J. Grimshire on "The Abbey Churches of England, both Perfect and Ruinous, with Special Reference to, and Suggestions as to the Treatment of, the latter." The lecture was illustrated by nearly a hundred lime-light views.

The London County Council have accepted the offer of 12 acres of river-side land, adjoining the Palace of the Bishop of London, at Fulham, as a public recreation ground. An expenditure of £1,500 on laying out the grounds was approved, but not a proposal to inclose them by a concrete wall, estimated to cost £8,800.

The Glasgow Police Commissioners have appointed Mr. G. Alsing, of Sheffield, as engineer, in connection with the proposed Parliamentary Bill for sewerage works for the eastern district of the city.

The new Soldiers' Home at Piershill, Edinburgh, was opened on Monday by Lady Ashburton. The building has cost £2,700, and has been erected under the supervision of Mr. W. Allan Carter, of Edinburgh, who acted as honorary architect to the committee.

Large additions are to be made to the workhouse at Woolwich, at a cost of over £7,500. Mr. J. O. Cook, of Woolwich, is the architect, and the contract has been taken by Messrs. Kirk and Randall, of the same town.

Last Saturday at the Royal Hotel, Brighouse, Yorks, the workmen engaged in the erection of billiard-room and other additions to Bonegate House were entertained to supper. The new building, which is now approaching completion, has been erected from plans prepared by Messrs. George Hepworth and Son, Brighouse, and is 43ft. by 23ft. 6in., the billiard-room occupying a space of 20ft. by 25ft. On the second floor are bedrooms. The contractors are:—Masons, Messrs. John Bottomley and Son; joiner, Mr. Thos. Bottomley; painters, Messrs. Hirst and Barraclough; plasterer, Mr. C. Heponstall; and ironwork, Messrs. Beckwith Brothers.

St. Lawrence's Church, Kirkby Sigston, near Northallerton, was reopened on Thursday in last week, after undergoing restoration. It has been found necessary to pull nearly half of it down and rebuild it. The architecture is Norman and Early English. About 80 years ago a so-called restoration took place, and it has been the aim of the present restoration to restore the features then obliterated. The work has been executed by Messrs. Simpson and Malone, of Hull, under the direction of Mr. Temple Moore, of Hampstead, architect. The whole of the nave has been entirely reroofed, and a great part of the north aisle rebuilt; new windows have been put in, and as far as possible the Norman design of the old ones followed. The chancel roof has been repaired, and the old high-backed pews have been replaced by chairs. The cost has been £1,100.

Intercommunication.

QUESTIONS.

[10447.]—**Cleaning Chalk Drawings.**—Will any of your numerous readers inform me how to clean chalk drawings?—A. B. C.

[10448.]—**Malling Abbey.**—Are the Pointed arches in the lower part of the west front of Malling Abbey, Kent, insertions or original work? I cannot find mention of the supposed earliest example of its use in Gwilt's, and Parker gives his earliest as Malmesbury Abbey, Wilts, 1115-39, and Fountains Abbey, Yorks, about 1132. Malling he gives as previous to 1087.—DREYHELLER.

[10449.]—**Compulsory Powers of Local Authorities.**—Is it in the power of any corporation to compel a private person or body (trustees) to give up a portion of their land for the purpose of street improvements without equitable compensation?—DREYHELLER.

WATER SUPPLY AND SANITARY MATTERS.

BERKHAMPSTEAD.—A joint committee for Berkhampstead and Northchurch met on Wednesday week, to appoint an engineer for the sewerage of the district. The selected candidates were Mr. John Anstie, Westminster; Mr. H. Bancroft, Manchester; Mr. Alfred M. Fowler, Stockport; Mr. William Gallon, Islington; Mr. H. G. Huxley, Westminster; Mr. Nicholson C. Lailey, Westminster; Mr. W. H. Radford, Nottingham; Mr. Urban A. Smith, Westminster. Mr. Fowler having been formally proposed, Dr. Batterbury proposed Mr. Huxley, who, he said, was an experienced engineer, and undertook at 3½ per cent. on the cost of the work done what others would charge 5 per cent. The result of the voting was that Mr. Fowler received seven, Mr. Huxley two, and Mr. Urban Smith two votes. Mr. Fowler was accordingly elected engineer. Mr. Fowler was afterwards asked what would be his charge for preparing a scheme and preliminary plan and specifications, with approximate estimate of cost of the works, and details ready for a contractor, and to give evidence in support of such scheme at a public inquiry—supposing the scheme should not be accepted. After discussion and consideration, Mr. Fowler undertook the same for £100, to be merged in the commission in case the works were carried out, the cost being estimated at £13,000.

WEST ARDSLEY DRAINAGE, YORKSHIRE.—The rural sanitary authority of the Wakefield Union having considered a scheme prepared by their engineer, Mr. Frank Massie, Assoc. M. Inst. C.E., for the drainage of the Westerton and Lower-street hamlets of this township, resolved at their last meeting to apply to the Local Government Board to sanction the borrowing of £2,800 for the completion of a portion of the works, comprising the construction of outfall sewer with outfall works for the Westerton drainage area, and for the purchase and preparation of two acres of land for the treatment of the sewage from Lower-street.

A long range of industrial dwellings, four stories in height, is being built in Wassail-square and Church-street, Swansea, by an artisans' dwellings company. The street frontages on ground floor are occupied by shops, and the flats above are divided into sets of two, three, and four rooms to a tenement.

For the past month the work of removing the National Museum of the Antiquaries of Scotland from the Royal Institution to its new home in the National Portrait Gallery at Edinburgh, has been in progress under the direction of the Scottish Board of Manufactures. The library, which is lodged in one of the upper galleries, has been completely transferred and arranged. The scheme of rearrangement proposed by the curator, Dr. Joseph Anderson, will in a general way locate the historical articles on the ground floor, the pre-historic on the first floor, and the comparative collection on the upper floor. On the ground and first floor the articles will be entirely Scottish. The portraits belonging to the society will be hung in the council-room.

The London School Board have received a report from their architect, Mr. T. J. Bailey, suggesting whether two types of schools should not be adopted for erection on the majority of the sites. The latest schools erected include the requirements in a public elementary school, and Mr. Bailey suggests as the best and most complete models Halford and Langford-road for a school of 1,200, with power of enlargement to a complete school of 1,600; and Trinity-street for a school of 800, with power of enlargement to 1,200. These schools are now, in fact, being duplicated (with slight modifications to make them more perfect) on several sites, and the drawings being already practically completed, they could be copied for many, if not all, the sites upon which it is proposed to build, requiring only the ground-plan to be specially drawn in each case to suit the particular conditions of the site.

LEGAL INTELLIGENCE.

LONDON COUNTY COUNCIL v. JAMES MACKINTOSH. (Before Mr. Kennedy, the Magistrate of the Woolwich Police Court).—This action was brought by the London County Council against Mr. Mackintosh, the lessee of some building property fronting Albert-road, North Woolwich, to compel him to put back the dwarf wall of the fore-courts to some dwellings recently erected alongside the said road, as not being 20ft. from the centre thereof. The road was made up and taken over by the local board two years ago. It has a footpath on the side adjoining the buildings, but none on the other side, which is merely the fence of the North Woolwich Railway, its total width being 31ft. Mr. Mackintosh is the building lessee of the lands, which belong to Messrs. Kennard, and has built three terraces of artisans' dwellings to front the same about 8ft. inside the fence dividing the road from the property, and had put up a dwarf wall (which he had intended to continue the whole length) in front of the houses, 2ft. inside the road footpath and parallel with the old fence, thus voluntarily giving up a strip of land to the road, which, it was claimed, was not a new street or road within the meaning of the Metropolitan Building Acts. The London County Council served him with notice to pull down the same, and summoned him for not doing so, claiming that it must be put back to 20ft. from the centre of the road, or about 3ft. more than he had arranged, which he declined to do, acting on the advice of Messrs. Tapp and Jones, of Westminster, the surveyors for the owners. The case, on behalf of the lessee, was argued by Mr. Scrutton, barrister, and in the result the magistrate dismissed the summons, with £5 5s. costs against the London County Council, and refused to grant the latter a case for appeal.

SKY-SIGNS AND THE BUILDING ACTS.—Mr. George Rolls, landlord of the Lord Elgin Hotel, Maida-vale, was summoned on Friday by the London County Council to the Marylebone Police-court, for having had erected over his house a structure known as a "sky-sign," the same being of a movable or temporary character, without having first obtained a license. After hearing a Mr. A. Duvaston, surveyor under the London County Council, and Mr. Lewis Solomon for the defence, Mr. G. A. Sage, the patentee of the invention, and Mr. Forest Fulton, who contended that section 13 of the Act of 1855 under which the information was laid, referred only to wooden statues, and not to iron signs, Mr. Mead held that the sign in question was not of the kind described, and dismissed the summons, with £2 4s. costs.

According to a return which has just been issued at the instance of the Water Committee of the Liverpool Corporation, the expenditure on the Vyrnwy scheme up to the 30th September last amounted to £2,040,689 10s. 2d.

Under the title of "Christian Art in London," Mr. Everard Green, F.S.A., describes in eulogistic terms, in the *Tablet*, a new window put into the east end of the Chapel of the Holy Ghost in the Church of Our Lady of the Angels, at Bayswater, from a design by Mr. J. F. Bentley. The subject is the Descent of the Holy Ghost on the day of Pentecost.

New Wesleyan schools at Horwich, near Bolton, were opened last week. They have cost £3,035, and accommodate 600 scholars. The style is simple Gothic, and the building was erected from designs by Messrs. Woodhouse and Morley, architects, Bolton. The contractors were as follows:—Stonework and brickwork, Mr. W. Dougill, Horwich; carpenters and joinery, Messrs. Moore Brothers, Rawtenstall; slating, Messrs. Warr and Co., Bolton; plumbing, Mr. R. Cuerden, Bolton; and plastering and painting, Mr. A. E. Warburton, also of Bolton.

The annual concert and soirée of the Edinburgh Branch of the Scottish National Operative Plasterers' Federal Union was held on Friday night at the Oddfellows' Hall, the chair being taken by Mr. Geo. Washington Browne, architect. There was a crowded attendance. Speeches were made by the chairman and Mr. H. F. Guthrie, general secretary of the Union, congratulating the society on its position, and on the present prosperous state of the trade.

A special meeting of the Malmesbury municipal council was held on Thursday in last week, to consider applications in answer to an advertisement by the town clerk for persons desirous of fulfilling the offices of borough surveyor at £20 per annum, and inspector of nuisances at £30 per annum; the person elected to devote the whole of his time to the duties of the offices (which included the collecting of the municipal rates of the borough). There was, as was to be expected, a full meeting of members to distribute this unprecedentedly valuable piece of patronage. Applications were received from Mr. Jacob Angell (the borough surveyor), Mr. Frank Price, and Mr. Jabez Emery, the last two inclosing testimonials. After a long discussion, Mr. Angell was elected.

Our Office Table.

The disclosures in the recent action against Wall Brothers formed the subject of several questions put at the meeting of the London School Board yesterday (Thursday). In reply to Mr. Sharp, Mr. Helby, the chairman of the works committee, gave a *résumé* of the report of the Special Committee presented two years ago, adding that many of the recommendations of that committee had since been carried into effect. As to the possibility of similar irregularities and discrepancies occurring now, Mr. Helby answered that it depended on circumstances over which personally he had no control. Replying to Mr. Lobb, Mr. Helby said that, at a meeting of the Special Committee in March, 1888, he asked Mr. E. R. Robson, the late architect to the Board, if he considered himself entirely responsible to the Board for the proper construction of the schools built under his superintendence, and received the answer "Certainly." A resolution was adopted by the Board in July of that year calling upon the late architect to make good the loss resulting from the absence of proper foundations at Broad-street school. Although that resolution had not been rescinded, no action had been taken, in consequence of a report by the special committee that the opinion of counsel taken as to defects at Queen's Head School was that the builder alone could be made responsible, and that as the builder in question was bankrupt, the best course would be to prove in the bankruptcy, and then, after the builder had obtained his discharge, to sue him for the balance on the ground of fraud.

At the same meeting of the Board, Mr. Sharp pointed out that, owing to the large increase of school accommodation ordered during the past two years, no less than 33,067 school-places on eleven sites had been waiting to be planned; of these only 448 places had been provided. The work had evidently grown far beyond the powers of the architect's staff to provide, and even the mode of duplicating the plans of existing schools now proposed by Mr. Bailey, their architect, would fail to cope with the serious arrears in his department. He therefore moved, "That the Works Committee be instructed to have six new schools planned and built under the superintendence of three 'outside architects,' in addition to those schools to be duplicated, in accordance with the scheme proposed by the architect of the Board." The Rev. W. Copeland Bowie, in moving as an amendment that the Board adhere to its present practice, asserted that if outside architects were called in, each school would cost £1,000 extra, while their experience of schools planned by outside architects had shown them to be at least as costly for repairs and re-drainage as any designed by their late or present architect. Mr. Barnes deprecated going outside for architectural help. Either their architect was competent or not. If competent, they should provide him with more draughtsmen; if incompetent, which he denied, let them say so, and get a fresh professional adviser. Mr. Laing said Mr. Sharp's proposal was in the interests of Mr. Bailey, who was overworked, and had had to forego his vacation this year. It was a proposal designed to meet a temporary congestion, and was not a permanent measure. He objected on principle to the duplication of plans, and held if outside architects were called in, their own official would have leisure to visit existing schools, and ascertain the defects, and where they could be improved. The Hon. Lyulph Stanley said what was wanted was not better plans, but more effective supervision and wider competition among builders, and the passing of that resolution would delay, and not expedite, the work. Mr. Helby said no schools had stood so long as those designed by outside architects. Mr. Robson had suggested, since his own retirement, that the Board ought to have appointed a consulting architect, and have invited plans from independent architects. After a long and animated discussion, the amendment was carried by 24 votes to 13. The present practice of the Board will therefore be continued.

The London County Council have given notice of their intention to bring in a Bill of a comprehensive character dealing with "sky-signs," which, according to the magistrate at Marylebone, cannot be touched under the provisions of the existing Building Act and its numerous amendments. The Bill, if passed, will confer power on the Council "with respect to the exhibition of words, letters, models, signs, devices, or representations in the nature of advertisements, announcements, or directions, elevated or suspended so as to show against the sky from any street or public place, all of which are included in the term 'sky-signs.'" It also gives power to regulate and control existing sky-signs, and to prohibit the use of sky-signs in future; to provide for the inspection and survey of existing sky-signs by the district surveyors, or other persons appointed by the Council; to prohibit the maintenance of any existing sky-sign, except in pursuance of a certificate of its safety and of a license by the Council; to provide for the summary removal of sky-signs structurally defective or dangerous, and to authorise the Council and their officers to execute all such works as may be necessary for the purpose; to prohibit any addition to or alteration of a licensed sky-sign otherwise than with a license of the Council, to authorise and provide for the payment of fees for inspections, survey, and otherwise, and to make provision for enforcing the provisions of the intended Act by penalties or otherwise.

The third annual exhibition held under the auspices of the South Wales Art Society was opened in the Public Hall at Cardiff by Lord Windsor on Wednesday week. The chief works are the "Cupid and Psyche," by F. H. A. Parker, a subject suggested by a passage in Lewis Morris's "Epic of Hades"; H. Stacey Marks's "From Sunny Climes," which we have seen at the Academy; "Passing Shadows," by Herbert C. Sheppard; a View of the Glamorganshire Coast near Porthcawl, which was hung at the Salon this year. Other prominent works are Highland landscapes by Charles Jones, R.C.A.; a portrait of Mrs. Greaves by Seymour Lucas; sketches of street arabs by Mrs. H. M. Stanley (née Dorothy Tennant); and paintings by Mr. and Mrs. Edwin Seward, T. H. Thomas, H. Parker-Hagarty, and J. A. Sant. Among the water-colours, those by Walter Severn, J. Hodson, Jackson Curnock, and George Hayes are worthy of notice.

The second concert of the session of the A. A. Lyric Club was held at the headquarters, Mona Hotel, Covent-garden, on Tuesday, 25th inst. The following gentlemen contributed songs:—Messrs. R. G. H. Wills, W. J. Dyer, H. O. Cresswell, F. Christopher, J. Watson Slack, and Captain Anderson; Mr. S. B. Garcia gave some recitations, and Messrs. C. D. Imhof and E. A. Lambert delighted their hearers respectively with piano and violin solos. The president, Mr. W. Burrell, occupied the chair, and Messrs. Theo. Moore and W. Henry White were responsible for the arrangements. The next concert will take place on 18th December next.

Warrant was granted at the Edinburgh Dean of Guild Court on Friday to the Lord Provost, Magistrates, and Council of the city to make certain alterations at the Corn Market building, Grassmarket. What is proposed to be done is—(1) to convert the two vacant upper flats of the building into dwelling-houses; and (2) to convert a part of the second and the whole of the third floor of the tenement immediately to the west of the building into dwelling-houses. The alterations will consist of the lowering of certain floors, the insertion of steel beams, and the erection of brick and wood partitions, with the incidental work in connection therewith. The contract for the erection of this Corn Exchange formed the subject of an interesting and erudite paper read by Mr. T. M. Rickman, F.S.A., before the Institute of Builders in February last. He showed that the Exchange was built in 1754 under an extraordinary contract, the parties to it being the Dean and Guild of the city on the one part, and the mason, three wrights, and one John Fergus, architect, all of Edinburgh, on the other, and the latter tendered to do the works for £19,707 16s. 4d., and to take the land forming the site off the hands of the city at £11,749 6s. 8d., making up a total sum of £31,437 3s. The tenderers, including the architect, seemed to undertake this as a speculation, and both architect and surveyor were apparently paid by the builders. The premises now about to be altered correspond, with singularly few variations, with the plan and elevation given with the contract, and in the minuter details the specification was evidently scrupulously carried out. The Exchange was, however, never used for its proper purpose, and it was therefore sold by the corporation in apartments to a multitude of people, whose descendants are now the freeholders.

"Some of the Old Halls and Manor Houses of the County of Norfolk" is the title of an interesting and capitally produced small folio of pen-and-ink sketches just published (with a map of the county), from the pencil of the late Mr. Edward Preston Willins, A.R.I.B.A., an architect in practice in Norwich. The book, we learn from the editor's preface, was almost ready for publication at the time its author died, and at his wish Mr. Thomas Garratt, A.R.I.B.A., of Shepherd's Bush, has completed it, adding two or three useful plates, and enhancing the value of the work by concise and practical descriptive notices of the buildings represented. These include a very good choice of typical subjects, such as Arminghall, Barnham-Broom, Barningham, East Barsham, Blickling, Breccles Old Hall, Caister Castle, Great Cressingham Priory, Felbrigge Hall, Hautbois Hall, Kirstead, Mannington Hall, the Dolphin Inn, Norwich; Oxnead Hall, Rainthorpe Hall, Stanfield Old Hall, Stiffkey Hall, Thurton Hall, Great Witchingham, and stepped gabled houses at Wroxham, besides several other good old buildings. The topographical character of such a book is undoubted, and although the drawings, like the specimens, vary considerably in merit, the author did his best to make them thoroughly representative, and they speak well of his industry. Mr. T. Garratt has spared no pains to do his friend's work ample justice.

The death of William Bell Scott, LL.D., H.R.S.A., poet, painter, etcher, and man of letters, occurred on Sunday at Penkill Castle, Ayrshire. Born in 1811 at St. Leonard's, Edinburgh, deceased was the son of Robert Scott, the engraver. He entered the Antique Class of the Edinburgh Academy for the Advancement of Art. In 1832 he drew from the antique in the British Museum, and, six years later, exhibited at the British Institution his first noteworthy picture, entitled "The Old English Ballad Singer," a scene with many figures. In 1844, at the request of the Board of Trade, he undertook the establishment of a school of art at Newcastle-on-Tyne, and while there he published his "Memoir of David Scott," "Antiquarian Gleanings in the North of England," and "Ornamental Designs for Silver and Gold Work," with an essay on ornamental design. Under the title of "Chorea Sancti Viti, or Steps in the Life of Prince Legion," he published in 1851 a series of allegorical etchings. He was next employed on his most important painting, eight large pictures illustrating the history of the English Border, at Wallington Hall, the seat of the late Sir Walter Trevelyan, and in 1863-4 the complement of this work was executed in the form of eighteen oil paintings on canvas for the spandrels of the arches in the saloon, containing the Border subjects. In 1868 he completed in encaustic a series of mural paintings illustrating the King's Quair on the staircase of Penkill Castle, in Ayrshire; and in 1869 came out "Albert Dürer: His Life and Works," a biography containing etchings by the author. Other works from his pen are "Selections from the Works of David Scott, R.S.A., with a Memoir of his Life, etched and written by his Brother," "Half-hour Lectures on the History and Practice of the Fine and Ornamental Arts," "William Blake: Etchings from his Work, with Descriptive Text," and "The Little Masters of Germany." In 1882 he was the architect for a hall added to Penkill Castle. For over forty years he exercised, says the *Scotsman*, a wholesome influence on young men in the world of art and letters, notably on the Pre-Raphaelite Brotherhood.

The Colonial authorities of Lagos, with the aim of developing a trade in Yoruba timber, have issued a circular to the colonies, stating that the Government will readily receive specimen logs of native trees, and will send them to England to be reported on and valued by experts. It is stated that throughout the colony there exist a large number and variety of timber trees, and that that part of West Africa (in common with the Gambia and the Gold Coast) is rich in cabinet woods of good quality and appearance. Communications on the subject should be addressed to the Colonial Secretary, Lagos.

Mr. A. Lafone, M.P., will lay to-morrow (Saturday) the foundation-stone of the Bermondsey Free Library, which is to cost £8,000.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institution. General Monthly Meeting. 5 p.m.
Royal Institute of British Architects. "Sassanian Architecture," by R. Phené Spiers, F.S.A. 8 p.m.
Society of Arts. "Gaseous Illuminants," Cantor Lecture No. 2, by Professor Vivian B. Lewes. 8 p.m.
Liverpool Architectural Society. "House Drainage," by T. Harnett Harrisson. 7 p.m.
Leeds and Yorkshire Architectural Society. "Descriptive Notes on Normandy," by F. Clibborn, of Birkenhead. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "The Vibratory Movements of Locomotives." 8 p.m.
Manchester Architectural Association. "Terracotta," by G. H. Willoughby.
Glasgow Architectural Association. "Ornament," by W. J. Millwain. 8 p.m.

WEDNESDAY.—Society of Arts. "The Chicago Exhibition of 1893," by Jas. Dredge. 8 p.m.
British Archæological Association. "The Epinal Glossary," by W. de Gray Birch, F.S.A.; and "A Brass Recently Discovered at Gloucester," by Cecil Davis. 8 p.m.

A memorial window, executed by Messrs. Kayll and Co., Album-street, Leeds, has been placed in St. Jude's Church, Ramsey, Isle of Man. The subject is the Good Deeds of Dorcas.

At a special meeting of Coatbridge town council, held on Monday, the offers for the mason and brickwork of the new municipal buildings were considered, when those of Messrs. John Devlin and Son, builders, Glasgow, were accepted, the mason work amounting to £7,809 2s. 10d., and the brickwork to £1,702 18s. 4d., the building stone to be taken from Gatelawbridge Quarry, Dumfriesshire.

A new Cambridge quarter clock was set going the other day at St. Mary's parish church, Stamford, by the Marquis of Exeter, the opening service being conducted by the Lord Bishop of Lincoln, the Rev. C. H. St. John Mildmay, rector, and a large number of the neighbouring clergy and laity. The clock shows the time on two large external dials, and was made and fixed by Messrs. Wm. Potts and Sons, clock manufacturers, Guildford-street, Leeds, from the designs and plans of Lord Grimthorpe.

Trade News.

WAGES MOVEMENTS.

WARRINGTON.—The master builders of this town have received six months' notice from the operative bricklayers for an advance of ½d. per hour on the present rate of wages, also a reduction in the working hours during the winter months.

CHIPS.

The Southampton Corporation are supporting a scheme by which Parliamentary powers will be sought for the inclosure of the Mudbanks by an embankment, so as to provide a tidal basin and low-water channel near the pier.

On Monday the memorial-stones of additions to Salem English Baptist Chapel, Plasmarl, Landore, Swansea, were laid. The total cost of the extension is estimated at £455. Mr. S. Wilson Edwards, Swansea, is the architect, and Mr. Elias Morgan, Landore, the contractor. The chapel, which is principally in the Gothic style, will have an additional frontage of 8ft., and new galleries and seats, giving an increased sitting accommodation for 260 persons.

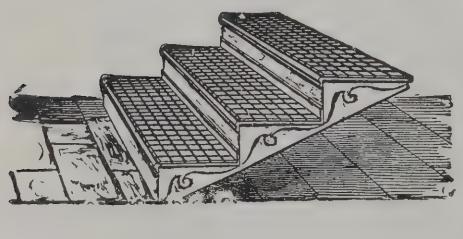
It has been decided to enlarge the hospital at West Bromwich, at a cost of about £6,000, by the addition of two circular wards to contain twelve beds each, and new laundry and sleeping apartments for the nurses.

New clothiers' premises in St. Mary-street, Cardiff, have just been built from plans by Mr. S. Rooney, of that town. The premises cover an area of 14,000sq.ft. Mr. Thomas Gough was the contractor.

A large illuminated turret clock has been erected at the entrance of Queen's Arcade, Briggate, Leeds, by Messrs. Potts and Sons, clock manufacturers, of the above town. There are two 5ft. dials fixed in an iron drum, and supported by an artistic iron bracket; on the top are the words "Queen's Arcade," which are illuminated at night, and above that a crown. The works are placed inside the arcade, and connected to the dial by a long rod. Lord Grimthorpe's escapement and other improvements are inserted.

A marble bust of William Symington, the designer and builder of the first successful steamboat, executed by Mr. D. W. Stevenson, R.S.A., was on Monday formally presented to the Edinburgh Museum of Science and Art.

Some additions have just been made to Cadeleigh Church, a 15th century edifice, some six miles from Tiverton. The new work consists of chancel fittings in carved oak, and includes a pulpit, hexagonal in plan, and containing in its central niche a statuette of St. Bartholomew, a priest's prayer-desk and seat, a lectern having an angel with outspread wings to carry the desk upon which the Bible rests, and an altar and super-altar. These additions have been carried out by Mr. Harry Hems, of Exeter, and were first used on Sunday week.



A new Post-office, erected by the Government in Queen Anne-street, Dunfermline, was formally opened on Monday. It has been built from plans by Mr. W. Wybrow Robertson, of H.M. Office of Works, Edinburgh.

Holloway's Pills.—These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically, on the functions of digestion and assimilation, that the whole body is revived, the blood is rendered richer and purer, the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated.

FRIDAY, DECEMBER 5, 1890.

ARCHITECTS' SUPERVISION.

HE obligations of an architect to carry out his own design and specification e been brought to the notice of the pro- ion by the discussion of questions at the don School Board having reference to disclosures made in the recent action nst a well-known firm of contractors. want of efficient superintendence has n the chief weakness of a department usted with the carrying out of very im- ant public buildings, and the fact has rally suggested to several members of Board the question whether outside pro- ional assistance should not be sought in design and construction of new schools. discussion on this question, and the posal made by one member that the rks Committee be instructed to have six schools planned and built under the erintendence of three outside architects, subjects reported in our last number, which we draw attention. The main stion turns upon superintendence. How n an architect should visit his work, what should be the general superin- lence which he is supposed to give, are stions that can only be decided by him- , assuming, of course, that he is willing ake into consideration the class of work the amount of personal attention that it ht to receive. Unfortunately, we do not this conscientiously self-imposed duty le a general rule among the profession. igation is set aside for convenience. The nber of engagements is considered to be a d excuse for reducing the amount of sonal supervision, as if the practitioner's ponsibilities to his client were to be gauged the extent of his business. Upon this nciple an architect having a large practice ght think it his duty to decline to give supervision, or to pay few visits at long ervals. There is a well-known story rent concerning an eminent church archi- t, now deceased, who, when travelling o the country to inspect a building in pro- ss, suddenly looked out of the window of railway carriage, and in accents of horror claimed: "Who has been allowed to aper with that grand old Abbey Church? is being positively ruined!" "Oh, that's of Sir ———'s restorations," was the iet reply of a gentleman sitting opposite, oting the Christian name of the titled in- rogator. Men of eminence in the pro- sion can make their own terms, and if public are willing to load them with nmissions, they cannot wonder if they eive very little personal attention after design has been accepted. The old ime, with its many advantages, has ssed away—men now practise architecture a business as well as an art, the days of ister masons and surveyors engaged on e work as superintendents have gone, and ployers engage architects, as they do ctors and lawyers, by paying them fees to pply designs and superintend the con- uction of buildings.

No custom or practice by law has been d down as obligatory with respect to architect's superintendence. There is thing to compel him to devote a certain nount of time to supervision; the only ing required of him is to see that the ns and specifications have been carried t fairly, and in a workmanlike manner. A tailed superintendence he is not compelled give, as, for instance, in seeing that the ain pipes have been properly laid and jointed, or that every brick and stone is of good quality and properly laid. Such details as these he could not attend to, nor is it desirable that he should when a clerk of works specially trained in these matters is employed. But though there is no legal definition as to what superintendence ought to be, or how far it ought to go, there is yet an unwritten law—the obligation of an architect to see that his design is carried into effect in a workmanlike and proper manner. We assume that every architect desires to rest his claims and merits, not on paper designs, but on actual buildings; that, for his own reputation, he is anxious to carry out his intentions in the best manner possible. If he does so, he is called upon to devote a considerable time to the superintendence of works, and that in proportion to the extent of artistic detail involved. Therefore, while there is nothing compulsory laid down requiring an architect to devote so much time every day or week to this part of his duties, we can hardly conceive it possible that he should take advantage of a circumstance that would jeopardise his reputation. But we have not far to go to find men engaged in official positions as architects to School Boards admitting that they never visited buildings until they were completed, and then not to examine the work. Our report of "The London School Board v. Wall Brothers" illustrates in a remarkable manner the very unsatisfactory kind of superintendence supplied in the carrying out of important public contracts, fully justifying the comments made by the judge and jury. When public buildings erected by important local authorities are thus controlled, it cannot be surprising if we hear of the want of proper supervision over works of lesser importance.

To some extent the question of the amount of supervision an architect should give to his work is affected by the employment of clerks of works. In every large building the clerk of works is absolutely necessary; he is supposed to give constant personal attention to the work, receiving his instructions from the architect, and the greater the work the more necessary it is to exercise sufficient control over the building, and to relieve the architect from the more arduous and mechanical duties of the superintendence. The architect, indeed, remits to the latter that part of the supervision which he cannot faithfully undertake himself. In so doing, however, he does not necessarily lighten his own responsibility. A clerk of works represents the architect—he takes his instructions from him; but he does not thereby take upon himself the responsibility of his chief. The general supervision still rests with the architect; the clerk of works is his factotum; but he does not relieve the former of any liability that belongs to the architect—a point that cannot be made too clear, and is very forcibly illustrated in the recent inquiries by the London School Board. The departmental clerk of works appears to have more responsibility thrown upon him than a clerk engaged under an independent architect. He is often called upon to superintend more than one building at a time; he is regarded as a sort of deputy architect, and certainly less control is exercised over him by the Board. We cannot wonder that the defects of the Board schools in London have been partly owing to divided authority, and to the clerk of works having several buildings to look after during the day. How can contract work, undertaken at a low price, be possibly carried out under these conditions? To place more than one building at a time under one clerk is to entirely take away the direct object of a resident superintendent, who is supposed to be on constant duty. Personal hourly superintendence is necessary in all the operations connected with building, more especially the laying of concrete foundations, drainage, the insertion of damp-courses, and the building of walls. Every description of ironwork and special construction requires constant overlooking. How many stones are likely to be laid on the wrong bed during a few hours' absence of the clerk of works? How many feet run of pipes and joints may be covered in during the time? With what carelessness damp-proof courses can be laid, or cutting and pinning the ends of iron joists, landings, and stone steps! Superintendence is more to the architect than the mechanical compliance with plans or specifications, for it means the actual realisation of the design. The painter and the sculptor execute their own designs; but the architect is compelled to leave to others the execution.

Our American brethren have wisely been considering and framing a code of rules on the subject. Employers in the States, as in this country, think that the rates they pay their architect ought to be sufficient to include his constant attention or that of a deputy or clerk—an idea held by many lawyers. The principles propounded at the Convention of the American Institute are—(1) that an architect offers, and is paid for, only a certain limited kind of superintendence; (2) that it is to the interest of the employer to pay for constant detailed superintendence; (3) that the architect is in no sense a contractor, nor is he responsible for the contractor's misdoings, and that the commissions usually paid are utterly insufficient for any such services or responsibilities, even if they were desirable. It is, therefore, urged that the employment of clerks of works should be assisted by the announcement of regular rates as an extra to the schedule. As regards the architect's supervision, is is affirmed that he will furnish "general superintendence by himself or deputy of such frequency or duration as in his judgment will suffice, to fully instruct the contractors, judge the merits of materials and workmanship, and maintain an effective working organisation of the several contractors, and to enable him to decide when the successive instalments are due. He is to determine in any constructive emergencies, and order necessary changes and define the true intent and meaning of the specification." He will also have power to demand the correction of all mistakes, but his superintendence is not to include liability or responsibility for any breach of contract by the contractor. The architect is to have the appointment of a clerk of works when necessary, to be paid on a schedule to be agreed. These amended clauses appear to go some way towards distinguishing the periodical supervision of the architect, and the constant superintendence of the clerk of works; but the clause as it reads is not so clear in asserting how far the clerk of works' authority is to extend. It would be more definitive to assert that the architect's supervision should be mainly interpretive of the drawings and specifications, that it should be chiefly exercised in reference to construction and materials, leaving the clerk of works the duty of carrying out these instructions in the building. All breaches of contract by the contractor, and all accidents and defects due to defective workmanship and materials, ought necessarily to fall upon him, and not upon the architect; but when due to imperfect design, or to errors of specification, the architect is certainly liable. A certain discretionary power would be given to the clerk of works in matters of detail. We can imagine in carrying out a building some question to arise as to whether some other course than that specified or agreed upon by the architect would be desirable. The clerk of works in possession of all the facts and circumstances is the right person to decide in the absence of the architect. He may suggest a trifling departure from the design or specification which would be an advantage to the building, and to this extent he ought to be allowed to go and exercise his discretion.

The fact is, architects leave too much in the hands of their superintendents, and if anything goes wrong they blame them. They give them *carte blanche* to alter the design or prepare any details that may be required, and, in fact, place the entire superintendence in their hands. We cannot wonder if the building is not so satisfactory as it might be, if responsibility is sometimes unjustly cast upon an individual who ought properly not to be subject to any, except that arising from sheer neglect of duty, in looking over the work.

ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

THE present Winter Exhibition at Pall Mall is somewhat disappointing compared with previous collections of finished work, though the fact that the display now on view is mainly one of sketches and studies will be sufficient to atone for the apparent want of importance or strength of the exhibits. The variety of the methods and technical modes of handling is at least of interest to the critical connoisseur. Take, for example, the sketches and studies of Sir John Gilbert, Birket Foster, and G. A. Fripp, and compare them with those of R. Thorne Waite, Wilmot Pilsbury, and Paul J. Naftel—painters who represent very opposite modes of artistic expression. Mr. G. A. Fripp's "View from the Bridge at Llanyltyd, North Wales" (2), "Near Horsham, Sussex" (27), "Study of Kisden Force, Upper Swaledale" (156), have all the delicacy of colour and minuteness of touch that characterise the earlier aquarellistes. Simple colour washes derive their form by delicate line work with the brush, putting us in mind of the early work of Prout and Gandy. The last-named subject is a careful study of stratification, showing the lines of cleavage of rock, the tone warm and subdued; the valley, too, of the Mawddach (2) between hills is full of sunlight and tone. Sir John Gilbert, the President, sends three studies: No. 30 is a "Study for a Larger Work," representing warriors in armour on horseback—a night effect, the colouring bold and the touch vigorous and free; "The Death of Adonis" (160) is more delicate in handling. The work of the veteran water-colourist, Birket Foster, is still remarkable for patient delineation and touch: No. 6, "On the Rocks"; "A Crofter's Cottage" (74); his sketches at Arisaig (82—95, 178), and his other Highland studies are marvellous for their truthful drawing and colour. By a different method, less laboured and depending more on a subtle sense of colour and manipulative skill, Paul J. Naftel's work claims notice—his "Langdale Pikes" (3), "Dungeon Ghyl, Westmoreland" (16), are delightfully delicate in tone; notice the hillside with its foliage in the last, and the sunlight effect in trees in "Mid-day Rest" (65). The painter's most finished work is "Stones on the Lyn, N. Devon" (108), a purling stream through rocks and foliage, solidly handled in forcible colour, the stones drawn with much power. The evening effect (180) is a charming effect of a rough shore. Francis Powell, P.R.S.W.S., in his "Shore Waves" (5), and other coast sketches, shows also a dexterous touch and pure, healthful colour. W. Eyre Walker sends several landscapes. His "Old Farmstead" (109) is delicate in tone, and there is a true feeling in most of his work. Vigorous and strong in colour is Robert W. Allan's "Kirchweihe" (19). The perspective and drawing of the market-place and the group of market folk are skilful. "A Scotch Washing" (33), "Campbelltown Harbour" (149), and the smaller sketches on the screen are highly characteristic of Mr. Allan's bold decisive touch and brilliancy of execution, though lacking somewhat in atmosphere. Ambitious is the landscape of Tom Lloyd, "The First Breath of Autumn," a garden overlooking a lake, and a young lady with her dog, pensively musing at the gate in the wall of her demesne—a charmful scene of tranquil nature, luxuriant in the bright reds and browns of autumnal foliage, with gossamer-like thistledown wafting in the breeze. The idea is sentimental, the tangle of flags and grasses admirable in rendering. Mrs. Allingham's pretty studies of rural beauties are fascinating in the true tenderness and feeling with which she depicts every leaf and flower. A "Spring Copse" (14), a bank of primroses and other wild flowers; and the sketches of cottages at Freshwater, Isle of Wight (168, 171), are delightful in their minute and conscientious rendering of cottage life.

Impressionism finds few exponents. A. Melville (23) has a note of colour, a "Gleam of Sunlight," and other clever impressions of the same effect, including a sketch of the "Mosque of Cordova" (297) on the screen, and the "Canon of Ronda" (67). Strong and healthful in colour are R. Thorne Waite's landscape sketches. "The Road to Maldon" (25), "Danbury Common" (94), "A Roadside Cottage" (120), and other studies are works that indicate a vigorous touch and a true sense of tone and colour. Edward A. Goodall's "The Gate of Justice, Alhambra" (26), and his drawings of "Trajan's Aqueduct, Segovia," and other foreign studies have an archæological interest apart from their merits as drawings. Pleasant as bright sketches are the landscapes of John Parker "Sleepy Streatley" (59), bathed in sunlight and haze. "Almshouse, Kent" (78), "On the Thames" (170), are among those; also a pretty study of a girl arranging poppies (98). Also in a vein of true poetry we must place the work of Wilmot Pilsbury, whose "Wheatfield" (44) and "Village Homes" (58) are delicately soft in tone, but somewhat mannered in technique. The flowering creepers, the nasturtiums growing against the cottages, the apple blossom in 143, the golden corn in 166, the ricks and poppies (177), and other studies from field, wayside, and hedgerow, indicate true feeling and tenderness. Another artist, Herbert M. Marshall, well known on these walls, contributes some pleasing sketches on the banks of the Thames. "Old Chelsea" (36), "Millbank, Westminster" (68), "Sketches at Whitby" (62, 364) "Staithes" (117), are some of these, all exhibiting sharpness of handling, pleasing grouping and colour. A large and luminous subject, "Lost" (46), by Chas. Robertson, an Indian courtyard, with costly plunder strewed over the ground, is cleverly painted—the groups of soldiers and articles of value especially. Other Eastern studies and views of Devonshire are sent, all bearing evidence of Mr. Robertson's versatility.

"On the Banks of the Mawddach" (40), by Arthur Hopkins, is subtle in its rendering of foreground and wild flowers, the handling delicate; "Haymaking" (56) and some other sketches are also clever. Matthew Hale has a nice sketch of blue sea and cliff (43); Cuthbert Rigby (45) contributes some nice landscape effects, and there are a good few works by G. H. Andrews (47, 87). The contributions of William Callow are not quite so numerous or equal in quality to former displays. No. 17, a Gravesend view, "St. Helier's" (84), "A Bit of Wimbledon" (121), "Caister Castle, Norfolk" (191), "Dartmouth Castle" (238), are nevertheless characteristic drawings, full of power and tone. Colin B. Phillip's study of "Rock in Argyleshire" (91) is more forcible than pleasing as a subject. We must notice briefly John Burr's "Village Beau" (77), Norman Tayler's "On the Way to the Monastery" (89), Miss Clara Montalba's delightful Venetian sketches (111, 144), and many on the screen, luminous and pearly in hue; Samuel J. Hodson's views in Verona (128, 139 especially the "Corso," full of careful draw ing, light, and shade; E. F. Brewtnall' pastel study, "Dora" (129); Walter Field' small sketches of Windsor and Eton (153) Alfred W. Hunt's "Warkworth" (161), clever study of atmospheric effect, sea, an mist; A. W. Hunt's charming sketch "Robin Hood's Bay" (164); Henry Moore "Thunderstorm," a dexterous study cloud, (174); Sir Oswald W. Brierly's ver charming studies of "Venetian Craft" (179 and other sketches of fishing boats (333, 34 and studies from nature (257). Cuthbe Rigby's "Summer Days" is a little flat i effect; Albert Goodwin's powerful "Afterglo on the Mediterranean" (185), "Maidstone (20), and the night scene, "Ponte Vecchi Florence" (243), are poetic in conceptio strong yet subtle. We must note the figu studies of H. Gillard Glindoni as bein especially characteristic and spirited- "Cherry Ripe" (232), "Vive la République (253), "Vive le Roi" (278), "Expectations, an old beau with nosegay (283), are ver clever studies. Walter Crane's ideal figu studies of the seasons are graceful, but h other figures lack atmosphere. The studi by George Clausen (110, 222), and som interesting drawings by the late Arthu Glennie, and the large monochrome stud "Wreck of the Halswell" (241), by G. H Andrews, cannot be passed over.

THE PROPOSED CHANGES AT TH ARCHITECTURAL ASSOCIATION.

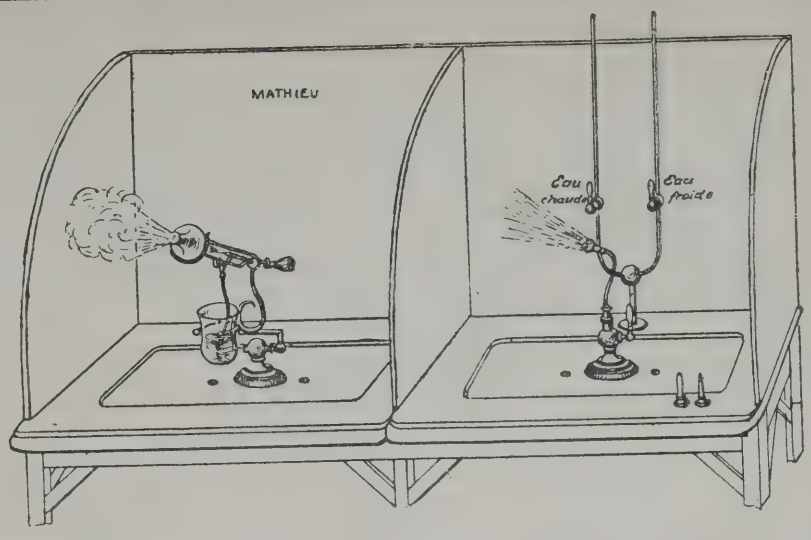
WE are glad to see that the Speci Committee for the Revision of th Rules of the Architectural Association, in report to be presented at the business mee ing to be held on Friday in next week, th 12th inst., have adopted a suggestion w have repeatedly made, that if any increas in the subscriptions is considered necessar it should apply *to future* members only. Th funds of the Association will doubly benefi for while candidates for membership wi pay, as a matter of course, the sum demande for admission and as a subscription, th senior members who have retained the names on the roll for old acquaintance' sak although rarely attending the meetings, wi not be reminded by an increase in the sul scription that the present is a favourab opportunity for closing their connection wit the Association. The proposals of the Speci Committee are that the entrance fee should raised from one guinea, as at present, to tw guineas, and that the annual subscripti for all members elected after the 1st January next shall be one guinea instead half-a-guinea, as now payable.

A feature of the revision is that the rul are now split up into a constitution an by-laws, and the arrangement is on t whole clear and satisfactory, although nee ing a little trimming and verbal alterati here and there. The proposed substitution By-law 36 of voting by show of hands inste of papers sent by post, recently propose is open to criticism, favouring, as it do metropolitan members at the expense provincial men in any future changes in t rules, and we trust the point will be de with at the meeting of Friday in ne week. In the constitution, consisti of eleven of the most important claus the chief changes are that the declar tion asserting it to be one of the ai of the Association "to advance the pr fession" is omitted. Branch bodies henceforth to be known as "allied" in l of "affiliated" societies, and are defined holding their meetings not less than thi miles from Charing Cross. A definition qualification for membership is now given

The principal change in the by-laws, so 39 in number, is, besides the proposed incre in the entrance fees and in the subscripti

new members, the addition of a "studio" the methods by which the objects of the sociation are to be carried out. Rule 29 ovides that "the committee shall have wer to appoint . . . any paid officials to ist in the work of the Association at such nuneration as may be deemed expedient," parently an intimation that it is proposed at the arduous work now so efficiently rformed by the two honorary secretaries at cost to themselves, it has been said, of at ast £50 a year each, shall in future be compensed.

HE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—XII.



By R. Owen Allsop, Architect.
uthor of "The Turkish Bath: its Design and Construction.")

THE treatment of local diseases by means of the application of pulverised water certain parts of the body is carried on in pulverisation rooms." These features of ie well-appointed medical bath-house will robably be increasingly required in the ear future, and therefore merit their share attention. The curative attributes of ulverisations of the kind to be considered re referable to the same sources as those of ny true hydropathic remedy, so long, at ast, as the water employed is in a state of atural purity. The temperature and dura-ion of the application chiefly govern the ffects produced. When, however, spring vaters, naturally medicated with sulphur, ron, or salt, &c., are employed the curative nd remedial virtues of these chemical sub-tances must be added to the benefit derived rom water simply. The application of pure vater in a pulverised form is in harmony vith every principle of the strict hydro-athist, and consequently deserves his atten-ion. Where thermal or cold spring waters re the media employed, the treatment may e said to be more suited to the medical ath-house.

THE MONT DORE CURE.

The Mont Dore Cure, as carried on at the famous establishment in the Auvergne, Puy le Dome, consists properly of a treatment embracing not merely pulverisation, but every kind of application of the Mont Dore waters that can be devised. The term has, nevertheless, in this country become iden-tified chiefly with pulverisations. In its full and complete form, the cure embraces drinking of the water, inhaling it in vaporised and pulverised conditions, nasal irrigations, ear and eye douches, and baths of various kinds and at various temperatures. The greater part of these require no special explanation; but the method of pulverising the water, and its mode of application may not be so self-evident to the reader.

The details of the administration of pul-verised water, on the Mont Dore system, may vary according to individual fancy; but the main principles are similar. As a general rule, the pulverisation of the water —the act of splitting it up into infini-tesimally small portions—the formation, in homely words, of very delicate *spray*—is accomplished by means of a fine jet of steam impinging upon an equally fine jet of water. The apparatus for producing this spray is placed upon tables, before which the patient sits, and directs the spray against the throat or other part to be treated. In a good bath-house the pulverisation-rooms should be fitted with specially-arranged benches or tables for this purpose. If refer-ence be made to the last article of this series published in the Building News, p. 423, September 26th last, a plan will be found of a pulverisation room for a medical bath-house of some pretension. It is arranged adjoining the lavatory of the inhalation hall. In the centre of the room is provision for six patients, and four more are accommodated at

one side. The section, it will be noticed, cuts through the central table, showing its general form, with the quadrant-shaped vertical divisions between the compartments. Each patient has one of these compartments to himself, and it should be seen that the space allotted allows a sense of comfort. The table, stands, and divisions shown may be formed of marble slabs. A sinking, or "dishing," should be provided at the top of the table or horizontal slab in each compartment, to receive any water or moisture, which should be drawn away in a proper manner. In each compartment a pulverising machine is placed, unless the small douching apparatus is also to be provided, when there will be an assortment of the two kinds.

Pulverising instruments may be made to individual fancy; but the greatest care should be observed in selecting only those of first-class make, and so insure against any defect that may lead to the danger of scalding. Some excellent appliances of this nature at the baths at the Hôtel Mont Dore, at Bourne-mouth, were made by Mathieu, of Paris; and illustrations of these are given herewith. The drawing shows a stand supporting a double compartment; in one is placed a pulveriser, and in the other a delicate douch-ing apparatus for the ear, eye, and nose. The horizontal slabs or tables are sunk or "dished," as explained. In the left-hand compartment is the "pulveriser," consisting of a pedestal or stand, forming a steam tube, and holding a glass to receive the Mont Dore water. The steam-pipe terminates in a fine nozzle, and a similar nozzle, commu-nicating by means of an indiarubber tube with the water, is placed at an acute angle with it. Two slight metal arms support a thin porcelain funnel, which collects the spray into a stream. The upper portion of the appliance works on a joint, and thus, by means of the handle on the right, the stream can be conveniently directed as may be necessary. The action is as follows:—When steam is turned on, it rushes out of the fine nozzle, and draws water up the lower nozzle, the water being pulverised or converted into spray, in the process. This is concentrated into one stream by the funnel, and the patient, with his right hand on the handle, directs it against the throat or other part. In the former case, he keeps his mouth widely open, to admit the spray, and in cases of throat and chest affections actually in-hales.

The principle of the pulveriser is precisely that of the common "spray-producer" for scent-bottles. In the latter case, however, a rush of air causes the liquid to ascend its tube; in the pulveriser the jet of steam is the agent. The treatment requiring to be given with heat, this is effected by means of the steam.

There is some slight danger of scalding under the system of treatment. Should the jet of steam be suddenly raised to a higher temperature, or the flow of water suddenly checked, the result will be an increase of heat. To guard against this, it is important to employ a low-pressure, and consequently a low temperature of steam. It is further necessary that the apparatus be kept in per-fect condition by continual examination, and, above all, that it be scrupulously clean. The water should be free from foreign particles of matter, and the tube should not reach to the bottom of the glass. Of great moment is the nature of the steam supply. It would be perfectly easy to connect a series of these pulverising appliances to the main steam-pipe of an ordinary boiler, but nothing would be more unsuitable. If any such general system of steam supply were adopted, the boiler would have to be of special construc-tion, and specially reserved for its purpose, the boiler being weighted to the lowest pressure. A convenient, safe, and ordi-narily-adopted plan is to employ a small gas or spirit-heated boiler to each apparatus, or to have two or three such boilers in the pulverisation-room, each one being movable and easily detachable from the pipe leading to the apparatus, so that it can be used with such a one as may be desired. These small boilers can be placed under the tables, if more complete arrangements have not been made for their reception. Cylindrical copper boilers with domed-tops, safety-valve, gauge, steam, and water-cocks, heated by gas-flames will serve all purposes. If fitted with side handles and easily-detachable unions, they can be moved about as required.

With proper precautions a treatment that is undoubtedly efficacious in many throat and chest diseases will not be open to the charge of danger from scalding.

The apparatus, shown in the right-hand compartment of the accompanying illus-tration, is a miniature douche for the eye, ear, and nose, as used in the Mont Dore cure. It consists of a stand or pedestal, much after the kind of that of the pulveriser, but terminating with a curved pipe, the end of which is prepared to receive a minute rose or douches of various degrees of fineness. It is fitted with a stop-cock. Behind, are seen the small supply-pipes of hot and cold water with regulators. The pipes unite in a ball to allow of proper mixing of the hot and cold supplies, so that the mixed water may issue at an even temperature. The patient sits before the apparatus and directs the spray or douche against the eye, ear, or nose as may be required. On the front of the table, or tray, are seen two extra nozzles for forming douches of different strengths, the rose being in position on the pedestal. This is a true *local hydropathic bath*, though, when used with the Mont Dore water, possessing some special therapeutic qualities.

(*To be continued.*)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary meeting of the Institute was held on Monday evening, the President, Mr. Alfred Waterhouse, R.A., in the chair. The President announced that the council would proceed on the 2nd February to nominate to Her Majesty a person as a fitting recipient of the Royal Gold Medal. Any nominations by members must be sent in to the council before January 1st. Mr. Waterhouse added that he wished to make a personal explanation as to a portion of his opening address which referred to the relations between the Institute and the Architectural Association. He had been informed that an unfavourable impression had been left in the minds of some who were interested in both the senior and junior bodies. He had called attention to the fact that from some cause the Association had not furnished so large a proportion of candidates for examination as might have been expected, and in this he was supported by the President, Mr. Leonard Stokes, who, in his inaugural addresses both last year and this, expressed fears that the Association classes did not prepare men fully for the examinations. So far from wishing to give offence, he had for some years been a member of the Association, and although he had not had the privilege of attending its classes, he was interested in its welfare and success. He wished the Association to seriously consider its position with regard to the Institute.

Mr. C. H. Brodie rose to continue the discussion, but was ruled out of order.

SASSANIAN ARCHITECTURE.

A paper on this subject, illustrated by numerous drawings and photographs, was read by Mr. R. Phene Spiers, F.S.A. Although the Sassanian dynasty endured but little more than 400 years, from A.D. 226 to 636, the architects and artists of the period had developed a characteristically marked style from a constructional point of view. But the style had other claims to consideration, as it seemed to form a connecting link between Assyrian and Babylonian architecture on the one hand, and Byzantine work on the other—of retrospective value, if the vaults of Al Hadhr, Serbistan, and Firouzabad represented the traditional method of such coverings handed down from Assyrian times, and of prospective value in regard to Byzantine work, provided that the dates given to Serbistan (about A.D. 350) and Firouzabad (about A.D. 450) were correct. The earliest building classed as Sassanian by Fergusson was the Palace of Hatra, now called Al Hadhr, respecting which little was known beyond the information communicated to the Institute in 1846 by Mr. (now Sir) A. H. Layard. Further accounts of the ruins had been given by the late Dr. Ross, the surgeon of the British Residency in Baghdad. Two of the great halls of Al Hadhr measured about 95ft. by 42ft. or 46ft., and the third 60ft. by 65ft., and their vaults, which had fallen in, were said to be semicircular, though the Sassanian vaults were usually elliptical. The doorways were, however, invariably circular-headed. Certain of the voussoirs of the arches were enriched with sculptured heads, and the entrance doorways to a smaller hall had heads with curly bag-wigs, such as were found on Parthian coins, on every voussoir. As regarded the form of the vaults, the elliptical, or three-centred curve, was that used at Serbistan and Firouzabad, and as a matter of fact that form of arch in brick construction was one of the earliest known, for the vaulted granaries behind the Ramesseuses of Thebes in Egypt were of the same elliptical form as those found in Persia. The possibility that the palace owed its erection to Parthian rather than Sassanian architects had been suggested in Professor Rawlinson's "Sixth Great Oriental Monarchy," for when the city was besieged by Trajan in A.D. 116 it contained a Temple of the Sun, which was probably the square building at the back of the palace, containing a frieze, above the doorway, ornamented with the head of the Sun-God, with crescents to represent the moon on either side, and, among other emblems, winged griffins. These last were precisely similar to a griffin found at Warka (the ancient Erech), in the south of Mesopotamia, 250 miles south of Al Hadhr, and described by Loftus, who had given drawings of various objects discovered at Warka, of the same type as that shown in Sir H. Layard's sketches—viz., Syrio-Greek. The second building mentioned by Fergusson was the so-called Palace of Tigranes—now the Great Mosque at Diabekh—which seemed to have been built up of materials taken from some earlier building, while the ornament, which resembled that found by Loftus at Warka, seemed to be Parthian in style. The next example quoted by Fergusson, the Palace of Serbistan, seemed to the lecturer to be the first genuine Sassanian building; and in design and construction it appeared to be the outcome of many experiments made in earlier buildings no longer existing, or not yet discovered. The halls, which were abont 26ft. wide, had been covered with elliptical barrel-vaults. There was also the Palace of Firouzabad (A.D. 450), which had a frontage of about 170ft., and a depth of about 320ft. The entrance consisted of a hall 90ft. in depth, nearly 40ft. wide, covered with an elliptical barrel-vault. Other halls were on either side, and beyond were three halls side by side, each vaulted with a dome on pendentives, which consisted of a series of concentric arches advancing one over the other, and displaying increased scientific knowledge, whereby the Sassanian architect did away with centring altogether, each superimposed ring being carried back on the top of such ring beneath, and resting on it. The Palace of Ctesiphon, on the Tigris, distant about thirty miles from Baghdad (about A.D. 550), which was known to have been built by Chosroes I., formed a rectangular block 312ft. by 170ft., and about 110ft. high. In the centre of the front a magnificent portal, which rose to the full height of the building, gave access to a hall, 163ft. deep by 83ft. wide, covered with an elliptical barrel-vault, 95ft. from the ground to the crown of the vault, and 67ft. from the ground to the springing of the vault. The bricks, or tiles, with which it was built were laid flatwise, as in the granaries at Thebes. The remains of two other palaces have been found in Persia, one at Imumzade, which consisted of a dome on arches, and a second, called the Taj-Eiran, recently discovered by M. Dieulafoy, the hall of which showed a considerable advance in construction, as it was lighted by clerestory windows between the barrel-vaults. The vaults were composed virtually of a series of transverse arches, the interspaces being vaulted across in a most scientific manner. Two other Sassanian buildings, remarkable for their decoration rather than their construction, were the Palace at Mashita and the Hall at Rabboth-Ammon, both at Moab. They were supposed to have been erected under Chosroes II. by Syrio-Greek artists, and they were enriched with ornament derived from Hebrew monuments, interspersed with Persian figures and Sassanian decorative details.

At the close, Mr. William Simpson, R.I., moved a vote of thanks to Mr. Spiers for his exhaustive paper, which was seconded by Mr. Alma-Tadema, R.A., and carried by acclamation.

THE ARCHITECTURAL ASSOCIATION.

The fortnightly meeting of the Association was held on Friday evening, the President, Mr. Leonard Stokes, in the chair. Mr. P. J. Marvin was elected unopposed on the committee, to fill the vacancy caused by the resignation of Mr. Francis Hooper. The following new members were elected:—E. L. Collins, E. L. Harrison, E. Jessop, G. B. Macdona, G. A. Kerr, and A. H. Carter.

ARTS AND ARTISTS IN FORMER TIMES AND TO-DAY.

Mr. William H. White, Sec. R.I.B.A., read a long paper on this subject. Until a comparatively recent periods national or public building contained within itself, the author remarked, as parts of itself, all the great arts, technic, æsthetic, and phonetic, or accessory. These arts were common to the artists of every nation which achieved excellence prior to the invention of printing, and the consequent diffusion of general knowledge between the years 1450 and 1550, wherein the boundary-line between the old and the new methods of artistic practice, according to Fergusson, must be sought. The progress of the arts was traced from the migrations of the Greeks through Eastern Europe, Egypt, Asia Minor, and North-Western India; and then, after a glance at the work of the Romans, Mr. White urged that, under the influence of the monastic system, the sway of Rome over the world had never been entirely lost. A reference to the progress of Europe in the Middle Ages was followed by a sketch of the r and growth of the Renaissance, which moveme he contended, was a development or renovati rather than a revival. In England, three d tinct epochs of intellectual activity in the gr arts could be defined as having occurred in years 1250, 1550, and 1850, there being thu lapse of 300 years between each. The first these movements was a practical, general ma festation of artistic vigour. The second wa studious relaxation of religious discipline, mental demonstration which affected everythi which contributed to the enjoyment of life. T third, in our own time, had been mainly pictor and scenic—an affair of sentiment, fashion, a party spirit, confined to only a portion of t community at large. The lecturer pointed o that it was only during the last century that t word "artist" had been perverted from original meaning of signifying one who exercis a mechanical trade to mean a person of æsthe training and acquirements. Having shown h largely English art had benefited in all perio by the immigration of foreigners, he proceed to consider the art of to-day, ridiculing the pr valent desire to make our edifices picturesq in skyline and on plan, by adding useless towe and irregular masses of building. The arts painting and sculpture, once subsidiary, nc attempted to display their charms independent of architecture. In conclusion, he prophesi that there would be in the future a closer relati between the technic, æsthetic, and phonet artists, and between them and the architect. T technic artists would, he believed, rise in t social scale, and in the next century the ma monopolist would have, he believed, to conte with female competition in all the gentle art Painting, sculpture, or, more properly speakin modelling, and design of every kind wou eventually be practised by women to the ultima exclusion of men, and the designer, pure a simple, "who now calls himself an architect, would be sorely pressed by the softer man in t mutual struggle for existence, and, as a cons quence, the masculine arts of construction wou regain the consideration attached to their practi in Roman and Mediæval times.

A vote of thanks was accorded the lecturer o the motion of Messrs. John Slater and F. Baggallay.

BUILDERS' BENEVOLENT INSTITUTION.

An election of one pensioner on the funds this Institution was held at the office 4, Vernon-place, Bloomsbury-square, on Thur day, the 27th ult., Mr. W. Shepherd, presiden in the chair. There were five candidates for th one vacancy—viz., one man and four wome Shortly after the close of the poll, the scrutinee (Messrs. T. Stirling and T. F. Rider) announce the results of the polling to be as follow, viz.:- Charles Sabey, 97, St. Peter's-street, Islingto aged 71, builder (third application), 1,636 votes Margaret Alice Richardson, 5, Preston, Nort Shields, aged 66, widow of T. B. Richardson builder (fourth application), 1,297 votes; Mar Ann Shapland, 132, Stamford-street, Lambeth aged 71, widow of William Shapland, builde (third application), 1,241 votes; Elizabeth Darby 2, Sangora-road, Clapham Junction, aged 81 widow of Edward Darby, builder (first applica tion), 3,227 votes; Bessy Webb, 314, Old-street E.C., aged 60, widow of Robert Webb, builde (second application), 1,585 votes. The successfu candidate was therefore declared to be Elizabet Darby, whose late husband subscribed to th Institution from the time of its foundation.

SHADOWS.—VII.

We will now follow the system for shadow thrown against the wall-plane by isolate objects more or less distant from the plane. Th student should study carefully the followin examples, as they embody the main elements fo the formation of the shadows thrown by columns their capitals and bases, &c.

In Fig. 24 we have a square block, such a the abacus of a capital in an isolated position a some distance from the plane receiving th shadow. From the points at the angles in th plan we draw the lines at 45° to meet the wall plane, and from the corresponding points in th elevation, the shadow lines A A, B B, C C, D D The intersection of the projection of the line

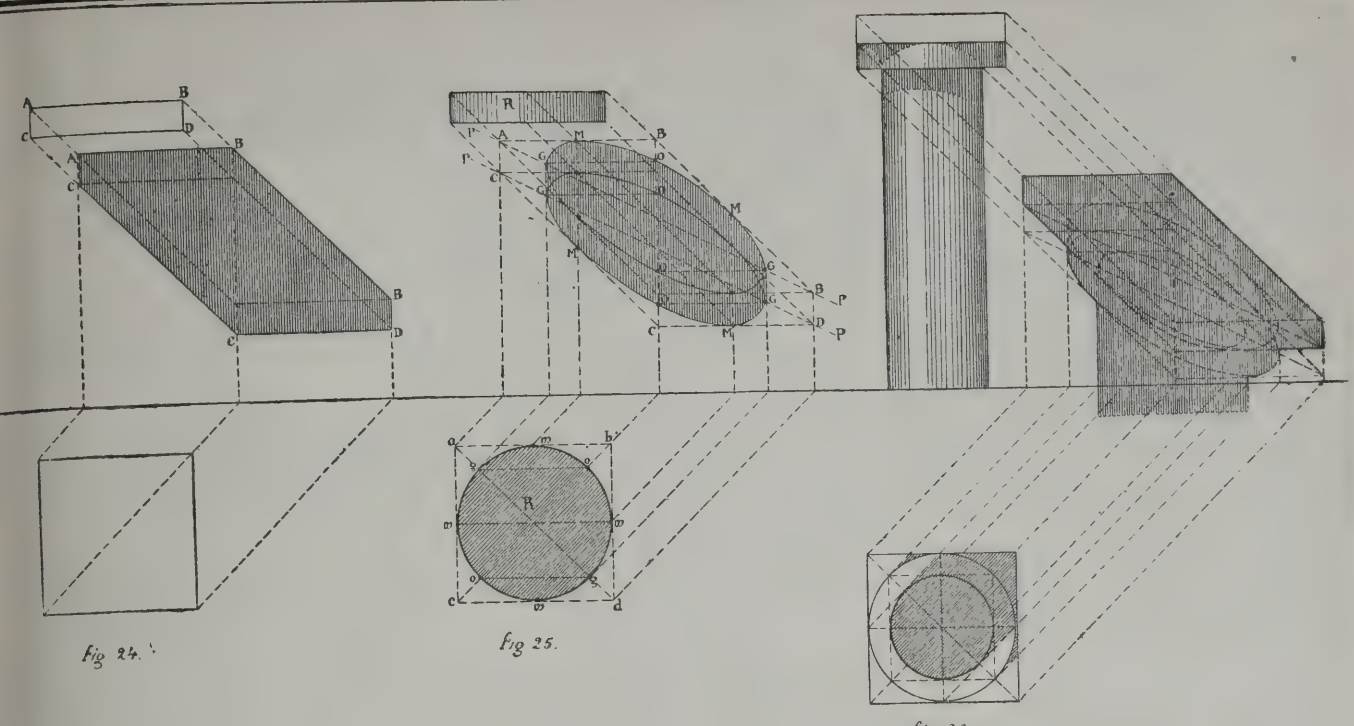


Fig 24.

Fig 25.

Fig 26.

rom the plan with the corresponding lines in he elevation will give us the shadow of the block A B C D.

In Fig. 25 we have the same kind of shadow, except that in this case the block is circular in form. We draw the square *a b c d*, containing the circular block R, then the diagonals *a d*, *c b*, and the diameters *m m m m*. The diagonals will give us the tangent points *g g*, *o o*. From the angle-points *a b c d* we draw the lines at 45° to meet the wall-plane. The intersection of their projection with the shadow lines in the elevation R gives us the traces of the shadow of the containing square *a b c d* at A B C D, as in Fig. 24. We have now to find the shadow of the circular block contained in the figure, A B C D. Draw P P. The projection of the lines at 45° from the tangent points *g g* will give us at their intersection with P P in the elevation, the points G G, G G. The projections of the lines at 45° from the points *m, m, m, m* will give us in the elevation the corresponding points M, M, M, M. In the plan the parallels to *a b* and *c d* from the points *g g* meet the diagonals at the tangent points *o o*. The diagonal *c b* is represented in the elevation by its projection C B; therefore, to obtain the points in the elevation corresponding to *o o*, we have to draw from points G G, lines parallel to A B and C D, meeting the diagonal C B at O O. We thus obtain the principal points of the shadow of the circular block; the curve drawn through these points, G, M, O, G, M, O, &c, will contain the shadow of the block against the wall plane.

In Fig. 26 we have a column crowned by a circular and square capping. We obtain the shadow of the whole figure by following the method first employed for its component parts in Figs. 24 and 5. Figs. 25 and 6 may appear somewhat complicated, but in reality they are perfectly simple; we have only to notice carefully the position of the various points in the plan and follow their projection to the elevation, remarking that they occupy precisely similar positions in respect to each other as in the plan. We must remember that, to obtain the shadow of an isolated circular body, we must first find the shadow thrown by the containing rectangle, obtaining the true shadow of the contained figure by the projection and intersection of the various lines in plan and elevation. The Fig. 26 would, drawn to a large scale, be good practice for the student in the study of this system of shadows, important as being the principle for all shadows of rounded projecting bodies.

A NEW METHOD OF TUNNELLING.

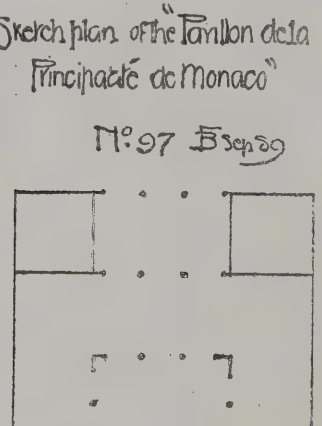
AN important improvement in the working of tunnels has been patented by Messrs. Jennings and Stannard, of 84, Victoria-street, Westminster, which promises to effect a considerable saving in the cost of construction, not only of tunnels, but of subways, sewers, and other underground excavation. The principal object of the invention is to economise the labour and materials in the driving of tunnels, and to prevent the subsidence of the soil or superincumbent ground. It consists briefly of the design and arrangement of a series of steel bars or "needles" placed side by side, resembling a series of rebated boards, so as to form a temporary lining and support to the soil during the construction of the brick arch of a tunnel which is built up close to it underneath. The old system of constructing tunnels requires the insertion and use above the permanent brick arch of timbers, which are known as "crown bars" and poling boards, to enable which bars to be introduced it is necessary to excavate 3ft. at least above and beyond the crown of the tunnel arch. After the arch is built the longitudinal bars are left, and the spaces between and under them are filled in with brickwork to the outside of the completed arch to prevent subsidence of the earth. By the use of the steel needles, which are 10ft. long and 6in. wide and 2in. thick, the edges being provided with longitudinal tubular grooves and corresponding tongues, which give the needles mutual support, the ground need be excavated only to the exact section of the tunnel plus the 2in. thickness of the needles. The brick arch is built close up to this lining of needles; they are then separately pushed forward by screw-jacks as the ground is excavated for the succeeding length.

This improved method of supporting the superincumbent ground during the work of tunnelling is now in operation in the construction of the new main line tunnel of the Great Northern Railway at King's Cross. A party of engineers and representatives of the Press inspected the operation in the new tunnel last Tuesday, and the general opinion was decidedly in favour of the adoption of the invention. The ease and rapidity with which the excavation can be made by the insertion and drawing forward of the needles, avoiding the removal and disturbance of the ground overhead, and the readiness with which the brick arch of tunnel can be built, were points apparent to all who have seen the primitive and bungling nature of the old timbering. The needles can be separately pushed forward with little force, as they are linked together by longitudinal grooves. These tubular cavities or grooves allow liquid grouting or other material to be introduced to fill the space left vacant by the advancing needles between the top of arch and the earth above, so as to prevent any subsidence. The needles being narrow, grooved together to allow of free play, they can be fitted to every arch curve. In the Great Northern tunnel the inside width is about 26ft., and the invert 25ft. 3in.

Messrs. Jennings and Stannard's invention facilitates the operation of tunnelling. Many advantages are effected—(1) By the use of the steel needles unnecessary excavation is avoided, and the ground dug out only to the exact size of the tunnel. (2) A large amount of timbering in crown bars, &c., is rendered unnecessary, and is therefore not required to be bricked up and left round the arch. (3) All subsidence by the disturbance of the ground in introducing the bars, or by imperfect packing, is thereby prevented, also the consequent heavy compensations paid for damage to property overhead. (4) Time is saved, and the excavation rendered more rapid and safe. The advantages of this system are more evident in the construction of tunnels, subways, or sewers which have their crowns near the surface of the ground, and where the risks of subsidence and injury to buildings overhead are increased. In these cases the needle lining can be introduced without the slightest vibration or disturbance of the soil, in proof of which we have only to look at the successful operation in the Great Northern tunnel, the crown of which is in some parts only 4 or 5ft. below the ground, which is largely weighted with potato market buildings. The experience gained by the use of these needles has proved that a considerable economy of labour and cost has been effected, that a reduction of about 50 per cent. on the cost of all the work has resulted in the upper portion of the tunnel, or from the crown to the top sill of the face timbering. The old system necessitates an open excavation where the thickness of only a few feet above the crown exists, as it is impossible to prevent disturbance of the surface when the crown bars are used. Many other uses might be suggested for these needles, which are worthy the attention of all engineers and architects who have subways or underground works.

BUILDERS' IRONMONGERY.

THE illustrated catalogue of Messrs. Young and Marten, builders' ironmongers, of the Caledonian Works, Stratford, E., contains many articles, kept in stock, and departments of trade of importance to builders and architects. The prices are revised to date, and show a large trade profit. Wholesale trade prices are given of lead, zinc, solder, glass, colours, oils, and varnishes, plumbers' and painters' tools, plumbers' brass-work. A very comprehensive assortment is shown of cast-iron waste-not cisterns, tanks, cisterns, wrought-iron gas, steam, galvanised, and heated fittings. In this department we find

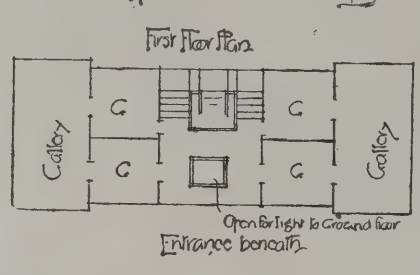


illustrations and prices of every special kind, elbow, tee, diminished sockets, from ⅛in. to 4in. in diameter. Several kinds of contractors' chain and lift and deep well pumps are shown. The sanitary department includes pan, elastic valve, cottage, and combination closets of various patterns and prices. The marble and enamelled slate chimneypieces of different designs, and varying in price to suit every pocket, are worth the notice of builders. They are made of different jamb widths, 7in., 8in., 9in., and 10in. piers in Sicilian and vein marbles, or to imitate various marbles, according to taste. The fluted pier and panel patterns are both shown. Equally low-priced are the special cheap mantel registers, curb-fenders, the overmantels, the tile grates, the elliptic Rumford Dundee stoves, and self-acting cottage ranges. The prices of the latter are remarkably low—from 12s. to 15s. 6d. with oven only, and from 15s. to 18s. 6d. with oven and boiler, the last price being for a 36in. opening. Stronger ranges vary from 16s. to 29s., according to width and fittings. Hot-water fittings and apparatus, heating stoves, stable fittings of very inexpensive and effective design, and a variety of miscellaneous ironmongery and castings, including locks and door furniture, gas-fittings, electric bells and fittings, will be found illustrated and priced in Messrs. Young and Marten's catalogue, which ought to be in the office of every architect and builder, house-furnisher and ironmonger.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XX.

By Banister Fletcher, Jun., A.R.I.B.A.

THE MONACO PAVILION.



THE architect is M. Tantz. Occupies a space of 358 square yards, and is situated almost opposite the end entrance to the Palais des Beaux-Arts. It is in the Italian Renaissance style, and

constructed in pan-de-bois or brick-nog walling, covered externally and internally with plaster. The plan is as below. The central hall roof is supported on columns, and is tiled. The four angle towers are carried up separately and joined together at first-floor level by a balcony over the intermediate parts. The towers themselves are arranged as open "belvederes," and have flat-pitched tiled roofs, the eaves being supported by wooden brackets painted red. There is a greenhouse at the back furthest from the entrance. The outside decoration is nearly all white. The interior architecture partakes of the François I. type of French Renaissance, and is delicately treated. The colouring, whose key-note is gold, red, yellow, is very satisfactorily managed; the terracotta medallions being brought from Monaco.

The two followings buildings, the pavilions of the "Aquarellistes" and the "Pastellites," on account of their construction, merit little notice, being both built in the ordinary pan-de-bois or brick-nog walling type, covered profusely as to their interiors with plaster of Paris and "staff" decorations.

The "Aquarellistes" consists of a low central entrance with circular arch, over which is a quadrangular dome in zinc. Behind this entrance is the staircase leading to the first floor, which is lighted from the roof. The ground floor is also used for water-colours and prints. The elevation is quite white, with the exception of

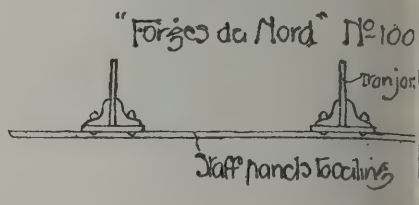
the long wide panels on each containing the name of the pavilion, which is in gold, and also a decorative circular panel at each end of the façade at the first-floor level. The roof is in zinc where not covered with glass. The walling is 25cent., or about 10in. thick.

The "Pastellites" Pavilion is covered internally with shades of light and dark green. It is treated very floridly with bulbous pilasters, with connecting arches, the cornices supported by brackets, and in the frieze below, the names of famous *pastellites*. It is covered with a flat roof.

THE "PAVILLON DE LA PRESSE ET DES POSTES ET TELEGRAPHES,"

by M. Vaudoyer, architect, consists really of three buildings (see No. 99 from *Le Génie Civil*), a restaurant, a press pavilion (two stories), and a telegraph office.

It is all constructed in pan-de-bois (brick-nog walling). The restaurant for the press and the telegraph office are constructed with the wooden framing showing, and the brick-filling into the latter being arranged in patterns. The press pavilion itself has the wood-framing entirely covered with plaster "staff" ornamentation to the window-heads, &c. All three buildings are covered with slates. The central building is two stories in height, containing, on ground floor, committee-room, corresponding-room, telephone-room; and on first floor, two rooms for the French and foreign press, and a library. The telegraph office and the restaurant are only one story in height. The style adopted by M. Vaudoyer is, as will be seen by the drawing, tolerably simple, the enrichments over the doors and windows being such as could be executed with ease in "staff."



THE BUILDING OF THE "FORGES DU NORD"

is an iron structure consisting of one large gallery. It consists of iron uprights and intermediate iron entrance steps, and iron flooring with sheet-plates ribbed to prevent slipping. The ceiling consists of iron joists, "staff" filling in, which, after careful examination, I found was glued to the underside of the joists.

THE "TURKISH TOBACCO PAVILION"

consists of a large hall. The design is curious, with projecting circular piers at the angle, and the deep projecting flat roof covered round them. The piers are taken through the roof and are used as flag-posts. The three windows in the façade are formed with Tudor arches. The whole façade is plastered and painted in Arabesques under the eaves. This probably necessitated the deep projecting roof to protect them.

Along the "Avenue de la Bourdonnais," we notice the Belgian commission building facing the interior gallery of the "Expositions diverses." There is nothing remarkable about its construction; but it is a composition characteristic of the modern Belgian school, in which the grouping, colouring, and general effect are so eminently happy, and which makes one wonder why there is such a poor show of Belgian drawings in the "Galerie Rapp," when, as a matter of fact, modern Belgian architecture is anything but commonplace, from the Palais de Justice at Brussels downwards. The pavilion is composed of a central hall, with an aisle on each side, with a steep central roof hipped from each corner

which is covered with green slates, and has a lantern and quaint flèche over.

The pilasters are in blue Belgian stone, which looks like, and is often taken for, granite, the same stone having been used in the Brussels Palais de Justice.

The circular columns to the entrance are in polished granite. The front is entirely in stone and marble, but the sides of the buildings are in brick and tiles, &c., forming exhibits.

The building, erected by the Vieille Montagne Company, is constructed to show the uses to which zinc may be put in buildings. It is a one-storey building with a low tower, and is labelled "Façade en zinc, peint au silicate (imitation pierre blanche"), and in truth it is a good imitation, for it is only by tapping it that one discovers that the whole façade is in zinc. Even the columns are faced with zinc. It has an iron framework.

THE WEIR HOUSE, MAIDENHEAD.

THIS house has recently been erected on some land immediately opposite the well-known Clieveden Woods. The walls of the ground floor have been erected in red brick, and the upper portion being in half-timber, with backing of adamant cement, which has been left white. The roofs have been covered with dark Broseley tiles, which have been executed by Messrs. Braby, of Belvedere-road; and the roof of the turret has been covered with copper by Messrs. Benham and Froud, who have by the use of a solution brought it out a good copperous colour, which presents a pleasing contrast with the other colouring. The designs were prepared by Mr. T. Searancke Archer, F.R.I.B.A., of 2, Gresham-buildings, London, E.C., and the work was carried out by Mr. Joseph Higgs, of 25 and 26, Upper Park-place, London, N.W.

CHIPS.

Among the adjudicators in bankruptcy announced in last week's *Gazette*, the name appears of Walter Graham, of Air-street, W., architect.

Extensive additions are in progress at the lunatic asylum at Fishponds, near Bristol. Mr. A. J. Beaven, of Bristol, is the contractor.

On Sunday week Mr. William Gray, sanitary inspector for the Knaresborough Union and inspector of the new drainage works at the Little Wonder, Harrogate, committed suicide at his residence in Harrogate by cutting his throat with a knife.

Messrs. John Ross and Sons, the contractors for the Black Isle Railway, commenced the construction of this line last week with a large staff of workmen. The contract price is over £54,000, and the work is to be pushed forward as rapidly as possible.

At St. John's, Torquay, one of the largest churches built from the designs of the late Mr. George Edmund Street, R.A., the morning chapel, situated on the south side of the chancel, has just been furnished at the cost of one of the churchwardens—Major Bridson, J.P.—as a memorial. It is divided from the chancel and south aisle by metal grills, and is seated with oak carved benches, the handiwork of Mr. Harry Hems, of Exeter. There is also a reredos of carved oak, containing a painting of the Annunciation, and an altar table with a marble front to it. The four niches in the reredos Mr. Hems has just filled by carved statues of oak in the round—of angels in attitudes of adoration. A latten brass, representing an angel with outstretched wings bearing an inscribed scroll, has also been placed in the chapel. This brass is inlaid upon a polished slab of grey Dove marble.

NORWICH CATHEDRAL.—JOAN OF ARC AND FAIR ROSAMOND—RUE ETOUPEE, ROUEN.—SPIERS AND POND'S NEW STORES, LUDGATE.—HOTEL SCHEVENINGHEN, HOLLAND.—THE WEIR HOUSE, MAIDENHEAD.—CONSTRUCTIONAL DETAILS AT THE PARIS EXHIBITION.

Our Illustrations.

NORWICH CATHEDRAL: INTERIOR, LOOKING WEST.

The fine double-page photograph which we publish to-day of Norwich Cathedral is from a platinotype print taken by Mr. H. Dudley Arnott, architect, of Gorleston, Great Yarmouth, who exhibited it at the last Photographic Exhibition held in the Crystal Palace. The picture also took the first prize medal at Cardiff in a similar exhibition as the best enlargement by an amateur photographer. We may add that Mr. Arnott took the Amateur Champion medal at the Richmond Exhibition. The view gives an excellent idea of the elaborate and beautiful vaulting of the nave which Bishop Walter Lehart (1446—1472) erected. Ex-Dean Goulburn fully described the carvings on the bosses of this vaulting in his big book, in which the entire series were illustrated. Bishop Lehart built the lower portion of the choir screen, on which now stands the organ, but the upper part, which is heavy and ugly, was completed in 1833. The Early Norman Tower at the crossing is lantern-like in effect, and the transepts open into it. The choir has been much more altered than the nave, and no doubt the roof and clerestory were much injured when the spire was struck by lightning in 1463. Soon after this date Bishop Goldwell re-erected them, and his work still stands a graceful and light piece of design, though the carvings on the bosses of the vaulting are far inferior to those of the nave. The bishop's throne and the stalls of the choir are all modern, and are very poor in their detail. The episcopal chair originally stood here under the central arch of the apse at the back of the high altar, the most ancient position for the throne, as at Canterbury, and in several churches still on the Continent.

"FAIR WOMEN" (FROM THE ROYAL ACADEMY EXHIBITION).

The week before last we gave four of the six Fair Women so beautifully drawn by Mr. Henry Holiday, and to-day we give the remaining two figures to complete the illustration of Tennyson's grand poem, better known as "The Dream," in which, referring to Fair Rosamond, he says:—

"'Alas! alas! a low voice full of care
Murmur'd beside me: 'Turn and look on me:
I am that Rosamond whom men call fair,
If what I was I be.

'Would I had been some maiden coarse and poor!
O me, that I should ever see the light!
Those dragon eyes of anger'd Eleanor
Do hunt me, day and night.'"

About "Joan of Arc, a light of Ancient France," little is said in the poem; but the history of the peasant-heroine is too well known to be repeated here. The cartoons which we have reproduced speak for themselves, and will be valued by our readers for their true decorative character and refined womanly grace of form.

RUE ETOUPEE, ROUEN.

This street view is from a water-colour drawing by Mr. William E. Pinkerton, architect, of Islington. It shows some quaint old gabled houses from the ancient part of the city of Rouen, much of which is now being improved out of all knowledge by the new great thoroughfares being constructed for the municipal improvement scheme.

NEW PREMISES AND STORES FOR MESSRS. SPIERS AND POND, LIMITED.

Owing to the rapid strides and increase made in the stores department of Messrs. Spiers and Pond's business, it has been found necessary to considerably increase their premises in Water-lane; consequently land was purchased, and after pulling down the old buildings, the handsome and spacious building as depicted in our sketch was opened to the public on the 17th day of Nov., 1890. The building is intended to be used as a central supply stores for such articles as grocery, haberdashery, millinery, leather goods, boots, china, glass, hardware, electro-plate, jewelry, watches, furniture, stationery, also printing and luncheon room. The building extends from Water-lane to Queen Victoria-street, with entrances in both those streets, and consists of sub-basement, basement, ground, 1st, 2nd, and 3rd floors, and is fireproof throughout. The whole of the sub-basement is devoted to a central electric lighting station, with engines, boilers, &c., complete, of about 400 horse-power; also pumps, hot water heating apparatus, hydraulic machinery for lifts, workshops, &c. The whole of the building has been faced both inside and outside with glazed bricks. The passenger lifts, luggage lifts, and lightning lifts by Messrs. Waygood and Co. The woodwork throughout is polished teak and mahogany. The main staircase is one of the principal architectural features of the building. It is built in teak and mahogany, with ornamental wrought-iron and copper lift guard. The staircase windows are filled in with stained glass, and the walls are finished with tiling, mosaic work, and faïence. The columns supporting the staircase are fine cast iron, with bronze capitals and other parts cast from models by Signor Raggi. The whole of the building, offices, wine-cellars, restaurant, and shops, down the entire length of Water-lane, are lighted entirely by the electric light, the current for which is supplied from the sub-basement. The exterior of the building is Aberdeen granite up to 6ft. high, and glazed bricks with coloured bands for the remainder. The cornice, sills, &c., are of Mansfield stone. The whole of the above works have been carried out jointly by Mr. H. A. Matear, architect, of London and Liverpool, and Mr. Sydney Hargreaves, civil engineer, London. Messrs. J. Mowlem and Co., of Westminster, were the contractors, and Mr. W. J. Allen acted as clerk of the works.

HOTEL, SCHEVENINGEN.

We publish to-day a view of the hotel proposed to be erected at Scheveningen, Holland. The drawing from which our illustration is taken was exhibited at the Royal Academy this year, and was reviewed by us at the time. The architect is Mr. Thos. W. Aldwinckle, F.R.I.B.A.

A new wing has just been added to the business premises of G. H. Lee and Co., of Basnett-street, Liverpool. It is a parallelogram 94ft. by 48ft., six floors in height, the frontage being of grey granite, Cefn stone, and Ruabon bricks. Mr. Henry Hartley, of Liverpool, was the architect, and Mr. Samuel Webster, of Bootle, the contractor; the hydraulic lift is by Messrs. Waygood and Co., of London. Alterations have also been effected in the old premises, including a new central staircase also from Mr. Hartley's designs.

There has just been completed in the parish church of Peebles a chancel memorial screen, the gift of Mr. R. T. Hamilton Bruce, of Edinburgh, in memory of his two sisters. The screen consists of three bays, each being divided into two portions by a representation of a tree stem, spreading out into branches, leaves, and fruit in the cusped head of the bay respectively, the vine in the centre, with apples and pomegranates on the sides. In the side bays are painted the Ten Commandments, and in the centre the Lord's Prayer. Above the bays are nine niches, each being filled with a kneeling figure representing a Christian virtue. The work has been executed by Messrs. Cottier and Co., of London. A memorial window immediately above is also the work of Cottier and company.

SCHOOLS OF ART.

Metropolitan Drawing Classes.—The annual presentation of the Queen's prizes and certificates awarded by the Science and Art Department to the successful students of the Metropolitan Drawing Classes, under the direction of Mr. Busbridge, took place at the Carpenters' Hall, London Wall, on Thursday, the 27th Nov., the ceremony being performed by the Duke of Fife. Prof. Banister Fletcher, F.R.I.B.A., presided. Mr. Busbridge read the annual report, showing that during the 25 years the classes had been in existence 15,000 students had passed through the various courses of instruction, and that upwards of 2,800 Queen's prizes, as well as a large number of medals and certificates, had been awarded. The classes were established in 22 local centres.

COMPETITIONS.

Lichfield.—The guardians of the Lichfield Union having decided to erect a new infirmary, it was decided to invite several architects to meet a committee of the guardians, who were to select one gentleman to be recommended to the meeting of the Board for the appointment. This was done, and Mr. W. H. Woodroffe, 214, Great Dover-street, London, was unanimously appointed.

CHIPS.

The new schools, Swindon, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

The waterworks constructed at Campos about four years ago are about to be extended. Mr. Fredk. Beesley, M.I.C.E., of Westminster, is the engineer.

A new board school at Burham, Kent, accommodating 150 boys, was opened last week. It has been built from plans by the late Mr. E. W. Stephens, of Maidstone, carried out under the superintendence of his successor, Mr. H. Bensted. Mr. R. George was the builder.

A further stage in the St. Paul's reredos litigation has been reached, the Court of Appeal having dismissed, after two days' hearing, the application for a mandamus to compel the Bishop of London to proceed in the case.

The realise of the residue of her estate, left by Miss Pedlar, of Liskeard, for the completion of Truro Cathedral, is estimated at not less than £13,000. The money is left to the Bishop and Archdeacon Hobhouse, and is to be applied as they see fit. A great part of it will be applied to the improvement and maintenance of the services, and the remainder will form the nucleus of a fund for the building of the nave.

The Epidemic Hospital, Nottingham, is warmed and ventilated throughout by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

The new line of railway between Grays and Romford, a distance of ten miles, has been commenced by the contractors, Messrs. Mowlem and Co., of Pimlico. The railway is being made by the London, Tilbury, and Southend Co., from plans by their engineer, Mr. J. R. Robertson, and will for the present be a single line. Junctions will be made with the main line at Grays, with the Southend direct line at Upminster, and with the Great Eastern system at Romford station. The ground is fairly level, the deepest cutting being 24ft. Mr. George Burt, jun., a member of the firm, is superintending the work for the contractors.

The church of St. Paul, Chatham, which has been restored externally at a cost of some £1,050, was reopened on Friday last. The restoration has been carried out by Messrs. Naylor and Son, of Rochester, from the plans of Mr. J. Drake, also of Rochester.

Mr. James Hill, builder, of Warrington, was returned to the town council of that borough at a bye-election held on Monday.

At a meeting of the Architectural Section of the Philosophical Society of Glasgow held on Monday night, Mr. Campbell Douglas read a paper on "Some Architectural and Other Notes on the Iberian Peninsula." Specially prepared views to illustrate the lecture were exhibited by limelight.

The R.C. Church of St. Osburgh, at Coventry, was reopened last week after restoration and renovation at a cost of £2,500. Mr. C. G. Hill was the contractor, and Mr. T. Richmond Donnelly the architect. The stonework has been repaired and the roofs entirely renewed in pitch-pine with hammer-beams of oak. The carving has been executed by Mr. Wall, of Cheltenham.

THE PARIS EXHIBITION.

WAYSIDE NOTES.

At the recent conference of architects and craftsmen at the New Gallery—how far the meeting in question merits the designation of *conference* between *designer* and *worker* I am not in a position to determine—something was said by Mr. William Morris derogatory to the reputation of the much-reviled blue or purple slate of the North Cambrian quarries. I gathered this information in the course of conversation with a friend some few days subsequent to the conference, he having attended by virtue of a ticket received as member of the R.I.B.A. At the time I remarked to him that I thought Mr. Morris might have saved himself the trouble of pointing out the shortcomings of the Welsh slate, seeing that every architect with the smallest amount of taste prefers the little green slabs obtained from Westmoreland. Since then I have observed many comments in print on Mr. Morris's allusion to the æsthetic aspect of slates as a roof covering. As a result, on hearing so much abuse of a material that has long done honourable service to man in sheltering his head from the inclemencies of the weather, I, perhaps out of what the American calls pure "cussedness," am tempted to say a word on its behalf. Without any desire to detract from the esteem in which the profession holds the green variety of slate, it may be pointed out that, as generally used, their small superficies and appreciable thickness give them at once an artistic advantage over the unwieldy, thin Welsh slate ordinarily employed. Moreover, our great familiarity with the blue or purple class of slates has bred a certain amount of contempt. Once upon a time the Welsh slate was well-nigh the only covering for roofs visible in portions of a city or town that were of modern production, and up till a recent period was the only wear with the speculative builder. Until we all broke out into a veritable scarlet fever of red bricks and tiles, the blue slate held its own. All through that serious epidemic it has stayed with us on the merits of cheapness and economy, and I doubt not but that it will remain to the end.

As used by the builder, with an eye solely to economy, nothing is so repelling as the grey-blue or grey-purple—the latter, for some reason, known as "red"—slate of the Welsh quarries. To save timbering in truss rafters and battening, his hardened Philistine employs the largest slates, and as thin as they can be split. For any resultant artistic effect, the building were as well covered with sheets of cast iron. But is it reasonable to judge the capabilities of the blue or purple slate by such roofs? I believe, on the contrary, that the possibilities of these materials have never, in the hands of modern architects—with the rarest exceptions, at any rate—been fully exemplified. I make bold to assert so much, because, in my wanderings in Continental cities, I have observed that the slates employed in the old roofs there, in nowise depend upon any special tint for their effect, than which nothing purer of its kind can be found. Clear away all the moss and lichen that gives them so silvery an appearance, and often it would be found that the colour of the most despised Welsh slate was superior to that of the material in question. The effect of such roofs is to be referred to two causes — (1) the tiny size of the slates, and (2) their appreciative thickness. Slates I have seen to which one of our "doubles" or "ladies" would be a monster, and a "countess"—to which the average modern architect is rather partial—a veritable Goliath.

Speaking of French slates, "Laxton" says: "It is a source of frequent regret that they should be split so exceedingly thin." To this I would add that it would be as well if regret were as frequently expressed that they are employed so inartistically, leading the superficial critic to condemn a material for no great fault of its own, but because it finds few, if any, sympathetic friends. If the Welsh slate were employed as in the old roofs on the Continent, such, for example, as those to be found in Normandy and Brittany, and in Holland and Belgium, it would be found almost as adapted to architectural ends as the green slate, either of Wales or Westmoreland. The latter variety—the green—is undoubtedly, viewed as crude material, more highly favoured than its humbler brother; but in certain designs I can imagine how a well-selected blue-grey slate, or a purple-grey, would be more calculated to lend harmony to the scheme of colouring. With red brickwork, red stone, or red terra-cotta a green slate is just the thing. Where there is a pronounced yellow or orange in the walling, as in stock-brickwork, buff terracotta, yellow or orange stonework, then I believe anyone who will break through trade customs and tradition, and employ Welsh slates in exceedingly tiny pieces, graduated withal, will find that there is more in this despised material than Mr. Morris, and many others, would have him believe.

There is something really refreshing and wholesomely invigorating to the architectural senses about the incident at Coventry, when three of our leading architects were requested to confer together and make observations as to the possible effect of the erection of a new campanile near the famous group of spires. It is such a contrast to the *laissez faire* of everyday architectural life. It has a positively Florentine ring about it. I only hope that the conclusion of the three observing architects, judges, assessors, referees, or arbitrators, or whatever they may best be designated, will be justified in practice. The sentimental interest attaching to the three spires will disappear in a measure when No. 4 is completed, but sentiment of this nature has to give way to practical necessities in cases like these. The competition for the new campanile should prove interesting to the profession.

The Institute Council, I understand, are deliberating as to the award of the gold medal. Up to date the medal has been awarded to fifteen foreigners and twenty-eight Englishmen. I am told that there is an unwritten law whereby the medal is awarded twice to British architects to once to foreigners, that is to say every third medal goes abroad. Consequently, British architects are two medals in arrears, if one may look at matters in so prosaic and mathematical a light. The next two medals should be kept in the country, after which a fair start can be made, which should mean two more medals to British architects. Thus, four medals should be dispensed—not a bad term this—at home, before a foreigner is again the recipient. If I had the honour to be an Institute Councillor, I should move that no foreigners need apply. They might provide their own medals. Distributed in a broader spirit, there would be found plenty of worthy recipients for the token in the British Isles without offering it to architects who can find no use for it, and don't require it, like Mr. Ruskin.

In *A.A. Notes* for December, Mr. F. M. Simpson writes on "Painters' Architecture," concerning which, as may be imagined, much may be said. Reference is made to the curious organ-case in Mr. Frank Dicksee's "Harmony." Some years back I was looking at a print of this picture in a shop window in Moorgate-street. By comes a man who stops beside me to look at the print. He was a perfect stranger, and, so far as I can remember, I did not remove my gaze from the picture. Nevertheless, says this individual, "Did you ever see such an organ! Isn't it a wretched thing?" &c., to some extent. "Here, take my card; I'm an organ-builder." This man should have got on in the world, if "push" will do anything. What good, however, he thought I might do him I cannot to this day comprehend. If I said anything it was merely in the form of monosyllabic affirmations or negations, and being then, as now "'umble" in my calling, like the celebrated Mr. Heep, I cannot flatter myself that he recognised me as pertaining to the architectural ranks.

The Oswestry competition has gone in the narrow way. The report of the meeting of the O. town council to consider the award of Mr. Thos. M. Lockwood, of Chester, the referee, is very pleasant reading. It may be found in the *Oswestry and Border Counties Advertiser* for the 26th ult., a copy of which a correspondent has kindly forwarded to me—many thanks to him. In Mr. Lockwood's report he states that 26 sets of designs were sent in, and that he recommended No. 9, as numbered by the authorities, for first place. Before the sealed envelope was opened, some discussion took place, and a member of the Council wanted, evidently, to "run" a friend. I won't however, actually make this charge against Mr. Councillor Porter, of the Oswestry Town Council, but merely state that he is reported to have said that "his mind was fixed on No. 21." From "No. 21," as it appears in the paper, the gentleman who sends it has drawn a line with his pen to the margin, whereon he writes the legend, "*A Local F.R.I.B.A.*" Readers may thus draw their own conclusions. The endeavour to run No. 21 failed signally, and it is to note the impartial bearing of the Mayor and the great majority of councillors in these discussions that makes the report such pleasant reading. Mr. Cheers, of Twickenham—a very successful competitor in many instances, as it seems to me—was the fortunate "9"—the "magic number," is it not?

In the *A.A. Notes* the report of the Special Committee for the Revision of the Rules of the Association has been published. The first point that strikes one about the proposed rules is that they are primarily divided into two parts—"Constitution" and "By-laws." I cannot say that I have sufficiently studied this matter to give an opinion as to the advisability of this division; but I have received a letter from a friend who wishes me to say something as to this, and as to the proposed increased entrance fee. My correspondent wrote before, in the summer, it may be remembered, touching the Requisition that any alteration in rules affecting constitution or subscriptions should be dealt with by all members. It appears that this requisition necessitated the two divisions "Constitution" and "By-laws," since the committee had first to determine what the constitution of the A.A. was. My correspondent thinks the division meaningless, unless the constitution portion of the rules be made more difficult of amendment, after the nature of a charter. So far as I can make out, his chief objection is to the method of voting by show of hands, and I must confess that the last part of the proposed rules seem specially framed to admit a small number of active members to modify the constitution with very little difficulty. The Requisition of last summer asked for voting-papers in matters of import, and the new rules allow merely a show of hands. I have all along urged that matters of vital importance to the Association should be determined by voting-papers. Otherwise, what could not over-zealous committees and packed meetings do? Members thinking that voting-papers should be adopted, and having definite opinions at the present position of Association matters, should not fail to attend the meeting at Conduit-street on Friday next—to-day week—when it may be that much will have to be settled for future weal or woe. Let us sincerely hope and trust that it may all be for the best.

I am afraid there is no respect for authority among the wicked young men at the Association who boss the remarkably enjoyable Lyric Club Concerts. You had a brief notice of the last one last week, but you did not print "A Lyric of the R.I.B.A. (from Dæ-vy Jones's Locker)," which appeared on the back of the programme. I think you ought to:—

"Of Conduit Street hast heard the name?
Does number nine still stand there?
Oh, yes; I think I know its fame
And sometimes hap to land there.
Why, *that's* where architecture's sleep
Is sound amid the ranting,
Where pedants prose and students weep
And look for what is wanting.

Just see the list of rusty *cranks*,
The papers for the session—
I hear the endless 'votes of thanks'
Drag on in dull procession.
Come newer men; come, will you not?
And give us light and leading,
And slit this red-tape at the knot,
For youth and art are pleading."

Dæ-vy Jones.

I always thought Batsford was the destined prophet of a new moral gospel. If any one doubts it, next time he wanders into 52, High Holborn to buy—to read up Architecture and Science on the cheap I mean—let him invest a shilling in Mr. Fawkes' little book, just out, called "Three Christian Tests." The author is known to most of us in quite other fields of authorship, but I never read him with greater interest before, and right down seriously recommend his latest effusion to all right-minded men. "We are all Socialists now," as that prince of all the virtues, Sir William Harcourt, said long ago, and it is true enough at any rate, I hope, so far as an agreement with Mr. Fawkes in his application of the "tests" of Love and Brotherhood to Christianity is concerned. The bases of his pro-

positions are ingeniously constructed on analogies curiously drawn from natural science and biology, and the earnest tone of simple faith in the good and true which pervades the book throughout is very refreshing—perhaps infrequently so now-a-days. Goth.

ROBERT BOYLE AND SON, LIMITED.

THE fifth annual meeting of this company was held at the City Terminus Hotel on the 26th ult., when a dividend of 12½ per cent. was declared on the ordinary and deferred shares, one-sixth of the profits earned being placed to the reserve fund, and a balance of £1,299 carried forward to next year.

The directors for the year and the auditor, having been unanimously elected, Mr. Robert Boyle, in acknowledging the unanimous vote of thanks accorded to the board and to himself as managing director, said: I beg to thank you on behalf of my co-directors and myself for the very cordial manner in which you have recorded your approval of the report which has been submitted to you. When the prospectus of this company was issued five years ago, I showed the confidence I had in the business by taking, practically, the whole of the purchase-money in shares in the company, I holding fully three-fourths of the shares issued, to which I have added as opportunity offered. I also personally guaranteed a minimum dividend of 10 per cent. each year for the first five years, which period having now elapsed, you are in a position to judge as to how I have fulfilled my undertaking. I trust, as I also believe, that the next five years will be equally as successful, the demand for the ventilating and sanitary appliances of the company increasing every year, both at home and abroad. The latest improved form of the self-acting air-pump ventilator is giving great satisfaction wherever used, and though of superior power and make, being constructed of the best rolled steel plates, galvanised, and the workmanship of the highest class, is sold at about fifty per cent. less in price than the inferior forms previously manufactured. The foreign agencies are progressing satisfactorily, the air-pump ventilator and other appliances being applied with continued success to an ever-increasing number of important public buildings in Germany, France, Russia, Belgium, Italy, Spain, Holland, Denmark, and Norway and Sweden, also America and Australia. You will doubtless have seen from the published accounts that I have during the past year visited Egypt, India, China, and Japan, and I believe a good foundation has been laid for an important extension of the company's business in those countries, where we have already ventilated a large number of Government and other public buildings. I have made surveys and furnished plans and estimates for the ventilation of, amongst other buildings, the Khedive's Palace, Cairo; the drainage of Bombay; French Cathedral, Canton; the Summer Palace of the Emperor of China, Pekin; new Houses of Parliament, Japan; and the Imperial University, Japan. I have also submitted a scheme to the Chinese Government, through Li Hung Chang, the great viceroy, whom I had the honour of meeting at Tientsin, for the improved sanitation of Pekin. You will have seen, from recently published reports of experiments with our system of ventilation in China, that it has proved to be most suitable for the requirements of that country, where open pipes and other contrivances have proved useless, and you will be glad to learn that as a result of these tests we have already executed important contracts in China, whilst others are now being arranged. It is my intention to proceed early next year to South Africa, where we have always done a large business, but which I believe to be capable of considerable development if systematically worked up, and I trust at our next annual meeting to be able to submit to you, as the outcome of my endeavours, results which may be considered satisfactory.

FORTIFICATION.*

MAJOR G. SYDENHAM CLARKE, C.M.G., R.E., has written a treatise on fortification, a subject that has less claim on the attention of military men in England than it has in France or Germany. The insulated position of the British Isles has been, perhaps, the chief cause why so little attention has been drawn to the subject of land defence. Major Clarke is a competent writer on this and other subjects, and has brought to his task a large amount of valuable information. He inquires what remains for fortification to accomplish, and what kind is best adapted for our purpose. For this purpose the first chapters are devoted to an account of the sieges of Marlborough and Eugene, the Peninsula defences, the wars of Napoleon, the Russo-Turkish campaigns, the Franco-German war, the works constructed in England after 1859. The results of these operations, their weak points, and the evolution of the art of defence are pointed out and principles defined that ought, according to the author, to guide future works. Major Clarke says: "In the works constructed within the past thirty years at our home ports and fortresses abroad, no sufficient indication of the results of experience obtained in the Peninsula, the Crimea, and the American Civil War can be traced. Some of these works might have been designed by clever cadets, quick to recognise the niceties of technical artifice, but unable, from sheer immaturity of thought and want of study, to grasp the broader aspects of the science." The summary of recent proposals by eminent foreign authorities contain many ingenious inventions. The disappearing cupola for the 53mm. quick-firing gun of the Schumann type, provide little sight holes in the side armour, so that by raising the cupola a view of the field of fire can be obtained. Fire is directed from the outside. The rate of fire is 12 to 15 rounds per minute. The weight of shell is 5½lb. The cupola is just overbalanced by a counter-weight. The firer sits on a seat and traverses the cupola by placing his feet on the spokes of a vertical wheel. The shield and gun rotate together. Other forms of cupola which are raised to the firing position and then disappears from view, are shown by engravings. The subterranean fort, by M. Mougin, consists of a "huge block of concrete buried in the ground, and carrying on the top three cupolas, each mounting 15-cm. guns, four disappearing cupolas, each having two machine guns, complete the armament." In this block of concrete are observing stations, electric lights, ventilating fans, and all necessaries, and it can be garrisoned by 30 or 40 skilled mechanics. The oscillating cupola, by Mougin, is very ingenious. The chapters in which the author deals with the development of arms and the requirements of modern fortification will be read with interest. Typical sections of redoubts are illustrated, and these are the bases of the defence of a position. The infantry redoubts should be, he says, of the simplest form, giving full development of rifle and machine gun fire; have efficient obstacle, shelter for the whole garrison, which should not exceed a half-battalion; unimpeded interior communication; and, lastly, invisibility. These requirements are discussed in detail. For shell-fire, sand or light soil are the best. Flat slopes offer great advantages. Stone and iron casemates have received their death-blow since the Shoeburyness experiments of 1884.

The author states the general conditions of the problem as regards coast defences. The changed construction and fire of ships, penetration of projectiles, the barbette mounting for guns for coast defences, and the development of armoured ships, illustrated by the types of British warships and those of France, are interesting questions dealt with by Major Clarke. The author describes the advantages and disadvantages of various modes of gun-mounting in a categorical form, including shielded casemates, Grüson battery, turret, as at Dover, armoured cupola, open battery with shield, barbettes, &c. These remarks are well worth the attention of our miltary engineers. Altogether the work is an able exposition of the subject, and will take its place among the higher class of textbooks. Principles, rather than mere technicalities, have been dealt with, and Major Clarke has shown in what directions we can look for improvement in construction of coast defences.

* Fortification: its Past Achievements, Recent Development, and Future Progress. By Major G. Sydenham Clarke, C.M.G., R.E. London: John Murray.

BOOKS RECEIVED.

Repairs: How to Measure and Value Them, by George Stephenson (London: B. T. Batsford), is a very serviceable handbook on the subject. As Mr. Stephenson points out, the lump system of estimating repairs to rooms is not a method on which any reliance can be placed. A good specification for repairs is given by the author, and then he proceeds, from the top floor downwards, to show how to value the items, by a method of framing the estimate in the measuring book. The *modus operandi* is simple and soon learnt. Thus to measure the stripping of paper from walls, the two dimensions of length and breadth, or the round of the walls, added to the projection of chimney jambs, by the height of ceiling above skirting, makes the first dimension, kept in a left-hand column. The description against this is "strip wall and repaper." The deductions for windows and doors and fireplace are then taken, with the number of times they are taken; thus, for two windows each 7ft. by 4ft. 6in., the dimensions inserted on the left-hand column would read $\frac{2/7\cdot}{4\cdot6}$ deduct windows. The same process is repeated for doors and fireplace. In taking the height dimension for door the proper way is to take from the top of skirting, and the same with the chimney opening. The value of abbreviating the labour of writing need not be pointed out. Thus for "deduct" write Ddt., for windows Ws., for doors Ds.; but the form of abbreviation is better left to each individual. Opposite the dimension and description are the pricing and the £ s. d. columns for making out the estimate. But it is needless to enter into details about things so well known to our readers. Mr. Stephenson's little book is chiefly of value in describing the method of booking and taking the dimensions. The directions given for painting woodwork and other items, and the remarks on pricing, will be found of especial value to the student and young surveyor. Perhaps the description is rather too verbose, and a little more method in arranging the book under headings would have been desirable, also a complete page of the dimension book showing the pricing and amounts, but we take the treatise as a very useful attempt to simplify the making of estimates for repairs.——*Estimating: a Method of Pricing Builders' Prices*, by George Stephenson, Second Edition (London: B. T. Batsford), is a very useful help to those who wish to price an estimate without having to resort to a price-book. Mr. Stephenson has succeeded in removing many of the difficulties of the young architect and surveyor in this branch of his profession, and anyone who has mastered this little book will be enabled to price a bill of quantities without recourse to his Laxton. The method of the author is to take the items from a bill of quantities one by one, and to show how each can be dissected and the prices obtained. Mr. Stephenson adds the profit to each item instead of leaving it to the end of the summary. To take an item at random:—"13ft. run 6in. by 4½in. oak, double sunk, weathered and throated sill to octagonal oriel. Take 2¼in. (the cubic of 6in. by 4½in.) at 10s. per foot cube, which comes to 1s. 10½d., and add the value of mitres thus:—

	s.	d.
2¼in. of oak sill, at 10s.	1	10½
No. 2 mitres and two joint-screws (spread over 13ft.), per foot	0	4
Add for being double sunk	0	2
	2	4½

I have put the mitres at 1s. each, and the joint screws at 1s. each, including profit." The other trades are treated by the same sensible method, which will much simplify the operation of pricing items.——*Modern Rural Homes* (arranged, designed, and illustrated by the National Architects' Union, Philadelphia) comprise a series of plans and views for sixteen "sensible, low-cost houses." The title and appearance of this work have a very commercial ring about them. The designs are "copyrighted," and the authors say the first editions have had a wide circulation. The trade-catalogue notion of preparing designs for houses is not new in America, and this book, in many respects, resembles the furniture dealers' list we often receive with stock designs that they can be made to suit anybody's taste and means. Considerable variety of design is shown, and to every one an estimate is attached. The authors say: "It has been impossible for us to give one estimate suitable for all locations, therefore the figures in the book include only the bare house, sometimes with and sometimes without a cellar." The authors further explain: "that heating apparatus, plumbing, drainage, and grading are not included in the figures given." The term "bare house" is misleading, unless it means the carcase. To suit their patrons' tastes

and pocket, certain additional sums are put down for bay windows, bath and toilette rooms, cemented cellar, slate roofs, &c., which, to our mind, tend rather to bewilder than make the appended estimates reliable. The designers appear to have attempted to reduce the labour and expense of design to a minimum, to avoid all preliminary surveying, and to supply at the least cost (*sic*) the plans of houses to suit everybody. It is further stated that "a number of handsome houses have been designed by us from sketches furnished by our clients." To facilitate this mode of doing business, sheets of cross-line paper are forwarded to anybody for 15 cents., on which he can send his idea, from which an estimate is prepared without cost. The Union undertake also to furnish the plans, specifications, and details, and builder's contract, at a certain price. Surely the would-be builder of his own house cannot grumble at these terms! Some of the plans are better than the perspectives, which generally have stone or brick foundations, clap-boarded and panelled first story, and shingled roof and gables.——*Descriptive Geometry*. By T. H. Eagles, M.A., Instructor in Geometrical Drawing, and Lecturer on Architecture at the Royal Indian Engineering College, Cooper's Hill. (London: Walter Scott, Warwick-lane). Mr. Eagles' treatise is comprehensive, and a clear and practical exposition of the principal and more useful problems. We agree with the author that in order to realise the conditions presented by an abstract definition of lines and planes, the learner would do well to associate a point with the angle of a solid, lines and planes with its edges and faces respectively. A clear understanding of the subject can only be acquired by drawing plans and elevations of a few solids having one face in the horizontal plane. Points, lines, and planes are explained by isometrically-drawn diagrams, and all the more important problems are given. Plane figures, solids contained by planes, trihedral angle, sections of solids, curved surfaces and tangent planes at given points, intersections and developments of surfaces, are other chapters. The value of the book would have been much increased if the propositions had been printed in another type. The diagrams are well selected; but the letters and figures are very small and indistinct, and have apparently suffered from reduction. Mr. Eagles's work will take its place among the higher textbooks on the subject.——*Asbestos: its Properties, Occurrence, and Uses*, by Robert H. Jones, collotype plates and illustrations (London: Crosby Lockwood and Son), is an interesting work on a material that is finding its way into various arts and industries. Little or nothing is known amongst general readers of asbestos, except in a casual way. Mr. Jones has supplied the student with a variety of information respecting this useful mineral. The introductory chapter is particularly interesting. The nature of asbestos is peculiar: it is described as a "mineralogical vegetable, both fibrous and crystalline, elastic, yet brittle, capable of being carded, spun, and woven, as flax, cotton, or silk." The fiercest heat cannot consume it, and acids cannot affect it. We all know it as a valuable non-conductor of heat and electricity, and it is only fusible at very high temperatures. It was known to the Romans for its fire-resisting properties. Describing the varieties of asbestos, of which there are many, the author observes that they are silicates of lime and magnesia or alumina, compounds of silicic acid with an earthy base. Asbestos proper is a fibrous variety of hornblende or pyroxene, and differs from that of Canada, which is a fibrous form of serpentine containing 12 to 14 per cent of water. Mountain wood, mountain leather, mountain paper, are sub-varieties, but differ in the direction of their fibres, which are more interlaced. The name of pierre-à coton (cotton-stone) has been given to it by the French-Canadian miners, from the fibres being so much like cotton. Asbestos is widely diffused, being found in all parts of the world. It is found in England, in Aberdeenshire, at Lough Foyle in the North of Ireland, and is plentiful in Portugal, Spain, Italy, and Savoy. In the island of Corsica it is abundant, and is met with in Switzerland, Germany, North and South America, and Australia. The Canadian asbestos mines supply large quantities of the mineral used in America, and its quality is excellent. The Italian asbestos is also of good quality, but more flossy and silky, and holds more water than the Canadian. A chapter is devoted to the produce from Canada. The Canadian ore is easier in working, and is more uniform than the Italian; but there are several varieties—coarse, and brittle, a fibrous quality, but impure; and a white, silky, fibrous quality, suitable for textile goods. The picrolite or bastard variety, illustrated by a beautiful collotype, is brittle, and of little value. Many companies are engaged in working the mines in Canada. The various applications and uses of asbestos form the subject of other chapters. For packings, boiler coverings, fire felt, and joints of hot-air pipes, the material is very largely used, and the author describes and illustrates these applications. Its structural value is of a varied character, as, for example, as a material for fireproof floors; cold stores, filters, gas-stoves, covering for woodwork, fire-ladders, stove linings. Substitutes, such as slag wool, and their many uses, are described; and these chapters are of particular interest to the profession. Mr. Jones's handbook will be a valuable addition to the architect's and engineer's library.

CHIPS.

A receiving order has been granted in the case of William Henry Croaker and Frederick Croaker (formerly trading in co-partnership as W. and F. Croaker), Great Dover-street, S.E., builders.

The Disney Professor of Archæology proposes to deliver six lectures in the Lent Term, 1891, on the "Sculptured Stones of Cornwall, Wales, and Mann," at the Archæological Museum at Cambridge.

The Perthshire County Council have appointed Mr. George M'Kay, sanitary inspector, Girvan, sanitary inspector for the county of Perth, at a salary of £300 per annum, with expenses.

A destructive fire broke out on Sunday morning on the extensive premises of Messrs. W. and T. Farmiloe, lead and glass merchants, at 88, Nine Elms-lane, S.W. The flames suddenly burst out in a building of one floor, 140ft. by 50ft., used as workshops and stores. A great quantity of stock became ignited, and four steamers and a private standpipe did not prevent the fire from blazing for nearly two hours. Although one building was destroyed, the main premises were saved, and the fire will not interfere with Messrs. Farmiloe's business.

The subscriptions to the memorial to the late Bishop of Durham (Dr. Lightfoot) now amount to over £5,280. The cost of the altar tomb and recumbent figure will be £1,400, and the cost of the restoration of the chapter-house will be £4,000. Sir Edgar Boehm has been commissioned to execute the recumbent figure.

The new Roman Catholic Cathedral at Mandalay is to be consecrated on Monday next, the 8th inst. The building has been erected at the sole expense of a Burman convert, and it is now the most striking building in Mandalay, its spire being higher than the Great Tower of the Palace.

At a general meeting of the Institute of Painters in Oil Colours held on Wednesday week, Messrs. Walter Osborne, R.H.A., James Clark, and W. F. Calderon were elected members.

At a general assembly of the Royal Society of British Artists, held on Monday, the president, on behalf of the members, presented to Mr. Horace H. Cauty a gold watch and chain, in recognition of the services rendered by him to the Society as hon. secretary. At the same meeting Mr. Robert Morley was elected hon. secretary. Mr. Cauty has been appointed to a mastership in the Painting Schools of the Royal Academy.

At their last meeting, the council of the Corporation of the Church House concluded the final arrangements connected with the purchase of the site for the Church House, and gave instructions for some of the buildings now standing to be pulled down, with a view to commencing building operations. The first part of Sir Arthur Blomfield's design to be built is the Great Hall block, or south front.

A new mission chapel was opened last week in the hamlet of Murchington, an outlying part of the parish of Throwleigh, Devon. The chapel is Early Decorated in style, is built of Dartmoor granite, consists of a nave and chancel, and has a hammer-beam roof of red deal. It is seated for 80 persons, and cost £410, exclusive of some special gifts. Mr. James Crocker, of Exeter, was the architect, and Messrs. Aggett and Underhill, of Chagford, were the builders.

The tower of the parish church of Willersey, near Evesham, has just been restored. The work was carried out by Mr. E. W. Billey, of Willersey.

Building Intelligence.

Birkenhead.—The new Y.M.C.A. building in Grange-road was opened on Wednesday week. It is described as Victorian Renaissance in style, has a frontage of 60ft., and is faced with red bricks and terracotta. On the ground floor on either side of the central entrance hall is a shop, 28ft. by 19ft., with cellar below, and in rear of the shops are the secretary's office and a class room. Over the shops and entrance hall, on the first floor, are the lecture room or library 28ft. by 19ft., and two reading-rooms 38ft. by 19ft., and 18ft. by 15ft. respectively, folding doors being provided between these rooms. On the second floor are residential apartments for the secretary, committee-rooms, &c. The gymnasium, in the rear of the entrance hall, but on a lower level, has a floor space of 70ft. by 40ft. At the one end is a visitors' gallery, and along the west side there are dressing and bath rooms. The public hall, 86ft. by 40ft., and accommodating over 900 persons, is placed over the gymnasium, and has four class-rooms, averaging each 17ft. square. The public hall, gymnasium, and dressing-rooms are heated by hot water, and the reading rooms, library, and class-rooms with open fireplaces. The architect is Mr. W. Wallis Baldwin, Lincoln's Inn-fields, W.C., under whose supervision and that of Mr. J. C. Ogle, jun., the work has been carried out by the contractor, Mr. Alexander Bleakley, Claughton-road, Birkenhead.

Lapley, Staffs.—All Saints' Church, Lapley, near Brewood, was reopened on Sunday week, after undergoing considerable repairs under the superintendence of Mr. C. Lynam, F.S.A., Stoke-upon-Trent, and executed by Mr. A. Gilbert, builder, of Penkridge. The removal of the ceiling in the nave, which was in a dangerous condition, has revealed the old oak roof, and the plaster has been scraped from the walls. More space has been provided around the font, and the vestry, which occupied a narrow strip in the central tower, has been placed at the west end of the church. In the tower two new windows have been introduced, to afford more light, which was greatly needed, and the pulpit is now placed near the chancel arch. Externally the church has been improved by the new tiled roof over the nave, and a pathway through the churchyard has been made. The village cross, of which for many years only a fragment remained, is also under repair, from a design of Mr. Lynam, and is being executed by Mr. H. Taylor, of Brewood, and Mr. Bridgeman, of Lichfield.

Pontypridd.—On Thursday, the 27th ult., the Pontypridd Free Library was opened. The building, which was erected at a cost of £2,000, from designs by Messrs. Hennings, of Furnival's Inn, London, is situated in Gelliwastad-grove. Mr. Julian, of Pontypridd, carried out the contract. The entrance consists of a tiled porch and an inner lobby with two sets of swing doors. Directly in front, on entering the inner lobby, is the borrowers' counter, fitted with an indicator. On the left-hand side is the staircase leading to the mineralogical museum and the caretaker's apartments on the first floor. On the right is the newspaper and reading-room, having an area of 1,500 square feet. This room is lighted by a skylight extending the length of the room, with an inner ceiling light to prevent down-draughts. On one side is the counter of the lending library and an entrance to the committe-room, and the other is taken up by the magazine and reference library and ladies' room. These are separated from the reading-room by a glazed screen 7ft. high. The walls are lined with bookcases, giving, together with those in the lending library, accommodation for 12,000 volumes. Under the entrance porch and lobby is the heating chamber for warming by hot-water pipes. Between the ladies' room and the porch is a small room for the use of the book-binder. The external walls are faced with Newbridge stone, with Box-ground Bath stone dressing.

The Bills and orders intended to be brought before Committees in the ensuing Session of Parliament show a large diminution on recent years. There are only 206 deposited plans this year, as compared with 332 in the previous year, and this is mainly owing to the great falling off in the electric lighting provisional orders from 159 last year to 62 this year. The railway plans number 50 against 70 last year, and the tramways 5 against 12.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Edinburgh Architectural Association.—The opening meeting of the thirty-third session of this association took place on Thursday, the 27th ult., when Mr. John Kinross, the president, delivered an address. He touched on the need for University teaching of architecture, and for that purpose the need of endowed chairs. He advocated the establishment of a Scottish institute of architects, and discussed the question of open or limited competitions. He thought, in regard to the latter point, that the remedy was in the hands of architects themselves, who ought to discourage competitions for buildings of little importance or moderate cost by refusing to enter them. Mr. Kinross thought the overcrowding and high buildings in some parts of the suburbs of Edinburgh ought to receive attention. No building seemed high enough. The limit seemed to be the power of a man's legs, and the conclusion seemed forced upon us that God made the country, man made the town, but the jerry builder made the suburbs. Another subject to which he drew attention was the antiquated methods of our buildings. We were still deplorably behind the age in some respects. The floors were a harbour of vermin. The roofs were far from being as advanced as they should be. It was high time a move was made towards improvements in those directions. Mr. Kinross went on to speak of matters which concerned the younger members of the profession. He passed some criticism upon the excessive refinement of some of the draughtsmanship of the present day, he emphasised the value of the systematic study of old buildings, and closed with some practical advice as to to methods in designing.

Liverpool Architectural Society.—An ordinary meeting of this society was held on the 1st inst., Mr. T. Mellard Reade, F.R.I.B.A., F.G.S., President, in the chair. It has been arranged that papers on practical subjects shall be given by members of the society, chiefly addressed to students with the view of fitting them in some measure for the R.I.B.A. examinations, and the first of these was delivered by Mr. T. Harnett Harrison, F.R.I.B.A., on Monday last, entitled "House Drainage." Mr. Harrison said, "That this was a vitally important subject, and he used the word vitally advisedly, for clean air, earth, and water were absolutely necessary to health. The medical profession had only of late years become fully alive to the importance of the subject, and then, although their interest might be said to lie in an opposite direction, they became pioneers in sanitary matters; how much more, therefore, did it behove architects to pay the greatest attention to the subject?" He proceeded to demonstrate by means of a glass receiver and siphon the action which takes place when the sewers or other receptacles for sewage are not ventilated, the gases being forced through the traps by the displacement caused by the inrush of sewage or by the expansion of the gases themselves. In concluding, Mr. Harrison pointed out that "Gwilt," which was recommended as a students' handbook, was very misleading on this subject; for instance, it mentions that clay joints may be used for drain-pipes; but this mode had long been discarded for various reasons, one being that roots readily find their way inside the pipes, through the joints, and immense vegetable growth took place under the moist and otherwise favourable conditions. Part of a mat-like mass of vegetable growth was shown, which had been taken from a clay-jointed drain, and others had been found which choked the drain entirely. Rain-water down pipes may, according to "Gwilt," be used as drain ventilators, but this is not an accepted mode of effecting the purpose, since gases from some may enter the upper story windows. After some discussion on the subject of the paper, a cordial vote of thanks was accorded Mr. Harrison on the motion of Mr. Thos. Cook, F.R.I.B.A., and seconded by Mr. A. Culshaw, F.R.I.B.A.

St. Paul's Ecclesiological Society.—At the last meeting of this Society a paper, illustrated with lantern views, was read by Mr. Joseph Grimshire, on "The Existing Abbey Ruins in England." He divided the English abbeys into three classes, those still nearly or quite perfect, and this list was nearly exhausted by the mention of Westminster, St. Alban's, Tewkesbury, Bath, Selby, Sherborne, Malvern, Wimborne, Christchurch, and Ottery St. Mary, and even these, with the exception of Westminster, had lost their cloisters and chapter-house. The second class comprised those remaining in part, and utilised as parish churches, and was a much longer list: Bridlington, Waltham, Leominster, Abbey Dore, Shrewsbury, Thornham, Worksop, Milton Abbas, Dunstable, and Bindon, were among those detailed in his category. In the third class were placed those which were roofless ruins. A great number of these were to be found in Yorkshire, including Fountains, Easby, Kirkstall, Hornden, and Byland; while in other counties Tintern, Netley, Furness, Wenlock, Buildwas, Tynemouth, Walsingham, Glastonbury, and Valle Crucis were among the more beautiful examples. Other abbeys had almost passed away, including Coventry, Chertsey, Bury St. Edmund's, Abingdon, and Reading. The destroyed buildings were vast in size, and of beautiful character, and had they been spared would have formed as fine a group as the existing English cathedrals. Having compared the present condition of some ten or twelve abbeys with that shown in Buck's views drawn in 1720-25, Mr. Grimshire argued in favour of the conservative renovation of our ancient buildings, referring with commendation to the work carried out at Croyland Abbey by the rector, and to those undertaken in a more radical fashion from Mr. Aston Webb's designs, at St. Bartholomew, West Smithfield, and by Mr. Pearson at Peterborough Cathedral. He also referred approvingly to the reconstruction on the old foundations of the nave of Bristol Cathedral, from Mr. Street's plans, and the chancel of Shrewsbury Abbey church under Mr. Pearson, the last-named work being spoken of as solid, dignified, and unpretentious. He questioned whether a much more important work by Mr. Pearson, the refronting of the north transept of Westminster Abbey, was not too thorough in character; while it was too early yet to speak of Sir Arthur Blomfield's contemplated work in reconstructing the nave of St. Mary Overie, Southwark. In closing, Lord Grimthorpe's work at St. Alban's was animadverted upon in brief terms of censure.

CHIPS.

The tender of Mr. Alfred Coe, of Ipswich, has been conditionally accepted at £4,975 for the building of Westcott Schools for the Swindon School Board. Mr. Brightwen Benyon, of Ipswich, is the architect.

The first of a course of eight lectures on "The Theory of Construction," to be delivered on alternate Tuesday evenings, was given by Mr. G. A. T. Middleton, at St. James's Hall, Piccadilly, on the 2nd inst. The subjects treated upon were the principle of moments, the parallelogram and polygon of forces, the distribution of loads on supports. The lecturer then passed on to consider vertical shearing stresses, and stresses in flanged structures and rectangular beams, giving graphic solutions of the problems involved.

The organ in St. Thomas's Church, Dodbrooke, Devon, was reopened on the 25th ult., after reconstruction and enlargement by Mr. H. C. Sims, of Southampton. The new pipes are decorated with stencilling, designed and executed by Mr. R. Watson (in the office of Mr. W. M. Tollit, architect, Totnes and Kingsbridge), who also has in hand designs for the decoration of walls of chancel, inside altar-rails.

New Board schools seated for 834 children, have just been erected in the rapidly-increasing district of Kingswood, Bristol. Mr. W. L. Bernard, of Baldwin-street, Bristol, whose plans were selected in competition, is the architect, and Mr. J. Perrott, also of Bristol, has carried out the contract, for about £6,000.

A new mission hall is about to be built at Wallsend, from plans by Mr. Hope, of Shields and Newcastle. It will be Elizabethan in style, and is estimated to cost £2,500.

Sir Edgar Boehm has finished the statue of the late Emperor Frederick, which he has been commissioned to execute by the Queen, and it will shortly be placed beneath the Pearson memorial window in St. George's Chapel, Windsor Castle. The figure is above life size, and sculptured in white marble. It represents the Emperor in a standing position, wearing a military uniform and the robes of the Order of the Garter, the cuirass being decorated with the collar, badge, and star of the same Companionship, and other insignia.

New public baths, designed by Mr. S. Trevail, M.S.A., are approaching completion at Truro. The swimming-bath is 48ft. by 27ft. The contract for masonry has been carried out by Messrs. Clements, and that for ironwork and engineering by Messrs. T. Bradford and Co., of Manchester and London.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

THE NEW YEAR'S DOUBLE NUMBER

of the Building News will be issued on Jan. 3, 1891. The space for extra advertisements is very limited this year, and insertion cannot be guaranteed after Dec. 14, by which date at latest it is respectfully requested all orders may be forwarded.

English Bishop. (There are other Jesse windows than that at Dorchester Abbey Church, on the Thame, Oxon, which we illustrated in the Building News for August 15th last. Thus, at Wimborne Minster there is an east window of the kind from Belgium. Instances occur at Merevale Abbey, Atherstone, Warwickshire; Margaretting Church, Essex (15th century); Ettington Park Private Chapel (this is said to have come from Bishop Wykeham's chapel at Winchester); east window at Wells, and mutilated Jesse reredos in St. Cuthbert's Church there; Llanrhaidr yn Kinmerch, Denbighshire (where the glass is dated 1533). The windows of the Galilee at Durham once had Jesse trees in them, and at Chartres and Rouen Cathedrals specimens are to be seen. Many examples of the kind exist in Belgium, and among modern Jesse windows is the often-quoted one in St. George's, Hanover-square. In the Parish Church, Folkestone, the north transept east wall has just been decorated with a Jesse tree spreading all over it)

"BUILDING NEWS" DESIGNING CLUB.

Correspondence.

PATENTED PLANS.

To the Editor of the Building News.

Sir,—In our letter to you of the 31st October, we stated, "The date of advertisement of this patent is, we believe, the 29th October, 1890."

Our attention has recently been drawn to an advertisement in the *Patent Journal* of October 8 of Patent No. 19,624, *Hockton* and Gibbs. This printer's error led to our patent agent not noticing the advertisement.

He has applied to the Patent Office for a correction, and, at our request, for an extension of the time within which notice of opposition must be given. The Patent Office will correct the printer's error, but refuse to extend the time of opposition beyond the 8th inst. We hasten to inform you of this.—We are, &c.,

Flockton and Gibbs.

15, St. James's-row, Sheffield, Dec. 3.

Sir,—Although of opinion that the initiative in opposing Messrs. Flockton and Gibbs' claim for a "patented plan" should be taken by the Institute or other representative body, still, all free-traders in art should take up the challenge. Hence we enter the lists.

Mr. Fairfax's conclusive and able letter in your issue of Nov. 14, in our opinion, once for all disposed of any claim for originality in the so-called "patent plan," and we were under the impression that Messrs. Flockton and Gibbs would see the uselessness of taking further action in the matter. As, however, that letter seems to have been either overlooked or ignored by these gentlemen, please permit us to continue the controversy, and to point out that:—

1. The plan of the Royal Courts of Justice (*vide* illustration in Building News, October 27, 1882) embodies *all* the advantages claimed for the "patent plan": the central hall taking the place of the public hall, the courts that of the general offices, and the judges' corridor that of the official corridor. Surely a renaming of the same plan cannot constitute a claim for originality!

2. Messrs. Verity and Hunt, at Nottingham (see Building News, August 24, 1883), on their ground-floor plan, gave us another illustration, having a central corridor, with pay-office and official rooms, *with private corridor*, grouped round same, almost identical with Messrs. Flockton and Gibbs' plan (Fig. 1). As a matter of fact, as soon as Messrs. Flockton and Gibbs' plan for Sheffield Municipal Buildings was published, we noticed that it was merely a duplication of the central portion of Messrs. Verity and Hunt's Nottingham plan.

3. We ourselves, in an important foreign competition not yet decided, the plans of which went in prior to the Sheffield competition being advertised, have adopted an arrangement identical in principle with plan, Fig. 3.

We could adduce other examples of the forestalment of this "patent plan," but refrain from occupying more of your space, as, in our opinion, the first and most notable example we have named is sufficient to prove that the patent should not be granted.

For ourselves, we shall, as heretofore, plan what we consider best, and, if occasion should arise, be prepared to defend same. Still, any attempt to arrogate the brains of others should be nipped in the bud.—We are, &c.,

Leeming and Leeming.

Victoria House, 117, Victoria-street, Westminster, Dec. 1.

THE PROPOSED BELL TOWER AT COVENTRY.

Sir,—Having recently visited St. Michael's and the other churches in Coventry, as well as being a practical campanist, will you allow me in your valuable paper to offer a few remarks relative to matters that should govern the design of the tower? With regard to style, the features of the 15th century would seem to be most in harmony with the churches, and if this is so adjudged, the best termination would be an open-traceried parapet and suitably-designed light pinnacles; but these are matters for the architect. No towers are so well adapted for the English ringing as those designed by Sir C. Wren, and the St. Paul's western towers are no exception. The ringing-room is always well lighted by windows at proper height, and the bells themselves stand in their frame up on a good basis. Buttresses are seldom employed, but the inside angles are frequently cut off by masonry having a circular sweep, which gives greatly increased stability. Now the external design of a tower solely intended for ringing should boldly express the internal arrangements. Of the lower portion, we read, plainness is to be the order: this is right. The ringing-room requires to be a large apartment, well lighted on all sides; the windows must open at the top, and be glazed with clear glass, so that anyone stationed by the ringers can view the approach of a procession. Ventilation is best obtained by a trap-door into the next floor, and also by means of which the ringers can regulate to a considerable extent the amount of sound to themselves. The gas-pendant should always be in the middle. The clock should not under any circumstances be in this apartment, and provision for the weights should be in the solid wall closed over by wood. The floor above the head of the ringers should be felted, and the wall of the ringing-room wainscoted, and a comfortable fixed seat entirely round. The apartment should not be so high as to require rope-guides, which tend to increase extraneous noise. The space above will probably contain the clock, and should be no higher than required in order that the ringers may be near the bells. The bell-chamber itself is of far greater importance. The best plan is to suddenly diminish the thickness of the tower so as to form a shelf on which the timbers or girders which support the bell-frame will both stand and be well built into the substance of the tower. Corbels are seen to be bad in many a fine old tower which has no inner set-off as now recommended.

The bell-frame should be all on one level, and in this instance would be constructed to hold twelve bells, of which the present ten would be the heavy end. The windows should have externally English louvres, and each opening within should be provided with a close shutter fitted into the stonework, which can be closed during snow, and also by the ringers in case of a practice by unskilled hands. Gas must be laid on above the bells, and the lead platform should be so constructed as to let out some of the sound without letting in water on the bell fittings. Any idea of an open lantern on skew-arches would be in a ringer's tower quite a mistake. The bell-towers of Chichester, and formerly Salisbury, would not in this respect be good models. Perhaps the best form would be Magdalen tower, Oxford, but elaborated to a greater extent in the parapets, and better fenestration at the ringing-room stage. I am fully aware that windows weaken a tower if unnecessarily multiplied, but this need not be the case in providing a comfortable ringing-room. An apartment *below* the ringing-room should have a lavatory, &c., and good water supply. These matters should be devised by the architect, and not be knocked in afterwards. In a well-known clock tower the weights were forgotten, which caused a great deal of trouble subsequently.

The staircase should extend to the summit, and no ladder should anywhere be necessary. In particular, the clock attendant must not pass through the ringing-room; ringers are liable to disturbance from this cause at all times in most towers. It should not be forgotten that the mouths of the bells when at rest should be above the window sills, and that space should be made to enable a person to walk right round the frame. A slight bridge, with handrail near the big bells, should also be contrived, in order that the clappers may be adjusted without climbing up on the frame, which is always attended with danger when all the bells are mouth upwards.

It is difficult to refer to a model bell-tower. That at Quex Park, Birchington, erected solely for ringers, is peculiarly faulty, and most of our church towers have been adapted for ringing whereby floors cut windows, and the bell-frame obtains a bearing far below its main girders, which is totally wrong in principle.

St. Saviour's, Southwark, and St. Paul's Cathedral illustrate the proper size of the ringing-room and the lighting—especially the former.

In conclusion, the position of the ringers' tower at Coventry should be well considered, whether totally detached and standing near where the wreck of the old bell-frame is placed or nearer to the church itself.—I am, &c.,

A Member of the Ancient Society of College Youths.

P.S.—It is evident from inspection alone that the bells could not be rung if placed beneath the existing spire.

Sir,—I am at a loss to understand how anyone can be opposed to the practical completion of the grand church of St. Michael's, Coventry, by the erection of a campanile, or bell tower. The idea of a detached bell tower for our larger churches is by no means a new one. When a church has such a soaring and delicately tapering steeple as the church in question has, it becomes unsafe in course of time to ring a peal of bells therein.

There is no doubt the proposed campanile will add immensely to the interest and beauty of the three famous spires; these additions in ancient art always assist the dominant feature of an old building. Would that the Coventry of the 19th century was still a six-spired city, as in the 16th century, and that it yet had its lovely cross and historic gateways!

The ancient charm and delight of our old cities and towns were the numerous towers and spires, as our Old London, with its cathedral spire, the loftiest in the world, to which a detached tower formerly belonged.

No city has lost more both in points of beauty and practical use than that of Salisbury, which possessed late in the last century a choice detached campanile, one which James (the destructive) Wyatt wantonly destroyed. Through that act of vandalism, Salisbury Cathedral steeple has been silent ever since, it not having been considered safe to ring a peal of bells in England's loftiest and loveliest of spires. I am thankful that three such eminent architects as visited Coventry last week came unanimously to the decision to erect a bell tower, and that they recommend the adoption that it should be united to the *actual* church by some kind of dwarf cloister.

I devoutly trust that this Coventry dispute may lead to a restoration of the destroyed bell tower at Salisbury and Lichfield.—I am, &c.,

Joseph Grimshire.

Park House, Dalston, N.E., Nov. 28.

Intercommunication.

QUESTIONS.

[10450.]—**Ventilation.**—Seeing that carbonic acid is considerably heavier than air is in its normal condition, and proportionally still heavier than heated air, should not vitiated air be taken off at or near the floor level, rather than at the highest point of the room as recommended in the textbooks, and carried out in so many systems of ventilation? Would some reader up in the subject enlighten and oblige?—Rustycuss.

[10451.]—**Gas Stove.**—I have fixed a small gas-stove in a room, and led an ordinary wrought-iron flue-pipe across the ceiling of another room in order to reach the chimney-stack. When the stove is lit water condenses in the flue-pipe and runs out at the joints. Can any of your readers tell me the cause of this, and the best way to remedy it?—Caloric.

[10452.]—**Plastering.**—I have a quantity of plastering to do in a library, and the specification says:—"Three coats strongly gauged plastering to walls, finished with parian cement for painting." Can any of your readers say what will be the result of following this specification? Will the parian cement adhere to lime floating? I have seen many instances where parian cement-setting has left the rough coat of plastering.—X. F. K.

[10453.]—**Indurating Fluid.**—I have been told of an indurating fluid called "Browning's solution," said to be used for marbles, &c. Can anyone give me particulars of it, and say if it is colourless and effective?—Text.

CHIPS.

Mr. W. H. Radford, C.E., of Nottingham, has been instructed by the Uttoxeter Rural Sanitary Authority to inspect and report on the water supply of the town, and if the present supply is found inadequate, to prepare a scheme, with plans, sections, report, and estimate, for obtaining a further supply from the best available sources.

A special service was recently held at the parish church of Penkridge, Staffs, on the occasion of the dedication of a new pulpit. The pulpit, which is of Penkridge stone, is from the design of Messrs. Bodley and Garner, from whose designs the church was restored two years ago, and is placed on the north side of the nave. The work has been done by Mr. Bridgeman, of Lichfield, who carried out the work of restoration. The pulpit is square in plan, and has pierced tracery with shields in sunk panels, bearing the emblems of the Evangelists. The wall at the back is covered with oak panelling, from which springs an overhanging canopy, ornamented with brattice work and shields.

Nothwithstanding the activity of building operations duriug the past year, it appears from a report presented to the Coventry council by Mr. E. J. Purnell, the city surveyor, that the number of plans for new houses (188) sanctioned during the year is a decrease of 35 upon the previous year, and a decrease of 39 upon 1888. The feature of the year, however, are that plans have been passed for six new bicycle works, and for 22 additions to existing works.

LEGAL INTELLIGENCE.

Wooden Signs and the Building Act.—At the Kensington Petty Sessions, held on Tuesday, Nov. 25th (Mr. William Bird, chairman), George Jennings was summoned by Ellis Marsland, district surveyor for East Kensington, for erecting a projection from a building not of fireproof material, contrary to Section 26 of the Metropolitan Building Act, 1885, at the Earl of Lonsdale public-house, Archer-street, W. The projection in question consisted of a wooden ring 8ft. diameter, 4in. wide, and 2in. thick, with letters of wood 2ft. high in the centre of the ring, and affixed to it by 1¼ by ¼ iron bar. The whole was projected over the public way from the face of the building, and stayed to the same by iron supports and wire stays. The district surveyor recited the Section of the Act, which states that every coping, cornice, fascia, window dressing, portico, balcony, verandah, balustrade, and architectural projection or decoration whatsoever, shall be of brick, tile, stone, artificial stone, slate, cement, or other fireproof material. He contended this was a projection within the meaning of the Section, inasmuch as it was affixed to the front wall, and being of wood, and likely to facilitate the spread of fire, was contrary to the Act, and he therefore asked for an order for its removal. The defendant, who was represented by counsel, cross-examined the district surveyor as to the meaning of the term "architectural," and elicited from him that it meant belonging to a building. He contended that this projection formed no part of the building, and was merely a trade sign, and if it were dangerous or a nuisance it could be dealt with by the vestry under 18 and 19 Vic. cap. 120, Section 119. He characterised this as another attempt on the part of the authorities to deal with these so-called "sky-signs." The Bench, after some consultation, decided to dismiss the summons, as they did not consider this was an architectural projection within the meaning of the Act.

In re George Brick.—At the Birkenhead County Court on Tuesday George Brick, builder, Liscard, and formerly building surveyor to the Salvation Army, applied for his discharge in bankruptcy. The petitioning creditor, Mr. George Lampard, described as a grocer and Salvationist, of London, opposed. The Official Receiver stated that the statement of affairs showed unsecured liabilities of £256 12s. 2d. and £160 for solicitors' costs, while the assets were set down as £3,000, and good book debts at £8. Nothing had been realised from these assets, but there was a debit balance against the estate of £3 13s. 9d. for Board of Trade fees, &c. Debtor was for six years building surveyor to the Salvation Army, but left in 1888, and had since been out of employment. He wrote a book, which contained certain allegations against the Salvation Army. The manuscript of this book, which debtor valued at £3,000, and was the asset referred to, was handed to the petitioning creditor, who advanced the debtor £50. An action was afterwards brought in the Court of Queen's Bench against the debtor, for the recovery of this money, which the debtor alleged was given him as hush-money to prevent him from publishing his book. Judgment was given against him, and this sum, with costs, formed the debt due to the petitioning creditor. The Official Receiver stated that the manuscript had been handed by Mr. Lampard to Mr. Bramwell Booth. He had applied to him for it, but could not get it. After a long argument, his Honour said he thought the debtor was entitled to his discharge; but whether absolutely or conditionally he would take time to consider.

WATER SUPPLY AND SANITARY MATTERS.

Matlock Bridge Waterworks.—A report has been received from Mr. W. H. Radford, C.E., of Nottingham, in which he advises the company to take an additional spring from the Yoredale Grit. The spring yields 68,580 gallons a day in dry weather. The water has been analysed by Dr. Frankland, and found to be of extraordinary purity and softness. The company has applied to the Board of Trade for a provisional order to increase their capital from £7,500 to £20,000.

Nuneaton.—The Nuneaton Local Board have decided to adopt the process of the "International Sewage and Water Purification Co." for the treatment of the sewage of their district, and have instructed their Surveyor, Mr. J. S. Pickering, C.E., to prepare the contract drawings for an area of 800 yards of "polarite" filters, and for the remodelling of the whole of the works. The Board have also resolved to erect new pumping machinery capable of raising 56,000 gallons per hour.

The current issue of the *Proceedings* of the Society of Architects has as a frontispiece a photographic group of the members and friends assembled in front of the south porch of Canterbury Cathedral, on August 29th last, during the annual excursion, in illustration of Mr. Middleton's lecture, reported in our last issue.

Our Office Table.

About one hundred and forty architects have registered under the Ontario Architects' Registration Act, largely exceeding the expectations of the council. The *Canadian Architect and Builder* says:—"Mr. Townsend, the Registrar, was kept busy during the last hours of the final day (Nov. 5). Human nature is the same all the world over, and procrastination is the bane of architects as well as of other people. While three months were allowed in which to observe this simple act, the majority did not register till within the last week or two of the limit. One man was so careless, that his more business like partner had to rush down at the eleventh hour and do the deed for him. And now will come the examination of candidates who were caught without oil in their lamps. We presume the standard will be gradually increased, so that in the course of a few years it will be impossible for any but competent and thoroughly trained men to enter the ranks of the profession—a consummation devoutly to be wished. It is to be hoped that long before that time the legislature will have so amended the statute, that no man may assume the simple title 'architect' who has not entered the ranks of the profession in the accredited manner."

The Art Exhibition at Aberdeen, opened on Tuesday, includes, besides work by members of the Aberdeen Artists' Society and others, a loan collection of old and modern examples. Among the pictures lent, noteworthy ones are a bust portrait of Jane Maxwell, Duchess of Gordon, by Sir Joshua Reynolds; portraits by Velasquez, Vandyck, and Jamesone, and coming down to the present day, Peter Graham's *chef d'œuvre*, "The Spate in the Highlands," "Delilah," by Solomon J. Solomon, Venetian studies, by the sisters Montalba, and Lady Butler's "Inkerman." Among the Scottish exhibits are landscapes by Russell Gowans, Campbell Noble, John Smart, and Beattie-Brown; portraits by A. D. Reid, and water-colours by W. E. Lockhart (a Royal procession in Edinburgh streets), R. Wallan, and R. B. Nisbet.

The Strand District Board of Works have petitioned the Local Government Board complaining of the overriding powers vested in various companies, which practically authorise them to break up or disturb the streets and pavements at will, and which involve not only unnecessary and frequent expense, but are also injurious to the surface of the streets, and cause obstruction and inconvenience to traffic, and injury to trade and business. The petitioners contend that the public interests require that the control over the streets and pavements shall be so vested in the various local authorities in the Metropolis as to enable them to make proper regulations as to the breaking up or disturbing of the streets and pavements in their several districts. It is also urged that further powers should be conferred for making and maintaining subways in streets, and that provisions should be made requiring that such subways should be used for the reception of pipes, wires, and the like, instead of the streets being from time to time thus broken up and interfered with. They ask that these suggestions and others dealing with overhead wires may be embodied in any Bill that may be introduced into Parliament for the creation of district councils.

Sir Mountstuart Grant-Duff has accepted the presidency and Sir J. D. Linton (president of the Royal Institute of Painters in Water-colours) the vice-presidency of a society just formed in London for the encouragement and preservation of Indian art. The society has been established to foster the indigenous decorative arts of India, and, if possible, to preserve their distinctive characteristics. It proposes to further these objects by encouraging the artisans in every province of the country to continue in the practice of their hereditary handicrafts. The society hopes to extend among European purchasers and patrons a taste for genuine Indian art work, and relies upon obtaining the assistance and support of the Indian Government. It is pointed out that the Indian handicrafts are being discredited by the prevailing rage for cheapness, the example of meretricious Western taste having had a deteriorating influence on native artists. The executive committee met last week in the rooms of the Society of Arts for the transaction of business in connection with the new society.

Messrs. Williams and Co., of 18, Berners-street, are introducing a new steel "climax" casement, which possesses many useful qualities. It is weather-tight under any circumstances, however arranged to open. The same section can be arranged to open in or out, and can be hung at side, or head, or sill, or to swing. Only one detail of the stone or wood work is necessary, which is the same as prepared for glazing. Side-opening casements are hung as a safe door, avoiding sagging. The glass is always in the same plane as in a fixed light. The casement can be fitted with glazing-fillets, which avoid the ragged appearance of putty, and facilitate glazing or repairs. It has a moulded face instead of the ordinary square edges. It can be adapted to any existing detail without extra cost, and being made of steel, is very strong and rigid.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Arts. "Gaseous Illuminants," Cantor Lecture No. 3, by Professor Vivian B. Lewes. 8 p.m.
Surveyors' Institution. Adjourned discussion on "The Labour Question as regards Agriculture." 8 p.m.

Tuesday.—Society of Architects. "Suggestive Points of Contact between Architecture and Painting," by A. W. Rimington. 7.30 p.m.
Institution of Civil Engineers.
Bradford Architects and Surveyors' Institution. "Where to Spend a Bank Holiday," by W. Hoffman Wood. 8 p.m.
Institution of Civil Engineers. "The New Chittravati Bridge, Madras Railway," by Mr. E. W. Stoney, M.E., M.Inst.C.E. 8 p.m.

Wednesday.—Society of Engineers. Annual Dinner a Holborn Restaurant. 6.15 p.m.
Society of Arts. "Electric Lighting Progress in London," by F. Bailey. 8 p.m.
St. Paul's Ecclesiological Society. Objects of Ecclesiological interest will be exhibited and described. St. Paul's Chapter House. 7.30 p.m.

Thursday.—Edinburgh Architectural Association. "Heating of Buildings by Hot Water and Steam," by A. D. Mackenzie. 8 p.m.

Friday.—Architectural Association. Special Business Meeting for the Revision of Rules. 7.45 p.m.

The Society of Architects.—The Third Ordinary Meeting of the Society of Architects for the Session 1890-91 will be held at St. James's Hall, Piccadilly, W., on Tuesday, Dec. 9th, 1890, at 7.30 o'clock p.m., when a Paper will be read by Mr. A. W. Rimington, R.P.E. (Associate), entitled "Suggestive Points of Contact between Architecture and Painting."

Edgar Farman, Hon. Sec.
G. A. T. Middleton, Sec.

Trade News.

WAGES MOVEMENTS.

Bristol.—A meeting of the committee of the Master Builders' Association was held on Friday, when it was resolved, pending the meeting of the Conciliation Board, that the hours of work should be from 7 to 5 during the first five days in the week, and from 7 to 1 on Saturdays, with the usual hours for meals. On Wednesday week a well-attended meeting of representatives from all branches of the building trade, with several of those on strike, both society and non-society men, was held to consider the present position of the strike at Stapleton Asylum and Bedminster Liberal Club; and the action of the contractor in attempting to introduce what was regarded as objectionable alterations in the code of working rules agreed to by the Master Builders' Association and the workmen. Mr. John Curle, secretary of the Bristol Trades Council, was in the chair. A long discussion took place, and a motion was passed expressing profound regret that an attempt should be made to violate the working rules of the trade, and calling upon the whole of the trade and trade-unions generally, to morally support them in their endeavour to resist their charter of privileges being filched from them.

Lambeth Potters Object to Apprentices.—A deputation representing the potters employed in the Lambeth Pottery waited on Tuesday on Sir H. Doulton, objecting to the employment of three youths lately apprenticed to the trade, those being the sons of journeymen, and employed at their request. The workmen considered that there was not sufficient prospect of demand to warrant their employment, and that their chance of continual employment in the future was endangered thereby.—Sir H. Doulton replied that he had far better opportunities of judging the future prospects of trade than the men, and the step he had taken was

not only necessary, but a very moderate one. At the present time he had seven wheels vacant, and the immediate demands made it important that these vacancies should be filled. Moreover, no application for work from journeymen had been received. It was not his wish to over-supply the market, and none of them should suffer by this action. He refused to accede to their demand, because this would be a positive check to the future development of trade. The deputation left apparently satisfied; but Sir Henry was subsequently informed by letter that unless he agreed to take the three boys off the wheel immediately, every pieceworker would cease work at once, and every day-worker on Thursday next. By this action not only the department affected, but the whole of the skilled workmen, will be called out. Sir H. Doulton regrets the action of the men in this matter, but feels it impossible to accede to their request.

Sir Edgar Boehm has been asked by the City Corporation to send in estimates and a design for a new statue of the Queen to be placed in the Royal Exchange, the existing figure being in an unsatisfactory condition.

Holloway's Pills.—The Great Need.—The blood is the life, and on its purity our existence depends. These Pills thoroughly cleanse the vital fluid from all contaminations, and by that means strengthen and invigorate the whole system. The balsamic nature of Holloway's Pills exercises marvellous power in giving tone to debilitated and nervous constitutions.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

DOULTING FREESTONE.
THE CHELYNCH STONE—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY.
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BATH.—For carrying out further works in front of Camden-crescent, necessitated by the landslip, for the city council:—
Ambrose, S., Bath (accepted) ... £236 0 0

BIRMINGHAM.—For the addition of separate sleeping accommodation for nurses and patients at Rubeny Hill Asylum, for the Birmingham town council:—
Barnsley and Sons (accepted) ... £2,616 0 0
(Lowest tender received.)

BRIXTON.—For alterations at the Effra Hall Tavern, Kellet-road, Brixton. Mr. R. A. Lewcock, 88, Bishopsgate-street Within, architect:—
Contractors:—

Spencer and Co.	£246	0	0
Williams...	239	0	0
Courtney and Fairbairn	227	0	0
Whitehead (accepted)	205	0	0

Gasfittings:—Winn (accepted).

CHELSEA.—For alterations and additions to No. 149a, Sloane-street, Chelsea, S.W. Mr. J. Emes, 151, Ebury-street, S.W., architect:—
Simmonds Bros., Chelsea (accepted) ... £1,020

DARTFORD.—For second portion of roads, sewers, &c., on the Westgate Estate, for the Kent and Essex Land Co. Mr. G. R. Cobham, F.S.I., Gravesend, surveyor:—

Multon and Wallis, Gravesend ...	£1,398	0	0
Wheeler, W. H.	1,349	0	0
Rackham & Bentham, Plumstead	1,274	0	0
Catley, A. T. (accepted)	1,270	0	0

GATESHEAD.—For the erection of a boys' school at the Lady Vernon Schools, Bensham, Gateshead-on-Tyne. Mr. S. Piper, County-chambers, Newcastle, architect. Mr. J. Savage, Grey-street, Newcastle, quantity surveyor:

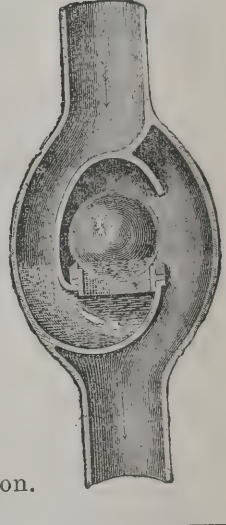
Reed, W. and R.	£2,710	1	4
Brown, H., and Co.	2,284	10	0
Tyrie and Graham, Gateshead* ...	2,231	14	0
Lamb, S. and R., Gateshead ...	2,104	13	8

Alterations to existing school:—

Brown, H., and Co.	231	0	0
Thompson, W...	185	0	0
Lamb, S. and R., Gateshead ...	176	4	1
Tyrie and Graham, Gateshead* ...	172	5	0
Reed, W. R.	168	0	0

Rest of Newcastle.
* Accepted.

LAMBETH.—For drainage works at the infirmary, Brook-street, Kennington-road, S.E., for the Guardians of St. Mary, Lambeth. Mr. T. W. Aldwinckle, 2, East India-avenue, Leadenhall-street, E.C., architect. Quantities supplied:—



Cooper and Squires	£1,920	0	0
Killingback, C.	1,900	0	0
Peacock Bros....	1,898	0	0
Mills, J.	1,845	0	0
Turtle and Appleton	1,730	0	0
Johnson, W.	1,670	0	0
Marshall, J. G. B.	1,548	0	0
Marsland, M....	1,437	0	0
Mayo, R. (accepted)	1,350	0	0

LIVERPOOL.—For the erection of an additional administrative block at the City Hospital, Parkhill, for the accommodation of nurses, wardmaids, and staff, for the city council:—
Morrison and Sons (accepted) ... £1,175 0 0
(No competition.)

JENNINGS' PATENT BALL TRAPS
For Lavatory, Bath, and Overflow Wastes.

THESE TRAPS (which consist of Indiarubber Balls fitting on seatings of the same material) possess **important advantages** over the ordinary kind; they constitute a **perfect seal** against back pressure; are **not** affected by absorption, evaporation, or siphonage, and are efficient under all conditions. They are made of various sizes, from 1in. to 2½in., and can be seen at the Works, where they may be subjected to experiments to test their efficiency.

Prices and particulars on application to
GEORGE JENNINGS, Sanitary Engineer, Stangate, S.E.
Patentee and Manufacturer of Improved Tip-up Lavatories, Baths, Water-closets, Sinks, Urinals, Pumps, Hydrants, Sluice Valves, and Water Fittings of every description.
AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

TWELVE GOLD AND SILVER MEDALS AWARDED.
ZINC ROOFING.
F. BRABY & CO., LD.
VIEILLE MONTAGNE SOLE MANUFACTURING AGENTS.
NO SOLDER. NO EXTERNAL FASTENINGS.
LONDON: 352 TO 362, EUSTON ROAD
LIVERPOOL: 6 & 8, HATTON GARDEN.
GLASGOW: 47 & 49, ST. ENOCH SQUARE.

LIVERPOOL.—For building steam laundry in Stanhope-street, Liverpool, for Mons. Kaufmann. Mr. G. H. Thomas, architect:—
Williams, V., (accepted).

LANDPORT.—For additions, &c., to the Gladstone Head beerhouse, Landport, Portsmouth. Mr. A. H. Foad, A.I.C.E., Portsmouth, architect:—

Beech, G.	£551 0 0
Crockerell, J.	456 0 0
Hall, T. P.	445 0 0
Brown, C.	400 0 0
White, F. G., and Son	399 18 0
Learmouth, W.	399 15 0
Boulton, H. F. (accepted)	399 2 0

All of Portsmouth.

LIMEHOUSE.—For alterations at the Aberfeldy Tavern, 357, East India Dock-road. Mr. R. A. Lewcock, 88, Bishopsgate-street Within, architect:—
Contractors:—

Spencer and Co.	£845 0 0
Courtney and Fairbairn	795 0 0
Reid	768 0 0
Todd	767 0 0

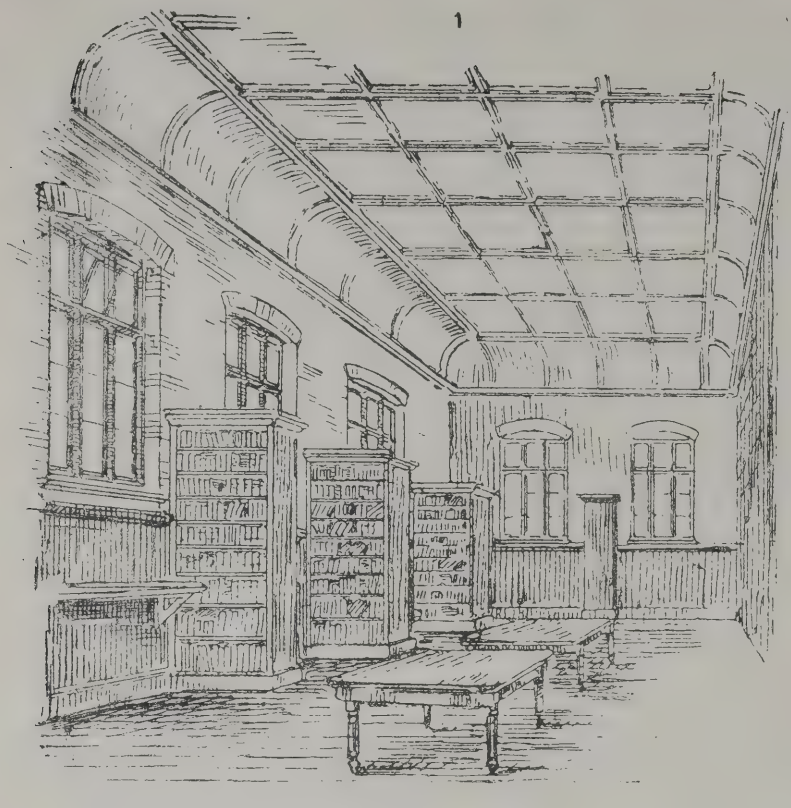
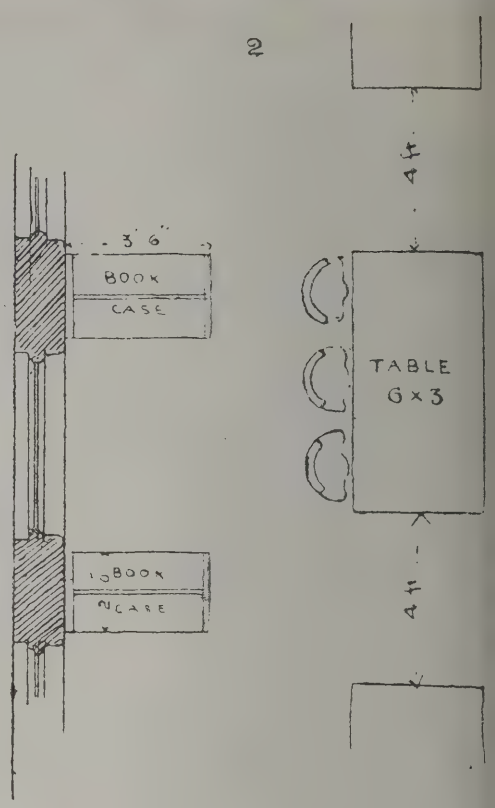
TOWN PRACTICE.

THE difficulties which beset the architect in his duties connected with building erations in London are often considerable, the occasional disputes and actions which me to light reveal. It is not a mere matter preparing designs and contracts, but of ranging with the owners of adjoining operties as to lines of boundary, light and r, of satisfying the requirements of the etropolitan Building Acts; and, to make the ity more arduous, of pacifying his own ient, and proving to him that what is pro-osed is the best under the circumstances. o do all these things is rather perplexing, pecially that of satisfying the mind of a ient who has a doubt as to the ability of his lviser. These duties become more onerous in rge towns, where the rights of owners and e requirements of the law have to be mplied with.

In the Queen's Bench Division the other ay two actions were brought by an architect recover from two defendants his fees for ork done and for wrongful dismissal, the rcumstances detailed in which show how any prevarications the architect has to ce through no fault of his own, and how sirable it is that he should be fortified in is position by a knowledge of the claims for ght and air, and that the plans he prepares r new buildings in streets are fully in mpliance with the law. The defendants this case were evidently afraid of the laims made by owners of adjoining premises, nd under threats to restrain them by in-nction from proceeding with the erection f their buildings on opposite sides of a new treet known as Copthall-avenue, London Vall, they declined to take the advice f their architect, and discharged him, and aid various sums to meet the claims for ompensation made upon them. In their efence they alleged that their architect was ncompetent, and counterclaimed against him o recover the sums paid for compensation o adjoining and opposite owners. Notwith-tanding the plaintiff's assurances that if his lans were carried out no valid claims could e made by any of the owners, the defend-nts refused to adopt this course, though hey afterwards, it appears, practically arried out his plans, which, as it was also roved, had been carefully prepared. Ultimately, during the progress of the case, erms were arranged between the plaintiff nd defendants, the sums claimed for fees vere agreed to be paid, and judgment was ntered for plaintiff on both the defendants' ounterclaims, while the charges of incom-etency were withdrawn unreservedly. The esult, as Mr. Justice Charles says, was nost satisfactory to all parties. At the same ime, we cannot help feeling that the archi-ect had suffered an injustice, to say nothing f the inconvenience and trouble of having o take these proceedings to vindicate his rofessional capacity.



Why should an architect's proficiency be called into question before he has fairly put his scheme into operation? is the natural nterrogation everybody would use. It seems carcely just to doubt the efficiency of a lesign upon the scant grounds the defendants ut forward. They refused to adopt their rchitect's advice, despite his assurance that f the buildings were erected in accordance vith his plans no legal claims could be made. Upon what grounds they alleged the incom-etence of their architect we are not told, nd we may presume that they thought it was unnecessary to incur further expense, or that, having seen the plans, they could dispense with his assistance. They, at any rate, carried out the buildings very nearly on the lines proposed. Architects' labours are often exposed to this treatment at the hands of employers who only desire to get an idea, and have no intention of employing professional assistance. The decision we have mentioned is a timely warning to those who imagine they can dismiss an architect on insufficient grounds.



Apart from the legal aspect, the case has interest. It shows what an architect has now to perform to carry out an engagement in London or in any large town; how many claims from interested parties have to be met, either by skilful evasion of their rights or by adroit management in the preliminary stage. The buildings erected in Copthall-avenue on opposite sides of that new street were apparently so situated as to lead to several claims being made. Adjoining owners made objections to the new buildings as to height. The Bridge House Trustees, who were freeholders of houses facing the new premises, argued that the new buildings would obstruct their light and air, and the City authorities threatened to restrain the defendants by injunction if they exceeded in height the premises which had formerly stood on the site. The tenants and occupants of adjoining premises also objected and made claims. The circumstances are not at all unusual: very few buildings of any height and importance can be erected in any part of the City that are exempt from such claims, many of them put forward with no other object but to extort compensation; others for the sake of claiming an imaginary right of light to certain windows that had acquired that light by the removal of the old building which occupied the site of the intended new structure, but which windows were always badly lighted; and other objections raised by litigious neighbours, who try to make the building owner as uncomfortable as they can, though they have no valid ground for a claim. The first-named class of claimants have generally some ghost of a case, or it may be, have a good claim for compensation. The new building obscures the light coming over some previous low erection at the back, by being built out to a greater depth. Generally the back premises of the said previous building were low, and there was a prescriptive right of light over them as servient tenement. When rebuilt to a greater height, their owner is certainly liable for compensation. Again, the owner of dominant tenement who pulls down and rebuilds, is bound to place the windows of the new building in the same positions as those of the old. If he alters them, he loses his rights. A more vexatious class of claimants adjoining a new building, whose windows received only partial light, may make a claim to establish a larger right than they originally possessed. The new building may not obstruct the light more than the old one did, but advantage is taken of the pulling down, and a claim for abandonment is set up. These are instances of the disputes very commonly met with during the erection of new premises, and prove the importance to architects of making careful and measured plans and elevations of the old premises, before they are demolished, indicating the position of the old windows, and in the case of alleged abandonment it is necessary that the person who claims the right should show the abandonment is only temporary. It is a question of evidence. Before the old building with ancient lights is pulled down, a correct elevation of the same should be made, which can be placed in evidence. A better plan is to erect a temporary wooden hoarding, showing the position of the ancient lights, thereby precluding any question as to their number and situation.

Other questions that arise in the rebuilding of old premises may seriously delay the progress of the work. An adjoining owner may complain of the settlement of his party-wall by the underpinning of the basement walls required in making a deeper cellar, and may claim damages from the building owner, or the party-walls may be seriously shaken, or damaged in rebuilding. The building owner is, of course, responsible, even if he has intrusted the work to the hands of a competent contractor; if he employs an architect, the responsibility is assumed to be taken by the latter. The necessity of underpinning party-walls, and of rebuilding them, is a considerable source of anxiety to the architect, and entails upon him the desirability of making the contract so complete that any damages through carelessness should be made good at the expense of the contractor. Even a very considerable acquaintance with the Party Structures Clauses of the Building Act will not prevent adjoining owners giving the architect great trouble in their dealing with them. We have often heard of vexatious owners making demands of an unreasonable kind, raising objections to the pulling down a party-wall that is not of sufficient thickness or is out of repair and defective. Under the 84th section the adjoining owner can make sundry requisitions, which it is the duty of the building owner to comply with, and though differences that arise between them can be determined by arbitration, the process is often vexatious, and much delay is caused. In the rebuilding of party-walls very great care is necessary, in seeing that the rules of the Act are carried out—requiring no small amount of vigilance on the part of the architect. But it is more with reference to the preparation of plans and the careful study of the rights of owners, municipal regulations, and by-laws relating to buildings that we now speak. The complex web of legislation, made up of various statutes, amendments, and by-laws, is sufficiently bewildering to tax the mind of any architect. He is hedged round not only with the statutory provisions of party-walls and structures, the rules of the Metropolis Management and Building Acts, Amendment Acts of 1878 and 1882 with reference to projections, lines of frontage, space in the rear of dwellings, but sanitary by-laws, easements of support, and light and air. These rights and duties, as they affect neighbours in front, at the side, and in the rear, make it imperative that he should study carefully the boundary walls of his design before he ventures to complete the internal arrangements. Frontage, party-walls, and back premises have to be planned in reference to sections of the Building Act; windows which have rights of light over the old premises must be taken into account; whilst other minor orders of local authorities have to be met.

BUILDING OPERATIONS.

THE building trades generally suffer a deadlock at this season of the year; building operations are suspended by frost, and a large number of tradesmen are thrown out of work. This is not invariably the rule. Many contractors who are in a hurry to complete their contracts are not very solicitous about their buildings, and we occasionally find bricklaying and plastering carried on under very undesirable conditions. We cannot have any doubt about the results. Half the buildings which show signs of incipient decay, defective brickwork, and rotten walls have been finished in wet or frosty weather. Take, for example, brickwork. How much of it is carried up in damp and frosty weather? The danger is, of course, that the wall is not sufficiently dry before the frost sets in. Architects pay little attention to these circumstances, and there is seldom any provision in the specification about suspending the work

during the winter months. The contractor is, of course, generally the responsible individual, for if any wall shows signs of damage by frost he has to make it good. How much of it is remedied is the point that chiefly concerns the architect and owner. A little re-pointing on the outside may cover serious defects in the body of the wall which are never found out till the rain tries it, or a second frost comes. The only safe-guard is to specify that no brickwork is to be carried up during wet weather in the winter season; or, at least, that the contractor will be held responsible for any damage resulting from the frost. Good builders who have a reputation to lose, adopt the plan of covering the walls with straw and weather-boards during an inclement season, and never to leave the work for the night till this has been done. But we know that very few bricklayers attend to the matter, and simply cover up the injured work when they resume operations. Some time ago a correspondence took place in these columns respecting the carrying on of brickwork in frosty weather, and many useful suggestions were made. It is asserted that frost will have no injurious effect on mortar if it is mixed with linseed oil and alum, used hot, the proportions being one pint of linseed oil containing one pound of alum, mixed with one bushel of unslaked lime to three of sharp sand. Others assert that sugar mixed with lime mortar in the proportion of 1lb. of ordinary common sugar to a cubic foot of mortar, the sugar being mixed with water and applied in a liquid state, will set quickly and prevent the action of freezing. Some time ago we gave the gist of a report describing the carrying on of bricklayers' work in Norway during frosty weather, which the Consul General of Christiania, M. T. Michell, described. In that country extensive building operations are carried on during frosty weather, the whole secret of the process being the use of unslaked lime. The mortar is prepared in small quantities as wanted, and the unslaked lime is increased as the thermometer falls. The theory is that the mortar sets before it cools, for, of course, the quicker the mortar sets the less risk is there of damage by freezing. To use the bricks dry with unslaked lime or linseed-oil and alum applied hot is worth attention by those who have contracts to complete in the winter months. But brickwork carried up during frosty weather may be rendered sound by using Portland cement, with good sand or aggregates. Selenitic mortar has been found also to be superior to ordinary mortar in resisting frost, and many large buildings have been carried out during the winter by its use. These precautionary methods of resisting the effects of frost are, however, confined to a few buildings. The ordinary contractor will not take the trouble to use any other materials than those he has on hand. But even rain spoils brickwork if it is heavy, and therefore the importance of covering the walls by weather hoarding during rainy weather, especially to prevent the rain from running down the face of wall and discolouring it.

The plasterers' trade is one that is also impeded by damp or frosty weather, and much of the bad work one sees is due to undue speed in finishing before the coats are dry enough. Modern builders are, however, better off than their predecessors: they have many appliances and methods of finishing walls, improved plaster that can be applied in one or more coats, and painted over within a few hours, tiles or slabs of plaster which can be nailed or screwed on the walls ready finished. The common "three coat" plastering has its disadvantages, especially during the winter months. The coats are long in drying, the walls are often saturated with moisture. "Render set" and "render float and set" work to brick walls cannot be successful when undertaken in a wet season, and these are operations which for certain contract reasons are generally hurried or are undertaken in the worst season. For insuring sound and dry work, the appliances introduced into builders' plant have to some extent rendered the trade independent of weather influences. Now we find buildings carried on in London during the night by the aid of artificial illuminants, and the electric light is used with great advantage. By these means the operations of brickwork and plastering can be expedited. Means of drying-out walls by apparatus specially prepared are in use, yet the ordinary builder is willing to run the risks of failure rather than avail himself of them. The specification is often silent on thes points, and much of the mischief of hurrie work is attributable to the desire to obta low tenders.

FREE PUBLIC LIBRARIES.—VIII.

IN the plan and construction of referenc libraries and reading rooms, the ski of the library architect is chiefly eviden It is easy enough to plan rooms that wi serve these purposes, but much mo difficult to give them the form, the pr portion, the furniture, lighting, and warmin that are appropriate to their requirement and which ought to distinguish them fro other rooms. The architect should en deavour to find out, as he should in ever other case, what are the desiderata and th differentia of a reference library. To dra out four walls in the form of a rectangl and to place windows in one or both alterna sides, and arrange bookcases and readin tables, is not to design a room that shall b suited to readers and students who ma spend several hours in it every day, whic should be retired from a main thoroughfa if possible, quiet, well lighted, and com fortable for study. We have laid it dow as an axiom of planning that the mod of lighting is the determining factor i arranging the bookcases and reading-tables but the architect is often free to dispose h windows, or to adopt top lights. Suppos we imagine a small reference or reading room, say 40ft. in length and 22ft. in width that can be lighted on one or both sides, an at one end. As 5 × 8 = 40, we can divid the length into five bays by four standar bookcases projecting from the wall formin alcoves, the distance between centres of th bookcases being 8ft. If we allow each cas to be 3ft. 6in. or 4ft. projection from th wall, and 2ft. wide, allowing a double back to-back row of books, this will allow a alcove of about 6ft. wide, within which th window can be placed. Thus there will b five windows with bookcases between, fairly good arrangement, that will abou compensate, as far as book accommoda tion goes, for the want of a continuou or rack arrangement along the wal By this disposal of the cases we de

termine the width of window bay. Three or four bays, or alcoves, would be less economical of space, for there would be a greater length of walling between the bookcases, and the architect would obtain more book-room by the other system of shelving, known as the "rack" system. Therefore, when only three or four windows can be obtained along the side wall, the architect must make his bookcases project further into the room to compensate for the loss of space, and consequently the room must be wider, to allow of the two rows of alcoves and a row of tables down the middle of room. The other alternative he has is to give up windows—adopt top lights and the rack system of shelving. For narrow reference-rooms, of course, the latter plan is the one that is most economical. Having thus decided how the room is to be broken up in its length, and the number and width of side windows obtained, it will be our duty to consider the width of room. A width of 22ft. is small for a double row of projecting cases. Taking their projection at 3ft. 6in. on each side, we get 7ft., to which we must add the width of the tables, arranged lengthwise, for economy sake, down the centre. Allowing 3ft. in width, which is a convenient width for a row of readers seated on each side, we have 7ft. + 3ft. = 10ft., which allows 12ft. for two 6ft. passages—a fair allowance for public traffic. The tables may each be 8ft. long, and allowing for a space at each end of the room, about three tables of this length can be placed, allowing an interval between the tables of 4ft. We have indicated such an arrangement of room in our sketch, plan 2, the appearance of the cases being shown also. It is not necessary that there should be windows on both sides; five side windows 4ft. or 5ft. high, and proportionately wide, would give ample light, with the end windows; and a blank wall on the other side is preferable for comfort, as the bookcases can be placed nearer together or along the wall flatwise. The reading or news room may be on the other side of such a wall, and of the same size as the reference library, a plan adopted at Norwood and Chelsea.

The alcove and rack system can be combined in large rooms by placing shelves along the wall between the projecting cases and under the windows—a plan that is followed at Wigan and other libraries. When the size of room and mode of lighting are both optional, the architect is free to design a room to suit the requirements of the building. He may take as a controlling factor the accommodation of books to be provided for, and the arrangement of the furniture. A top light allows of the bookshelves being placed on the rack system against the walls, or projecting on the alcove plan, already described, whichever is preferred for effect. Two other systems of placing the bookcases may be mentioned. One of these is to place the projecting cases closer together, forming a semi-alcove plan, dividing the alcove into two by a parallel case, and allowing 2ft. or 3ft. space between. The other is to arrange the cases in parallel stacks across the room, allowing a similar space between them—a plan adopted in lending libraries and in some reference libraries, as at Clerkenwell and Chelsea; but this latter system takes up more area, and is not so well suited for students. A large proportion of the floor-space of a reference room must be given up to the tables, and the middle of the room is best adapted for them. At Clerkenwell the tables are transversely arranged in parallel rows projecting from the window side, and allowing a passageway at the other side of room, a plan that economises space, but is less convenient than shorter tables to afford sitting room for eight or ten readers. In the public library at Reading, a plan of which we have given, the reading-room has twelve tables, some of which are in the form of desks for writing. These last are necessary in the reference library. Fewer tables are required in this room than in the reading-room, and we may cite the Wigan reference library as an example of the alcove arrangement in two tiers, the upper one forming a gallery over the lower alcoves.

A good reading-room should be quiet, well lighted and warmed, and comfortably furnished. The tables should not be too closely packed, be arranged transversely or longitudinally according to the proportion of the room; the books should be stored, if necessary, on wall racks or standards projecting from the wall, but these may not be so numerous or large as those in a reference library. In short, a reading-room should have ample space for traffic and movement round the tables, a condition that points to the desirability of making it less a store room for books than a comfortable room for reading. Indeed, in many of the libraries the general reading-room is without bookcases and is in immediate connection with the news room. One great advantage is gained by stacking the books in other rooms — namely, that there is more breathing room and less dust, sanitary reasons of much value. The tables should not be too large, as most readers like retirement, and object to be gazed at by others sitting at the same table. When placed in rows transversely, they may be arranged so that their ends are opposite to or between the windows, the latter position is preferable. A wide centre passage may divide the two opposite rows. When there are no side windows, and the room is lighted by a sky-light or lantern, the grouping of the tables would be more judicious if they were disposed in the middle, and with the passage-way round the walls.

A clever scheme for a town library of several stories is illustrated by the drawings of the Edinburgh Public Library, which we give this week. The design, as we have before noticed, is by Mr. Washington Browne, and is formed by a central square hall with four recesses, making a cruciform structure, the detailed plans of which we hope to give in our next article.

SUGGESTIVE POINTS OF CONTACT BETWEEN ARCHITECTURE AND PAINTING.*

IN his introductory remarks, the author referred to a paper he read on a similar subject last year, and reported in the BUILDING NEWS on Dec. 13, 1889 (p. 794, Vol. LVII.). In that paper Mr. Rimington endeavoured to show that the principles of composition in painting were derived in the first instance from nature herself, and that whether they were re-distilled from the practice of the old masters, or from that of the modern schools, their parentage was still clearly discernible, and that they were not mere arbitrary inventions of particular painters or academic cliques. He also urged that when their character and their use in the art of painting were rightly understood, and they were looked upon as helps and not masters, they did not fetter its methods of expression, clip its wings, or destroy its individuality. That, on the contrary, though they could not create an artistic genius, any more than a knowledge of counterpoint could create a musician, yet that they were of the greatest assistance to the painter, might help him out of many difficulties, assist him to discover defects in his own work, and enable him to take a more intelligent interest in that of others. There is, the lecturer continued, a school which prides itself upon discarding all the teachings of precedent in art, and which goes further and denies the existence of any such things as principles of composition, or indeed of principles of any kind. Its views have a certain plausibility, chiefly because there are a certain number of good painters who profess to hold them; but as a matter of fact the practice of these latter is in direct contradiction to their theory, and both from their works and their studio-axioms it would be easy to deduce, not merely a set of principles of composition, but a very narrow set, any infringement of which receives scathing criticism at their hands. These principles do, therefore, unquestionably exist, and their more or less general acceptance by painters is right and expedient. There will always be those who cavil at any method, and take fright at anything they suppose is an academic rule. Understood in the right sense, however, these large, broad principles can almost always be traced in the best work in painting, to whatever school it belongs. Our object now is to see how far a few more of them may be applicable to the sister art of architecture. The first subject I propose to touch upon is that of tone. A picture may possess many good qualities, but if it is wanting in tone, it may still be crude and untruthful, and vulgar in effect. In what then does tone consist? Tone, says a French artist of repute, is the greater or less intensity of a tint. As far as this goes it is quite a true definition. But by "tone" is meant, not only truth of tone, but also harmony of tone. Truth of tone in painting may be defined as the accurate reproduction, so far as pigments will allow it, of the relative light and shade values of an object. Harmony of tone is to a picture, as regards light and shade, what harmony of colour is to it as regards colour. Harmony of tone, however, is difficult to described, at least in the broader sense of the term, where, as in a musical composition, a note or two of strong contrast, or even discord, is not excluded. This being so, it is also not easy to say exactly why a given picture lacks this harmony, or, in other words, is out of tone; but still there are some general facts and principles with regard to tone which, as they are of service to the artist, may possibly also be so to the architect. For tone can, or ought to be taken into account in architectural designs. The neglect of the subject is one of the great causes of failure in many architectural works, and especially in interiors, sometimes perhaps because the architect is so entirely wrapped up in the archæological, ecclesiological, or utilitarian interests of his building. The appreciation of tone is best cultivated, and its enormous importance in giving impressiveness of effect best realised, by studying it in nature. But to benefit to the full extent by doing so, it is necessary to have first studied it in the works of the great masters. Great art is almost always characterised by its beauty of tone, and two pictures of the same subject, by a good and a bad artist respectively, differ quite as much from each other in point of the truthful and subtle rendering of harmonies of tone as in anything else. Let us endeavour, as far as we can, to discover some of the conditions upon which this harmony of tone existence depends. Taking some landscape subject—for example, a group of trees backed by a low line of hills—let us observe it when it is under harmonious effect of tone. We shall find that when it is most so—which will probably be in the early morning or late evening—as compared with when it is least so, the most important fact is that the details of leaf and branch in the tree; ridge and hollow, and distant marking on the hill, are least mapped out and individually defined. In a word, it is when the little patches and lines of light and shade which make visible the leaves and twigs, or the mounds and furrows, are least widely separated from each other and least in sharp and harsh contrast. Breadth and harmony of tone is, in fact, reached by a certain approximation of these little lines and patches to each other, and when, instead of fighting for supremacy, they sink their differences and unite in making the group of trees stand out as a harmonious mass of foliage and stem against the reposeful spaces of the distance and the sky. In this particular case tone harmony is obtained by decrease in the strength of some of the lights, the darks remaining tolerably constant. But the process may be reversed, and it may also be produced by lessening the strength of the darks, and bringing them nearer in value to the lights, as in the case of a mountain side, which, perhaps, under ordinary conditions of lighting, is cut up by innumerable scars, dents, and fissures; but which, when seen under the full glow of evening sunlight and an opalescent atmosphere, though its details are not lost, tells as a broad space of pale, delicate tone against the deep blue sky behind it. We may draw the conclusion that one of the essentials to harmony

* A paper read before the Society of Architects, Dec. 9, 1890, by A. Wallace Rimington, R.P.E.Assoc.S.A. See p. 840, *post*.

of tone in a picture or an architectural work is that there shall be large spaces in which the light and shade differences of the details shall not be very great. This is not saying that they should disappear, but merely that they are sunk into tone, rendered less obtrusive, and made subordinate to the larger forms of which a picture is composed. Harmony of tone in painting is so essentially, and by universal consent, connected with dignity and reposeful grandeur of effect, that where these qualities are aimed at by the architect he might do well to take the question of tone carefully into consideration. How frequently is the impressiveness of a church interior destroyed by the introduction of features or objects which cut into what to the artist would have been a beautiful and impressive tone harmony. A glaring and many-coloured reredos, a series of white marble slabs, the glitter of a piece of Birmingham brass-work, the needless insertion of a window, the reflected glare of encaustic tiles, often does this most completely. I may instance the disastrous effect upon the exterior of Coutances Cathedral, some years ago, by the introduction of new white sculptures in the dark-toned niches. Also of the reduced impressiveness of the choir of Westminster Abbey, owing to the figures in the modern reredos screen telling as white spots and breaking up its quietude of tone. A yet more striking example might also be drawn from Westminster in the case of the white marble memorials in the aisles and transepts, which injure it much more by their destruction of breadth of tone than by their incongruity of style. No one would, however, wish to see these abolished; for the value of their historical interest and associations far exceeds that of the artistic qualities of the building. So, too, in the exterior of a building; materials strongly opposed both in tone and colour, Bath stone and brick, for instance, light grey marble and dark red granite, are sometimes forced into an alliance they mutually detest, with destructive effects to the unity of tone of a building. I am far from asserting that harmony of tone is invariably a necessity in all parts of a building, or in all descriptions of buildings, or that many architects do not appreciate it. But in some cases, if the architect had been more conversant with the painter's axioms, and had appreciated their general truth, instead of destroying harmony of tone, he would have felt its imperative need, and have striven diligently to obtain it. It seems probable that the great Mediæval men, and possibly also the Early Classic architects, realised instinctively its importance. It is difficult to enter such churches as that of St. Francis at Assisi, our own magnificent Westminster, with its impressive tone silences, St. Mark's at Venice, the Pantheon at Rome, or the cathedrals of Milan, Canterbury, or Vienna, without feeling how important a part great harmonies of tone play in their impressiveness of effect. The exterior of St. Mark's, compared by Mr. Ruskin to an exquisite wreath of sea-foam, might be quoted as an instance of tone harmony in a light key, as contrasted with a dark one. So also such buildings as the Taj-Mahal and other pale-toned marble temples of India, or Giotto's Campanile in Florence. Much of the poetry and impressiveness of old buildings depends, at any rate in the eyes of the artist, upon their possession of this quality. It is partly on this account that bad restoration, by introducing greater differences of local tint, and placing light-toned objects against dark ones, does so much to destroy these qualities. A fact which may be observed in nature and in painting is that, given any space of tone, it will be rendered more subtle by objects darker than itself coming against it, or forming a part of it; more forcible but less subtle by the contrast of surrounding spaces or impinging objects lighter than itself. This fact may possibly be of use to the architect. Strong contrasts, though most valuable, are dangerously keen-edged tools, and require careful use. Possibly because this is felt they are very sparingly used in some pictures, and these works naturally fall into a particular key of tone—light, dark, or intermediate, as the case may be. Amongst a large school at the present time a very light key is in fashion, and if we except Fra Angelico, Botticelli, and a few others, the old masters mostly adopted a darker one. Whether the moderns or the old masters are right, this much is tolerably certain—namely, that a picture which includes too varied a range of separate tones is almost as unpleasant as one in which the artist has struck too many notes on the colour scale, and produced something suggestive of the kaleidoscope. The simpler the range the easier the treatment, and as in colour only an Oriental decorative designer, a Turner, or a Burne Jones can deal with a great complexity of colours, so only an artist who has an exceptional genius for black and white can deal with a great variety of tones. Perhaps this may serve to point out the path of safety for those of us, both painters and architects, who do not feel quite sure that we are great geniuses. May I submit that it would probably be advisable, under ordinary circumstances, for the architect, like the painter, to aim at simplicity, breadth, and subtlety of tone rather than at variety, and when he has a quiet space of half-dark in his interiors, to deepen and broaden it with any ornamentation he may use, only sparingly allowing himself the pleasure of bringing down some sharp light upon it. So, too, with spaces of pale tone when force and contrast are not essentially necessary. Finally, the careful examination of any good collection of pictures, with reference to some of the points to which I have referred, would suggest others, and would sharpen and render more sensitive the appreciation of tone. I now turn to a principle closely connected with tone, but so well known in art that it seems almost needless for me to refer to it. It is that of breadth. But though often spoken of, it is doubtful whether its importance is sufficiently realised; and as to the comprehension of it, if one may judge by many of the pictures to be seen in modern exhibitions, and many of the architectural buildings seen in modern streets, it is too often considered to mean vacancy. Perhaps breadth may best be defined by describing its antithesis, which is littleness—a crowding of detail and a display of fluttering lights and scattered forms, that confuse the eye and tire the mind. To give breadth to a picture is to get rid of this unpleasant quality, not necessarily to destroy detail, but to mass its subject in broad divisions of light and shade or of colour—to sink the prominence of some parts and to emphasise that of others. The need for breadth is probably as much an intellectual one as a visual, and might be traced in other subjects besides that of art. Nature continually shows the painter how it may be obtained, and when, for example, he is seated before a great rolling tract of country dotted with woods, farmhouses, and villages, bewildering to him in its complexity and apparently unpaintable, she quietly sweeps a great cloud across the centre of his subject, divides it into large and telling masses of light and shade, and gives him the means of expressing its beauty upon his canvas. Or, to take another example, how different in appearance is a crowded street of some Continental town under mid-day or grey-day glare, and the same street in delicious breadth of effect when the cool shadows of its gables are thrown diagonally across it, and the sunlight on the opposite windows and roofs is made the broader and more valuable. This principle applies not only to light and shade, but also to colour and grouping of detail. Its application to architecture is tolerably obvious, and more or less generally recognised. A building is often condemned by general consent on the ground of its effect being frittered away by a superfluity of detail. Yet in most cases the destruction of the impressiveness of a building is not nearly so much due to a superabundance of ornament, as to that ornament not having been properly massed and concentrated into large groupings, and the artistic principle of breadth not having been sufficiently considered. One of the peculiarities of the best French Mediæval work is the exquisite adjustment of the decorative features to the plain wall-spaces, as, for instance, in the façade at Bourges, or the way in which the details are built up into large forms, and a sense of breadth arrived at. It was chiefly in the decadent periods that the great intuitive principle of breadth and the division of the feature of a building into large masses was lost sight of. The grandeur and impressiveness of the interior of a great Norman abbey or Romanesque cathedral, such as those of Durham, the Abbaye aux Hommes at Caen, or St. Gervais at Falaise, is largely due to the breadth of effect of its cavernous arches, solid archivolts, and simple wall-spaces. That the intellectual demand for this quality in a building is a very deep-seated one is obvious from the widespread and reasonable admiration for the severest forms of Greek architecture, and in the almost equally widespread and unreasonable praise of some of the ugliest structures of the Middle Renaissance period, such, for instance, as the Pitti Palace in Florence. Breadth is so essential a quality, that many minds demand it at any cost. With regard to breadth of colour, it is clear that, as in a picture, the fewer and larger the spaces or the surfaces of colour in a building the broader will be the effect; and if the building is rich in detail, these large and separate colour-spaces will be useful in binding it together. Of course, breadth may be carried so far as to become monotonous; but as a rule in painting, as perhaps in architecture, the fault is on the other side. In referring to large separate spaces of colour, I mean the resultant or general colour, though this may well be built up of a number of smaller patches, as in a wall of delicately variegated marble, in which many colours are present, but of which the resultant tint is an opaline grey. An instance of the value of the application of the principle in colour is the broad yet subtle colour divisions of the Palazzo Public of Piacenza, which are peculiarly delightful in their avoidance of monotony and their gift of breadth. The success of many of the modern buildings of several well-known English architects is also mainly due to their comprehension of the necessity for breadth of colour effect.

(*To be continued.*)

INSTITUTION OF CIVIL ENGINEERS OF IRELAND.

SANITARY PROGRESS IN DUBLIN.

THE inaugural meeting of this institution was held in Dublin on the 3rd inst., when an address was delivered by Mr. Spencer Harty, M.Inst.C.E., the president, who took as his subject, "The Sanitary Works which are now in progress in Dublin." Of these, the President observed, one of the most important is the housing of the working classes. Much of Dublin was built at a time when sanitary knowledge did not exist, or was despised, and a very large portion, especially in the older districts, is now in an utterly ruinous and decayed state, and requires rebuilding. Among the admitted evils of the system under which the working classes are at present housed is the single-room system for in Dublin nearly one half of the population inhabit single rooms. Out of 54,000 families 32,000 reside in 7,200 houses, and occupy an average of 1·5 rooms per family. One of the chief causes of this state of things is that the artisan and labouring population of Dublin is abnormally large, and forms an exceptionally high percentage of the population as compared with other towns. Two sites have been cleared under the Artisans' Dwellings Acts in Dublin, one of these, the Coombe area, being the first area so cleared in Ireland by a local authority. The cost of clearance and new buildings amounted to £51,967. Since then Plunkett-street area has been cleared and built upon at a total cost to the ratepayers of nearly £30,000. The two areas cost, respectively, £24 7s. 9d., and £18 11s. 8d. per head. Another so frightfully insanitary area could not now be discovered in Dublin as Plunkett-street; yet there are some districts bad enough, and especially isolated cases of houses in a most wretched state, occupied by the poorer class. The Dublin Artisans' Dwellings Company and more lately still the Dublin Working Man's Suburban Dwellings Company, have since done good work in remedying this state of things, but very much yet remains to be done, for which ample powers are given in the Housing of the Working Classes Act passed this year. Great improvements have been made in the sewers of the city in recent years. Till in the recent years they were square-built dry-masonry channels with the natural earth for a bed, and flag stones for a top cover; but now the egg-shaped brick sewers are adopted, and manholes provided at frequent intervals. Fifteen years ago ventilators on the public sewers in Dublin were not known; now they were placed at an average distance of 100 yards apart. The ventilators as now designed are of the crudest description, and not worthy of the present generation. The only thing that can be said in their favour is "of the greater of two evils choose the least." Sewers in Dublin have for many years back been made with a sufficient gradient, so that they should be self-cleansing, yet in many instances they are not so, and this may be attributed to the large diameter of the

house drain, which in no instance is less than 9in., and through which foreign matters are sent with the greatest contentment on the part of the delinquent. In many cases the water-closet has been used as the common ashpit of the house, to carry away the refuse from which the main sewer must do duty. Cases have also been discovered in which the 3ft. 3in. egg-shaped brick sewers running through streets of rather quick declivity have been completely choked by road detritus and surface matter, swept in through gully grates and yard drains; and a certain proportion of the annual outlay in connection with sewers is for cleansing purposes. Proper house drains are now constructed with perfectly glazed pipes of a certain diameter; but the main sewer is built with rough bricks and rough mortar joints, which catch and retain the solids in the sewage passing through, and which remain and decompose there. All main sewers should be built up to top water level with the best glazed bricks and pure cement joints, smooth pointed and flush, manholes and ventilators being placed nearer to each other than at present, and sewers constantly flushed by means of manual labour. Automatic flushing is not quick enough, neither has it the force, nor can it act on the sides of the sewer in the same way as water discharged under pressure through a jet or hand-pipe; nor is it always reliable. Sewers and sewage treated in this way would be, of course, expensive; but a question of expense ought to be a minor matter in comparison with health. Dublin and Glasgow rank amongst the worst cities in the United Kingdom with regard to the outfall of their sewers—in each case the river which passes through the city forming the outfall, and being, in reality, an open or uncovered main sewer. Things remain in Dublin as they were from the beginning to this day, except that they are very much worse, by reason of water-closets now discharging into public sewers, and which 30 years ago existed only to a very limited extent, and also by reason of former watercourses being turned into public sewers. Turning next to plumbing matters, the President remarked that good and sound plumbing in a house is a most important matter in the interests of public health. The plumber should not only carry out the plumbing work of a house, but should also be the person to put in the drains. Bad plumbing work and bad drainage are imminently connected with enteric fevers and other diseases. Typhoid fever has been a frequent source of trouble in Dublin. He has been called upon, during the past year especially, to have many examinations made in houses, and in not one instance were the drains found perfect—the result being that sewer gas not only could, but did, get into the houses. The examination and registration of plumbers will only go a short way to remedy the evil, inasmuch as the registration is not compulsory; and the ignorant and jerry workman can still run riot in his work, and laugh at your death-rate statistics. A medical man will not be allowed to practise without having a legal qualification; a chemist will not be allowed to compound drugs; but any man who chooses to set up in a business and call himself a sanitary engineer is allowed to enter your house and erect as many death traps as his own sweet will may devise, and there is no remedy. All such men should have a legal qualification and license, and it should be made an indictable offence to carry out plumbing or drainage work in any house without notification to the local authority, who should be compelled to superintend that work and issue a certificate of its accuracy and correctness, and also to test and examine for defects every house in the city. At present a medical practitioner notifies cases of contagious disease to the sanitary authority, and similarly any alteration in a work done in a house connected with the sanitary system, and arrangements should also be notified—if such were done, coupled with good and sound dwellings for the poor, the high death rate of Dublin would be very much reduced. Tara-street, now a leading highway from Great Brunswick-street to Butt Bridge and the northern side of the city, was the first street made by the reformed Corporation of Dublin. It cost nearly £20,000, or one-third of a penny in the £, and passes through what was formerly a hotbed of disease and vice—the houses demolished being of the worst class of the tenement house in Dublin. Lord Edward-street, connecting Dame-street and Christchurch-place, cost £69,000. Two other streets have been made by the corporation, one opening up Blackhall-place to Ellis-quay, at a cost of £8,679, the other making a new thoroughfare between Upper Bridge-street and Usher's-quay, at a cost to date of £8,485. In Tara-street the corporation have built baths, wash-house, and laundry. The first-class swimming-bath measures 57ft. long by 33ft. wide, the second-class being 64ft. by 26ft., and are each 5ft. at their deepest, and contain 45,000 gallons and 40,000 gallons of water respectively. There are 12 first-class reclining-baths and 16 second-class, and in addition eight reclining-baths for women. The cost of the buildings was £14,000, and the loss on the working, including interest on loan, is about £900 per annum. The greatest of the sanitary works carried out by the Dublin Corporation has been the Vartry Waterworks, and the foresight of those engaged in it was abundantly proved in the year 1887, the driest year on record since the works were initiated. Formerly Dublin was mainly supplied by pumps and springs, and with water taken from the Dodder river, over which watercourse, by an Act of Parliament passed in 1719, no "house of ease" could be erected within one mile of the city; so that outside this distance a closet could be erected over the course (which would form, undoubtedly, a good water carriage system). Such was the idea of sanitary arrangements even in those comparatively modern days. Wooden water-pipes were laid through portions of the city for the distribution of the water from this source. Several of these wooden pipes had square or oblong holes cut in them for the purpose of a fire hydrant, which were plugged with wood; but to get at them one had to dig down from the street and search for them—meanwhile the house might burn. After this period came the canal supplies of water and iron pipes, which formed a very much more extended system; but still a large portion of Dublin could not be, and was not, supplied with water, and what was supplied was on the intermittent system. Now, an unlimited supply of water is given from the Vartry system, not only to the City of Dublin, but to a district extending from Artane on the north side of Dublin to about a mile below Bray on the south side, and from Dundrum, Wilbrook, and Rathfarnham on the west to the sea coast on the east, comprising roughly an area of about twenty-two square miles. The rain basin, or catchment area of the river from which the Roundwood Reservoir is supplied is 14,080 acres. Taking the population of Dublin and the townships and adjoining districts supplied with water as 340,000, the average consumption per day and per head since 1879, when the Vartry system was introduced, has varied from 42 to 44¾ gallons, including public services and trade supplies. In Dublin city the death-rate for 1887, when the quantity supplied was lowest, was 33·2—the highest since 1880, and much higher than it has been since. This may have arisen from want of sufficient water being had to flush sewers and drains. The rate of 1s. in the £ on the Government valuation has hitherto been paid for this great boon of pure water for domestic purposes (not including public rate); it is expected for 1891 it will be 4d. in the £ for the same supply, owing to the consolidation of the corporation stock. The annual cost of the production and supply of water to the citizens is about 2½d. (or a fraction over) per 1,000 gallons. In connection with this water supply the corporation has a most efficient, though small, fire brigade, consisting of one superintendent, one lieutenant, one inspector, and 38 men, and for whom a principal station has been built at Clarendon-row. The cost of the brigade for next year is estimated at £4,300. Proceeding next to describe the paving of the city, the President explained that when the present corporation came into existence the macadamised streets were laid down, and the old paved streets broken up, and later on macadam streets on a pitched foundation of from 9 to 12in. deep. Next came paving with Welsh setts with wide joints of from 2in. to 3in. wide. Then came paving (in streets of heavy traffic) on lime concrete foundations, and finally paving with close tarred joints, laid on a bed of cement concrete 6in. thick. Some of the great difficulties in properly maintaining the streets of Dublin arise from the fact of the substrata being dirty clay or mud, and in many instances the soft filling stuff which was formerly used; these, coupled with sunken gas, sewer, or water openings, are difficulties which have to be overcome, and if the streets are to be maintained as they ought, it would take a very much higher improvement rate than a city like Dublin can afford. Some of the old paving with falls to the centre and otherwise with the old bolder and blue paving setts, is still in existence in the back streets and lanes. It was a mistake to turn all the principal streets of Dublin into macadamised streets, as macadam in a city like Dublin with a damp climate, unless formed with good hard stone, and rolled and cleansed, is sure to become a nuisance. For some years back the corporation have been trying to improve these roads, and many of the streets of Dublin to-day will bear comparison with the best streets in England. Great difficulty is experienced in getting well-dressed paving stones; first cost in such matters as these is always cheapest. In carrying out the paving under the present and recent loans at an expenditure of £200,000, the corporation encouraged, as far as possible, the opening of stone quarries in Ireland; and accordingly, in 1879, setts from Dalkey, Newry, Rathdrum, and Ballintoy were tried on various streets; and, more lately, setts from Arklow have been extensively used in the city. The stones from the former quarries were laid only in patches as trials, and were surrounded by Welsh setts. In some instances the wear has not been at all satisfactory, and the stones have been removed. No better stone for macadamising can be got for Dublin than that which comes from Ballinascorney; but the difficulty is in getting quarries opened up, and to prevent the soft surface stone being supplied. Great strides have also been made with regard to footpaths, and the exception now is to see a gravelled or cobble stone footway. Tar, mineral rock, cement concrete, hygienic concrete, asphalte, ferrumite, compressed crushed granite and cement flags, and granite flagging have all been used in Dublin.

Cement concrete, 3 to 1, costs on an average, including excavation and carting away stuff, watching, &c., 3in. thick.....	2s. 6d. per yard.
Hygienic concrete, not now used, but wear has been good, 3in. thick, cost	4s. 6d. ,,
Asphalte, ¾in. thick, laid on 3in. of cement, 6 to 1 concrete, costs.....	5s. 6d. ,,
Ferrumite, the old flagging having been taken up and bed prepared, cost.....	5s. 0d. ,,
Compressed crushed granite and cement flags 2¼in. thick, cost	4s. 2d. per sq. yard.
Do., 2½in., cost	4s. 8d. ,,

And granite flagging, the flags themselves being 3in. thick (delivered, cost 7s. per yard), 11s. to 12s., including work around area grates, coal stoppers, stop-cock. Tar and mineral rock asphalte are not now used.

The hygienic concrete was composed of Portland cement, ground granite, and carbolic acid. The Corporation of Dublin is now proposing to expend £50,000 on an electric-light central station in Fleet-street, from which certain streets will be supplied with public and private lighting. The system proposed is for street or arc lighting, a continuous current with an electromotive force of 2,000 volts, with arc lamps in series (probably the Brockie-Pell pattern). The lights to be of 2,000 nominal candle-power. The private lighting to be supplied from alternating dynamos generating a current of 2,000 volts. Transformers to be suitably fixed to supply houses at a current of about 100 volts. Tenders have been received for this work from the best companies in the United Kingdom, and the amounts are well within the estimates. The corporation has also built a splendid cattle market, containing ten acres, at a cost of £30,000, on the North Circular-road. It is one of the largest in Europe at which markets are weekly held. An abattoir has been constructed at a cost of £15,000. A new fish and vegetable market is also in course of erection on the north side of the city, at Mary's-lane. A covered-in market, containing about 60,000sq.ft., will be built, and the adjoining streets are to be materially widened. The corporation has also two public libraries and a technical school. It will be seen, therefore, that the Corporation of Dublin is not, and has not been, idle, as all the works referred to have been carried out during the last thirty years; and yet a great deal remains to be done, if they are to keep pace with the local authorities on the other side of the water.

The will of the late Mr. John Mossman, sculptor, Glasgow, has been proved at £6,743.

ILLUSTRATIONS.

INTERIOR OF ST. MARY'S CHURCH, PORTSEA.—LIVESEY HALL, LANCASHIRE.—MEMORIAL FONT, HOLY TRINITY CHURCH, WOOLWICH.—NATIONAL SILVER MEDAL DESIGN FOR MARKET HALL.—EDINBURGH PUBLIC LIBRARY.—CHURCH SCHOOLS, HERNE BAY.—ST. JAMES'S CHURCH, GREAT GRIMSBY.

Our Illustrations.

ST. MARY'S CHURCH, PORTSEA.

We publish a double-page interior view of Sir Arthur Blomfield's great church, lately erected at Portsea. It accommodates about 1,400 adults in the nave and aisles. The roof is an open-timber one of exceptionally bold proportions and handsome character. A terracotta dado runs round the interior. Outside the walls are faced with flints on a Portland-cement concrete filling, and inside Bath-stone ashlar is employed. The chancel is groined, and an elaborate wrought-iron screen incloses the stalls, as seen in the view. The morning chapel is on the south side of the choir, and the organ-chamber is located in a transept on the north side. There is a massive tower in the centre of the nave at the west end. Our illustration is from a fine photograph by Messrs. Fry Bros., of Brighton, which was exhibited at the Crystal Palace Photographic Exhibition this year.

LIVESEY HALL.

I am afraid I have not anything further to add to that which accompanied Mr. Harrington's sketch of the same building you published on June 6th last. The present sketch shows the wing built in 1666; it is unoccupied and in a neglected condition, but contains some of the original internal fittings, including an oak staircase.—J. Langham.

MEMORIAL FONT, HOLY TRINITY CHURCH, WOOLWICH, E.

This font, in polished marble, is now in course of execution by Mr. Margetson, of Chelsea (the sculptor who carved the enrichments under the late Mr. Street at the Law Courts), from the designs of Mr. Maurice B. Adams, architect, in memory of the wife of the present vicar, the Rev. J. W. Horsley, M.A. The church is a very large one, erected during the early years of the present century in a sort of Classical style, with galleries at both sides of the building and at the entrance end. The strongly marked horizontal lines of the interior thus secured, in combination with a flat ceiling, seem to render a spire-like form for the font cover very desirable. The several details on the sheet, herewith printed from the working drawings, give full particulars of the composition. A balanced pulley and chain from the roof will carry the cover. The copper dome is intended to be seen when the cover is lifted during the Baptismal service. Handles are provided to pull it down by, as seen in the section. The ordinary plug and chain will not be used in the marble bowl, but instead a raised sort of circular rose, cut out of the solid, is contrived with four small holes in the rim, through which the water will draw away. A cock, governed by a long arm, is worked by a handle in the pedestal, as indicated.

DESIGN FOR MARKET HALL.

This design received the Silver Medal awarded in the National Competition. Mr. Frank Shayler is the author.

EDINBURGH PUBLIC LIBRARY.

The sketches of this building, which we illustrate to-day, are from the pencil of the architect, Mr. G. Washington Browne, prepared after the working drawings were matured, and were hung upon the walls of the Royal Scottish Academy Exhibition in the spring of the year. Our readers may recollect that this design was selected on the award of Mr. Alfred Waterhouse, R.A., from among upwards of thirty others submitted in competition by Edinburgh architects, and while the details of the building have been carefully studied and improved upon, the design remains in all its essential features as originally submitted. The site upon which it has been erected is a peculiar one, in respect that the two streets which form the east and south boundaries are at different levels, and, as its name implies, George IV. Bridge crosses the Cowgate at a height of 48ft. above the level of that street. The adjoining buildings to the north are of great height, and the difficulty had to be overcome of covering up the rough mutual gable, and at the same time leaving an area for access and light next the bridge. This has been successfully done by projecting the principal staircase forward to the building line of the adjoining tenement, while keeping the main part of the building 15ft. back from the parapet of the bridge. The *motif* of the design of this building is to secure abundance of light equally upon all four sides of the three large rooms—the general reading-room, the lending library, and the reference library. This has been attained by the adoption of the cruciform plan. The arms are short in length, and the whole end of each arm is occupied with large windows, so that ample light in every direction is obtained. The four angles which fill up the space between the cross form and the square outline of the site are occupied respectively with the grand staircase to the reference library, the public staircase from the Cowgate to the libraries, the service stair, also from the Cowgate to the libraries on the several floors, staff-rooms, and space for store-rooms to be built in the future when the necessity for further accommodation arises. The principal entrance is on the level of George IV. Bridge, giving access to a columnal vestibule 47ft. by 17ft., the walls of which are finished in polished ashlar, while the floor is laid in squares of polished marble. At one end of the vestibule is placed the stair up to the reference room, and at the other end the stair down to the general reading-room, while in the centre of the vestibule, directly opposite the main entrance, is the doorway of the lending library, placed for easy access upon George IV. Bridge level, with the reference library directly over it, and the general reading room or news-room directly under it. The lending library, 72ft. by 72ft. over the arms, is arranged internally in much the same way as the telling-room of a bank, the work to be performed being pretty similar in both cases. The centre area formed by the intersection of the arms of the cross is given up to the public, and is surrounded by a service counter, upon which are placed the indicators, and over which the books pass between the attendants and the public. The bookshelves are placed principally at right angles to the windows for good lighting, and are restricted to a height of 7ft. 6in. to top of cornice, so that every book can be reached without the aid of steps or ladders, and are within a yard or two of the attendant's place at the counter. The shelving affords accommodation for 48,000 volumes, which can be materially increased by the erection of the book stores, for which space has been left. On an entresol over the vestibule, and halfway up the grand staircase, is the board-room, 26ft. by 17ft. 6in., with strong room and lavatories attached. At the top of the grand staircase the reference room is entered. This is 90ft. by 72ft. over the arms, and is arranged internally upon the same principle as the lending library. The books are placed upon shelves in alcoves formed between the pillars and piers of the projecting arms, while the centre portion, represented by the intersection of the arms, is occupied by general readers. Each alcove is also provided with a table and chairs for the accommodation of readers who are engaged upon the special study of any subject requiring several books at once for cross-reference. The shelving in this room extends from floor to ceiling in three tiers each, 7ft. 6in. high, so that all books can be reached without ladders, and four spiral staircases inclosed within the responds of the arcade give access to the upper tiers. Only two tiers of shelving have been fitted up at present; but when the third tier is added and the adjoining book-store is erected, accommodation will be found for upwards of 100,000 volumes. Tables and chairs are provided for 146 readers. All the furniture of this room is of American walnut, with which material the bookcases are faced, and we may here mention that the whole of the furniture and fittings throughout the building have been specially designed by the architect. The general reading-room or news-room occupies the first floor below George IV. Bridge level, and is reached both from that street and from the Cowgate by straight flights of steps 6ft. wide, the walls of this staircase being tiled in lighter and darker bands of yellow, from tread to soffit throughout. The news-room corresponds exactly in size with the reference-room, the arms of the cross being fitted with newspaper stands, and the central portion of the floor with tables and chairs for magazine and journal readers. The doorways, fireplaces, column pedestals, skirting, string-courses, &c., in this room are executed in faïence of an ivory tone, with enrichments of yellow upon blue ground. A high dado of specially designed tiles in blue and yellow upon an ivory ground is surmounted by a deep frieze of lustre tiles, containing proverbs from the Book of Solomon. Entering from the news-room, and placed under the grand staircase, is the juveniles' room, 35ft. by 32ft., similarly treated with faïence and tiles, and containing a juvenile lending library of 4,000 volumes. On the remaining two floors, between this and the Cowgate level, are placed workshops and book-store, boilers and machinery for heating, ventilating and electric lighting, houses for engineer and caretaker, public lavatories, &c. The estimated cost of the building and furnishings, exclusive of electric lighting, was £30,000, and this has been most closely adhered to in execution. The stone used for the dressings is from Prudham Quarry, Stirlingshire, and that for rubble from Hailes Quarry, Midlothian. The girders and joists of floors and the principals of roofs are of steel, and concrete floors are used throughout. The steps are from Myreton Quarry, near Dundee. The contracts have been entirely in the hands of Edinburgh firms.

CHURCH SCHOOLS, HERNE BAY.

These schools are about to be erected in connection with the parish church, and will replace the old school buildings, which were constructed when the town was less than half its present size. The new building will be used not only as Sunday schools, but for parochial purposes of all kinds throughout the week. The perspective view from which our illustration is taken, was exhibited at the Royal Academy this year, and is from the design of Mr. Ernest Turner, architect, London.

ST. JAMES'S CHURCH, GREAT GRIMSBY, LINCOLNSHIRE.

The work of repair and reconstruction of St. James's Church, Great Grimsby, has been in hand since 1874. Much has already been accomplished, but a very great deal yet remains to be done before the drawings, prepared for the entire scheme by Mr. Withers, architect, and fully illustrated in the Building News for May 21, 1875. have been carried out. Among the repairs, the central tower occupied an important place. The tower contained a peal of eight bells, substituted for an older peal of six in 1830. These were rung until 1857, when the tower, being certified as unsafe, the bells remained silent until 1886, a period of 29 years. In the latter year the tower was taken in hand, and on removal of the bells and floors and examination of the tower, a serious state of dilapidation was revealed. The tower was honeycombed at the level of sills of belfry windows by insertion of immense beams, and was wholly resting on a few through-stones. The chancel arch was also badly cracked. The work of repair was long and costly. To prevent any of the new belfry timbers going into the upper walls of tower, the architect designed a cradle, which we illustrate to-day. Starting

with the insertion of eight hard York stone corbels, 48 by 17 by 15in., cut and pinned into the haunches of the four arches carrying tower, where the walls are 5ft. thick, a strong floor, for the ringers, was first constructed resting on same, and from thence standing 6in. from walls. Eight uprights, immediately over corbels, 12 by 12 and 16ft. high, were erected to carry floor for bells, the whole being cross-braced and tied together, as shown. On the belfry floor a new oak frame for the bells was placed. Three of the old bells, Nos. 2, 5, 6, which were cracked, were recast, and the whole refitted and rehung by Messrs. Warner and Son, of Cripplegate. The total cost of estimating and repair was £1,300. The bells have now been constantly rung for four years in perfect safety, the cradle answering its purpose in every respect, the various bolts requiring to be occasionally tightened, as they loosen from vibration.

WAYSIDE NOTES.

YOUR readers must have been pleased with Messrs. Leeming and Leeming's letter in the matter of the so-called patented plans. It adds materially to the weight of evidence as to the lack of novelty in these plans. This evidence is surely now strong enough to show clearly that the "invention" has been anticipated on many occasions. The examples instanced by Mr. Fairfax and Messrs. Leeming and Leeming would in themselves be amply sufficient to demonstrate this, even if others were not forthcoming. As a matter of fact, it is only necessary to enter into conversation on this topic with any well-informed architect to hear many buildings put forward, either as exact prototypes, or as having points in common with the design sought to be patented. So far, then, as concerns the novelty and originality of the invention, I take it that it has been abundantly shown to be entirely a negative quantity.

The would-be plan-patentees will get their patent; but what matters this? The Patent Office will "patent" *anything*, practically. It remains for the patentee to prove the validity of his claims. Having been patented, the invention must be supported. If it is a true invention, this costs the patentee comparatively little, since the courts are severe on infringements. If it be shown that the patent is invalid, the process of patenting has done harm or good to no one. Should any architect be served with an injunction to restrain him from carrying out some plan he has designed, and which is considered to "infringe" the patent plans, I doubt not but that, on his making the same publicly known, he will receive substantial support from the profession in sustaining his right to built on his plan. We all know how amazingly slothful the architectural profession is to act for the general well-being, but in a case of this kind I have a notion—false perhaps, but still a notion—that the co-operation would be forthcoming, since the true architect sees plainly enough the injurious effect of any restraint on freedom of design, and is aware that a rage for patenting of this nature, if validity should be proved, would be a worm and canker in the art of architecture. Co-operation would here be of vital necessity. I trust the reader will not think that I am giving undue importance to the subject. For my own part, I would look upon the attempt to patent an architectural plan in the same light as did Mr. Robert Walker, who, when the Council of the Society of Architects suggested that some reference might be made to this topic in his presidential address, intimated that it was unworthy of any serious notice. While, therefore, considering that it is beneath contempt, I am nevertheless bound to remember how out of apparently insignificant trifles comes much disaster, unless due attention be given. I would, accordingly, have every architect alive to the full bearings of this subject, and keep a constant, if easy, watch on the course of events.

The sky-signs nuisance received another mortal wound on Tuesday, when the seal of the County Council was affixed to a Parliamentary petition to bring in the London Sky-Signs Bill. An attempt was made by a councillor to modify the drastic nature of this measure, but happily failed. The passing of an Act to grapple with these offending signs and announcements will be a boon to the Metropolis, for I fancy I can detect an increase in their numbers, and that in a very limited space of time.

The Council's Bethnal-green Improvement Scheme has caused some small difficulty to arise as to the question of the unhoused tenants, who will, from a journalistic point of view, be left homeless on the demolition of the old buildings. I daresay that many of those residing in the district will manage very well of their own account, and have sufficient nobility of soul and manly independence to look after themselves, spite of the debilitating effect of the modern pauperising principle of action of institutions, governments, &c. To meet the difficulty named was, I believe, the object of the recommendation of the Housing of the Working Classes Committee, when they put forward a suggestion that the Council should acquire, in connection with the Boundary-street scheme, a piece of vacant land in Gossett-street. Why the recommendation was made to be withdrawn again the moment after by Earl Compton, the chairman of the committee, is a mystery to everyone outside the Council. The idea was to erect dwellings on this site before the main blocks included in the improvement scheme were tackled; and certainly something must be done in this way, as many persons will be unhoused who, for no fault of their own, will have little power to help themselves. To people of this description it must nowadays be no easy matter to find a new place of abode, since the pulling down of old rookeries and the worst class of property, where alone they can find the wretched accommodation suited to their means, has been so widespread an operation in the Metropolis. Taking also into consideration the large areas recently required for the formation of new streets, one may feel some surprise as to what becomes of these erstwhile inhabitants. Do they go into the suburbs with workmen's tickets? Doubtless vast numbers have taken to this mode of life, as the intentions of the Great Eastern Railway with regard to the new station at Liverpool-street, to which I recently alluded, show; but the poorest of the poor cannot avail themselves of these tickets. For such, it does appear to me, the County Council should provide, if they pull down a large area of slummy London; and this, howsoever many offered and withdrawn recommendations it may necessitate.

Campanology is an interesting science, and its devotees are interesting persons. They should be obliged to your correspondent the "M.A.S.C.Y." for his dissertation on bell-towers, bell-hanging, and bell-ringing. I rather wonder at his thinking of the tower at Quex Park when considering as to a model example of a campanile. If that curious erection is faulty constructionally, it is as undeniably so in outward appearance; and I know its general effect pretty well, having looked out at it from the Thames uplands for many a year in my youthful days when displaying evident suitability for an honourable architectural career by the construction of mud-houses. There is little doubt but that the architects selected for the competition will be able to supply designs of such stability that they won't come toppling down about the ears of the good people of Coventry, whenever a triple-bob-major is rung. I take exception to your correspondent's idea for a clock. A clock-tower is a clock-tower, and a bell-tower is a bell-tower, say I, with apologies for the double-barrelled platitude. Bell-ringing does not agree with the nervous system of a good clock. Let us have our clock-towers and our bell-towers, and plenty of them; excepting in London we cannot have too many, which I assert in the face of the remarks of more speakers than one at the Association the other evening. My advice to competitors (if there be a competition, which is doubtful), for the Coventry belfry would be not to make a feature of a clock, and if one be provided at all, let it be very modest and retiring, so that it may just serve to pass the time o' day.

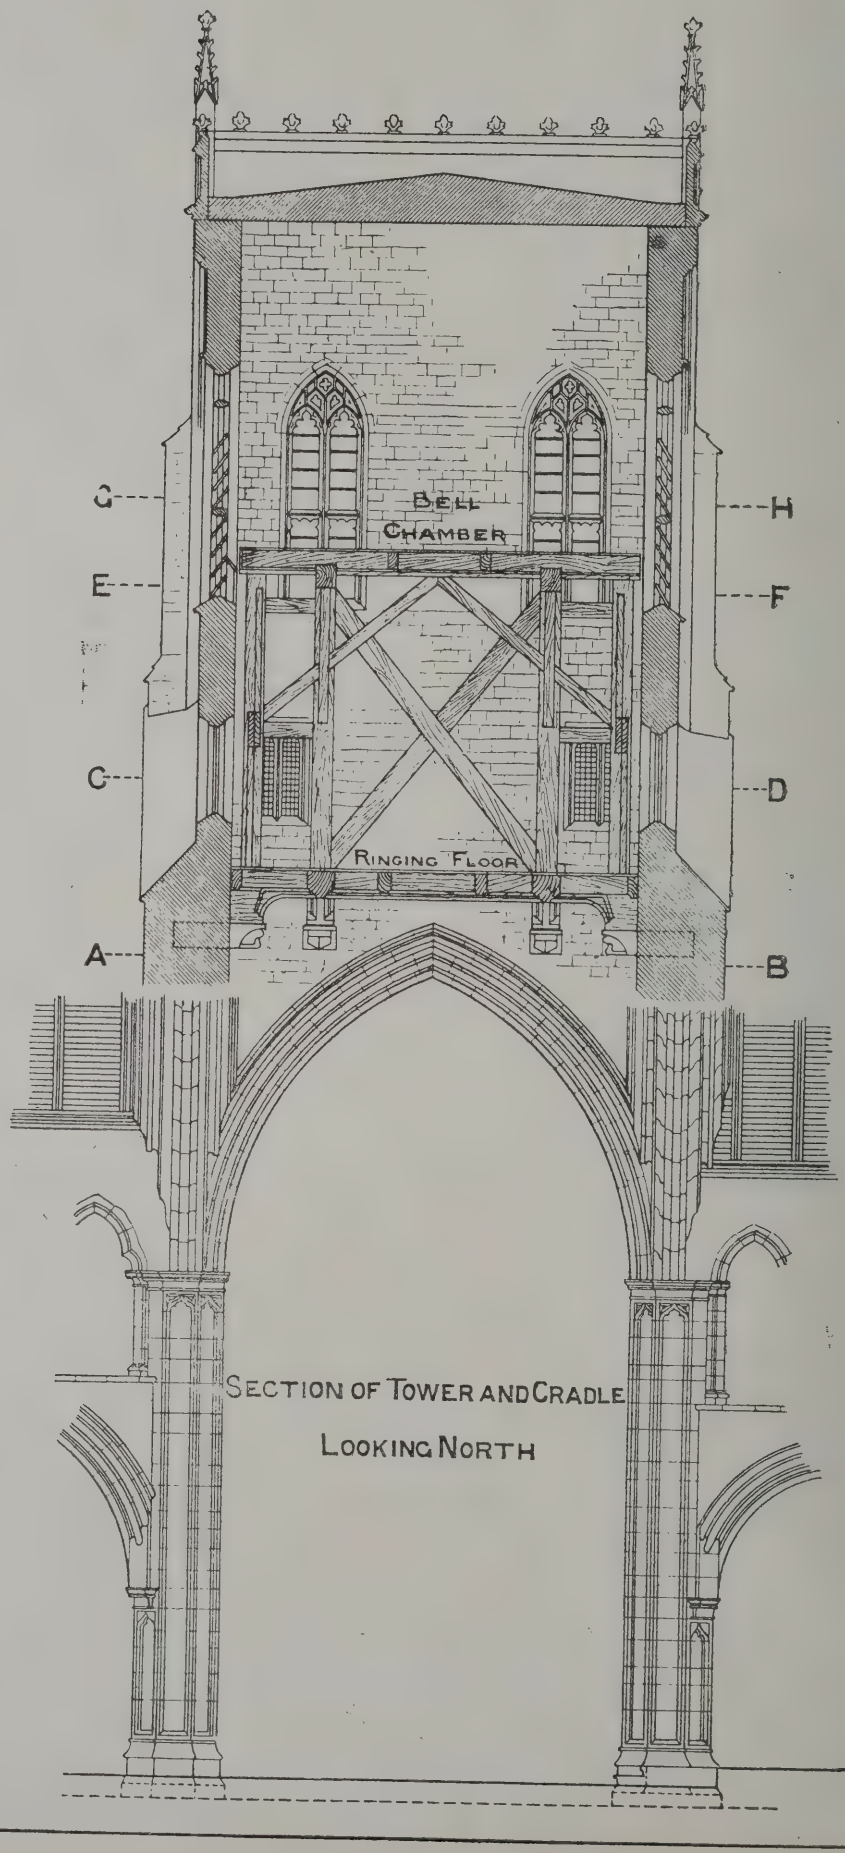
I have read Mr. Rimington's paper on "Suggestive Points of Contact between Painting and Architecture," and find it as full of good matter as the one this artist read last year before the members of the Society of Architects. It deserves an attentive perusal from all, for a careful consideration of many of the analogies drawn between the two arts will certainly tend to breadth of design and good composition—qualities sadly lacking in the work of the average architect. All that Mr. Rimington has said as to "tone," "breadth," &c., should be duly weighed and its full benefit obtained; for in these days we get so little literature on first principles, that what is put before us possesses a double value.

It is my intention to persist in an agitation for greater attention to the ethics of design, which I have never relinquished, in these columns. To a lack of study of principle we may refer all those digressions in composition that are such painfully common objects of the street. I would be far from urging the designer to work by rule, which ever results in a hard, mechanical style—academical, at the best. The use of a principle is rather to prevent errors and digressions. It is commonly said in many circumstances that what is wanted is rather a knowledge of what to avoid than of what to do. In this light I would regard the usefulness of a study, and of an acquired knowledge, of those first principles of beauty that underlie every style. It helps us to avoid the positively ugly even if it may not be sufficient to enable us to produce intrinsic beauty. No one supposes that a set of rules and precepts, however recondite, can prove a "royal road" to design, though if they were it would be a consummation in some measure deserved, since a knowledge of these true principles cannot be obtained by desultory study, but only after long and persistent trials, inquiries, and experiments. The facts revealed by individual thinkers and writers constitute a fragment only of the whole truth, there being things beyond that only the eye sees and the heart feels, and cannot be conveyed to others by word of mouth.

GOTH.

ROYAL ACADEMY SCHOOLS.

THE prizes in connection with the schools of the Royal Academy were presented on Wednesday night by the president, Sir Frederic Leighton.



The President said the competition in general was very varied in quality, and in one or two of the categories they did not see quite all the zeal and achievement they should perhaps like. In other cases, however, most excellent results were put before them. The following prizes were then presented:—

Landscape painting (from "Gray's Elegy").—Creswick prize (£30), Ralph Peacock. Painting of a figure from life (open to male students only).—Silver medal, first; second, not awarded. Painting of a head from the life.—Silver medal, first, Amy Clara Durell; second, Frederick Dudley Walenn. Painting of a draped figure (open to female students only).—Silver medal, first, Mary Emily Postlethwaite; second, Helen Sarah Squire. Cartoon of a draped figure (Cæsar draping himself to die)—"In his mantle muffling up his face" ("Julius Cæsar," Act III. sc. 2).—Silver medal and prize (£25), Hugh Goldwin Riviere. Design in monochrome for a figure picture (the Messengers coming to Job).—Armitage prizes, first (£30) and bronze medal, Elizabeth M. Nichol; second (£10), Ernest Spence. Design for the decoration of a portion of a public building (the Adoration of the Magi.)—Prize (£40), Alfred Charles Weatherstone. Set of six drawings of a figure from the life (open to male students only).—First prize (£50) and silver medal, Ralph Peacock; second (£25), Francis Joseph Mackenzie; third (£15), Frederick Dudley Walenn; fourth (£10), Stephen Briggs Carlill (disqualified owing to having received a superior prize in the same competition before). Drawing of a head from the life.—Silver medal, first, Lawrence Edward Koe; second, John Percy Cooke. Drawing of a statue or group.—Silver medal, first, not awarded: second, Julia Meyer. Perspective drawing in outline (open to painters and sculptors only).—Silver medal, not awarded. Model of a design ("Rescued").—First prize (£30), Charles John Allen; second (£10), Everard Stourton. Set of three models of a figure from the life (open to male students only).—First prize (£50) and silver medal, Charles John Allen; second (£20), Andrea C. Lucchesi. Model of a bust from the life (open to female students only).—Silver medal, first, Anna Maria Gayton; second, not awarded. Design containing figure and ornament.—Silver medal, Paul Raphael Montford. Model of a statue or group.—Silver medal, first, William Willis; second, not awarded. Design in architecture (a country gentleman's house).—Travelling Studentship (£60), Charles Sidney Spooner. Set of architectural drawings (a portion extending over one bay of the choir stalls, and the screen at their back, in St. Paul's Cathedral).—Silver medal, first, Charles William Baker; second, not awarded. Set of architectural designs (upper school).—Prize (£25), Alexander Mackintosh. Set of drawings of an architectural design (lower school).—Prize (£10), James Cromar Watt. Plan of a building (a provincial picture and sculpture gallery).—Prize (£10), Herbert Tooley. Original composition in ornament.—Silver medal, not awarded. Perspective drawing in outline (open to architects only) (the end and three bays of the Hall in Hampton Court Palace).—Silver medal, no competition. The Landseer Scholarships in painting and sculpture, of £40 a year each, tenable for two years, given for the best work done in the examinatipn for passing into the second term of studentship, have been awarded—in painting, to John Henry Frederick Bacon and Frederick Dudley Walenn; in sculpture, to Basil Gotto and Andrea Lucchesi.

It has been decided to erect a technical school and free library at Leigh, Lancs., at an estimated cost of about £6,000. About half the required amount is in hand.

THE LABOUR QUESTION AS REGARDS AGRICULTURE.

THE discussion of Mr. T. A. Dickson's paper on this subject, which was read before the Surveyors' Institution on Nov. 24, and to which we referred as having an interest for employers of labour not confined to those indicated by the title, was resumed by Mr. J. Shaw, F.S.I., at the meeting of Monday last. Mr. Daniel Watney, F.S.I., occupied the chair.

Mr. Shaw, after referring to what he considered some radical defects in the Poor Law Administration in past years, attributed the present improved condition of the labour market in rural districts greatly to the impulse given by the railway and other works some 20 or 25 years ago. He considered the position of the agricultural labourer to be now better than it had ever been before. Much had been done by the establishment of penny banks, clothing clubs, and allotment gardens, and in various other ways, to improve the conditions of rural life; but it was obvious that very much still remained to be done. In his paper, Mr. Dickson had laid great stress on the desirability of encouraging thrift. With this he quite agreed; but, when the establishment of a labourer's insurance company on a large scale was advocated, he doubted its applicability to the circumstances. The Post Office and penny banks gave the labourer, whether agricultural or otherwise, an opportunity of putting by small savings from time to time as opportunity arose, which was much more practically useful to him than the system of fixed compulsory payments to an insurance company. He entirely agreed that the more intelligent labourers should be taught simple useful trades, and the growing scarcity of skilled workmen, such as thatchers, for instance, bore out Mr. Dickson's argument in favour of such a step. A prime necessity was the provision of good cottages and sufficient gardens, and he was convinced that, in studying this question, not only must the conditions under which the labourer worked be considered, but also the surroundings amid which his wife lived and helped him.

Mr. E. Ryder, F.S.I., said that too much stress should not be laid on the historical aspect of this question, for fear that, in regarding that aspect too closely, the practical side might be overlooked. He thought that, within living recollection, the labourer of some twenty years ago was perhaps at his highest point of prosperity. The agricultural labourer had advanced in position quite as much as, if not more than, any class connected with land; while landowners and farmers had not received any adequate return for their capital and skill, the labourer had still continued to receive his wages. The man of the future, even in this capacity, would be an educated man, and he (Mr. Ryde) was convinced that education would make him a better and more useful workman. In his district (Surrey) he had met with very considerable opposition in his endeavours to establish Board schools; but when they were once established, he had heard it remarked by a competent authority, that the improvement in the work they turned out was very noticeable. He thought that there were many good benefit societies already in operation in rural districts, but quite concurred with the author of the paper that the old-fashioned village club was, as a rule, unsound and unsafe.

Mr. J. Looker, F.S.I., said that all the grief of agricultural labour had arisen from the fact that the profit of the employer had steadily decreased. The rates pressed far too heavily on the farmer. It seemed always to have been assumed that land was the most convenient thing on which to place the burden of taxation. Of four men who invested their capital in, respectively, land, the funds, a mill, or a bank, it would be found that, while the first paid rates on the gross estimated rental of all his land, the others, engaged in far more lucrative occupations, perhaps, were only assessed in the value of their dwelling-houses, or comparatively small business premises. He supposed that every employer of labour would like to pay much better wages if he could; but it was obvious that, where land was occupied by men whose capital was exhausted and whose profits were almost nil, the standard of wages must remain low. All improvements must be done by the class of landowners who could afford to lay out capital in view of a remote prospective return.

Mr. J. W. Willis-Bund (Associate) believed that the present dearth of good labour was to a large extent owing to the operation of the Education Act. He quite agreed that a good labourer well educated was a better labourer in consequence of his education; but the result of the School Board system unfortunately seemed to be to swell the great army of unemployed clerks, to increase the supply of scientific criminals, and to leave the farmer no choice but to pay his wages for the refuse labour, instead of being able to command the best. He was forcibly reminded of the words of Homer, which, as translated by Lord Sherbrook, ran:—

> "He could not sow nor reap,
> He was not wise at all;
> For though full many arts he knew,
> He badly knew them all."

The improved agricultural labourer knew 'ologies, could talk 'ologies, but could not do a good day's work.

Mr. J. Martin, F.S.I., thought one of the great evils was the present system of out-door relief, which he considered offered a premium on idleness. A good labourer was seldom in want of work, and he was sure that one great step towards producing good labourers was first of all to build good cottages, with good gardens close to them.

Mr. C. W. Gray, M.P., said that, at the wages paid, at least in East Anglia, the labourer, even with all his perquisites, could not be expected to put by much. One principle must and would always prevail in wages-paying. When a trade was prosperous, the wages would be high; but unless the present conditions of agriculture materially altered, the scale of payment of rural labour could not possibly alter. With corn at an unremunerative price, the labour market must necessarily be bad, and villages must become depopulated by the migration to the towns.

Mr. T. A. Dickson, F.S.I., in replying, said that although the Post Office and the savings banks were good, he thought their operations in country districts should be more extended. A man would not walk four or five miles to place his weekly 6d. in the bank. He had received a letter from Lord Hampden on the subject of his profit-sharing sytem, in which he said that although he guaranteed a minimum interest on advances of 2½ per cent. in bad seasons, and of course, at a higher rate in good ones, he had not been able to make the scheme a success. He (Lord Hampden) was convinced that the system of profit-sharing was in itself sound, and that it would be found the solution of the great labour and capital difficulty; but he had not yet succeeded in overcoming many of the difficulties which, in the case of co-operative farming, militated against its successful working.

The Chairman, in summing up the discussion, after remarking that the introduction of machinery had, probably more than anything, altered the conditions of agricultural labour, strongly advocated improvement in the direction of better cottages, and said that an ideal labourer's cottage should consist of a good kitchen or living-room, a scullery where a small fire could be lighted in summer, a small pantry, and a bedroom. The subject was one which he thought Mr. Dickson had done great service in so ably bringing forward.

THE BELL TOWER FOR ST. MICHAEL'S, COVENTRY.

THE following is the report of the architects who recently visited Coventry to report on the question of a new bell tower for St. Michael's:—

Dear Sir,—In compliance with the request made in your letter of the 4th of July last, we visited Coventry on the 20th inst., and carefully considered the points which were in that letter submitted to our judgment.

1. Whether a suitably designed campanile would detract from the beauty of the existing towers and spires.

On this we are unanimously of opinion that it would not, but might be made, on the contrary, very materially to add to the interest of the group.

2. As to the site for such a campanile if erected.

After having viewed the churches and their spires from various points, both close and distant, we are of opinion that the best position for such a tower would be immediately on the north side of the footpath traversing the churchyard from east to west, and opposite the two western windows in the north wall of the chapel of St. Lawrence.

We are further of opinion that such a tower should be connected with the church by a low porch or groined corridor, extending across the footway, over which it would be arched, thus directly connecting the tower with the church itself, and giving the church an additional entrance. This, considering the large congregations that occasionally gather there, we hold to be a matter of considerable importance, and for convenient egress it could hardly be better placed. The porch itself, we think, might be made a feature of great beauty, and the entrance to the tower would be best placed under the archway.

The position suggested for the tower would enable its designer to import a character of solidity to its base, such as we hold to be an element of primary importance in respect of the beauty, strength, and dignity of a structure devoted to the intended purpose.

3. As to the terms of a competition between five of the leading ecclesiastical architects.

With regard to this clause, we venture to express our opinion that a competition for a work of this kind is undesirable. We believe the views of those interested would be best served by intrusting the work to an architect of undoubted ability and experience, possessed of wide knowledge both of the general character and the details of the style of architecture in which the old church has been built.

We believe that such an architect, after consultation with the committee as to the special requirements to be met, would give them a design which, while possessing naturally a distinctive character of its own, would, when carried out, enhance the architectural interest which must necessarily always belong to such a magnificent structure as the Church of St. Michael in Coventry. We much doubt whether such a result would be attained by the process of competition suggested in your letter.

We are, dear sir, yours faithfully,
EWAN CHRISTIAN.

Bailey-lane, Coventry.

THE LEDWARD FUND EXHIBITION.

THIS small exhibition of pictures and sculpture is now on view at the Royal Arcade Gallery, Old Bond-street. Its object is to raise a fund in aid of the widow and children of the promising young sculptor, the late Mr. R. A. Ledward, whose death we recently recorded, and the proceeds derived from the sale of works (given for that purpose by sympathising artists) will, it is hoped, meet with substantial success. Mr. Harry Bates contributes a plaster relief illustrating "Psyche Transported by Zephyrus," on whose mantle she is borne recumbent in an attitude of easy and graceful abandonment. A tiny bronze statuette of "The Mower" emanates from the studio of Mr. Hamo Thornycroft, R.A., and is a skilful production. "Poetry" and "Sympathy" are two works in bronze by the deceased sculptor. Other pieces of sculpture are "A Brittany Peasant," by Mr. Onslow Ford, A.R.A., cleverly modelled; a small bust of John Ruskin, by Mr. C. Dressler; "Lilith," by Mr. A. Toft, exhibited at the R. A. in 1889; and a terracotta bust of a woman by Mr. H. Montford. Amongst oil paintings there is a noticeable and powerful head of St. Simeon Stylites, gazing upward, by Mr. W. M. Palin; also a "St. Cecilia," by Mrs. A. Lea Merritt, one of the most highly finished of the pictures exhibited; and a clever study of "Poppies" by Miss E. Hunt. Mr. W. L. Wyllie, A.R.A., sends a masterly water-colour sketch of a naval subject, "War is declared, and we put to sea—Watch man and arm ship"; and a vigorous water-colour drawing is "A Street in Brittany," by Miss A. M. Woodward, who obtains a sunny effect in subdued colours. "In the Desert," by Mr. J. McLure Hamilton, is a fine study in crayon of a huge lion outstretched on the sand by the margin of some water, while a lioness keeps watch by his side in a couchant attitude. Some other contributors are Mr. E. Burne Jones, Mr. J. McN. Whistler, Mr. Fred Brown, Mr. F. Brangwyn, and Mr. E. W. Waite.

THE PLUMBERS' COMPANY DINNER.

A DINNER and *conversazione* was given by the Worshipful Company of Plumbers at Merchant Taylors' Hall, to meet the Lord Mayor and the Sheriffs. The Master, Mr. W. H. Bishop, took the chair. Lord Basing responded to the toast of the House of Lords, and Mr. H. C. Raikes to that of the House of Commons.

n the course of a brief speech the Postmaster-General expressed a hope that in future the Lower House would do as much for the plumbers s the plumbers had done for the Lower House. The Lord Mayor, in acknowledging the toast in honour of the civic authorities, proposed by the Lord Provost of Glasgow, spoke warmly in favour of the work undertaken by the Plumbers' Company in the way of technical instruction, adding that if London was to maintain her position at the head of the commercial world they must pay all possible attention to, and do their utmost to promote, the development of sanitary science. The Master afterwards proposed "Modern Sanitary Science and Technical Education." Their aim, he said, was to effect an improvement of the conditions under which civilised communities lived. The plumbing craft claimed supervision and control of watercourses of the house from the roof to the basement. Their great lever was the registration of those who sought to follow the craft. The educational authorities had co-operated in the preparation of a comprehensive scheme of instruction upon the subject, and in some degree this had already been applied in certain classes. Apprentice plumbers might now receive continuous instruction in the principles of sanitary science and the practice of their trade. Sir Bernhard Samuelson, M.P., and Professor Garnett replied to the toast. The Master next proposed "The Municipal Corporations of Great Britain and Ireland," remarking that that assemblage of chief sanitary authorities of the three kingdoms by the Ancient Guild of Plumbers was evidence of a movement national in character and of assured success. With this toast the name of the Mayor of Manchester was coupled. "The Health of the Master" was proposed by the Lord Mayor, who said that the success achieved by the Plumbers' Company would have been impossible but for the presence of a guiding spirit at their head, and that he hoped to see a congress on hygiene held in the City of London next year.

CHIPS.

The lecture arrangements before Easter at the Royal Institute include three lectures by Prof. C. Meymott Tidy on modern chemistry in relation to sanitation; and three by Mr. W. Martin Conway on pre-Greek schools of art.

On page 807 we mentioned the opening of the Mission Chapel at Murchington, Devon. The roof of this building was covered with the Broomhall Patent Tiles, supplied by the Broomhall Tile Company, of London, and fixed by their own workmen. The company have also just finished covering the roof of St. Andrew's Church, Acton, Middlesex, and are now covering the roofs of St. Leonard's Church, Grimsbury, Banbury, Oxon, with the same description of tiles.

The town council of Bournemouth have raised the salary of the inspector of nuisances from £120 to £275 a year, to include the cost of clerical assistance.

A new school-chapel, erected for the Wesleyan Methodist body off Booth Ferry-road, Leeds, was opened on the 4th inst. The cost of the building is £800. Mr. H. B. Thorpe, Goole, was the architect.

The Wolverhampton School Board have under consideration a scheme for the establishment of a higher grade school. It is proposed to find accommodation for 600 children, the estimate of cost being £1,200 for the site, and £12 per head for buildings and furniture.

Athletic grounds are being laid out on a field off Burbage-road, Herne Hill, on the Dulwich College Estate. Mr. Charles Barry, as architect to the College Governors, has designed the club house and pavillon, which will be seated for 800 persons. Messrs. Peacock Brothers, of Brixton, are the builders.

The death occurred last week of Mr. J. B. Bennett, for many years head of the firm of Messrs. J. B. and F. Bennett, builders and contractors, Ipswich. The deceased was the eldest son of the late Mr. John Bennett, who carried on the same business at the works in New-street. After his father's death in 1857, Mr. J. B. Bennett continued the business on behalf of his mother, and in 1868 his brother, Mr. Fred. Bennett, became associated with him in partnership. During that partnership many important public works in Ipswich were carried out by the firm, notably the erection of the new Museum and the restoration of the Town Hall. Many of the large private houses on the north side of the town were also built by them, the most prominent being the residence of Mr. John Limmer on Constitution-hill. Mr. Bennett, who, at the time of death, was fifty years of age, leaves a widow and one son, who is articled to a local architect.

Engineering Notes.

New Roadway Bridge over the River Cam at Cambridge. — Owing to the township of Chesterton, which lies immediately opposite to the town of Cambridge on the north side of the River Cam, having considerably increased as a residential place, and to the fact of all the College boat-houses being on that side of the river, the boat ferries have proved wholly insufficient for the traffic, besides being very inconvenient and unsafe for children. The town of Cambridge, therefore, joined with the Local Board of Chesterton, and obtained Parliamentary powers for constructing a new road across Midsummer Common, just behind Jesus College, and a new bridge across the river. These works are now completed, and were formally opened yesterday (Thursday) by the Mayor of Cambridge jointly with the chairman of the Chesterton Local Board. The new roadway is about half-a-mile long, and is 40ft. wide. The bridge is 100ft. clear span, 40ft. wide between parapets, and has a clear headway at the centre of 14ft. 6in. above the normal water level, a towing-path 12ft. wide being formed on the south side. The superstructure consists of six elliptic wrought-iron arches, with braced spandrels, spaced 7ft. 6in. centre to centre under the roadway, and 9ft. 1½in. to the parapet girders. The outer spandrels are covered with cast-iron ornamental panels, surmounted with handsome cornice, plinth, and parapet, the coats-of-arms of the Borough, University, County Council, and Local Board being on their respective panels in the centre of the spandrel. The roadway over the bridge is of granite macadam, and the footpaths of granolithic pavement. The abutments are of Portland cement concrete, resting on piled foundations, and faced with Darley Dale stone. The total cost of the work is about £14,000. The engineers for the scheme are Mr. John J. Webster, M.I.C.E., of Liverpool and Westminster, and Mr. Frank Waters, of Cambridge, the whole of the works being designed by Mr. Webster, Mr. Waters acting as resident engineer. The sole contractor for the work was Mr. John Mackay, J.P., of Hereford, and he sublet the superstructure to the Butterley Company (Limited). The structure is an undoubted additional attraction to the district.

Society of Engineers. — The thirty-sixth annual meeting of this society was held on Monday at their rooms, 17, Victoria-street, S.W. The chair was occupied by Mr. Henry Adams, M.Inst.C.E., M.S.A., president. The following were elected as the council and officers for 1891, viz.:—As president, Mr. William Newby Colam; as vice-presidents, Messrs. Joseph William Wilson, jun., William Andrew Valon, and George A. Goodwin; as other members of council, Messrs. Chris. Anderson, R. W. Peregrine Birch, Chas. C. Carpenter, Henry Faija, C. Nicholson Lailey, T. Bell Lightfoot, William G. Pierce, and Arthur Rigg; as hon. secretary and treasurer, Mr. Alfred Williams; as hon. auditor, Mr. Alfred Lass (Messrs. A. Lass and Co.) —The annual dinner was given at the Holborn Restaurant on Wednesday. The retiring president, Mr. Henry Adams, occupied the chair, and amongst those present were Sir Benjamin Baker and Sir J. N. Douglass, F.R.S. (hon. members); Professor Unwin, F.R.S., Col. Banister Fletcher, F.R.I.B.A., and Mr. A. R. Binnie, engineer, L.C.C.; Mr. J. W. Wilson, jun. (vice-president), Mr. Jabez Church, Mr. Chas. Gandon, Mr. P. F. Nursey, Mr. Arthur Rigg, Professor Robinson, and Mr. A. T. Walmisley (past presidents); Mr. Alfred Williams (hon. sec. and treasurer), and Mr. G. A. Pryce-Cuxson (secretary). The President proposed the chief toast of the evening, "The Society of Engineers." Believing in the proverb that nothing succeeds like success, he ventured to affirm that the success which the society had already achieved was a forecast of the greater success which might be looked forward to. During the past year the number of members had increased by 8 per cent., exclusive of honorary members, the roll now numbering 454, and the attendance at the meetings had increased by 10 per cent. The financial position was highly satisfactory, and the rules had been revised during the year. The papers which had been read and discussed included various branches of civil and mechanical engineering, and were fully up to the mark of previous sessions. The visits to works in progress and centres of manufacture had this year included the Thames Ironworks, the Royal Arsenal at Woolwich, and the London and North-Western Railway Works at Crewe. In concluding his remarks the President paid a well-deserved compliment to the energy of the secretary, Mr. Pryce-Cuxson. The toast was coupled with the name of Mr. Alfred Williams, hon. sec. and treasurer, who was enthusiastically received. The health of the President was proposed by Mr. A. T. Walmisley, past-president, and Mr. Adams, in responding, proposed that of his successor in office, expressing his regret that business connected with his cable tramway enterprise was detaining Mr. Colam in the United States.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Leeds and Yorkshire Architectural Society.—It is the custom of the members of this society to dine together biennially, and in the intervening year a soirée is held. Such a soirée took place on Monday, and there were about fifty members present. Mr. W. H. Thorp (president) occupied the chair. Coffee was served in the large hall of the Queen's Hotel from 7.30 to 8 o'clock, and afterwards Mr. Clibborn, of Birkenhead, gave a description of scenes in Normandy, illustrated by some exceptionally fine lantern slides, contributed by Mr. Thompson, of Bold-street, Liverpool. Later, the evening was passed with music. Professor Kershaw gave a number of selections on the violin, accompanied by Mr. Fred Holt on the piano, and songs were sung by members of the society.

Manchester Society of Architects.—The report for 1890 commences with reference to two recently deceased members, Mr. J. P. Holden, for 28 years architect to the Dean and Chapter, and Mr. Ellis (of Barker and Ellis). The society now numbers fifty-two members. It has been decided to reconstruct the society, and to incorporate it under the Companies Acts of 1862-9. The council congratulate the members on the issue to the public of the revised code of Manchester Building By-Laws—a subject which during many years has engaged much of the attention of this society.

Manchester Architectural Association.—At the third ordinary meeting held on Tuesday evening, Dec. 2nd, at the Court Room, Diocesan Chambers, South King-street, Mr. T. Chadwick, A.R.I.B.A., president, in the chair, a paper was read before a large attendance of members by Mr. G. H. Willoughby, M.S.A., on "The Advantages of Terracotta relative to our Town and City Buildings." The advantages claimed by Mr. Willoughby were classified under the following heads, viz.:—(1) Its durabilities and wearing properties compared with stone and stucco, (2) its comparative cost, (3) its variety and permanency of colour, (4) its advantages for internal decoration in the form of glazed terracotta or faïence, (5) a few general objections. Each heading was clearly and exhaustively dealt with, and interspersed with references to many modern buildings, both in London and elsewhere, which were illustrated by photographs, drawings, and ink perspective views. The injury done to the progress and adoption of terracotta by the frequent using of an indifferent and perishable make (on account of cheapness) was very severely censured by the lecturer. The advantages of the permanency and variety of colour for the clothing of our town and city buildings were also clearly set forth, the author stating: "At present we (in Manchester) are far behind the Londoners in our appreciation and adoption of terracotta. To Mr. Waterhouse, who may be regarded as its most enthusiastic advocate, are the London people greatly indebted for the increased cheerfulness and sightliness his buildings have given to their streets and suburbs." The application of faïence (or glazed terracotta) for internal decoration was also commented on, and its use in some of the Manchester buildings recently erected "was (the lecturer said) a sign of its recognition and future value as a permanent decorative material." Before concluding, several objections to terracotta, and suggested remedies for same, were fully gone into, and at the finish of the paper a cordial vote of thanks to Mr. Willoughby was proposed by Mr. Davies-Colley, and seconded by Mr. Mee, and endorsed by Mr. Chadwick (the president), Mr. Hodgson, and others.

Royal Scottish Society of Arts.—At a meeting of this society held on Monday evening at Edinburgh, Mr. R. K. Miller, vice-president, in the chair. Mr. J. H. Cunningham showed a series of photographs exhibiting the operation of floating into its permanent position upon the stone piers the 1,523ft. span of the bridge over the Ohio River at Pittsburg. The span was built on shore upon trusses of a sufficient height to carry it to the top of the piers, and span and trusses were then floated out into the river upon pontoons, from which the span was finally brought into position upon the piers.

Society of Architects.—The third ordinary meeting of the Society for the present session was held on Tuesday evening at St. James's Hall, Piccadilly. Mr. Edgar Farman, hon. secretary, occupied the chair. Mr. Henry Fawcett Crawford, 99, Main-street, Cavan, was elected as a member, and one nomination was also announced. Mr. A. Wallace Rimington, R.P.E. (Assoc. S.A.), read a paper, entitled "Suggestive Points of Contact between Architecture and Painting." The address (see p. 815, *ante*) was illustrated by a series of valuable etchings and engravings, lent by the Fine Art Society, of New Bond-street, W. A vote of thanks was cordially passed to the author on the motion of Mr. W. H. Seth-Smith, seconded by Mr. W. A. Wilberforce, and supported by Messrs. W. Hewitt and W. Allport.

York Architectural Association. — The eighth session of this Association will be opened on Thursday evening next, the 18th inst., when an address on "Edwardian Architecture," by Mr. B. Priestley Shires, a former secretary of the society, and now of Plymouth, will be read.

COMPETITIONS.

City of York.—Of the sixteen designs submitted in competition for the furnishing of the New Council Chamber for the city of York, that of Mr. Gilbert Smith Doughty, architect, of Nottingham, has been accepted.

Swansea.—A competition is to be held shortly at Swansea for a new higher-grade school. The site will either be next the club in Alexander-road, or on the site of Russell House. A premium will be offered for the best set of plans. These are to provide accommodation for 800 boys, office for the use of the board, caretaker's residence, technical and manual instruction rooms, a gymnasium, physical lecture room for 120 students, a chemical laboratory for 60 pupils, and two art class-rooms.

CHIPS.

Competitive plans for a working men's club have been invited at Ayr. The club is to contain a hall capable of accommodating 600, a billiard-room, reading-room, recreation-room for games, &c., and is not to cost more than £1,800. Two prizes of no less than £12 and £8 are to be given to the two unsuccessful architects next to the one whose plan is adopted, whose princely recompense will merge into the ordinary commission.

A scheme is being prepared by the Hastings borough surveyor for the purpose of obtaining an additional water supply, the cost of which work is roughly estimated at £140,000.

The Whitworth trustees have added to their munificent gifts to Manchester 12½ acres of land, known as the Stanley-grove Estate, purchased by them for £27,000, for a hospital under the direction of Owens College. The site is alongside the Whitworth Park.

A parish-room in connection with St. James's Church, Shirley, Southampton, was opened last week. It consists of a disused chapel in the High-street, which has been rearranged for its new purposes from plans by Mr. W. Burrough Hill, of Southampton.

Steady progress is being made with the pier and harbour works at Torquay, commenced last summer by the local boord. Mr. Inglis is the acting engineer, and Messrs. Cochrane and Sons are the contractors; Mr. A. Buchan being the clerk of works.

The section of the main line of the Midland system between Bedford (North) and Oakley has just been increased from two to four lines. The additional double track was brought into use last week, and will be exclusively used for goods trains.

The East Grinstead rural sanitary authority have adopted plans and a scheme prepared by Mr. N. A. Smith, C.E., for the sewerage of the village of Groombridge, and have applied to the Local Government Board for sanction to borrow £2,800 for carrying out the works.

Building Intelligence.

Blaengarw. — This town, situate at the northern end of the Garw Valley, has been created through the sinking of collieries, and now contains about 3,000 inhabitants. A little church in the centre of the town was consecrated on Monday by the Bishop of Llandaff. The church is a stone building, cruciform on plan, and in plain Early English style. The nave is 61ft. by 28ft., and the chancel 23ft. by 19ft. 6in. There is also a vestry and an organ-chamber, spaces being left on the north side for extra accommodation—the present being for 300. The ground woodwork is all of pitch pine, and the roofing of stained red deal. The building is heated by hot air on Porritt's system. The contract price was £1,085, making the cost 72s. a head. The architects were Messrs. Bruton and Williams, Cardiff and Barry Dock, and the builder was Mr. John Rees, Ynysybwl.

Cambridge.—The new buildings of the Persse School for Boys in Cambridge were opened on Thursday, Dec. 4th last, by the mayor. The general plan of the school building is that of a large hall, with twelve class-rooms grouped on the north side of it. The hall is 77ft. by 37ft. 6in. wide and 25ft. high to the wall-plate. It has an open-timbered roof. The class-rooms are each 24ft. by 20ft., and those on the ground floor are 13ft. high, and those on the first floor 15ft. to the collar. Besides the above rooms, there are head master's and assistant master's rooms, a large entrance lobby, and a board-room on the east and west sides, and then all necessary lavatories and outbuildings. The lodge is a small building at the gateway, calculated to accommodate a porter without family. The general style of the building is that of the end of the 17th century. It is built of red bricks, and the roof covered with tiles.

Cardiff.—A special meeting of the Free Library Committee was held at the town hall, Cardiff, on Wednesday week, to consider the plans for the proposed extension of the free library building. Mr. Edwin Seward, R.C.A., of Seward and Thomas, architects, submitted four sets of alternate plans of the new building, and said before setting to work upon them he had visited some of the best free libraries and reading-rooms in the country, including that given by Mr. Carnegie to Edinburgh at a cost of £50,000. There were two essential differences to be noticed in the planning of the building, and the first was the position of the entrance. Mr. Seward produced the plan showing the entrance from the Hayes, and the committee recognised that the taking away of so large a space by a central corridor from the building was undesirable, and, after considerable discussion, this plan was unanimously decided against. Mr. Seward then proceeded to show the difference which would result from placing the entrance in Working-street and in Trinity-street, the former being adopted by the committee. The question of the position of the art gallery was discussed, and it was decided that it should be placed on the upper floor with the museum, although the architect regretted that he could not arrange for it on the ground floor of the building. The plans were considered in detail, and ultimately that marked No. 4 was adopted, subject to alterations. The estimated cost of the building was £15,000. It was decided to complete the building, and apply for further borrowing powers, in accordance with this plan.

Hull.—The ceremony of laying the foundation-stones of a new Grammar School for Hull was performed on Friday. The site is in Leicester-street, and the design for the new schools has been prepared by Messrs. Smith and Brodrick, of Hull. It will be in a Collegiate style of Gothic architecture, having an elevation of red brick and stone dressings. The site was purchased some years ago and the design prepared, but the matter has remained in abeyance owing to the refusal of the Charity Commissioners to sanction the work until there was an endowment fund raised. The funds for the erection of the building are obtained from the sale of the original Grammar School, which is now a clergy-house and school in connection with Holy Trinity Church.

Llandewy Ystradenny.—The parish church of Llandewy Ystradenny has been reopened after having been partially rebuilt from plans by Mr. S. W. Williams, of Rhayader. When the ol roof was stripped, it was found that the timbe was so decayed as to need entire removal. Th north wall of the old church was found to b fairly sound; but all the south and west wal and part of the east wall had to be taken dow and rebuilt, therefore the present fabric is nearl new. The restored church has been rebuilt o the lines of the original fabric as nearly a possible. Although Late Norman priests' doo remain, little of the work taken down was earlie than the 17th century. The style adopted Early Perpendicular, the nave windows ar square-headed, the east window is a three-ligh one, and the west window of two lights. Th roof is continuous over nave and chancel. Th bell cot, at the west end, is framed in oak an covered with oak shingles. The floors of th nave and chancel have been laid with tiles fro the works of Mr. J. C. Edwards, Ruabon; th floors under the seats are laid with wood block set in asphalte, by Mr. R. L. Lowe, of Farn worth, near Bolton. The church is heated by Porrit's underground stove. The seats are o pitch pine. The pulpit, which is of oak on stone base, is the gift of, and has been carved by the Hon. Edith Walsh; it has been speciall designed by the architect. The contract ha been carried out by Mr. John D. Williams, o Knighton, at a cost of £800.

London School Board.—At the last meetin of this Board the Salaries' Committee reporte that they had had under consideration th following letter from Messrs. Gedge and Co with reference to the Capland-street School:— "We are of opinion that Messrs. Wall Brother have broken their contract with the Board, an are liable to an action for damages. They ar bankrupt, and the statement of accounts shows possible dividend of from 2s. to 2s. 6d. in th pound. Two actions are already pending agains them at the suit of the Board for similar breache of contract. One of these is expected to be trie on Monday week. We advise that the result o this action be waited for before commencing a action with regard to the Capland-street School." In view of this letter, and of the result of th action brought by the Board against Messrs Wall Bros. with regard to the Kilburn-lan School, the Committee recommended that the be authorised to enter an action against Messrs Wall Brothers and their trustee in bankruptcy to recover damages for breaches of contract i the erection of the said school. This was agreed to. On the motion of Mr. Lucraft, the attentio of the Works Committee was called to the metho by which urgent orders for repairs to building and furniture have been given, with instruction to remedy the same.

Redbourn.—The completion of the parti restoration of Redbourn Church was marked o Wednesday week by a service, in which Dr Festing, the new Bishop, took part. For som time the state of the nave roof has caused grav anxiety, and last winter it was found to b necessary to take steps for its restoration. A committee for the purpose was formed, Messrs J. E. K. and J. P. Cutts, architects, were con sulted, and under their direction tenders wer invited; that of Mr. Redhouse was accepted The nave roof has been reconstructed wher necessary, repairs to chancel arch, and cleanin the pillars and walls carried out. The roof o the north aisle was reboarded and releaded. Th roof at the east end of the south aisle (a sectio supposed to have been built by John of Wheat hampstead) was so far gone that, with the excep tion of three of the old timbers, it has been re placed by a new oak roof of a similar pattern t the old one, the beams of which were moulded The unused space in the basement of the towe has been converted into a vestry, and the wes door leading into the new vestry, and which wa formerly blocked up, has been opened. Th vestry is parted from the church by an oak screen with panels of cathedral glass. The organ ha been removed from the south of the chancel an placed at the eastern end of the south aisle. Th centre aisle has been widened, the pews have bee varnished, and the walls have been re-coloure throughout.

Tynewydd.—On Thursday, Nov. 27th, th ceremony of laying the foundation-stone of church at Tynewdd was performed by th Countess of Dunraven. The church, which i designed to accommodate about 400 worshippers will be inexpensive in character, the style bein Early English. It consists of a nave, 63ft. 6in

by 25ft. The chancel is also 25ft. wide by 26ft. 6in. long; and an organ-chamber and vestry, 23ft. by 10ft., is also provided. The roof internally will be open to the apex, and constructed of unvarnished pitch-pine. The chancel roof is similar, and is divided from the nave with a double principal. The seating and furniture are to be of pitch pine. Externally the walls will be faced with grey stone, and the jambs and arches of doors and windows are to be worked out of Bath stone. The long roof, which is to be covered with green slates and a red tile ridge cresting, will be broken over the chancel with a lofty bell-flêche. The church, including the whole of the seating and furniture, heating apparatus, and boundary walls, will cost £1,500. The architect is Mr. E. M. Bruce-Vaughan, and the contract is let to Mr. John Haines, of Cardiff.

Walsall.—A block of buildings which has just been completed for Mr. Draycott at the junction of Lichfield-street and Bridge-street was formally inspected last week by the mayor and corporation. The building comprises five retail shops on the basement; a suite of rooms used by the Literary Institute; and photographic and picture-framing premises. The greater part of the fittings and fixtures have been executed by Messrs. Norton and Co., of Birmingham, from designs prepared by the architect, and are in character with the style of this building, which is Queen Anne, treated in red terracotta, with a sea-green slated roof, surmounted with iron cresting and a flagstaff. The contract has been carried out by Messrs. Bradney and Co., of Wolverhampton, from the designs and under the superintendence of Mr. F. E. F. Bailey, A.R.I.B.A., Walsall.

CHIPS.

The Kettering School Board have decided to build two schools, each for 1,050 children, in different parts of the town, and have instructed Mr. J. A. Gotch to prepare the plans.

An inquiry was held at Bacup on Friday by Mr. S. J. Smith, one of the inspectors of the Local Government Board, relative to an application by the Bacup town council for power to borrow a sum of £18,000 for the purchase of land at Glentop for sewage works, and the sewerage of the Stacksteads portion of the borough. The town clerk said the population of the district now proposed to be dealt with was 6,000. The borough surveyor said the land proposed to be acquired was 3 acres 3 roods, and it was proposed to treat the sewage with a solution of lime and alumina, and afterwards pass it through filtering beds on to the river. Mr. Melliss, C.E., of London, said he had gone over the plans and estimates prepared by the borough surveyor, and he thought they made a complete and workable scheme.

Lord Burton has just borne the cost of a porch for the west door of St. Paul's Church, near Burton-on-Trent. The porch is made of English oak, and is almost throughout filled in with drapery panels, the whole being surmounted by a carved creston, which bears a shield, on which the letters I.H.S. are carved. There is also a floral carving let in above the doors. The doors are divided, so that the top portions may be opened alone, when necessary for ventilation. A wing of corresponding material and workmanship has also been placed on either side of the porch, and these conceal the heating pipes and portions of the bare walls. The work has been executed by Messrs. Rattee and Kett, of Cambridge, from the designs of Mr. G. F. Bodley, A.R.A.

The church of Welsh St. Donatts, near Cowbridge, is now to undergo restoration. The building was in a very dilapidated condition, and quite unfit for use. The tower and bell framing is to be made good, new floors and passages in the tower, nave, and chancel, new heating apparatus, new pulpit, lectern, altar, and seats, the complete restoration of the grand old oak doors, &c. The architects are Messrs. Kempson and Fowler, of Llandaff.

At the Manchester Consistory Court on Friday faculties were decreed for St. James's, Lower Darwen, in which it is proposed to place a figure monument to the memory of Emily Clegg Lees; St. Leonard's, Walton-le-Dale, in which it its proposed to replace the plain glass in the north transept with stained glass; parish church of Middleton, where two new bells are to be added to the present peal of six in the tower; parish church of Flixton, stained-glass window on the south side; St. James's Church, Church, two stained-glass windows. Citation was also granted for St. Thomas's Church, Radcliffe, where it is proposed to erect an oak reredos, and to put stained glass in two windows on the south side of chancel.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—B. and P.—W. H. L. and Co.—E. G. M.

PATENTED PLANS.

To the Editor of the Building News.

Sir,—Referring to your editorial remarks of November 7th and 14th, and to the letters of Mr. J. Sinclair Fairfax and Messrs. Leeming and Leeming, respecting our patent, we have to say:

That the greater part of the adverse criticism contained in the above appears to arise from a misunderstanding of the extent of the class of building to which our patent is applicable, and to the indiscriminate use of the words "public building." The title of the patent states that it is "applicable" to "public offices and courts," and the preliminary specification states that "it is primarily intended to control the public when admitted into the building," and "is *not* applicable to all such buildings as hospitals, workhouses, lunatic asylums, prisons, palaces, and mansions," where "the public have little or no business, and are generally admitted only by special permission." For the same reason it is not applicable to Houses of Parliament. Neither is it applicable to museums and picture galleries, where the public are admitted unreservedly, and are allowed to wander unrestrictedly. But, by the very nature of the invention, it is applicable only to such buildings as have general or inquiry offices, by or through which the public have entrance to the private offices.

As to its novelty, the three principles embodied in it, viz.:—(1) Building in wings or compartments; (2) the use of a central hall; and (3) the entrance by or through a general or inquiry office, have been applied separately in many buildings; and the first two are applied in combination in the Natural History Museum, the Royal Courts of Justice, and no doubt in other buildings; but the application of a *combination* of the *three* principles to any one building is, so far as we are aware, an entire novelty. This has been, necessarily, a much more difficult problem to solve than the application of any one principle or of any two principles in combination, and having solved the problem, we are entitled to and may safely trust to the protection of a patent.

In reply to Messrs. Leeming and Leeming, we have to point out that the Royal Courts of Justice do *not* "embody all the advantages claimed for the patent plan," inasmuch as the offices are not approached by the public from the central hall, but from the open quadrangle at the outside of the main building, and are arranged with private offices which open directly from public corridors. Neither can the courts be fairly said to take the place of the general offices in our plan, as, if used for the purposes of inquiry and passage for the public to other rooms, they would be useless as courts.

Messrs. Leeming and Leeming are also wrong in their statement, that Messrs. Verity and Hunt's design for the Nottingham Municipal Buildings is "almost identical with our plan," as the following comparisons will show:—Messrs. Verity and Hunt have the three departments—accounts, gas, and water—using one pay-office in common, and with general clerks' offices in a corridor common to all. We have "entire separation of the several departments." Messrs. Verity and Hunt's corridor (called "private" by Messrs. Leeming and Leeming) is open to the public hall at both ends. We have a separate official corridor for each department, and it cannot be entered by the public except by or through the general or inquiry office. Messrs. Verity and Hunt have also some of the private offices separated from the general offices of the same departments by the public hall; and the private offices of the heads of the three departments, viz.:—the borough accountant, the gas manager, and the water manager, are not shown to be on the same floor as the general and pay offices. Our private offices all open out of the official corridors, and cannot be approached by the public except by or through the general or inquiry office, and the official corridor; and the private offices of the head of a department being in the midst of his departments, enable the management to be more perfect than by the plan generally adopted.

We wish also to state what has led to the invention. Our attention was first called to the defects of the corridor system of designing public offices by the publication of the numerous competitive plans for the Admiralty and War Offices, which showed an extraordinary length of corridor, some of the designs having no less than 3,350 yards, or nearly two miles, of public corridor, with about 700 office doors. We immediately thought of the great advantage, in so large a building, of a proper subdivision into separate wings or compartments, each complete in itself; and we have, in the six years since this competition, gradually improved, and, we believe, perfected, the application of the principle of subdivision to such buildings.

We do not share your apprehensions as to "the rapidity and certainty with which unscrupulous persons will follow up with a whole galaxy of patented plans," as it will be useless to patent any which are not either new in principle (which of necessity must be very rarely discovered) or new in combination of old principles, which will be difficult to invent. We quite agree with you, that "the advantages of protecting by patent a clever plan will be an incentive to invention," and that "a good idea will be more likely to be perfected"; and if it leads only to more thorough study of plan, we think the profession will be largely benefited, and will receive more confidence from the public. We do not see that "the patenting of a design [plan] would seriously hamper the profession, for they would have to steer clear of existing rights." If a patent plan is really useful and valuable, the profession should use it as they do a patent for any article of building; not paying the royalty themselves, but advising their clients to do so. We shall, as far as possible, seek to follow this course in regard to our patent; and, in the case of competition for public offices, to arrange that the payment by the public body for royalty shall cover the right to competitors of submitting designs based upon the patent plan. This would not be derogatory to the profession, any more than is the custom of basing plans for hospitals on the pavilion principle, and for board schools on the central-hall principle, which leaves ample scope for display of the ability of the architect in modifying

the plan to meet the special requirements of each case, and in choice of the architectural treatment. —We are, &c., Flockton and Gibbs.
Sheffield, Dec. 10.

Sir,—Along with Mr. Alfred Ardron, of London, I furnished designs in the preliminary competition for the proposed Sheffield Municipal Offices, which, with the other unsuccessful plans, were publicly exhibited after the first decision.

These were based on the system now being patented by Messrs. Flockton and Gibbs. Believing this to be a novelty, special attention was drawn to it in the accompanying report, a copy of which is still in the hands of the town council.

Messrs. Flockton and Gibbs inspected these plans when exhibited, and were made acquainted by me with the portion of the report bearing on the question immediately the final decision was come so.

A claim to patent anything can only be opposed on certain rigidly definite grounds, which in this case do not exist.

The patent will therefore probably be granted; but its usefulness is doubtful, as anyone who has worked on similar lines before may do so again.

I do not like public correspondence, but after Messrs. Leeming and Leeming's letter in your last issue, I wish to state that I, too, shall have no hesitation in working in the future on the system that is to be the subject of this patent.—I am, &c., Herbert W. Lockwood.
Queen Insurance Buildings, Church-street, Sheffield.

NEW SYSTEM OF TUNNELLING.

Sir,—I have read with interest the article in the Building News of yesterday. As a practical engineer, I should like to know how the process would work if in driving the "needles" forward a large stone or boulder were met with? Would the needles cut through it, or how would it be got through? The occurrence of such an obstacle is common enough in boulder clay.

I suppose the arching would be done as closely as possible up to the obstacle, and that it would be cut through or removed in the ordinary way? The system of driving forward these strong grooved "needles" seems to be very good, and likely to prove of great service in tunnels, whether of large or small dimensions, in strata other than rock.—I am, &c.,
December 6. M.I.C.E.

SLATES.

Sir,—For colour and texture of surface in appearance the remarks of "Goth" in his "Wayside Notes" on green slates are all very well; but it should be remembered that there is no better quality of slate than the best Welsh—as, for instance, that from the quarries of Smith or Lord Penrhyn—and that in many roofs soundness is of greater importance than appearance, especially when out of sight. That which gives the slates from these quarries their uninteresting texture when laid over a considerable surface of roof—viz., the evenness, perfect plane, and closeness of fit—causes them to be most efficient in excluding the wet. Undoubtedly, as slate, they are the best adapted to their initial purpose, the forming of a tight roof, and, being less absorbent than any other description, they longer resist decay, which is principally caused by the attacks of frost. The very thinness of these slates is one of the best signs of their quality; no bad slate is capable of being split so thin, and it may be taken as a sure test of a good sound slate that it can be split thin. This is very unfortunate, as the slates are made so very fine, that, like the celebrated Cremorne sandwiches, it is almost necessary, when they are being taken up the ladder, to carry a weight on top to prevent them being blown away. "Goth" suggests that they should be thicker, and graduated in size like the Westmoreland slates (which, by the bye, are not made graduated, but of random sizes, and are sorted and graded by the slater). I have tried hard for both these desirable things; but notwithstanding my buildings require slating by the acre, the quarry working is too conservative to permit the usual methods of cutting and splitting to be departed from. The messages I get from the quarries are to the effect that they can sell as many slates as they desire in the usual way, without troubling their heads about new-fangled notions, and I have been assured by a slater that when he required a freight of Countess slates of a particular thickness his cheque was returned and order refused; and, in confirmation, he told me that, having a particular order for a not very large number of Bangor slates, he had to purchase blocks of the size required, and bring up a Welshman to split them in London, where I saw the man actually at work.

If "Goth" can, by merely paying for them—or even, in addition, praying for them—get the best Bangor slates made to his own sizes and thickness, I will thank him to let me know, and I will again specify these slates, which I have at present reluctantly dropped for others.—I am, &c., A. H.

Intercommunication.

QUESTIONS.

[10454.]—**Hot-Water Pipes.**—The Metropolitan Act, 1855, sec. 21, provides that "no pipe for conveying hot water shall be placed nearer than 3in. to any combustible materials." The Amendment Act, 1882, sec. 16, repeals this stipulation by providing that the restriction imposed by the former section is not to apply "in the case of pipes for conveying hot water at *low pressure*." What is low pressure? I am fixing a hot-water supply circulation, which I consider to be low pressure, as it has an expansion pipe of ample capacity at its highest point, and is fed with cold water from an open cistern. But the district surveyor insists upon the pipes conveying the hot water being kept 3in. away from woodwork, as though the Amendment Act had not been passed, upon the ground that the cold-water cistern being 40ft. high (i.e., above boiler), the system is not low pressure. If he is right—which I very much doubt—where would high pressure commence in an open circulating system? The head of water undoubtedly exerts a pressure on the lower parts of the pipes; but does that pressure cause the water circulating therein and in the boiler, to attain a higher (and more dangerous) temperature than 212°?—W.

[10455.]—**Legal.**—Is it legal for an architect who has been ordered to prepare plans and specification for a certain building, to get bill of quantities taken out without first having the permission of his client to do so?—Nankassa.

[70456.]—**Hearths.**—Can any reader inform me of a cheap and durable method of colouring hearthstones, or any means of improving their appearance (other than by tiles)?—J. W. S.

REPLIES.

[10450.]—**Ventilation.**—"Rustycuss" is on the wrong tack. If the carbonic acid was generally cold when generated or sent into the atmosphere, and especially also if it were not so largely diluted as it generally is, then it might be best to carry it off at the floor level; but this is not so. The carbonic acid as given off from the lungs, and from gas-lights, &c., being warmer than the air, rises upwards, and before it could get away at an outlet at the floor would have to fall, and in falling would be mixing with the general atmosphere of the room, and so be breathed over again. To prevent this rebreathing of the vitiated air before it gets cooled and falls, and gets diffused, is the object of carrying off the vitiated air or carbonic acid, with its bad companions, at the roof.—W. P. Buchan.

CHIPS.

The church of St. Michael, Rudbaxton, Pembrokeshire, is to be restored by Mr. Reginald G. Pinder, F.R.I.B.A., of Bournemouth, the architect appointed by the restoration committee. It is one of the oldest churches in the county, and possesses many interesting features. It is at present in a very bad state of repair.

The free library for Bermondsey, of which the foundation stone was laid last week, is being built in red brick and stone from plans by Mr. J. Johnson, A.R.I.B.A. The estimated cost is £7,000. The site adjoins the Bermondsey Town Hall in Spa-road.

A memorial brass to the late Rev. Edward Thring, headmaster of Uppingham School, has been placed in the new galilee of the chapel of that school, a building recently erected by Messrs. Parnell and Son, from Mr. Arthur E. Street's designs, and illustrated in our pages on the 13th June last. The brass, which has an ornamental border of Provençal roses (Mr. Thring's favourite flower), was designed by Mr. Lawrence Turner, and executed by Messrs. Barkentin and Krall.

The Town Council of Gateshead having applied to the Local Government Board for sanction to borrow £9,000 under the Baths and Washhouses Acts, £9,837 12s. for scavenging purposes, £2,350 for providing a recreation ground, and £500 for an entrance lodge and other works at Saltwell Park, an inquiry was held on Friday by Col. Hasted, when evidence was given by the borough surveyor and others.

A carved oak screen has just been presented to St. Mary's Church, Wistaston, as a memorial to the late E. W. Delves Broughton, of Wistaston Hall. It harmonises with a memorial reredos, and, like it, has been executed from designs of Mr. John Brook, architect, of Manchester.

The smoking concert of the Royal Academy students will be held at the Meistersingers' Club, St. James's-street, to-morrow night, at 9 p.m.

LEGAL INTELLIGENCE.

Fireproof Corridors and the Building Act.—At the Kensington Petty Sessions, on Tuesday November 25th (Mr. William Bird, chairman) J. W. Hobbs and Co., of Croydon, were summoned by Ellis Marsland, district surveyor of East Kensington, for an alleged breach of the rules of the Metropolitan Building Act in the erection of the well-known large 13-story building at Albert Gate. Mr. Walter C. Williams appeared for the district surveyor, and Mr. Horace Avory represented the defendants. The defendants were the builders engaged in the erection of the premises in question containing more than 125,000cub.ft., to be used as a dwelling house for separate families, and therefore coming within the provisions of section 22 of the Metropolitan Building Act (1855), which states that "The floors of the lobbies, corridors, passages, and landings shall be of stone, or other fireproof material." The district surveyor contended that the corridors in this instance were not constructed in accordance with this rule, inasmuch as although the main portion was formed of concrete and iron joists, the top surface was covered with wood, and submitted a drawing showing a margin to the corridor of ½in. oak superimposed upon a ⅝in. thickness of deal affixed by deal block bedded in the concrete of the corridor. There was also an open channel in the concrete on either side of the corridor for pipes and electric wires covered by an iron grating resting on the edge of the oak margin; the central portion of the corridor was covered with 1¼in. oak block flooring bedded in cement on the concrete. The district surveyor contended although this mode of construction would prevent a fire extending vertically, it would not prevent a fire extending horizontally from suite to suite on the same floor, the wooden surface conducing to the spread of fire, and especially along the edges of the channels formed in the concrete for containing the pipes and electric wires; moreover, the surface was not a fireproof material, and therefore contrary to the section recited. For the defence it was contended that the wooden surface formed no portion of the floor, which was of concrete, but was only an addition to it for the purpose of preventing the clatter occasioned by a hard surface such as cement or tiles, and took the position of cocoanut matting or linoleum, and was less combustible than either, and as the concrete was 14in. thick, and was the floor required by the Act, the woodwork in question was simply a covering to it, and not the floor. The majority of Bench, after consultation, decided to support the district surveyor, and on Mr. Avory asking for a case, granted it. Subsequently, however, Mr. Avory asked the Bench, before coming to a final decision, to allow him to call further evidence to show that the corridor in question was practically fireproof. The Bench then decided to reopen the case and allow Mr. Avory to bring his additional evidence, and adjourned the case for 14 days. At the adjourned hearing on Dec. 9th, Mr. F. Izant, surveyor of risks to the Phœnix Fire Office, was called in support of the defendant's contention, and stated that in his opinion the floor in question was practically fireproof, as the woodwork was bedded directly in the concrete, and could only be burned upon the surface, and if during the progress of a fire the surface was charred, it would form an uninflammable non-conducting surface. He also thought the chance of the fire spreading along the edge of the channel, protected as it was by being bedded on the concrete, very improbable, and he should not hesitate to call the corridor in question a fireproof one. The Bench, without waiting for Mr. Avory to call his other witness, appeared satisfied with the evidence, and dismissed the summons, the chairman stating that in the opinion of the Bench "the floor, as constructed, was practically of fireproof material." The Bench also refused to grant the district surveyor a case, although it was represented to them that the London County Council (so important did they consider the question) had instructed Mr. Marsland to apply for it.

Damages Claimed for Breach of Contract.—At the Manchester Assizes, last week, Dr. Cox claimed damages for breach of contract against Messrs. Moore and Sons, contractors. In 1888 Dr. Cox determined on building a house at Eccles. Tenders were invited, and the lowest of five sent in was £2,233, and the highest £2,800. Dr. Cox accepted the lowest of these tenders, and the work began. A contract was drawn up, and this, the plaintiff alleged, had been broken by the defendants, the materials not being, as provided, of the best quality. Dr. Cox now sought to recover in money the difference in the value of the house actually built and the house which should have been built. For the defendants, it was submitted that their work was done honestly and well. Defects in the building of the house there undoubtedly were, but they were such as the defendants had from the first been prepared to remedy, in accordance with the contract. The judge directed a verdict for the defendants, and gave judgment.

Claim by an Architect.—At Birkenhead County Court, last week, before his Honour Judge Wynne Foulkes, an action was brought in which Mr. Eddy,

an architect, of Birkenhead, sued Mr. Hope, contractor, for £45, for services rendered in connection with a gas-holder tank he was constructing in 1888 at Neston, and a large quantity of water pipes he was laying down for the Walton Local Board. The work done was in advising the defendant about a mode of remedying defects in the foundation of the tank, which had caused the gasworks engineers to threaten to take the contract out of his hands and do it themselves at his cost. There were also consultations and letters and interviews. The defence was that the work was grossly exaggerated, the basis of charge irregular, having been calculated on the value of the expense saved to the defendant. Defendant paid £10 into court. After a lengthened hearing his Honour gave judgment for the plaintiff for £30 with costs.

CLIENT BOUND BY CONTRACTOR'S ORDERS.—MUSGRAVE AND CO. v. COCHRANE.—In the Queen's Bench Division on Saturday, the plaintiffs, manufacturers of stable fittings, sued Col. M. Cochrane for a sum of £117 in respect of goods supplied. The defendant denied liability. The goods in question consisted of fittings for stables the defendant was erecting at Cadogan-place, and the plaintiffs' case was that the defendant ordered them. The defendant, on the other hand, said they were ordered by a contractor, who undertook to the plaintiffs to be responsible, and who had been paid for them. The contractor was called, and stated that he gave the order, and was responsible. The jury, however, after deliberating for some time, found a verdict for the plaintiffs for the sum claimed, and judgment was given accordingly.

CHIPS.

The parish church of Backford, Cheshire, has been reopened after decoration of the walls of the nave with frescoes, the work of Mr. Edward Frampton, of London.

The town council of St. Helen's, Lancs, have voted £100 to the borough surveyor in recognition of his work in connection with the erection of the new baths in Boundary-road.

The new mission hall, which has been erected in the Grove, Totnes, has been opened. It consists of a hall and class-room, the former 40ft. by 28ft., and the latter 28ft. by 20ft. The building has been erected by Messrs. Brook and Ash, Totnes.

The new Empire Theatre of Varieties in Newgate-Street, Newcastle-on-Tyne, built from the designs of Oliver and Leeson of that city, was formally opened last week. Mr. Alexander Pringle, of Gateshead, was the contractor.

Foundation stones have been laid of a new adult school at Highbridge, Somersetshire. It is Queen Anne in character, and has been designed by Mr. C. S. Leech, of Weston-super-Mare. Mr. Keats, of Burnham, is the builder.

Various improvements are in progress in Oxhey Church, Hants, from designs by Mr. J. E. K. Cutts, including the provision of a reredos in oak.

Mr. Francis William Bedford, of Leeds, has been awarded the Ashpitel Prize by the council of the R.I.B.A., on the recommendation of the Board of Examiners.

From Chester the discovery is announced by Mr. Earwaker of fourteen inscribed stones and various architectural fragments of Roman buildings.

Mr. C. H. Brodie writes, stating that at the last R.I.B.A. meeting, reported by us on p. 780, "I expressly disclaimed any intention of discussing what the President had said. I asked a question, and received the polite reply I expected."

The first of a series of twelve lectures on "The Elements of Architecture" was given at St. James's Hall, Piccadilly, on Thursday evening, by Mr. G. A. T. Middleton. The course is specially intended to assist students in preparation for the R.I.B.A. examinations, and is illustrated by lantern views. The first lecture dealt with the origin of Grecian architecture, the development of the Doric and Doric orders being traced, and their proportions shown. Mr. Middleton closed by giving views of some of the principal buildings in which they were used.

On Saturday memorial-stones were laid in connection with the building of an additional Wesleyan Sunday-school in Whingate, Armley, near Leeds. The new premises include an assembly-room to accommodate 600 persons, and classrooms along two sides of the structure, while the existing school is to be altered into an infants' schoolroom and two large classrooms. This scheme will cost £900. The architect of the new building is Mr. F. Rhodes, Wortley; and the principal contractors are Mr. Paul Rhodes, builder, Leeds, and Mr. Elam, joiner, Stanningley.

A new cemetery is being laid out at Wenlock for the burial board. The contract for the boundary walls and fencing has been let to Mr. George, and that for the chapel and lodge to Mr. Charles Corfield.

WATER SUPPLY AND SANITARY MATTERS.

MARKET HARBOROUGH.—The new waterworks for Market Harborough and Great and Little Bowden were formally opened on Thursday, the 4th inst. The new supply has been obtained from two springs at Husbands Bosworth and from the valve house and reservoir in that parish is conveyed some 8½ miles to Harborough by gravitation in 10in. pipes, the service reservoir being situate on Barn Mill Hill, and having a capacity of half a million gallons. The scheme was prepared by Mr. C. B. Everard, M.Inst.C.E., of Leicester, and has been carried out for the local board. Mr. Everard also designed the works, and superintended their construction, Mr. H. G. Coales, A.M.I.C.E., the surveyor to the local board, having acted as resident engineer for the works within the district, and Mr. J. Manley as clerk of the works for those outside the district, including the source. The general contractor was Mr. J. T. Wingrove, of Northampton, the pipes having been supplied by Messrs. C. E. Firmstone Bros., of Stourbridge, and the valves and other fittings by Messrs. Hamilton, Woods, and Co., of Manchester. The total cost of the works, including purchase of land and compensation, will be about £23,000.

NEWCASTLE-ON-TYNE.—A new sewer, which has been in course of construction at the instance of the Newcastle Corporation and the Gosforth Local Board, has been completed. The undertaking has been under way for about two years and a half. It was started in Lime-street and carried under Byker Bridge, the Ouseburn Railway Viaduct, and through a hill to Heaton Heughs. From this point the sewer was built across the Ouseburn, small pipes being placed to allow the burn water to pass unobstructedly on its course at low water, while at high tide the water will easily pass over the top of the sewer. The sewer runs through Jesmond Vale, and from Benton Bridge through Jesmond Dene it is constructed of pipes of the sanitary kind, 24in. by 18in. The oval brick sewer at the commencement is 4ft. by 2ft. 8in. internal dimensions, and narrows down to 3ft. by 2ft. The sewage running into the new duct will come from about 630 acres of land, and the cost will be about £16,000. The work has been carried out from plans by Mr. W. G. Laws, the City surveyor of Newcastle.

PAISLEY.—An important addition to the scheme for supplying Paisley with water is on the eve of completion. The present work is an extension of that undertaken under the private Act of 1881, when the burgh authorities obtained powers to take in the Rye Water, a tributary of the Garnock, which falls into the sea at Irvine. The spot selected for the reservoir was at a point on the stream about eight miles from Paisley, among the hills, above the mining village of Dalry. The reservoir was not made to the full size for which powers were taken. The embankment was stopped within 25ft. of the authorised height, and this formed a reservoir 40 acres in extent, with a capacity of one hundred and eighty million gallons. But the quantity of water obtainable—about one and a half million gallons per day—from this pond as thus constructed being found insufficient, it was resolved to enlarge the reservoir to the size originally contemplated, and this has now been done from plans by, and under the superintendence of, Messrs. Leslie and Reid, C.E., Edinburgh, the consulting engineers to the Paisley Corporation. The embankment across the Rye has been heightened from 45ft. to 70ft.; the area flooded now extends to 120 acres, and the reservoir has a capacity of seven hundred and fifty millions of gallons. The length of the reservoir is about one mile and a quarter, and the lake which will be formed will greatly enhance the appearance of the locality. The puddle wall is founded on trap rock of the district. The waste-weir is of great blocks of granite—most of them about a ton in weight—set in concrete, and forming a cascade of steps 25ft. in height, over which the water falls. The cost of the works has been about £70,000, of which one-half was expended in the partial construction of it six years ago. The contractor is Mr. R. B. Stewart. The limit of supply which Paisley and the neighbouring burgh of Johnston, which is also supplied, will have is 6,000,000 gallons per day to a population of 70,000, equal to about 85 gallons per head per day.

TAYPORT SEWERAGE, SCOTLAND.—The sea outfall works have just been completed at a cost of £3,080. The population of Tayport is about 3,000, and the contract has included new pipe sewers in every street. There are two sea outfalls into the tidal estuary of the Tay. All gases generated in the sea outfalls have been disconnected from the town sewers. The sewage discharges by gravitation at all states of the tide, and therefore no storage is required. Street surface water is admitted to the sewers. The sewers are flushed with brook water. The commissioners have expressed themselves well satisfied with the efficient working of the scheme, and with the fact that the actual cost has proved less than the estimate. The engineer to the works is Mr. W. H. Radford, C.E., of Nottingham, and the design was chosen in open competition. The contractors were Messrs. McKay and Son, of Broughty Ferry, near Dundee.

PARLIAMENTARY NOTES.

BIRMINGHAM POST OFFICE.—Replying on Monday to Mr. Sidney Buxton, Mr. Plunket stated that the sub-contract for plastering at the Birmingham Post Office had been sublet to Mr. Welling by the contractor, with the consent of H.M. Board of Works. In July last the attention of the clerk of the works was called to the fact that the work in certain places was not being done in accordance with the specification, the cement being mixed with putty. The circumstances were fully investigated by the Board's surveyor and the architect of the building, and it was not proved that Mr. Welling was aware of the adulteration. There was a strong local feeling against Mr. Welling, and, being unable to determine on which side the fault lay, the Board did not feel justified in inflicting on him the heavy loss that would have been entailed on him by the withdrawal of the work from him in the middle of the contract. The job on the whole had been very well done, and the defects referred to were promptly remedied by Mr. Welling. In view of the strong feeling that had been excited in the case, the clerk of the works had objected to the continued employment of the men who were shown to have taken part in the adulteration, but not of others. Further inquiry seemed unnecessary.

The new head-quarters and drill-hall of the 1st Volunteer Battalion of the Sussex Regiment was opened on Saturday, at Brighton. The head-quarters and drill-hall are situated in Church-street, and cost £15,000. The hall is said to be the largest in Brighton, and there is also a Morris tube gallery, an armoury, sergeants' mess, commanding officers' and officers' quarters, and a canteen.

A bazaar was held last week at Evesham, having for its object the restoration of the fine church of St. Lawrence. A little over fifty years ago the then vicar set about the restoration of the church, then in ruins and disused. The north side was rebuilt, and the external restoration was, for the period, substantially done. The fine east end, with its double row of panelling and angle buttresses, was happily left in its original beauty. The elegant Perpendicular chantry on the south side, with its rich fan-tracery, remains much the same as it figures in Rickman, though a modern screen has been erected at its entrance. The two chief defects now proposed to be remedied are the ceilings, which are of stucco and plaster, and the seats, which are of painted deal, and as ugly and inconvenient in form as mean in material.

The annual soirée and concert in connection with the Edinburgh branch of the Joiners' Association was held on Friday night at the Oddfellows' Hall, Edinburgh. Councillor M'Crae presided, and there was a large attendance. The chairman congratulated the association on being able to distribute £289 in sick benefit, and contrasted it with the sum spent for strike allowance, which amounted to £5 8s. Mr. Peter Docherty, Edinburgh, said that the total income of the General Association for the year was £7,087 3s. 4d., an increase of £931 6s. 3d. over last year; and the gross expenditure was £7,050 3s. 4d., leaving a balance of £537 on the year's transactions.

A large clock and chimes have just been erected in the parish-church tower of Barrington, Oxfordshire, by John Smith and Sons, Midland Clock Works, Derby. The clock is fitted with all the latest improvements; all the wheels are of gunmetal, with machine-cut teeth. There is apparatus to continue the action during winding, and although the chimes play upon the ordinary church bells, the hammers are so arranged that the ringing is not interfered with. It will be a valuable adjunct to the church and a boon to the parishioners.

The contract for what will be the most powerful steam crane in the world of its type has just been let by the Clyde Trust to Messrs. Cowan, Sheldon, and Co., Carlisle. It is a 130-ton steam wharf crane to be erected on Finnieston Quay, Glasgow. When finished the crane will be tested by lifting 150 tons at a radius of 65ft., and its height from the level of the quay to the top of the jib will be 100ft.

At a meeting on Monday of the town council of Dunfermline, Mr. Chisholm, the burgh surveyor, submitted a report on the drainage system of the burgh, in which he stated that in order to provide an ample and satisfactory scheme of drainage for the requirements of the burgh, a sum of about £11,000 would be required. It was resolved to hold a special meeting to consider the subject.

The new highway bridge between Aberthaw and Cowbridge, and crossing the Cowbridge and Aberthaw Railway, was formally opened on Wednesday week by Miss Brewer, daughter of the engineer from whose plans it has been constructed.

Our Office Table.

The London County Council on Tuesday, after a lengthened debate, applied their seal to a petition to a separate Bill by which it will be attempted to moderate and regulate the increasing growth of "sky-signs" on roofs in the Metropolis. Under the Bill provision is made for an inspection or survey of sky-signs, and the district surveyor is to grant or refuse a certificate as to the stability of the sign and its stays and construction generally. The Council will grant a license for a continuance of the sign on the certificate being sent to them, and the license will remain in force two years. It may be renewed for two periods of two years each, making six years in all. The sky-sign is in every case, at the end of six years, to be removed, regardless of its structural condition, and failing its removal, summary proceedings against the owner will be taken by the Council. If the sign is wanting in stability, and is not repaired or strengthened, proceedings may be taken by the Council to demolish it. By section 4, after the passing of the Act it will be unlawful to erect or place any sky-sign wholly or in part above or over any house, building, structure, street, or way. Special clauses will prevent the Bill from applying to auctioneers' advertisements of houses to let, and brewers' signs. The General Powers Bill of the Council, which was also formally approved at the same meeting, contains the powers required by the Council for dealing with street improvements, bridges, and open spaces, as well as the Brook-street Artisans area, the site of Kennington Fire Brigade Station, and of the proposed station at Clapham Common; extension of powers in respect of Rosebery-avenue, the site of Millbank Prison, and inquiries as to markets.

It is proposed, in connection with the visit to Edinburgh in the summer of 1891 of the Royal Archæological Institute, to hold in that city an exhibition illustrative of heraldry in its various aspects. This will be the first exclusively Heraldic Exhibition that has been arranged in Britain, although such an exhibition was held in Berlin in 1882. Accommodation will be granted for the purposes of the Exhibition by the Board of Manufactures in the Scottish National Portrait Galleries. Mr. Balfour Paul, Lyon King of Arms, will act as chairman of the committee, and the exhibition will be divided into two sections—an historical section, dealing generally with objects of heraldic interest; and a decorative section, illustrative of heraldic painting and delineation as a branch of the Fine Arts. Mr. A. Ross, F.S.A. Scot., Marchmont Herald, is the secretary of the former section, which will appeal mainly to the historical and genealogical student; and the latter section, which it is hoped will be of interest to decorative and other artists, will be under the direction of Dr. R. Rowand Anderson, architect, and Mr. J. M. Gray, curator of the Scottish National Portrait Gallery. Mr. Thomas Ross, architect, joint author of "The Castellated and Domestic Architecture of Scotland," has undertaken to superintend the production of a series of drawings and reproductions of painted and other heraldic decorations of old Scottish castles and mansions; and Mr. Stewart Smith will collect a set of photographs illustrating examples of exterior heraldic sculpture throughout Scotland. If energetically organised and rendered fairly representative, the exhibition ought to prove of great interest, and very suggestive to architects and decorators.

The question of compensation for subsidence caused by brine-pumping has been amicably settled in the Cheshire salt district, Mr. Joseph Verdin, of Northwich, having offered £30,000 to be settled as a trust for the provision of compensation for injuries to property through brine-pumping in the districts of Northwich and Winsford. The trust deed sets forth that the gift is to relieve extreme cases of hardship and damage occasioned by subsidence in the Cheshire salt district, and explains that it will be devoted to private and public roads, except railways, tramways, and main roads; to sewer and drain-pipes, but not gaspipes; and to property other than that belonging to the county, gas company, board of guardians, trustes of the river Weaver, or those engaged or interested in the salt or alkali business. Compensation is to be given for the destruction or structural damage of buildings, to alterations of approaches, levels, erection of retaining-walls; to bolting together, underpinning, supporting, raising, or repairing buildings; and to raising, lowering, diverting, and making good injured roads. Under the deed power is provided to defray the whole or part of the additional cost incurred by the erection of framework buildings. A number of claims have already been received from sufferers, which will be considered at an early date.

The Housing of the Working Classes Act, 1890, is discussed in an appendix to the fourth annual report of the Federation of Working Men's Social Clubs, just issued. The council recommend that the machinery for assessing compensation under the Act should be simplified to a further degree and be made less costly; that the award of the Goverment arbitrator should be conclusive in all questions of amount; and that the costs should be regulated by a scale, and a limit placed upon the number of expert witnesses to value. The council also think that adequate provision has not been made for the expenses of carrying out the Act as regards the Metropolitan area. It is urged that the sanitation laws require consolidation.

The Bedford Hill Estate, adjoining Tooting Bec Common, and of which it is generally supposed to form an inclosed portion, is now being cut up for building purposes. Its chief feature is a grove of old trees close to the boundary line, and the builder offers to sell the strip of land on which the trees stand, to be added to the common, for £12,000. As it is probable that if half of this sum can be collected, the London County Council will be inclined to make up the remainder, an appeal is being made for subscriptions. It is doubtful if anything like £6,000 can be collected locally, as the bulk of the inhabitants hold their houses on short tenancies, and most of the houses in the immediate neighbourhood are of a small class. We have not heard as yet of any more or less liberal donations from the owners of the reversions, who will ultimately benefit largely by the preservation of the amenities of Balham, Tooting, and Streatham. A local committee has been formed, with Mr. Charles Mortimer, J.P., of Woodfield, Streatham, as chairman, who will be glad to receive any donations towards the purchase of the land.

The value of the personal estate of the late Sir Edwin Chadwick, of Park Cottage, East Sheen, who died on the 5th of July last, and whose portrait and biography were published by us on the 19th September, has been sworn at £47,766. The executors are Dr. B. W. Richardson, to whom the testator bequeaths £200, and Mr. James Heywood. His wife and daughter being otherwise sufficiently provided for, the testator bequeaths to his son Osbert three-fourths of the income on certain conditions. Subject thereto, the trust fund is to be applied as the trustees shall direct for the advancement of sanitary science. By the codicil to his will, the testator suggests that the trustees may offer a cup of the value of £20, to be given annually for a term of years, to sanitary authorities at home or abroad showing the greatest reduction in the death-rate of the population in their district. He suggests also the offer of a silver medal to the school teacher showing the best mental results of the half-time principle, and a gold medal for district school managers obtaining the best results in subjects named.

A new sort of pavement, according to *Wiener Bauindustrie-zeitung*, has been tried in some places with different degrees of success. The ground is first excavated about a foot deep, and rolled; then a layer of broken stone, 6in. thick, is spread over it, and melted tar put on, until the joints are filled. A layer of fine gravel is then scattered over the whole, and rolled. The same process is repeated, and the pavement is ready for use. In Budapest this pavement seems to be satisfactory; but something similar has been put down in Vienna, Carlsruhe, and Munich, and removed, as it showed a disposition to form ruts.

Mr. Harry Hems, of Exeter, and his merry men celebrated the 24th anniversary of the finding of "Ye Luckie Horse Shoe" on the evening of Thursday in last week by a supper in the studios in Longbrook-street. About a hundred employés and friends sat down, under the genial chairmanship of Mr. Hems, the vice-chair being occupied by Mr. Dyer. A feature of the evening was the presentation by the staff to the eldest son of the host, Mr. Grenville C. Hems, of an illuminated address, together with a silver-mounted and well fitted-up travelling leather case. With toast and song an agreeable evening rapidly passed away.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. Short papers on "Decorative Plaster Work," by E. S. Prior, M.A.; G. T. Robinson, Heywood Sumner, and Stephen Webb; to be followed by a practical demonstration of "Modelling in Plaster," by Messrs. Whitcombe and Priestley. 8 p.m.
Society of Arts. "Gaseous Illuminants," Cantor Lecture No. 4, by Professor Vivian B. Lewes. 8 p.m.
Liverpool Architectural Society. Special Meeting at 15, Cable-street. 7.30 p.m.

Tuesday.—Institution of Civil Engineers. Discussion on "The Lansdowne and Chittravati Bridges." 8 p.m.
Glasgow Architectural Association. "Impressionism in Architecture," by F. H. Newberry, New Master, Glasgow School of Arts. 8 p.m.

Wednesday.—Society of Arts. "Impressionism in Photography," by Geo. Davison. 8 p.m.

Thursday.—Leeds and Yorkshire Architectural Society. "At the Cathedral Door," by Wyke Bayliss, P.R.S.B.A. 8 p.m.
York Architectural Association. "Edwardian Architecture," by B. Priestley Shires, of Plymouth.

Friday. — Junior Engineering Society. "Artesian Wells," by Percy G. Bowen.

Trade News.

WAGES MOVEMENTS.

Bristol.—The board of arbitrators, consisting of four master builders and four operatives, have unanimously agreed to an award in the case of the dispute between Mr. Beavan and his workmen. They are of opinion that in three instances Mr. Beavan infringed Rule I. Clause B of the Working Rules agreed to by the Master Builders' Association and the operatives in their employ, by putting up the notices before ascertaining the opinions of the workmen on the jobs; but that in a fourth case he did not break this rule, having the majority in favour of the alterations. On the other hand, through ignorance of the fact that Mr. Beavan was a member of the Master Builders' Association, his employés broke Rule XI. by striking instead of bringing the dispute before a board of conciliation.

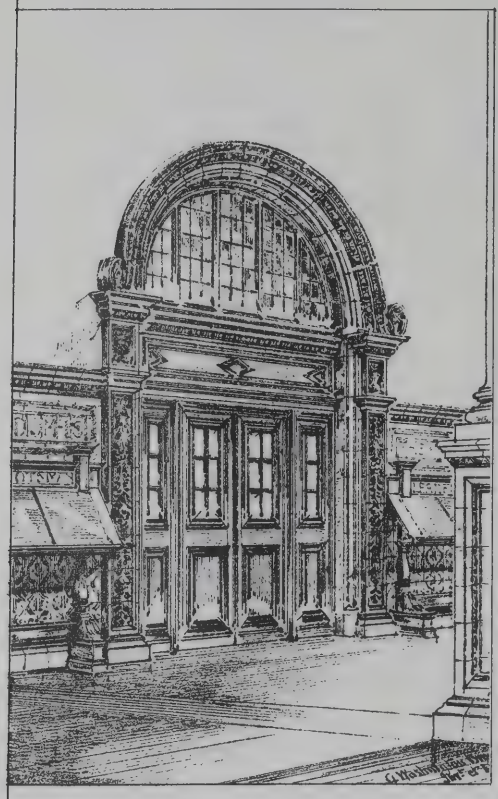
CHIPS.

The restoration of the cathedral church of St. Nicholas, Newcastle-on-Tyne, is about to be completed by the placing of a peal of bells in the tower. Part of the cost has been voted by the corporation, and the remainder will be met by a citizen, Mr. John Hall.

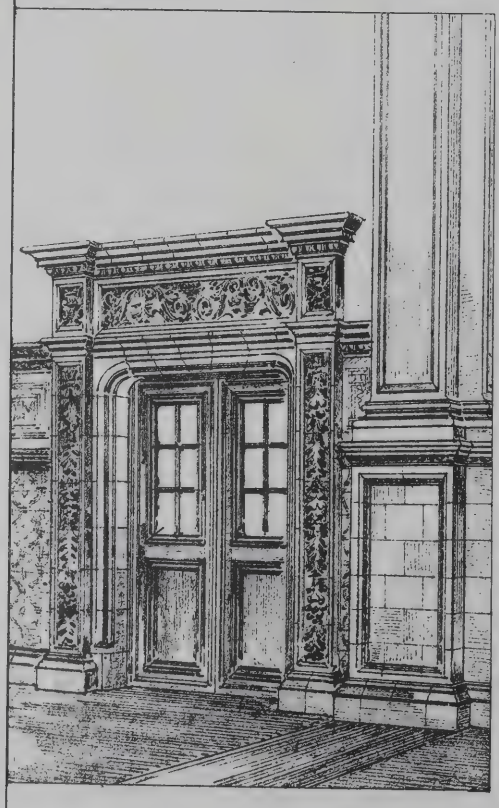
For the erection of the proposed new Royal Hotel the corporation of Weymouth have accepted the plans and designs by Messrs. Helyer and Hunt, of Bournemouth, on the understanding that the hotel shall not cost more than £27,000, exclusive of furnishing.

The Leicester town council decided on Tuesday night, after two nights' discussion, and by a majority of one, to open the free library, art gallery, and museum on Sunday for 12 months as an experiment.

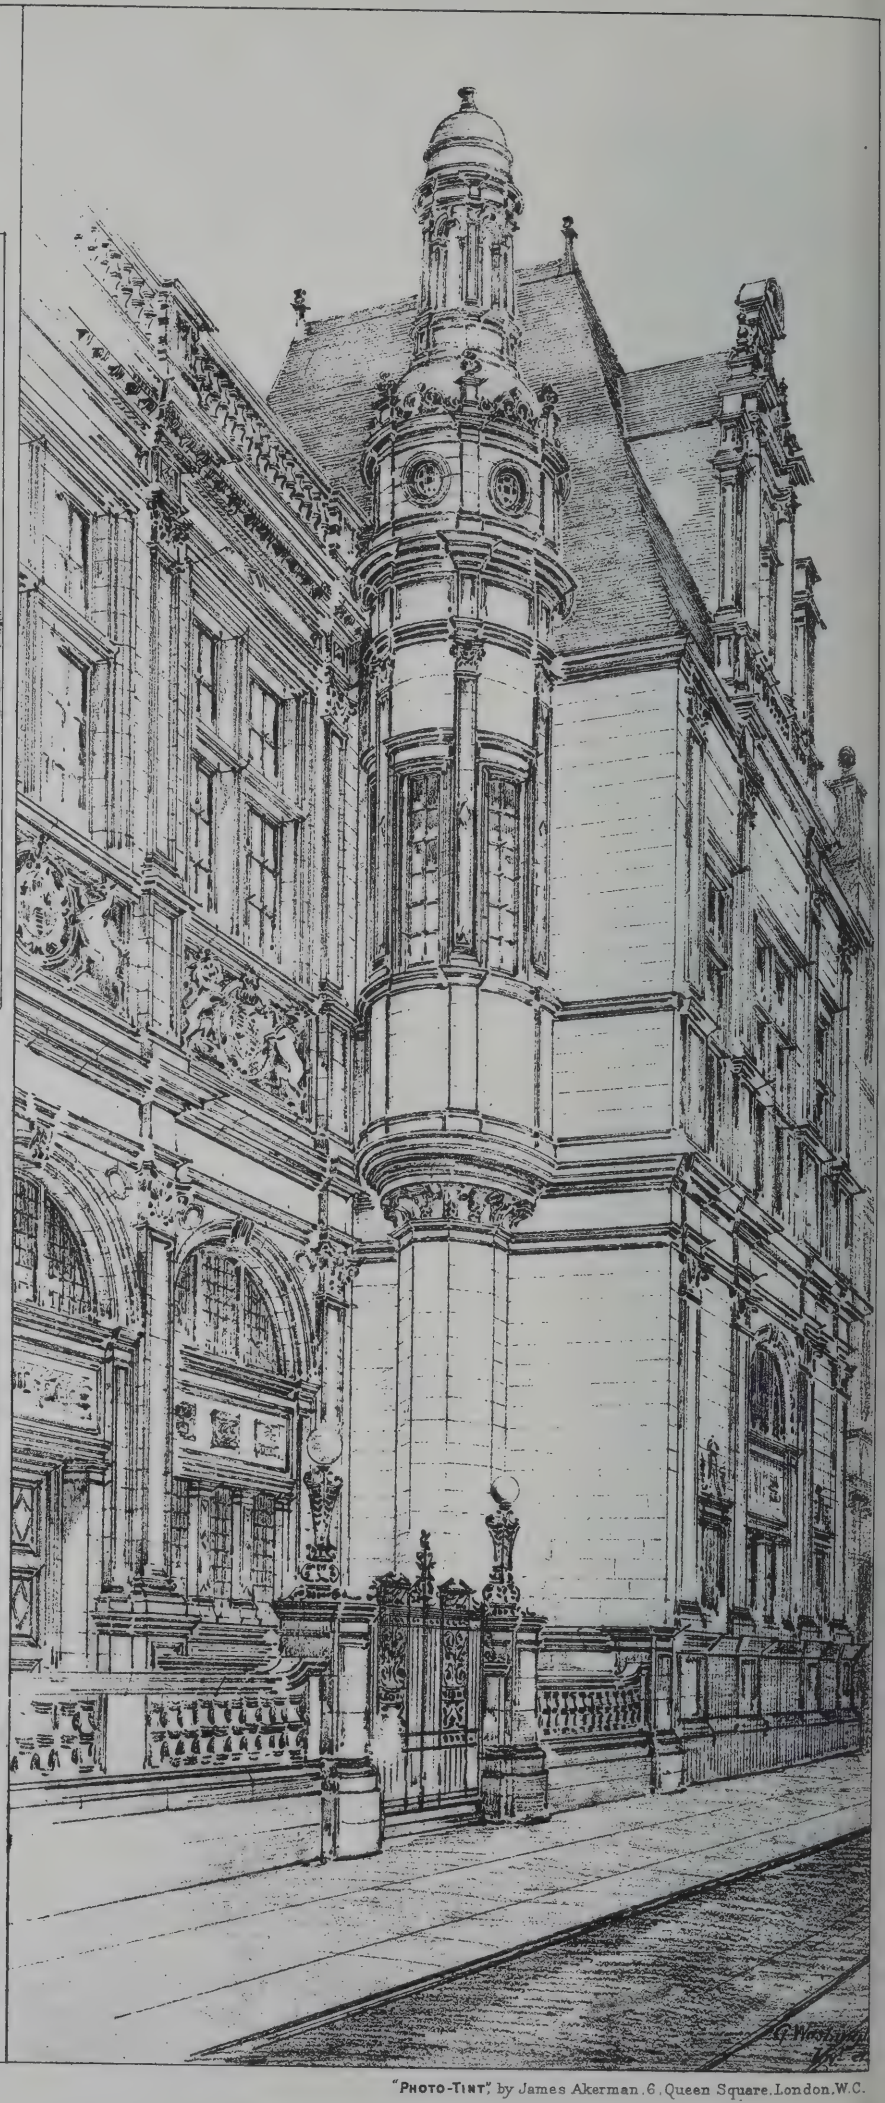
The statue of the Emperor Frederick, erected by Sir Edgar Boehm, which the Queen has had placed in St. George's Chapel, Windsor Castle, will be unveiled on Monday next.



Mr. Thomas Ainsworth, head of the firm of Ainsworth, Sanderson, and Howson, solicitors, Blackburn, who was interred at the Blackburn cemetery on Monday, has bequeathed all his pictures and books (except those on law) to the free library of that town.



An officer sent out by the Provincial Government of Quebec to investigate the unexplored forests of the Northern Ottawa region, has returned, after several months' absence, and reports his discovery of about 2,500 square miles covered with the finest pine, spruce, and other valuable timber, with excellent streams to float it out. He describes this region, which lies between Abbitibbi in the west and Camachimaga in the east, as fertile in soil and temperate in climate.



At the Gas Light and Coke Company's works at Kensal-green a three-lift gasholder, to contain seven and a half million cubic feet of gas, is being constructed by Messrs. Slater and Son, and the tank for its reception by Messrs. Lucas, Aird, and Ellis. The engineer is Mr. J. C. Trewby, and the engineer in charge is Mr. A. McMinn.

The Winchcombe school board have appointed Mr. Darby architect for a new school to be built at Gretton, and to be faced with Cleeve Hill stone.

AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1876.
FRIDAY, DECEMBER 19, 1890.

BLIGATIONS OF TENANTS TO REPAIR.

MANY people sign an agreement to keep the premises in "good tenantable air," though what that phrase exactly olies in the mind of the law they do not ible to inquire. When we find official rees and judges differing as to the meaning veyed, it seems not at all strange that inary tenants should differ as to what is ected from them. Indeed, it seems absurd expect anyone, however skilful and im-tial he may be, to decide upon any given e, unless he has seen the condition of the mises when the tenant entered, and can pare the first with the last state. enant naturally gets the worst of the case e enters a house that is in a bad state of air, for, according to the dictum of authority — Lord Esher — where the mises are not in repair when the ant takes them, he must put them repair in order to discharge his obliga- n "to keep and deliver them up in repair." t only so: a recent interpretation of the demands a standard of repair that is high in very many cases to suit tenants o enter dilapidated buildings. The words ood tenantable repair" must have some erence to a standard condition of ciency, and it cannot be taken too low. rally and justly, the condition of efficiency a building when it is taken ought to be- ne the standard; but it does not. It may so old and out of repair when taken, that 'ourt could not believe a respectable person uld take it, and so he has to put it in a ter state of repair at the expiration of the m than it was when he took it.

Our present remarks are to point out the nion of the Courts on the question of re- rs. In the case of "Proudfoot v. Hart," ich came before the Court of Appeal this ar, there was an agreement to keep a house "good tenantable repair," and so leave the ne at the expiration of the term of three ars. Damages had been awarded by the cial referee in respect of the cost in- red by plaintiff after the expiration of tenancy in repapering the walls of rooms, ainting internal woodwork where worn , in whitewashing and cleaning staircases l ceilings, and in replacing a kitchen floor. e Divisional Court only partly acquiesced the decision thus given, and referred the tter again to the referee to reconsider the ie upon principles they had enunciated. e plaintiff appealed on the ground that referee's opinion was right; but the lges on appeal took an independent w, refusing to agree with either of the ore-named authorities. We dismiss the ts of the particular case, and consider inly the question as to what a tenant is ected to do. We will suppose he takes ouse in which the wall-papering and nt to the internal woodwork are in a erable state, but which become worn out en he leaves the house. Now, according the generally received legal view, tenant- e repair extends to commissive and missive waste. The tenant must make d damage which is done by himself or ily (commissive waste), and also make d damage done by other causes, like m tearing off slates from the roof, or dows broken by stones. If he neglects lo the latter, further damage may result he premises, and he must make good this , because it has resulted from his lect of keeping the premises in repair, and is permissive waste. This general principle makes it clear, first, that all damage done by the tenant or his family has to be made good; second, that any damage done by a storm or by external agencies that may lead to further injury to the premises, must be repaired. Many things are included under this principle. A tenant may accidentally or otherwise break a door-panel or the balusters of a staircase, or a boy may throw a stone and break a window, or a violent gale of wind may cause the slates of the roof or a lead gutter to be torn off, for all of which he is liable; and if through want of timely repair the rain comes through the ceilings and causes them to fall, or damage is done to the wall-paper or plastering in consequence, he is responsible for the results of his negligence. But the mere wearing of a wall-paper, or the paint internally, is not usually considered a thing that a tenant is expected to make good. Justices Cave and Mathew are both of this opinion. With respect to paper on walls the former says: "I cannot see how, in any case, a man can be bound to put new paper on the walls simply because the old paper which was on at the time when he took the house has become worn out." If the paper is required to hold a wall or ceiling together (plastering, of course, is meant), the case may be different, but it is unusual. If the paper in this case is torn down and the ceiling falls, the tenant would be liable for commissive waste; or if the paper had so worn that it could no longer support the plaster, it might amount to a case of permissive waste, though it would hardly be fair to call upon a tenant to repair so rotten a wall. But that a tenant should be called upon to put up new paper, because the old has become discoloured or worn out by age, appears hardly fair to the majority of people. Yet this is a point upon which there is a difference of opinion. While one judge says a tenant is "not bound to repair what is worn out by age, nor to restore it, nor is he bound to replace anything that is worn out by age," another one, Lord Esher, says—"I am of opinion that under a contract to keep the premises in tenantable repair and leave them in tenantable repair, the obligation of the tenant, if the premises are not in tenantable repair when the tenancy begins, is to put them into, keep them in, and deliver them up in tenantable repair." These are rather opposite views of the obligations of a tenant to keep premises in tenantable repair. Lord Esher quotes some important rulings, amongst others that of Parke. The contract was to keep the premises in good repair as old premises, and deliver up the same in "good repair." According to the ruling of J. Parke, "the contract to keep the premises in good repair as *old premises* does not justify the keeping them in bad repair because they happened to be in that state when the defendant took them. The cases show that the age and class of the premises let, with their general condition as to repair, may be estimated in order to measure the extent of the repairs to be done. Thus a house at Spitalfields may be repaired with materials inferior to those requisite for repairing a mansion in Grosvenor-square." The lessee was to keep them in a state of good repair with reference to their age and class, and so give them up. It has been held by another judge (Rolfe) that the term "good repair" is to be construed with reference to the subject-matter, and must differ, as that may be a palace or a cottage; to keep in good repair pre-supposes the putting it into, and means that during the whole term the premises shall be in good repair. The conclusion, then, is this: that the state of the premises when the tenancy begins is immaterial, though the age of it has to be taken into account, and the obligation of the tenant decreases as the house gets older. From this conclusion it follows that the age of premises is the determining element; therefore a tenant in taking a house should ascertain its condition before he enters. Lord Esher points out that not only the age of the house, but its character and locality must be taken into account, because the same class of repairs as would be necessary to a palace would be wholly unnecessary to a cottage. A house need not be put into the same condition as when the tenant took it, but only in such a "state as renders it reasonably fit for the occupation of a reasonably-minded tenant of the class who would be likely to take it." So far for the principle. How is it to be applied? In the case referred to, he differs from the decision of the Court below. He agrees with the dictum that the tenant is not bound to repaper simply because the old paper has become worn out; but he does not agree that the tenant who has a covenant to keep a house in tenantable repair can never be required to put up a new paper. If, for example, the damp has caused the paper to peel off the walls, the tenant would be bound under his covenant to put up a new paper, though it need not be one of equal value to the old paper so long as it would satisfy a reasonable man. So with painting. If the woodwork would decay unless it is repainted, the tenant must repaint; but he is bound to go farther than that: he must leave the paintwork in a condition that is in keeping with the character and locality of the house, and will satisfy a reasonable tenant.

These are conclusions that appear to be logical and reasonable, though they appear to increase the obligations of tenants who covenant to keep in tenantable repair. It is difficult to say in some instances what "a reasonably-minded tenant" who took a house of a certain class would expect. The paper or the painting that would suit one person would not suit another. An ornamental ceiling originally painted and gilded that had become dirty, or the gilding black or discoloured, could not be expected to meet the requirements of a tenant who knew what such a ceiling ought to be, in which case, under the dictum we have cited, the outgoing tenant would be required to clean, repair, and regild it. Ornamental plastering or woodwork could hardly be exempted from repair because some "reasonably minded" tenants were satisfied with plainer finish to the rooms. The same principle of putting it into a state of tenantable repair would apply, though the Courts hold that a tenant is not bound to do repairs that are merely decorative. As to a rotten floor, the case is simple; for, however bad it may have been when the tenant entered, he is bound to put it into a state of repair befitting its character when he leaves. If quite rotten he must lay a new one; but if it can be repaired or patched to suit the general state of other parts of the premises, he is not called upon to renew it. Professional men are often called in to report on the nature of the repairs to be done by an outgoing tenant, and it is their duty to make themselves familiar with the law on the subject. There is a generally-received opinion that a tenant is not called upon to do more than repair commissive waste, and if the premises are old and dilapidated he is not required to repair them or to make them more tenantable than they were when he entered. This opinion is wrong. If they are out of repair when he takes them, he must put them into good tenantable repair, and maintain this condition throughout his tenancy. A surveyor called upon to make a specification of repairs, ought to be in possession of facts bearing upon the state of the house at the beginning of the tenancy; but he is often ignorant of it, and therefore the tenant is expected to do more than he is obliged to do. The three points named by

Lord Justice Lopes, in his definition of "good tenantable repair," age, character, and locality, are very often neglected by the surveyor, who puts down those things which he thinks ought to be done to render the house tenantable as a modern house. The stability or otherwise of the building, its "jerry"-built or other qualities ought to be considered as well; but this is a point very seldom, if ever, taken into consideration. A scamped house in a good locality, with cracked walls and ceilings, and decayed floors, constantly showing defects, naturally falls into dilapidation sooner than one that is well built though much older, and thus the tenant who signs a repairing covenant may have to do three times as much as he who takes a well-built house of the same age. The condition of repair in the former at the end of a few years would be much worse than that of the better-built premises, and the obligation to deliver in good tenantable repair would be greater. We think, therefore, stability and workmanship ought to be taken into account in estimating a tenant's obligations.

REBUILDING ON INSANITARY AREAS.

THE Bethnal-green scheme, which has occupied the attention of the London County Council for some time, and is still being debated amongst the inhabitants of that overcrowded district of the East-end with so much warmth, opens a problem of momentous bearing and of far-reaching results. It is no other than the question whether municipal or local authorities are justified in buying up insanitary areas, compensating the owners, turning the people who inhabit the houses adrift, and, in the mean time, rebuilding the houses in the form of huge blocks of flats. There are two points of importance involved in this question, the first being the purchase of insanitary areas for the purpose of rebuilding, the second the class of building with which it is proposed to replace the old dwellings. As our readers may be aware, the London County Council have, under the provisions of the Housing of the Working Classes Act, agreed to purchase an insanitary area of 15 acres at Bethnal-green, and to rebuild the dwellings, for which purpose the County Council proposed to acquire by purchase, or lease, a small area of land near, on which to build workmen's dwellings for the rehousing of the displaced tenants. The accommodation would be for about 250 persons on buildings of four floors. The report of the committee on this subject has since been withdrawn, it being understood that the gentleman who offered the site is about to erect cottage dwellings for the working classes. The main question is, however, how to deal with a large insanitary site. Is it desirable that the Council should purchase such an area and clear it, rebuilding upon it new blocks for the tenants?

We think it would be more in accord with the powers invested in the County Council if they brought the Act to bear upon landlords of insanitary houses, and Lord Compton's letter in the *Times* a few days ago conveys the impression that the Council have taken this view of the matter, and he says the committee of which he is the chairman "desire that a crusade shall be started, under Part II. of the Act of 1890, against the owners of insanitary houses." The rehousing difficulty is the one that presses; but not equally under both parts of the Act. By demolishing a large area of squalid houses, a great number of the working classes is displaced, and must find accommodation in the neighbourhood, as this would be the result of putting into force Part I. of the Act. On the contrary, if the Council proceed to put the machinery of the second part into operation to compel owners of insanitary houses to demolish or repair them, the displacement would not be so great, nor so severely felt by the inhabitants. There is another and stronger moral reason why it is better to deal with the landlords of insanitary areas than with the site as a whole. It has been asserted in evidence, and is a matter of every-day experience, that landlords of the lowest class of property endeavour to evade their responsibilities and obligations to their tenants, believing that by so doing there will be a chance of selling their property at a high price. They do not care a straw for the wretched tenants who occupy dwellings scarcely good enough for pigstyes; the middleman or house-jobber has an intermediate interest, and further precludes any outlay on improvements. We think, therefore, it is the duty of a local authority to compel the owners of insanitary premises to put them into a wholesome and habitable state, rather than that the cost of doing so should fall upon the ratepayers. The duty of an authority is primarily to enforce the obligations of landlords, and not to incur new responsibilities till they have tried the measures which the Act has placed in their hands. The landlords rather than the ratepayers should be taxed to pay for improvement schemes which their own neglect have rendered necessary in the cause of public health.

The report of the Committee on the Housing of the Working Classes indicates the difficulties which have to be encountered. The Committee have had to seek information from vestries and district boards as to insanitary areas in their districts, and these are not always forthcoming. In many instances those interested in the insanitary premises are members of local authorities, or are personal friends of members; in other cases, the authorities are said to be "averse to take action under Torrens' Acts, and with some justice, as superficial repairs to insanitary houses in a small court or area may be held sufficient by the justices to whom an appeal is made by the owner of the property, and thus little result is effected." The Committee, therefore, have made suggestions with the object of making Torrens' Acts more workable. They say that local authorities prefer an area, however small, being dealt with under Cross's Act, which necessitates full compensation and a scheme at the expense of the whole Metropolis; the Committee therefore believe if "Torrens' Acts were amended much could be done with the smaller insanitary areas of London." "They also suggest that, in order to put a local authority in motion, the Council should have the power of requiring the local medical officer to report; that in case of demolition the authority, or, failing it, the Council, should have the same powers of compulsory purchase as the Acts give with regard to obstructive buildings"—that is, those badly situated or obstructive to ventilation, and incapable of improvement.

We do not now discuss these recommendations, which have some weight, but the Acts known as Torrens' and Cross's have not worked satisfactorily. The procedure is dilatory and costly, the compensation given to owners of unhealthy houses has in many cases been in excess of the fair value for dilapidated properties, but, what is worse, these compensations give encouragement to owners of such premises to neglect their duties as landlords, and to allow the houses to fall into bad repair. It is true subsequent amendments made in 1879 and 1882 made the principle of compensation more reasonable. Owners were not to be compensated according to the profits they derived from these dwellings, but as houses "unfit for habitation." Again, the obligation to provide on the same area for the persons displaced compelled the late Board to sell at a low price the ground, which, with the houses on it, cost seven or eight times much. This was altered: the Board h power to sell the site of the unhealt dwellings for commercial purposes, and provide sites for the displaced dwellers other less expensive parts, a plan that ha however, the obvious disadvantage of taki the tenants away from their work, and destroying localities with monster bloc The Housing of the Working Classes A afterwards passed, amended the rules as the power of appeal from the arbitrat and simplified the operation. Notwit standing these improvements, somethi more is required before it can be said th the Acts work satisfactorily. One of t greatest difficulties is that of providing n dwelling accommodation to the same amou as that demolished. The Act of 1882 not compel the local authority to provide t same amount, and the obligation of t authority was reduced to provide half t number; but the fact is the new dwellin occupy more area than many of the ter ments in courts and alleys—on the oth hand, the new dwellings have more stories

Another and equally vital point is t mode of building. The County Coun following the example of the Metropolit Board of Works, intend to rebuild on t cleared sites model dwellings in large bloc as being the most economical way of utilisi the area of 15 acres. To this mode rebuilding, the inhabitants of Bethnal Gre as in every other case, offer an indigna protest. The meeting held the other d was unanimous in its opinion that t area should be covered with small six-room or "two-family houses" instead of t model dwellings in blocks. Wherever go we find strong objections raised amon the poorer classes to the monster block flats. It is a grievous eyesore in the mi of the East-end localities; too barrack-li or too prison-like to be popular amongst t working classes. The blocks are look upon with a sort of horror by those who ha lived comfortably in a couple of rooms in house of moderate size, though perhaps n in the most efficient sanitary state. Th people rebel against the regularity, the mi tary discipline, and even the cleanliness the regulation "block dwelling," not beca they are well built or clean, but because th lose a sense of individuality and of perso comfort which they enjoyed in their haunts. In the great block, up some fou or fifth flat, they become lost, separated fr their neighbours and acquaintances, isola from the world, and pigeon-holed under *régime* which is hateful to the Engl artisan. The evidence taken at commissio and the reports of the dwellings commit of the Charity Organisation Society, all co firm the fact that the classes for which th model dwellings are erected do not inha them. Labourers spend as little as possi in rent, and are often destructive of proper while the artisan prefers to have a sm house of his own. Association and Peabo Dwellings are disliked by both classes. Th are some reasons for the aversion ot than those we have given. The huge bl of flats by its height and ugliness reve itself as a regulation building for the po It represents the attempt to pack the wor ing classes in great buildings as a means removing them out of the way of super neighbourhoods, and the difference betwe the model dwelling and the small ho expresses the fact in a manner the worki classes resent. It has too much of the wor house look.

How is the problem to be met? On one hand the local authorities are acti under statute provisions to demolish u healthy houses, and rebuild them upon economical principle of placing as ma dwellings on the area as they can; on other, those who are chiefly interested decl to live in the "model blocks." We have

ong advocated the rebuilding of these sites th two or three family houses of six oms; but the objection is that this plan ould not be economical, and could not pay. at the plan has never been tried on a large ale. Wherever these six-roomed dwellings ve been erected, they have let to the asses for whom they are intended, whereas e model dwellings in blocks have only rtially been occupied by them. The great st of purchasing under the old Acts has mpelled associations and authorities to ild blocks of several stories. An enormous nount of money was given for the trade and nnection of low public-houses; tenants aving only short leases would demand metimes several years' trade profits. In is way sites and houses have been rchased which have cost three or four mes their fair value. The system of mpensation was grossly at fault; and in ne case a Great Wild-street area was ctually assessed under the arbitrator's ward at £3,500; which under the Cross's mending Act would only have been valued t £500. This was no solitary instance of the aluations made before the amendments ame into force in 1879, which Act enabled ne arbitrator to deduct in value the expense f abating the nuisance when the premises ere unhealthy or overcrowded. Under a ystem of exorbitant compensations for nhealthy property, we cannot wonder that romoters of schemes endeavoured to house s many as possible within a limited area. But now properties which have fallen into an nhealthy or overcrowded condition can be ealt with on a different basis of compensa- ion; the local authority, on the owner's eglect, can demolish, and compensate only or the value of land and houses unfit for abitation. In many cases only the land and naterials ought to be valued. These altered conditions as to compensation, and the dis- ensation of the obligation to re-accommo- late as many of the tenants as are displaced by the clearance of a site, have made it pos- ible to revert to a mode of rebuilding that will accommodate a large proportion of the nhoused classes without doing violence to heir prejudices. In Liverpool, Edinburgh, nd other towns self-contained houses for our or more families have been erected affording all the conveniences and sanitary conditions required.

THE ARCHITECTURAL ASSOCIATION.

THE REVISION OF RULES.

A BUSINESS MEETING of the Association was held on Friday evening, to consider the report of the special committee on the the revision of the rules, the substance of which we gave in our issue of a fortnight since, p. 778. The President, Mr. Leonard Stokes, occupied the chair, and there was a large attendance of members. During the preliminary ordinary meeting, P. Bantoft, T. J. Morgan, and A. H. Bamber were elected as members. Mr. Cole A. Adams inquired whether or not the *A. A. Notes* was the official organ of the Association, and whether the leading article in the December issue, entitled "Two Presidential Addresses" was an authorised expression of the views of the committee. The President replied to the first question "Yes," and as to the second, the article in question did not express the views of the committee, for that body did not see it till the publication of the journal. In reply to Mr. Max Clarke, the President added that Mr. F. T. Baggallay was solely responsible for the article. Mr. Clarke expressed his regret that it had appeared.

Mr. Hugh Stannus, as chairman of the special committee, explained that in revising the rules they had thought it advisable to divide them into two classes, a Constitution and By-laws, the latter of which ought to be more easily altered to suit changing circumstances. He moved, *pro formâ*, the adoption of Rule 1 of the Constitution, giving the name of the Association. This was seconded by Mr. Hampden W. Pratt, and agreed to. Rule 2, defining the objects of the Association, was also passed, on the motion of Messrs. Stannus and Baggallay, after Mr. C. H. Brodie had questioned the necessity for eliminating from the rule, as formerly standing, the words "to advance the profession" from its professed aims. Number 3, defining the Association as consisting of "ordinary members and allied societies" aroused more controversy. Mr. Owen Fleming wanted to know why no distinction was to be made between town and country members, and other speakers having questioned whether "allied societies" could be designated members, he moved that its consideration be deferred till other rules affecting affiliated bodies had been dealt with. This was seconded by Mr. Bernard Dicksee, and led to the first division, the postponement being carried by 44 votes to 8. The adoption of Rule 4, stating the qualification for membership, was moved by Messrs. Stannus and John Slater. Mr. Creswell moved, and Mr. Burrell seconded, that the word "ordinary" be inserted before "members" to distinguish them from "gentlemen interested in the arts or sciences associated" with architecture, who may be elected with the special sanction of the committee. Only three hands being held up for the amendment, it was lost. After a discussion, in which Messrs. E. R. Barrow, F. T. W. Goldsmith, G. A. Pryce-Cuxson, and Chas. M. Hudson took part, the rule was adopted with but four dissentients; the President explaining that legal advice would hereafter be taken on the construction of the rules before they were finally printed. To Rule 6, defining the rights of members, Mr. Stannus proposed to insert after "shall have . . . the right to vote" the words "and the ordinary annual subscription shall be half-a-guinea payable" before the clause, "as prescribed in the by-laws." Mr. Cole A. Adams expressed "the utmost amazement" that Mr. Stannus should have raised the question of the subscription at this point, and the President mentioned that the committee had given a similar suggestion by Mr. Stannus careful consideration, but could not see their way to adopt it. Messrs. Burrell, Baggallay, W. H. Atkin Berry, Slater, and Goldsmith having spoken, the amendment was withdrawn by Mr. Stannus, and the rule agreed to as printed. Rule 6, defining the qualification of allied societies, having been moved by Messrs. Stannus and E. W. Mountford, Mr. Cresswell suggested that the rule ought to define who should be members, or they might have tinkers and tailors offering to affiliate themselves with the Association. He moved the insertion of the words "architectural or kindred" before "societies." This was seconded by Mr. Pratt, and Messrs. Cole Adams, E. W. Wimperis, Percy Hunter, A. B. Pite, Barrow, Berry, Brodie, Burrell, and Hudson having spoken, the addition was carried on a division—the first alteration made in the committee's draft report. Mr. Burrell could not see why the distance of the head-quarters of allied societies had been increased by the committee from 20 to 30 miles, but the alteration was agreed to. Rule 7, defining the privileges of allied societies, was agreed to, as was also Rule 8, approving the management of the affairs of the Association by a committee. Rule 9, fixing the constitution of the committee, gave rise to more discussion, a strong feeling being manifested for placing before the secretaries the title "honorary," so as to insure that a paid official should not vote in committee. The President pointed out that all the members of the committee were honorary, from the president to the librarian, and that the paid assistant would be merely a paid clerk; but Messrs. Cresswell, Berry, Brodie, Dicksee, Hudson, Max Clarke, Wimperis, W. Leverton, Slater, Pryce-Cuxson, and Pratt having spoken, he moved from the chair that the rule commence: The committee shall consist of "the following honorary officers," the words quoted being additions. This was agreed to *nem. con.* In order to prevent "gentlemen interested in the arts or sciences"—*i.e.*, amateurs, eligible for election under the much-debated Rule 4—from being placed on the committee, Messrs. Burrell and Fleming proposed to restrict qualification for the committee in Rule 10 to "ordinary members"; but the proposal was objected to by Mr. Pite and others, and was withdrawn. Rule 11, relating to meetings, having been agreed to, Mr. Stannus moved an additional rule, so as to render it less easy to amend the Constitution: "That the Constitution of the Association should be only altered or amended by vote taken by means of voting-papers sent to all members as prescribed by the by-laws." This proposal, raising as it did the question of the mode of voting, was energetically opposed by Mr. Cole Adams, who appealed to the members to adhere to the English mode of open voting in public meeting assembled, and said if votes were to be sent by post, each member ought, in fairness to those who attended the meeting, to have a verbatim report of the discussion. Mr. Dicksee seconded Mr. Stannus's motion, which was supported by Messrs. Brodie, Harry Sirr, Hudson, Goldsmith, Pryce, and R. Needham Wilson, the last speaker urging that it was only fair to country members to give them equal facilities to town men. Mr. R. Phené Spiers proposed as an amendment that the words be added to the new rule, that no alteration be made in the Constitution unless approved by "a majority of two-thirds of those voting." This was seconded by Mr. T. E. Pryce, and supported by Mr. Pite; but on being put to the meeting was lost by a large majority, and Mr. Stannus's new rule was adopted with but one dissentient. Mr. Stannus proposed, as a further addition to the Constitution, a new rule, fixing the subscription of present members at half a guinea; but it being now ten o'clock, Mr. Fleming moved, and Mr. Dicksee seconded, the adjournment of the discussion. This was carried, and the meeting accordingly stands adjourned for a week—*i.e.*, until this (Friday) evening at 7 o'clock, when Rule 3 and the whole of the by-laws—39 in number—come up for consideration.

SUGGESTIVE POINTS OF CONTACT BETWEEN ARCHITECTURE AND PAINTING.*

(*Concluded from page* 816.)

THERE is a minor principle which is closely associated with breadth which may perhaps be briefly referred to. Most artists have no definite name for it, but amongst some it is known as "focusing." In most objects in nature there is a tendency towards gradation, either in tone or colour, and towards the emphasis of some part or point above the rest. Observation will soon show this, and the more the eye is trained to look for it, the more it will be apparent. In atmost all groups of foliage, for example, there is some particular spray or group of leaves on which shadow, colour, or light culminates in intensity. Even such a straggling object as a mass of clematis usually has some particular trail which asserts itself over the others. Paint the group of foliage or the bush of clematis without this gradation and binding together by the supremacy of the individual trail or spray, and it looks confused and lifeless and unsatisfactory. Examine the works of many of the old masters and the best men of the modern schools, and you will usually find that, consciously or unconsciously, the painter frequently binds together a group of objects by making one of them assert its supremacy and the other their loyal submission to it. Apply this to architecture, and it will be found that when a patch of ornamental detail will not work itself out harmoniously, a little "focusing" upon some particular feature, by means of the extra elevation, deeper undercutting, more forcible treatment or emphasis through strength or contrast of colour, may assist the designer out of his difficulties. Before passing on to a larger subject, let me add a word or two as to "quantities." Of course I do not mean the kind of quantities with which an architect is most wearisomely familiar, but the "quantities" of the painter. What the latter understands by the term are the large masses of tone which compose a picture or a subject in nature. The question of the relative size and relative position of these is one of considerable importance for him in the composition, or, to use a word which will less offend the susceptibilities, the selection of the materials for his picture. In this matter there are no firm rocks upon which he can place his feet and feel that he is æsthetically safe; but there are one or two points in connection with quantities upon which there is tolerable agreement amongst artists. One is that neither the size nor the form of any two such prominent masses or quantities in a picture should be exactly equal. To give a very simple instance, I do not suppose that Mr. Colin Hunter or Mr. Henry Moore would divide one of their seascapes into two precisely equal spaces of sky and water by an horizon line exactly intersecting the picture, nor in a figure subject would two

* A paper read before the Society of Architects, Dec. 9, 1890, by A. Wallace Rimington, R.P.E.Assoc S.A.

figures, or two groups of figures, be allowed to occupy the same amount of space on the canvas. Another generally accepted canon, also obtained from nature, and one so obvious to the painter as to be hardly worth referring to, is that two quantities of somewhat similar shape should not be immediately below each other, or on the same horizontal line; though when placed upon a diagonal line they do not seem to offend the eye so much. It will not do to project the shadow of these two small artistic dogmas too strongly upon the principles of architectural design, because perspective complicates the question; but most artists, and perhaps the art-educated portion of the public, would have a preference for the façade of a building in which the quantities relieved against the sky were varied and not uniformly balanced. Few architects also would deliberately place two features of equal size and form immediately above one another. The adjustment of relative quantities has been carefully considered by various painters, who have attempted to throw some light upon the natural or optical principles which may be supposed to lie behind the question. But it would be dangerous to attempt to tie art down by hard-and-fast canons. These artistic principles should be helps to assist us in exploring nature's intricacies, and not inflexible rules; servants, and not masters. Moreover, there is always an ultimate court of appeal in art, a court in which individual taste is the judge, though it would be well for art if his judgment were more free from the influences of fashion. Let us turn to a somewhat kindred subject, to a factor in any art work which, though it can hardly be called a principle, cannot be neglected, and which it would, perhaps, be well to recognise the existence of a little more definitely. That factor is what, for want of a better word, can only be described as "feeling." When an artist remarks that a sketch is "full of feeling," he means that in some way or other, even perhaps with the sacrifice of some other truths, the maker of the sketch has been so diligently or enthusiastically feeling after the essential qualities of the object he has drawn, that his sketch is full of a certain indefinable suggestiveness of truth and delicacy of perception. In a dozen other cases it might be said "very careful, very dashing, and very clever in handling, but without an atom of feeling." The difference in the drawing of a tree stem, or a hand, with and without feeling, is extremely small, and the quality of feeling is often arrived at in despite of a certain indirectness and confusion. It may lie in the thickness of a line or the general effect of a confused net of lines, or in the expression of a curvature so subtle that a mathematical instrument would hardly detect it. Yet in work which is instinct with feeling this difference tells, and there would be no life without it. Feeling, then, does not consist in mere fineness or carefulness of drawing. It consists much more in the suggestion of the most beautiful or the most important facts, and in the not being satisfied with anything else. Feeling in art is a quality which must be felt rather than described. But, as in the painter's work, its absence is absolutely ruinous, so in architecture its presence is not less needed to produce a building, or a piece of decoration which shall be truly an art work. As an instance, Mr. Rimington exhibited a diagram showing the general forms of a Mediæval crocket on the exterior of a cathedral in Southern Europe, and side by side with it a drawing of a similar crocket as restored by a leading architect who has executed several admirable buildings. In this case, however, the subtlety and beauty of the old work has, the lecturer thought, to a great extent escaped him—an opinion confirmed by the general view of the audience. The difference is not, the author added, great, but if the designer had been on his guard against absence of feeling creeping into his work, he would not have missed the subtle but deliberate curvature of these lines (it is not due to the weather wear) and have converted them into ones suggestive of machine-made ornament. It is this subtle and indescribable quality of feeling which stamps so many works with individuality and gives them so high an art value. Broadly speaking, it is what most divides an original style from an imitated one. The absence of "feeling" in the execution of the architect's design often destroys all its charm, and, like the painter, he cannot too ardently seek after it, or insist too strongly on its being striven for in the execution of his drawings by the craftsmen. Closely associated with "feeling" is the quality of suggestiveness. Suggestiveness in painting means that a given piece of work prompts the mind to imagine more than is actually rendered. The bas-reliefs beneath the dark porches of some great Italian church, say the cathedral at Lucca, are not clearly visible at a short distance. An artist who is fairly skilful will suggest them with a few touches, and they will give richness and interest in his drawing, as they do in nature. There is a charm about this suggestiveness in that it leaves the imagination to some extent free. A bad artist, to revert to the example of the Lucca porch, would deliberately paint more than he could actually see, by moving his position and going closer; but in doing so he would get a hard, matter of fact character into his drawing, and destroy its suggestive poetry. A painting that is highly finished in every part is rarely suggestive, and seldom satisfactory as a work of art. So, too, that architectural ornament which is in every respect highly finished and cleanly tooled and scraped has, in getting rid of all suggestiveness, lost much of its charm. In a newly restored cathedral the artist often longs to put a little more inequality and roughness in the cleanly sculptured capitals, and sharp-edged wall tracery; or to introduce a little vague irregularity of surface and suggestiveness of age and interest in the monotonously clean walls behind the triforium arches, or below the clerestory. It will be said, perhaps, that this kind of suggestiveness did not exist in the original building. If so, and it has gained it by time, why should we not take a hint from the fact? But it is indisputable that much old work does distinctly show a feeling for this quality of suggestiveness, by the deliberate leaving of parts of the ornament in a rough and suggestive condition, and the absence of monotonously equal finish. In the undercutting and hollowing out of much 13th-century work in France and Germany, and occasionally in Italy, may be noticed the intentional, or apparently intentional, leaving of roughness and coarse inequalities, which at a little distance give poetry and suggestive richness. In the earlier mosaics it is deliberately intentional, and so, too, in the bas-reliefs of Lucca Della Robbia. In fact, in good mosaics it is questionable whether this broken suggestiveness is not one of its greatest charms, apart from its giving quality to the colour. Or, to take another instance, in the flat surface, carved furniture of Gothic and Early Renaissance times in Southern Germany and parts of Alpine Italy, the chiselled surface upon which the design is relieved is almost invariably left as rough as possible, in order to prevent uniform cleanness, to give suggestiveness, and to make the finish that exists more valuable. Total absence of suggestiveness in a painting, that is to say, omission to leave any part of it sufficiently undefined to appeal to the imagination, is singularly destructive of scale. May not this, perhaps, also be the case sometimes in architecture? Reference may be made to one or two minor and somewhat commonplace painters' axioms. One is as to grouping. Most painters feel that in introducing movable objects, such as figures or animals, into their pictures, or in choosing a position to draw a number of stationary ones, such as trees, or buildings, it is well that they should assemble themselves into groups, and not be dotted about the canvas in an altogether haphazard and irresponsible way. In introducing a figure into a landscape, it is usually a question whether it shall group with some other object in the subject, and, as in the black and white of a picture, it is well to keep the lights somewhat together, and the darks also in company, so it is found advisable to allow the objects of interest to arrange themselves in groups. A similar principle is, of course, well recognised by the architect in giving coherence to his ornament, and preventing the external features of his building from becoming too scattered and disunited. Grouping suggests the action of the will, controlling and overruling mere accident; isolated and monotonous repetition implies feebleness of mind and intention. In a good design the elimination of a single decorative feature should be felt to be a loss. If it is not, it does not group; it is cutting the design up and reducing its impressiveness. So, too, in a picture, and various hints may be obtained from the study of pictures in which the grouping is especially good. Symmetry is, perhaps, a subject upon which the artist is necessarily somewhat at issue with the architect. The painter has a strong objection to absolute or geometric symmetry. The same motives that lead him to reject equal quantiti and groups of similar magnitude cause him prefer the kind of symmetry which is so w exemplified in Japanese art, in which exampl of equally balanced design are very rare. Fe who have studied it will deny that this is one its many charms. Though the eye finds repos the mind is not lulled to sleep by mere repet tion, but is forced to take an interest each part of the decorative composition. The is little of the dead and meaningless ornamer which often distresses us in other schools design. So also in a good painter's work, equ balance is seldom or never found. Instinctivel or of set purpose the artist shifts his position s as to get unequal quantities; he will balance whole mass of darks on one side of his picture by mere spot on the other, or will control a whol system of leading lines by a single opposing one If this is so deeply rooted a principle or prejudic in pictorial art, it is but natural to expect to fin something similar in architectural practice, an this is the case. Even in the severest forms o Greek art absolute symmetry was felt to be defect, as has been pointed out by Fergusson wit regard to the temples and other buildings of th Acropolis. As for Gothic art, hardly a building is to be found in which absolute geometric sym metry exists, though a careless observer is ofte deceived into thinking that it does. In drawing of the towers of Tours Cathedral, hasty glance would lead one to suppose that th towers were exactly similar, but if they ar examined they will be found to differ in almos every single particular, only a general similarity of form being retained. This is more a questio of detail and not of main forms. But take one or two examples from domestic architecture, fo instance, the Chateau de Pierrefonds in France, or Castle Fraser, or Craigievar in Scotland, each of them representative buildings of their kind. In all these geometric balance is not adhered to, or it has been deliberately abandoned for something better. We might appeal to countless other instances showing how strongly the mediæval men were opposed to absolute uniformity and equal balance. It was left to the later Renaissance periods to override this natural desire for a certain freedom and variety of treatment in different parts of a building, and to substitute for it a hard and heartless uniformity. The development of this uniformity led almost necessarily to the hideous structures of the end of the 18th and the beginning of the present century, and the consequent destruction of public interest in architecture. In modern French Renaissance, the present-day European style, as it has been termed, it is a canon, that everything should be carefully balanced on a centre line, with, if possible, exact re-duplication of parts; but how delightful to turn from the wearisomeness of the modern French villa, with its ostentation and its pompous falsities of construction, to the English country house of the last 20 or 30 years, or of earlier periods, full of delightful variety and play of invention. The author closed with some remarks on the principle of economy of means. It is the fashion of the day among artists, and the public, to attach an enormous, perhaps an exaggerated, value to what is termed directness and cleverness of "handling" in painting. So far is this the case, that, to some painters, a picture is good or bad according to whether its brushwork is skilful or the reverse. It may be uninteresting in subject, coarse and commonplace in black and white, even more or less offensive in colour, but if its author has fulfilled this one condition of skilfulness of handling, it is, for those we are refering to, a work of art. Now the majority of painters of all countries and of all time are very far from agreeing with this exaggerated view of the matter, but a certain very valuable truth does certainly underlie it, which should not be disparaged. It is the double truth that a good workman should know how to use his tools to the best advantage, and that effect in art of whatever kind should be obtained with careful economy of means. There is moreover, so great a charm about crisp and masterly handling, that the undue exaggeration of its importance is easy to understand. But the underrating of the principle in the past, the poor weak handling which has injured the work of many otherwise great painters, and a simultaneous loss of feeling for the greater qualities and higher aims of art, has led to a reaction and to such an over-statement of the case for "handling," that the skilful spreader of paint almost ousts the artist. If, in painting, economy of means is so

extremely important as to lead to such a reaction in its favour, it may perhaps also be worth while to see whether no parallel to the principle can be found in architecture. Is it not probable that much of the noble and impressive effect of many buildings is due to the economy of means which lies behind their seeming elaborateness—no detail inserted but what fulfils the double object of giving interest near at hand, expressing the construction, and giving richness and power of effect at a distance, no frittering away of opportunities of enrichment in poor and shallow, or in too projecting and overcharged, ornamentation? How many mouldings would be improved by the omission of some of their members? How much ornament is wasted in positions where it is perfectly ineffective? How much time is thrown away upon trivial elaboration, which might have been spent in getting the general forms and details more full of "feeling," and more harmonious in proportion? The architect paints almost as surely with light and shade in his ornament as does the painter in his picture. May it not be well for him to devote the same care to the consideration of the directness and force of his handling as do many painters? Economy of means in pictorial art is not limited to handling with the brush, or the pen; the pencil or the etching needle. It applies quite as much to expression of form and use of colour. A great writer on art goes so far as to say that there is not one speck of superfluous colour in a really great work of art. Be this as it may, it is quite clear that it is easy to ruin a picture by the addition of a single spot of colour in the wrong place. So, too, with regard to form. The over making-out of form is as offensive in a picture as it is untrue. In her most beautiful effects nature usually defines her form with extreme economy, she detaches them here and there with great sharpness and force from their surroundings, but she models them with tones which differ very slightly from each other, and suggests the infinity of creation by leaving parts of them mysterious and undefined. Figuratively speaking, nature teaches the artist the value of economy of means. Without good architecture painting can hardly live. How shall we expect men's appreciation of painting to be deep or vital if the desire for beauty and interest is perpetually blunted by the deadly monotony, or the degrading hideousness of the buildings by which they are surrounded. The great work of making our eyes sensitive to form, and to poetry of surroundings, must ever fall to architecture. How hopeless is it for pictorial art to preach beauty, if at every turn in our towns and cities the need for it is insolently denied. Buildings are ever present, whereas pictures and statues are not. Buildings are, as it were, the national costume of social life. We live in them and amongst them, and cannot escape from their artistic, or anti-artistic, influence. These facts are a close tie between the two arts, and when it is remembered how similar are their aims and ideals, it would seem but reasonable also, that there should be some points of contact between their artistic methods and working principles. Some may say that I have made these points of contact too important, others that I have not traced them far enough; but most will agree that whether you, as architects, can or cannot afford to take a few hints from painting, we, as painters, have, at least, much and lasting cause to be grateful to architecture.

DECORATIVE PLASTER-WORK.

At the Royal Institute of British Architects, on Monday evening, a new departure was made in the first of a series of meetings to be held under the management of the Art Standing Committee for the discussion and illustration of new and revived decorative processes as applied to architectural details. The chair was occupied by the President, Mr. Alfred Waterhouse, R.A., and, despite the inclemency of the evening, the room was crowded. The subject for consideration was "Decorative Plaster-Work," and in addition to four short addresses, a corner of the room was fitted up with a platform, with ceiling above, on which Messrs. Whitcombe and Priestley gave throughout the evening a practical demonstration of the method of working in plaster, which was watched with manifest interest. On the walls and table were shown cartoons of Æsop's fables and panels by Mr. Walter Crane, and photographs of plaster-work and panels by Mr. Walter Smith.

Mr. Edward S. Prior, M.A., in the first paper read, entitled "Design in Plaster," said the material had its own special capabilities and limitations, and if the architect transgressed those limits in his design, the practical worker must, in his interpretation, so modify the idea shown as in effect to re-design the whole scheme himself. Architects were therefore driven to the study of first principles. Unfortunately, the design was, as a rule, left to be interpreted by the plasterer, and it was little wonder how ineffective some of the paper designs by architects were. It was not surprising that some questioned whether the professional man should design the plaster-work at all—it was so much easier to leave the "firm" to do it all. Some would say, let our architects renounce plaster decoration till they learned to design their own work, and so be above all commercial art. This was, however, unpractical, for commercial art was the art of the day. In endeavouring to design, they should first of all bear in mind that plaster was the most impressionable of all materials which lent themselves to the artist's purpose. It did not need to be chiselled like marble or hammered like metal, but the touch of the finger gave it life. Mr. Prior referred, in passing, to the many fine examples of old plaster to be seen in this country, including the vigorous work on the street-fronts of the Ancient House at Ipswich and on Speke Hall, the delicate ceilings and friezes by the Brothers Adam, and the bold staircase ceiling at Ashburnham House, Westminster. Where plaster was employed as a surface for painting upon, its chief recommendation and virtue were its faculty of self-effacement, and half-way between plaster-work proper and decoration came sgraffito. He referred to the eminently satisfactory surface presented by the plaster-work of two centuries ago, and proceeded to urge that, in designing in plaster, the artist must be careful that he had something to express; if not, the work, however elaborately treated, would but show up his emptiness. Sincerity was the chief quality that the designer in plaster needed, and he would do best to go direct to Nature herself to study, provided that he possessed the great gift of selection. The face of plaster presented a clearer field than did any other material for free architectonic effect, there being no joints or breaks to restrict the designer. If the art of designing in plaster was to progress, the architect must not remain dissociated from the crafts, but must take his place beside the craftsman as a fellow artist on the building.

"Stucco Duro, or Modelling in Plaster," was the title of a second paper read by Mr. G. T. Robinson, who confined himself chiefly to an historical *résumé* of the carbonate of lime processes. The recipe given by Vitruvius was still the best given; he recommended that the lime be of the best quality, and tempered a long time before use, and that there be three coats of sand and three of marble dust, so as to render the walls solid. Reference was made to the great revival of the art of working in stucco, which took place in this country in the 15th century, and somewhat later in Italy, where the opening of the Baths of Caracalla by Leo X. in 1515 led to the making of numerous experiments. The work executed by Bramanto Lazzari for Raffaelle, consisting of plaster cast in moulds and set on brickwork, was referred to, and also the work by Giulio Romano, Udino, Primaticcio at Mantua, and others, and the work done by Italian artists for Henry VIII. at Nonsuch Palace, now utterly destroyed, were described in detail. The steady influx of Italian workmen into England continued till almost the closing years of the 18th century. The workmen were being trained up by the Departmental Schools of Art, and for its success the revival of hard stucco only needed the willingness of the architect to put on the blouse and cap of the workman, and associate himself with the craftsman in executing the works.

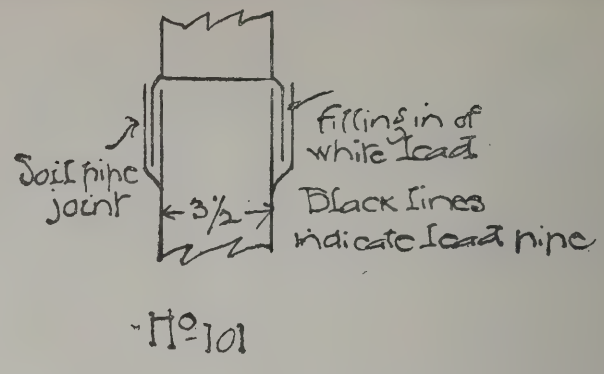
Mr. Heywood Sumner delivered an address on "The Methods of Sgraffito as Applied to Plaster Decoration." Sgraffito was, he explained, quite the simplest form of all plaster decoration, being merely, as the name implied, the scratching off before it had quite set of portions of a surface of a coat of one colour, and overlaying another colour, so as to reveal a design. The lowest form of the art was seen in the making of false joints in a stuccoed wall surface. In sgraffito the artist need not restrict himself to two colours, but could introduce many tints into the surface to be exposed. An example of this was shown in a sgraffito panel, on which a saint's head with aureole was treated polychromatically. Proceeding to describe the process itself, Mr. Sumner explained that a panel to be treated in sgraffito must have the surface well coated with a composition of one of Portland cement to three of sand. On this coarse coat should be laid the colour coat, or patches of colours proposed to be brought out, and of these the composition would be one of Portland cement to one of sharp sand, with one of colour. When this had set for three days or so, it would be ready for the cartoon. On this cartoon the design was drawn, and the outline pricked out by minute holes. The cartoon was laid on it gently and dusted with a pounce-bag, so that the powder passed through the prick holes on to the panel. One could work in two or three colours, if necessary. The assistant plasterer then followed on, and filled up all the space, registers or pins being provided so as to insure that the cartoon should fit in exactly the same place each time it was laid on. The surface or finishing coat was then added. This consisted either of Parian cement, or of 1 of selenitic cement and 1 of Aberthaw lime, or of 1 of selenitic cement and ½ of silver-sand. The cartoon was then again put on and pressed, extreme care being taken where several colours were used below to keep the registers true. While the surface was setting, the surface was cut through at the required places with a set of very simple tools, procurable at Buck's. The more delicate parts were removed by the artist himself, the wider spaces being left to the assistant. As the material was continuing to set it became increasingly difficult to remove, and after the first two or three hours it was quite firm. Mr. Sumner and his assistant gave a practical illustration of the process of removal, the completed panel, a hart reclining within a trefoiled (heartsease) border, being received with continuous applause.

The last paper read was by Mr. Stephen Webb, the subject being "The Proper Treatment of Modelled Work for Plaster as Applied to Ceilings and Friezes." The author remarked that one of the most serious difficulties of the architectural modeller in plaster was that of scale. He must acquire the faculty of seeing his work, not on the easel, but in the situation that it was intended to beautify. This question of scale, or proportion, was of the essence of the problem. The advantage of executing plaster-work in the space it was to occupy was, therefore, obvious; but the practice had its disadvantages—the awkward position on the scaffolding and the numerous draughts in rooms in which the windows had seldom been fitted. It was consequently desirable that the designer should see his work mentally from the first in the place it was designed to fill. If the architect had confidence in his modeller, he first set to work to divide his design—say, for a frieze—into spaces for repetition, endeavouring to bring the large divisions into the angles and other interruptions. The next point was to consider the scale. This was partly fixed by the work itself and partly by the angle at which it was to be viewed. In a strong light it was necessary to avoid high relief, especially in the vertical lines, as these would show most distinctly. Especial care should be taken in any employment of the human figure, as any mistake was readily detected and always disastrous to the effect of the composition. There should also always be a motive for the introduction of the human figure, and this increased the difficulty of dealing with it. As to the decoration of a ceiling, a well-known living painter said in his hearing that this was wrong in principle; for, in the first place, no one would look at it; and in the second place, that if they did look at it, the function of the ceiling—to reflect back the light—would be destroyed. He differed entirely from this, believing that it added to the finish of a room; but the ceiling decorator should bear in mind that only a part of his work could usually be viewed at one time. He must also remember that while the ceiling must be in keeping with the other decoration, resort could not be had to raising the surface or marking the edge, or similar devices. Nothing, he thought, gave such completeness to a room as a well-decorated ceiling; but it should never be self-assertive. Nowhere were reticence and self-repression s necessary. Assuming that it would probably be examined most often by persons occupying an easy-chair, the treatment should be quiet and reposeful. No more shade should be introduced than was absolutely necessary, and much repetition was fatiguing in large surfaces. Speaking

for himself, he had never invented any texture. He believed that if the design was satisfactory, the texture of the surface could be left to itself. Besides working up the surface-texture, another fruitful source of waste of time was the endeavour to give the work the impress of some other man's manner. A man's peculiarities of manner had no sort of artistic or educational value, and it was but pitiful fooling to try to copy them. This manner belonged to an individual as much as did his face, and we might as well take a liberty with the one as with the other.

Mr. J. D. Sedding, chairman of the Arts Standing Committee, remarked that the art of modelling was one that all architects ought to possess, and, owing to the varied tastes of his assistants, his own office was just now, he was pleased to notice, like a workshop. He trusted one of the younger men would strive to gain experience in plaster-work. He was glad to hear it recognised that men ought to design in Renaissance, as well as in Gothic, for architects ought to go forward with open and receptive minds.

Mr. Basil Champneys was glad to see plaster-work brought forward, as the craft had been too much neglected by the profession and the public hitherto. Such séances as the one at which they were assisting that evening must do good, as they fixed attention on the subject.



Mr. George Simmons feared that polychromatic treatment of sgraffito such as the first panel Mr. Sumner had exhibited, was rather transgressing the limits of the proper use of the process. Where white lines were subsequently laid on the outlines, the work must be extremely fragile. The word "repeat" was one he detested in connection with designs; the curse of decorative plaster work was its repetition. In a large room in Harrington-gardens he saw a ceiling with a decorative treatment so pronounced that you could not help looking at it. In a few moments one saw the same little fat boy was kicking up his heels in every direction, and the effect became wearisome. The reason was the public demanded a great effect in decoration at very little cost. In some exhibits in that room all the rules were set at defiance, the planes being disintegrated. In other cases there was a great lack of reticence, and the subjects on the cartoons were spread over the surface in a manner that would be destructive to effect in a panel. He agreed with several of the readers of papers that anything which would bring sculptors and architects into more direct contact would be beneficial to both.

Prof. G. Aitchison, A.R.A., differed from the theory referred to by Mr. Robinson, and which he had heard advanced by Mr. Brett, that ceilings should not be decorated. The idea was utterly erroneous, for nothing gave a room so good a finish as a well-modelled ceiling. To those who had visited Italy, a vast expanse of white ceiling in a room looked as if the occupier had expended all his means before reaching that surface. One of the most important things to consider in designing ceiling treatment was the position of the light. He was surprised to hear Mr. Sumner advocate going directly to Nature for his subjects, for it was surely safer to follow the modifications suggested by the experiences of past ages than to endeavour to deal directly with natural objects. The danger was that, except in the most experienced hands, such work would be either flabby or wiredrawn. Every great artist had gone to Nature, but he always modified it to suit his purpose.

Mr. Ralph Nevill, F.S.A., referred to the effective use in the stone district of Gloucestershire of cast plaster ornament on the stuccoed surface of external stonework. Repetition in ceiling and friezes should be employed as little as possible, a good plan being to combine a certain amount of handwork with patterns. He would say, Do not copy from Nature directly, but modify the treatment in consonance with what was done by older workers.

Mr. Cates moved a vote of thanks to the readers of the papers, to the "silent talkers on the scaffolding" (Messrs. Whitcombe and Priestley), and to Messrs. Sedding and Pite, the chairman and secretary of the Art Committee. This was seconded by Prof. Banister Fletcher.

In replying on behalf of the readers of papers, Mr. Sumner explained that he exhibited the sgraffito panel in polychrome not as an example to be followed, but merely as a specimen of the range of colours obtainable. Mr. Priestley also acknowledged the vote, explaining that the ceiling he and his partner were reproducing was one designed by Mr. Norman Shaw for a house in Queen's-gate; it was elliptical, 14ft. by 18ft. The surface was of lime plaster and Portland cement pricked up, the advantage of having Portland for the keying material being that the ornament could be added at any time after completion, even six months later, by simply wetting it.

No 101

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XXI.

By Banister Fletcher, Jun., A.R.I.B.A.

THE PAVILIONS OF THE VILLE DE PARIS.

Of the two pavilions erected by the Ville de Paris (which have been described under the Champ de Mars Pavilion) which stand symmetrically on each side of the central axis on the Champ de Mars, the easternmost one is of the greatest interest to architects, showing the progress made by the Ville de Paris during the last ten years in the construction of schools, the forming of new thoroughfares, the perfection of the drainage system, and finishing with the great architectural work, the completion of the Sorbonne.

Entering from the south, the first thing we notice are the two erections representing a "maison salubre" and a "maison insalubre." The "maison salubre" is very interesting to architects as being a perfect French house with respect to drainage, ventilation, lighting, water supply, &c. Commencing on the second floor, we notice that one of the rooms (each floor has two rooms, a w.c., and staircase) is lighted with gas on the Wenham principle, let down from the ceiling, the foul air from the gas being led by a duct into a chimney-flue.

In the same room the stove shows that "L'air nécessaire à la combustion est pris au dehors par un conduit ménagé dans l'épaisseur du plancher." It would have been better to have supplied the fire with air direct from the outside; but the fireplace is not situated in an outside wall. This system, which is also adopted in England, they tell us "active le tirage" (quickens the draught); but it also does more—it prevents draughts in the room, and is better in every respect than supplying the fire from the air in the room. In the next room is a "lavabo," with waste-pipe ventilated; but it does not discharge into an open head as it should do.

One of the rooms on the first floor is fitted up as a bathroom, and the principle insisted on by various inscriptions on the walls is that the walls and floor should be covered with a hard, non-porous substance: for this purpose several forms of tiles are shown, and enamelled slate (*revêtement en ardoise emaillée*) is also suggested. The bath itself is an improvement on the ordinary "cased" bath (which is an abomination, as it leaves dark places for the collection of dust); there are no casings, every part of the bath being exposed to view. It is placed on a raised step with a standing-place for the bather, which is drained. The bath is fitted with overflow-pipe branched into the waste-pipe, which is provided with a siphon trap ventilated on its outer side. The waste, however, does not discharge into an open head, as it should do, but is taken direct into a down-pipe. All the pipes are uncovered, and the stop-cocks (robinets d'arrêt) visible and easily got at. The overflow to bath empties into an open channel running along under the length of the bath, and discharges into the open air with a flap at the end. The floor of the bath-room is finished with a hard layer of cement and with a fall towards this channel, which is an improvement on the ordinary wooden. Everything is indicated very plainly, the pipes being coloured as follows:—Cold-water pipes are blue; hot-water pipes, white; ventilation-pipes, green; waste pipes, yellow.

In the room next the bath is a mica-trap ventilator for the exhaustion of foul air at the top of the room, which I doubt whether it would act, as it is placed in the outer wall, and not in the chimney-breast.

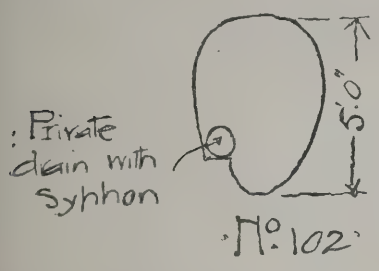
Several kinds of sanitary papers are given, and you are told quite rightly to avoid papers containing arsenic, &c. An electric light is given, which you are told quaintly "ne dégage ni chaleur, ni gaz délétères, n'absorbe pas d'oxygène." The same room is laid with oak parquet and iron tongues, which is recommended in consequence of being easily *démontable* if it is necessary to get to gas-pipes, &c.

In the hall by this room is a draw-off tap (poste d'eau) fitted with a siphon trap, and by the side are sections of the joints of pipes at different angles of junction, showing the "wiping" of the joints, which is, of course, perfect.

The w.c. on first floor is fitted with a combination-seat, as in England, to use as urinal, slop sink, &c. The soil-pipes are in lead, and a small supply-cistern is fitted above. The w.c. is made in porcelain in one piece, with trap ventilated by a small pipe running up inside the house (it would be preferable to have it outside). The supply-cistern gives a discharge of 10 litres, or 2½gals. The vertical soil-pipe is 9 centimètres, or 3½in. diameter.

The joint between the porcelain trap and the lead-coil pipe is made in white lead (it ought also to be cauked with tow, and be covered with a strong indiarubber covering band). The great lesson instilled is that the stop-cocks to all the supplies are visible and accessible, in order to be turned off if a leakage occurs.

The ground floor contains a court, and from this entered the servants' w.c., which has no seat, but is provided a standing place, all being made in glazed porcelain. The inspection chamber (*regard de visite*) is reached from this court, and is in half-pipes, with cement bottom, rising to the inclosing walls at an angle of 60°. The jointing to the vertical soil-pipe is as following sketch (No. 101), and makes a capital joint:—



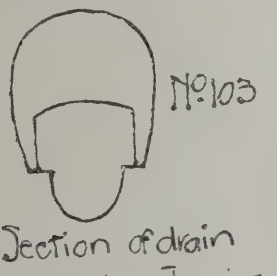
The bath, &c., waste-pipes discharge into a gully just below the ground level and between two movable gratings, whose bars are placed in an opposite direction to prevent anything getting in and blocking up the horizontal drain

The scullery has a tiled floor sloped to a channel, which empties itself into a gully to admit of the place being thoroughly cleaned down occasionally, "à grande eau." This is a very good idea, and one which ought to be more generally followed in England.

There are also shown three lavatory basins emptying into the same waste, each siphon ventilated into a vent-pipe common to the three basins. Some well-executed joints are also shown.

Basement.—The drainage system in the basement is interesting, and in many respects differs, and is superior to the English system. The method is as follows:—The house drain, running into the public sewer, is not covered up, but is placed at the side of the egg-shaped section walking-way, 5ft. high, which runs from the basement to the main sewer (No. 102). This is called the "conduite d'évacuation," and at the point where it leaves the basement are placed the compteur (meter) for gas, ditto for river water, ditto for spring water, with stop-cocks to all the supplies to the house for cutting off water, &c., and the ventilation to the house-drain is

carried up at this point. The top to the siphon to the house-drain unscrews (as in England), in order to clean out or in case of stoppage. This is a most perfect system of arrangement, for in order to get to the drain to examine there is no



cutting away required. All can be got at from this point, entered from the cellar.

This is exceedingly well shown, everything being life-size.

Outside the "maison salubre" the house-drain and "conduite d'évacuation" described above are shown running into a public drain, of the type known to the Paris municipal engineers as "No. 12 bis" with channel and footway at the side (carmeau et banquette). This drain is 7ft. 6in. high. At one end of this public drain is shown the "reservoir de chasse" (flushing tank) which empties itself at intervals. The hand-cock for shutting off the water is also shown, and the inclosing wall to the private drain. Also the supply-pipe for spring water and for river water, which are always exposed in case of a leakage, and which run at the top of the "conduite" leaving the house, one on each side. A grating is shown at the bottom of the "conduite" to prevent anything getting into the house-drain.

The "maison insalubre" need not be described. Paris itself contains several of this class, for the Parisian drainage is far from perfect, especially in the old quarters of the town. There are, in fact, three drainage systems in Paris: (*a*) Cesspools; (*b*) tinettes (or iron containers, emptied periodically—these are very general); (*c*) the system of "tout à l'égout," which is the English system, and which is only used in certain quarters of Paris.

The "Maison Insalubre" contains several methods of sanitation by M. Le Perdrieux, and there are models of everything insanitary, and some old D-traps are shown, and badly-jointed pipes. The two houses are well-arranged to show the "masses" what to do in the matter of

sanitation, and ought to teach the French people valuable lessons.

There are also large diagrams of healthy and unhealthy houses. Plans, books, sections of different kinds of drains follow, some showing the method of running the "cleaning engine" along the drain on rails made for the purpose, which has an underneath part to the shape of the bottom of the drain, thus cleansing it.

A drawing of the public entrance to the drains in the Place du Châtelet is also shown, and I should advise every one when visiting Paris to "do" the sewers.

The different forms of Paris sewers all take after the egg-shape section; they contain two supply pipes for water, which are hung from above (one from river water, the other from spring water).

The plan of the Paris sewer system is quite a study in itself.

I noticed that the junction of the lead water supply pipe with the main iron service pipe was formed by iron bands, with reverse screws clipping the two tightly. The walking way from the drain to the "maison salubre" is 18in. wide (No. 104), and runs along one side only. Plans

of the Paris drainage system in 1837, 1854, and 1878 are given, and show the enormous increase that has taken place.

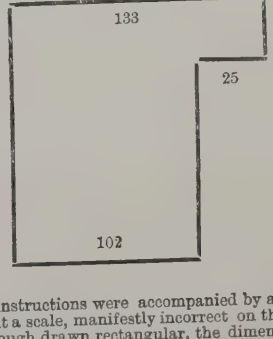
The interesting collection of paintings of old and new Paris are given, and a model to 0·02c. to the mètre of the famous "Carrieres des Maréchaux," the sandstone quarries belonging to the Ville de Paris, and of which the Parisian houses are built.

The interesting collection of drawings and buildings executed by the Paris Municipality are given under the head of "Ville de Paris Pavilion Drawings," along with the other architectural drawings.

Near the "maison salubre," at the other end of the pavilion, is a Parisian lamp-post (why cannot we in England have artistic lamp-posts?—they are just as easy to cast as badly-designed ones) used as a "station manométrique" for measuring the compression of water in the supply pipes with which it is of course in communication.

The west pavilion contains students' works from the "Ecole Municipale Professionelle de Paris"; apparatus in connection with help to the drowning undertaken by the municipality; the exhibits of the Paris Fire Brigade, and also in connection with the teaching of drawing, &c., in the municipal schools.

WHITEFIELD TABERNACLE COMPETITION.



As Mr. Woodward could not bring the question of the award in this competition before the notice of the Institute on the 17th ult., he agreed with the assessor, Professor T. Roger Smith, that they should refer the matter to the decision of the President, if he were willing to undertake the service, and publish his decision. The President, having acceded to this proposal, arranged a meeting with the foregoing gentlemen, and the following is a copy of his decision:—

WHITEFIELD TABERNACLE COMPETITION.
20, New Cavendish-street, W.
9th Dec. 1890.

Gentlemen,—At our interview on the 28th ult., Mr. Woodward stated his objections, with a view to the interests of the profession, to Professor Smith's award, and the Professor offered his explanations in defence of his action in the matter. It now becomes my duty, in accordance with my promise, to express the opinion I have formed on the merits of the case.

I should premise that I have arrived at my decision on the questions at issue without seeing or considering the merits of the various designs.

It appears, in the first place, that the instructions to competing architects were not prepared by a professional adviser, and contained a clause limiting the cost to the sum of £15,000, which, as Professor Smith, the assessor appointed to report on the plans, rightly points out, appears inadequate for the purpose. That, in the second

place, the instructions were accompanied by a plan of the site without a scale, manifestly incorrect on the face of it, because though drawn rectangular, the dimensions of the sides running N. and S. do not agree. It further appears, from Mr. Woodward, that one, at any rate, of the competitors inquired at headquarters what he was to do under the circumstances, and was told by the representative of the secretary that he was "to stick to the dimensions figured on the plan"; while, on the other hand, the assessor was informed by the secretary that one or more other competitors who made similar inquiries were told that, as no further instructions could be given, they must act in the matter as they thought best. They, therefore, went to the site itself, and found that the frontage towards Tottenham Court-road actually measured 108ft., which exactly tallied with the difference between the two other dimensions at the back of the site. They accordingly made their designs fit the actual site. One of these designs was that selected by the assessor for the first place in the competition. Mr. Woodward's contention is that though the assessor had stated that the sum to which the competitors were limited, was not, in his opinion, adequate to carry out the work in a worthy manner, and though the plan was incorrect, it was nevertheless his duty to have rejected at once every design the cost of which did not conform to the instructions, and the outline of which was not kept within all the dimensions figured on the plan issued to the competitors.

Now, after a very attentive consideration of Mr. Woodward's arguments, I confess, though I am fully sensible of the difficulties peculiar to the case, which seem to me to preclude an entirely satisfactory course of action on the part of the assessor, I do not agree with him in his conclusions, as they would practically have rendered the competition abortive. As the assessor points out, it is impossible to pronounce authoritatively on the question of cost. All an assessor can do is to form his own opinion as to the probable cost of the respective designs, and to let that opinion have full weight in his decision. In this case he informed us that, though, according to his estimate, the design of his selection would probably exceed the limit by about 11 per cent. (a subject, however, on which he could not pronounce authoritatively), it was one of the least expensive of the series.

With regard to Mr. Woodward's second objection, I am of opinion that, had I been a competitor, given a manifestly faulty plan, I should probably have done what the successful competitor did—sought information on the subject; and that being refused, should have measured the site, and, finding that such measurements satisfactorily corrected the plan, I should have adhered to them. And had I been the assessor, I should probably have not rejected designs so prepared, especially if I had seen, as Professor Smith assures me he saw, designs on the restricted site which he preferred as designs, but which he was obliged to set aside on the score of cost.

I cannot withhold my opinion that the decision has an unsatisfactory aspect; but I entirely attribute this to the nature of the instructions issued before the assessor was appointed.

In coming, therefore, to the conclusion to uphold Professor Smith's award in a very perplexing case, I would put it most earnestly to future competitors to urge upon committees the absolute necessity of choosing their assessor at an early stage, so that the instructions, and the plan of site accompanying such instructions, may be sent out under his supervision, when probably awards would be arrived at which would not call forth the censorship of those who are anxious for the fair repute of competitions, to which we are in so many instances doomed at present.

I am,
Gentlemen,
Yours faithfully,
(Signed) Alfred Waterhouse.

Professor T. Roger Smith and W. Woodward, Esq.

SCHOOLS OF ART.

The Camden School of Art.—The annual distribution of prizes at this Government district school of art took place at the school premises, 4, St. Bartholomew-road, Camden-road, on Saturday night. Mr. Richard Chamberlain, M.P., who presided, congratulated the school on its success during the past year, remarking that whereas the number attending had been about the same as in the previous year, the number of prizes and certificates gained had increased from 140 to 168. The increase had been mainly in the higher branches of art. Sir Philip Cunliffe Owen, in addressing the students, said that this school had the highest reputation with the authorities at South Kensington, and he was glad to find that one of its chief points was the study of design. Some of the best designers of the day were now to be found in English schools of art, and we had not now to go to France for our designs. Students in these schools now had a very promising future before them as regarded remunerative work, not only in this country, but also in France.

The Royal Female School of Art.—The annual distribution of prizes to the students of this institution was made on Tuesday at Mercers' Hall, Cheapside. The 31st annual report stated that during the past year 172 students received instruction in art, and that on the 8th of April 517 works were forwarded to South Kensington for examination and competition for awards. The Duchess of Rutland distributed the prizes, the chief recipients of which were: Alice Mabel Hoke and Rosie Cordelia Whiteside (the National Gilchrist scholarships of £50); Hariot Dunnell (the Atkinson scholarship of £25); Alice Langford (the Clothworkers' scholarship of £50); Ida Marion Kirkpatrick (the Queen's scholarship of £60), and Helena Evans (the Queen's gold medal).

WAYSIDE NOTES.

IN the current number of the *Nineteenth Century* there is an appeal by Mr. Frederic Harrison for the return of the Elgin marbles to the Greek nation. This appeal having been seconded by an article in the *Standard* early in the month, the hopes of the Hellenes have been raised in anticipation of possible repossession of these really priceless sculptures. The *Standard* correspondent writes from Athens, on Tuesday night, to the effect that the appeal and the subsequent article have revived a grievance which has been practically dormant for over half a century. For the last fifty years the Greek nation has had all its spare energies fully occupied in endeavours to maintain its independence; but having lately settled down into a condition worthy of some respect, is prepared to look after matters of a more domestic character. Its condition with regard to the Elgin marbles question may have been comparable to that of a lighted match to a barrel of gunpowder. A writer in the *Nineteenth Century* holds the match and the gunpowder explodes.

The disappearance of the Elgin marbles from the galleries of the British Museum would be a national artistic calamity. This must be evident to all. It may require an accomplished sculptor to appreciate their full glories of line and form, of composition and workmanship; but the nobility of conception and the divine grace in the figures represented must be apparent to even a casual observer having either a modicum of good taste or a limited measure of cultivation. What the young artistic world would do without the marbles it would be difficult to say. The loss would be irreparable. It is certain that the claims of the Greek nation on the sense of morality of the English people rest upon some foundation. Lord Elgin, the Greeks would argue, purchased the marbles of an invader of Greek territory, and thus, though bought for a price, the payment was not made to the rightful owners. Contemporary opinion at the time when the fragments were removed to this country was often adverse to the removal, even passing over Lord Byron's denunciation. It has been said that the sculptures are better preserved at the British Museum than in Athens; to which the Greeks reply, that though in the days when the country was overrun with Turkish troops this might have been a forcible plea enough, it does not hold good now that the nation is independent and consolidated.

Anyhow, it would seem that the Greek nation is prepared to make the most of a prospect of a revived controversy on this subject, and to avail itself to the full of the appeal to the British conscience. The keenest interest is aroused, and the question, says the *Standard* correspondent, has now gone beyond the stage of discussion, and entered that of action. The Municipal Council of Athens has decided to make a formal appeal to the British Government and Parliament for the return of the marbles. The Greeks already look forward to the result of the petition with some degree of hope. They have confidence in the sense of justice of the English people, and, says the correspondent, if they are not disappointed, there will be a strong revival of their former enthusiasm for England.

We shall like the enthusiasm of the Greeks; but we also are strongly attached to the fascinating beauty of the Elgin marbles. The matter will now probably come before Parliament. There will be discussion on the subject: some will hold that "possession is nine points of the law"; others will say that we are under a moral obligation to Greece to return the sculptures. Let the matter be judged impartially. If it be shown that the Greek nation cannot fairly expect us to make the sacrifice, and that the marbles are of more true service to humanity in their present position, let them remain: but if it can be clearly demonstrated that the English people are morally bound to return them forthwith, in order that the public conscience may be clear and serene, then whatsoever pangs and regrets it may cost the artistic world, let us cheerfully give to their rightful owners these gems of the old Parthenon.

All will be glad to hear that Dr. Schliemann, who lately underwent an operation on the eye at Halle, is now quite recovered, and is returning by way of Berlin and Paris, to the scene of his excavations in Greece.

The Commission appointed to inquire into the condition of Westminster Abbey, although no report has yet been published, have issued a blue-book wherein will be found much matter of interest to archæologists, and, indeed to many others. Accounts of the witnesses examined will be found therein, and the statements of the clerk of works to the Abbey, and of Mr. Pearson, the architect to Mr. Shaw-Lefevre's Campo Santo scheme, will prove of interest. Mr. Pearson seems to have two plans for affording further accommodation for the monuments—the great question at issue. One would be the erection of a new north aisle connected with the west end of the church and with the north transept, and would include side chapels for the display of monuments. The other scheme would provide the desired accommodation on the other side of the Abbey, necessitating the pulling down of old buildings in Palace-square, and were this plan carried into effect, views of the Chapter House would be opened. It not being good form to comment on matters under the consideration of Royal Commissions, I say nothing as to these schemes further than that I feel convinced, should either the one or the other be carried out, the architectural profession would be of one voice in the matter.

The special A. A. business meeting held on Friday last for the alteration of the rules is adjourned—says the card I have received from the hon. secs. of the Association—till Friday next (to-day), the 19th inst., at 7 p.m., when the consideration of the new rules will be continued. I hear from my friend, whose perseverance bespeaks the honesty and earnestness of his intentions, that last Friday's meeting decided on ballot papers, and that Mr. Cole A. Adams has raised a question of a two-thirds majority, which will be contended for. The rule as to the continuance of the half-guinea subscription for old members is not yet decided, but will be considered to-night. There was some difference in opinion as to whether this should come under the heading "Constitution" or "By-laws." The former, I should say, certainly. "Who wants it altered when it is settled?" asks my correspondent, referring to the argument that if under "Constitution" it would be difficult to alter.

I am always ready to give our dear friend, Mr. Buggins, a tip—a "cert," or "sure thing"—because he so frequently affords me a serviceable illustration wherewith to point a moral. Here is a really good thing:—Owing to the erection of the L. and S.W.R. Company's new works at Eastleigh Junction, Hants, building operations have been proceeding on an extensive scale, and it is believed that two years hence the population will number at least 10,000.

Frost and snow has kept the bricklayer idle for weeks, and with the bricklayer in enforced idleness, other trades get slack in sympathy. Yet, it is pleasant to learn from a memorandum prepared, officially, for the *Board of Trade Journal*, that the number of unemployed has increased but slightly with the past month or so. "The demand for skilled labour remains remarkably good, even in those trades most affected by weather influences. The building trades are perhaps most susceptible to these causes of depression; but during the month the proportion of unemployed has only increased from 1·4 to 1·8, which is very low indeed." This is reassuring; yet I venture to think that even the difference between ·4 and ·8, insignificant as it appears to the mathematical eye, represents a considerable amount of shivering and starvation and general human misery.

A venerable F.R.I.B.A. in a generous after-dinner mood, has bet me half-a-crown to sixpence that I cannot drive a nail into the mortar of some brickwork in a building he erected during frost some 25 years back. Unfortunately, for several reasons, I cannot respond to this, but perhaps someone would like to take it on in my stead?

I hardly know what your correspondent who slates by the acre wishes to impress upon me or your readers by his letter in your last issue. I thought at first that "A. H." desired to demonstrate that I was ignorant of the fact that the slater graduates the slating of a roof; but as every intelligent architect's office-boy knows that neither the quarry owners nor their agents send out slates in assorted sizes like a conjuror's nest of boxes, I conclude he will admit the possibility of my also knowing the fact, or, at least, of having a suspicion of the truth! So I take the letter in good part, and if there is really any discrepancy in my "Notes" of a fortnight ago, and anything displaying knowledge of slates and slating inferior to that possessed by your correspondent, I crave lenient treatment from all, because I have never had in my bills of quantities:—"7 acres 0 roods 23 perches super. blue Bangor slating," &c., &c. My own modest slating with Welsh slates has ever had, perforce, that sleek appearance of which I complained. Were I to slate in acres, I would endeavour, as your correspondent has done, to improve the quarrymen's ideas, though I doubt not but that I should be, if anything, less successful than he.

A Merry Christmas to all! I had some thoughts of launching into poetry on the subject; but my poetic researches have utterly failed to produce anything in verse equal to the magnificent effusion of last year, which led to such an unprecedented run on the "B. N." that the Strand was blocked for hours, and, consequently, the whole business of the City thrown out of gear. I have essayed several couplets on the festive season, but I find no afflatus works within me. So, notwithstanding the loss that will ensue to the proprietor of this journal, I am reluctantly compelled to forego poetry and return to prose. A Merry Christmas—a Merry Christmas!

GOTH.

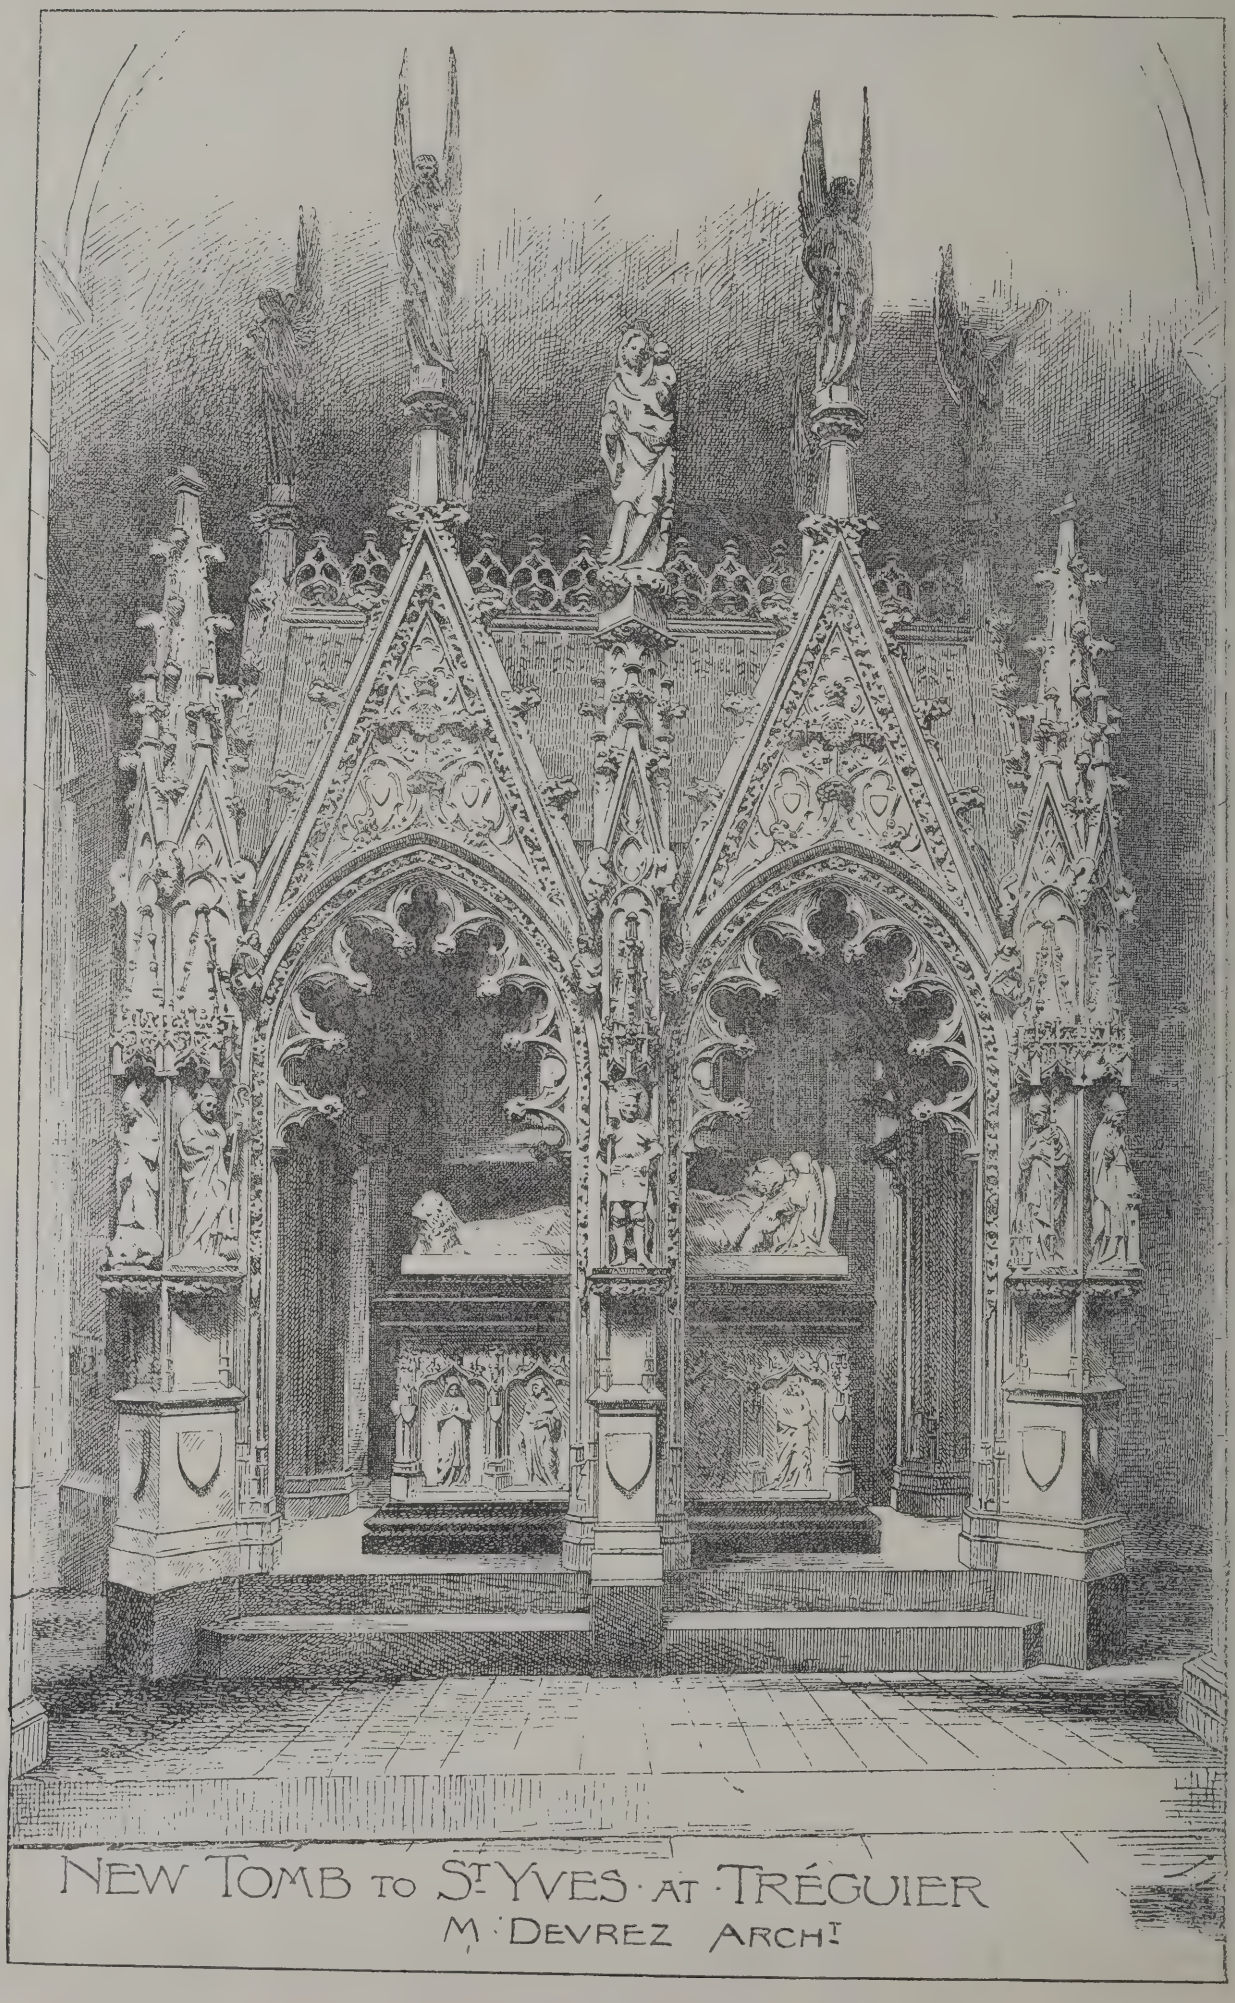
CHIPS.

The work of widening Bridge-street, Warrington, has been completed by the opening this week of provision shops at the Friars'-gate end. The last two shops have been built by Messrs. Gibson and Son, from designs by Alderman Wright, Sankey-street, Warrington, who has acted as architect for the whole block of buildings from Friars'-gate to the Roebuck Inn.

The late Mr. R. D. Catchpool has left to the Corporation of Colchester the sums of £3,000 for the purchase of a public park, and £1,000 towards the formation of a free library in that town.

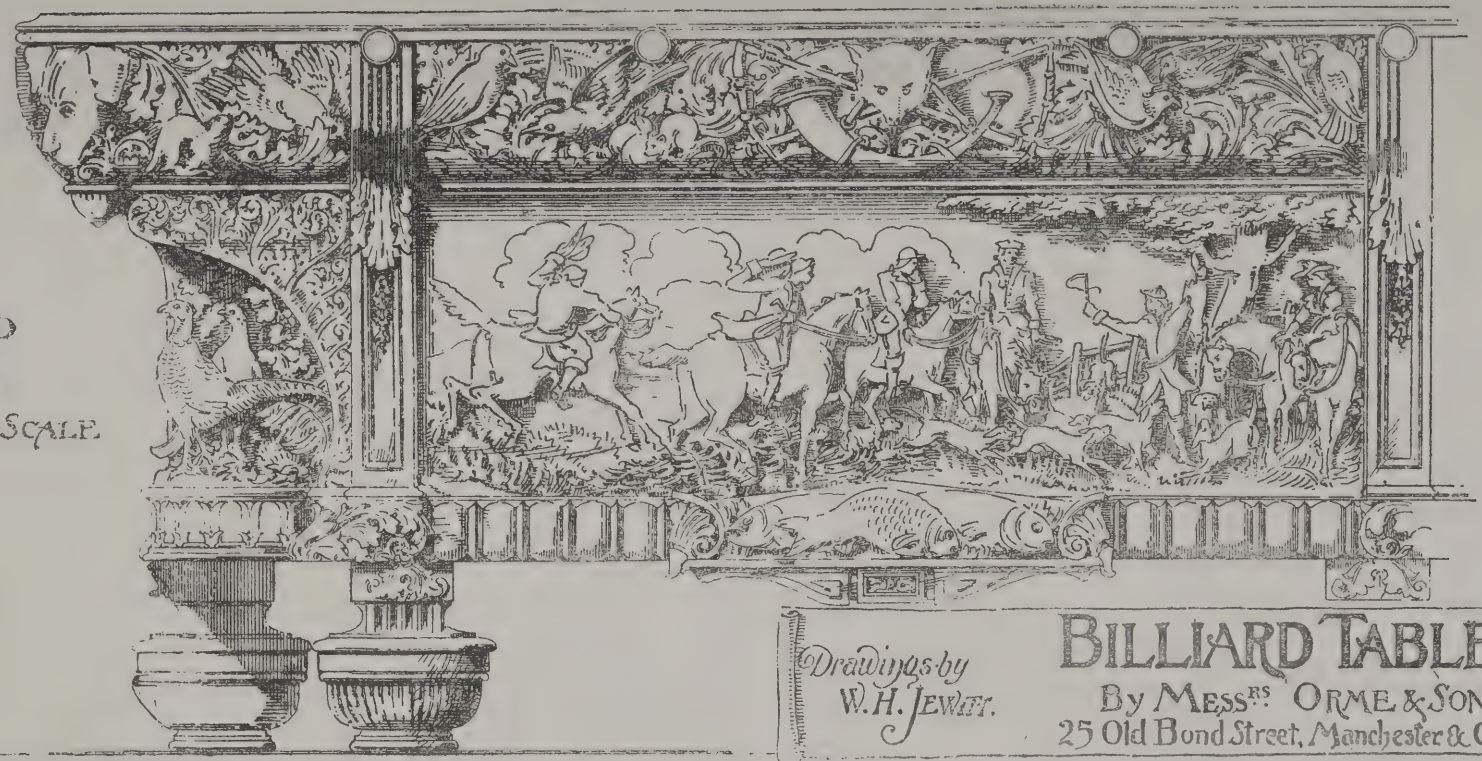
The Aberdeen granite business of Messrs. James Wright and Sons was exposed for sale on Friday at the upset price of £8,000, and purchased by one of the partners for £14,450.

At the York Consistory Court on Friday a faculty was decreed to the incumbent and churchwardens of St. Paul's, York, to enlarge the chancel, fix new choir seats, build a new choir vestry, take down the organ in the gallery, and refix it at the north-east corner, remove and refix the pulpit, and make other alterations. Messrs. Demaine and Brierley, of York, are the architects.



The town council of Tewkesbury have adopted plans by Mr. Medland for the enlargement and improvement of the town hall.

The Basford Union Hospitals, Nottingham, are warmed and ventilated throughout by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.



A new workmen's institute is about to be built at Moreton-in-Marsh, at a cost of about £1,600. Mr. J. F. Curwen, Kendal, is the architect, and the work has been intrusted to Mr. Alfred Groves, builder, Milton-under-Wychwood, Oxon.

There has recently been unveiled in Fairmount Park, Philadelphia, U.S., an equestrian statue of Joan of Arc, by M. Frémiet. It is a repetition, with some variations, of that bronze statue of the heroine which has long adorned the Place des Pyramides in Paris.

An inquest was held at Northallerton on two days of last week on John Mattison, 44, mason, of Richmond, who died from injuries sustained by the collapse of scaffolding. The contractor for masonry, Matthew Metcalfe, deposed that, assisted by deceased and another man, he erected the scaffolding, and thought it was perfectly safe. James Willoughby, builder and contractor, of Northallerton, said he had examined the scaffolding and building and he found it a very unworkmanlike piece of business. The footlogs were pieces of old timber, the majority of the poles were completely rotten through. It was totally unfit to occupy the position it had been placed in. He considered that the present scaffolding was not safe. The jury returned a verdict of "Accidental death," but added that there had been "great negligence on the part of the contractor (Metcalfe), but that the negligence was more of an error of judgment than anything that would have incriminated him."

GARDEN HOUSE, THROGMORTON AVENUE. — CINCINNATI ARCHITECTURAL CLUB DRAWINGS AND SKETCHES.—NEW TOWN HALL, SUNDERLAND.—PROPOSED MEMORIAL CHURCH AT COLSTON BASSETT.—SOUTH DOOR, ST. HELEN'S CHURCH, BISHOPSGATE.—DETAILS OF DOORWAY AT THE AMBER PALACE, LAHORE.—A BILLIARD-TABLE.—NEW TOMB TO ST. YVES AT TREGUIER.

Our Illustrations.

GARDEN HOUSE, THROGMORTON-AVENUE.

We give an illustration this week of a large block of offices just completed in Throgmorton-avenue. This building occupies a frontage of 142ft. next Throgmorton-avenue, and a short return frontage of 30ft. next Austin Friars. The site on which the building is erected belongs partly to the Carpenters' and partly to the Drapers' Companies, and is the last portion of land hitherto unbuilt on in Throgmorton-avenue, and which formerly formed a part of the gardens attached to the halls of the Carpenters' and Drapers' Companies. The entire fronts are faced with Portland stone. The first and all upper floors are planned for the occupation of the eminent firm of solicitors, Messrs. Ashurst, Morris, Crisp, and Co., and their strong-rooms are in the sub-basement. Portions of the ground floor and basement have been let to the International Financial Society, and have been suitably fitted for their occupation by their architect, Mr. E. A. Grüning. The remaining portions of ground floor and basement are not yet occupied. The sub-basement will be used for strong-room purposes only. A passenger lift traverses the entire building. The floors generally are fireproof, and the fittings of the best class. The architects are Messrs. Davis and Emanuel, and the builders Messrs. Colls and Sons. The work throughout is a successful example of the best class of City work. The passenger lift has been executed by Messrs. Archibald Smith and Stevens. The artistic wrought-iron inclosure to this lift, which passes up the well-hole of the staircase, has been executed by Mr. J. Caslake, and we illustrate a portion of this work, which is of a very successful character. The tiling to the staircases also deserves mention as being a successful combination of colour, and was executed by Messrs. Doulton and Co. The building throughout has been piped for gas and wired for electric lighting by Messrs. Strode and Co., and the fittings supplied by them are of satisfactory design. The principal staircase was executed in concrete. Mr. Gearing, the general foreman of Messrs. Colls and Sons, has superintended the work throughout, and credit is due to him for the way in which he has successfully carried out many troublesome matters of detail.

SELECTIONS FROM THE CINCINNATI ARCHITECTURAL CLUB EXHIBITION.

This sheet of reproductions which we give to-day from the exhibits at this collection of architects' drawings and sketches is exceedingly interesting, showing as it undoubtedly does the typical methods so characteristic of American draughtsmanship, of which we have a few successful imitators here. We have to thank the hon. sec. of the exhibition committee, Mr. A. O. Elzner, architect, Cincinnati, for the facilities afforded us by which we are enabled to bring our selection of reproductions before the readers of the Building News. The catalogue of the exhibition is quite a work of art, and got up in a style and with a finish quite unknown in this country. The cover, a rich, warm-red terracotta vellum paper lettered in gold, is not disfigured with imprints and advertisements. The ample use of margins and capital paper shows off the subjects illustrated to great advantage. We can only speak of the production in these general terms; want of space prevents our enumerating the illustrations in detail. Turning briefly to those herewith arranged on our plate, we have first a very American-looking chapel for the First Congregational Society, by Mr. Wm. Martin Aiken, architect, Cincinnati, with round towers, and a portal arcade of semicircular arches under a rose window of the main gable. Of a later type of work is Mr. G. W. E. Field's City Front, Cincinnati, next to the last. The Old Gateway, sketched by Mr. Claude Bragdon, Rochester, is boldly treated, bright, and telling; and Mr. F. H. Bacon has shown what a few masterly lines will do in his study of the Greek Exedra, situated near the Temple of Apollo, in the island of Delos. These seats, which formed part of the ancient baths and other buildings, were used for conversation by the visitors. The washed drawing of a small Altar under a Baldachin from St. Mark's, is by Mr. J. A. Schweinfurth, of Boston. Mr. J. Wilson Eyre, jun., is the author of a "Fountain in a Blank Wall," with the pent-roof over, and another clever sketch by Mr. Claude Bragdon, from Hildesheim, concludes the subjects on our plate. Will such an architectural exhibition and such an illustrated catalogue ever be possible among our English architects in London?

SUNDERLAND TOWN HALL.

The architect of this building is Mr. Brightwen Binyon, A.R.I.B.A., of Ipswich, whose design, submitted under the motto "Stabilitas," was awarded the first prize of £100 in competition, on the recommendation of Mr. Alfred Waterhouse, R.A. The builders are Messrs. E. H. and G. Allison. The foundation stone was laid Sept. 29th, 1887. The buildings are in the Italian Renaissance style, and are 150ft. long by 90ft. broad, with an average height of 46ft., and a height to the top of the tower of 140ft. Stone and brick are the materials used in construction. The plan is a simple rectangle, as will be seen from the figures just given, about twice the length of its breadth. On three sides a good light is obtained, but on the fourth, or north side, there is a blank wall where some day other buildings, it may be expected, suitable to the surroundings will abut. The offices are ranged round these three sides with a corridor, and inside that again are two spacious well-ways for light, with a grand central staircase between them. The result of an arrangement as simple as it is effective is that the corridor is beautifully light, and ready access is obtainable from one part of the building to another. In the centre of the Fawcett-street façade the tower is placed, 140ft. high and 20ft. square, finished at the top with a cupola dome and lantern. In the middle of the tower is a clock. The centre of the dial is 85ft. from the ground. The clock has four illuminated dials of skeleton cast-iron frames to form the circles, figures, and minutes. These dials are 8ft. 6in. each in diameter, filled in with white opal glass. The large going wheel is 16in. in diameter, and has Lord Grimthorpe's maintaining power to keep the clock going during the time of winding up. It has also his double three-legged gravity escapement, with a 1½ sec. pendulum, compensating for variations of temperature, with zinc and iron tubes, and steel rod through the centre. All the barrels are of iron, with patent steel cords. The main wheel for striking the hour is 21in. in diameter, with cams attached or fixed on it faced with steel, to raise a hammer of the proper size for striking the hours on the large or tenor bell, which weighs nearly 4 tons. The hammer weighs about 2cwt., and is fixed in an iron frame and pivoted in, with wrought-iron shaft and hardened and tempered check-spring. The main wheel of the Cambridge or Westminster quarters is about 22in. in diameter, with cams attached for lifting the hammers for chiming on the four quarter bells. The first blow of the quarters is struck exactly at 15, 30, and 45 minutes past the hour by special mechanism, first introduced by the makers, Messrs. Wm. Potts and Sons, at the Cathedral, Lincoln, and since then at Rochdale, Dewsbury, Burnley, and Bolton Town Halls, the clocks for the South Shields Corporation, and Hexham Abbey clock, and the church clocks of Ryton and Wylam-on-Tyne. The hours are let off independently of the quarters, and at the hours the first blow of the hour-hammer denotes the correct Greenwich time. There are also two index dials inside the clock chamber, one showing the seconds and the other the minutes, for the purpose of setting and adjusting the outside hands, weights cast in slips, and everything requisite and necessary in a first-class clock. The whole reflects great credit on the makers, Messrs. Potts and Sons, of Guildford-street, Leeds, who are also the makers of the Central Station clock. The tower affords a good opportunity for ornamentation, of which the architect has fully availed himself. As probably the tallest object in Sunderland, it affords a splendid view of the coast and inland for many a mile. The entrance to the building is approached by steps to the ground floor. The doorway is arched. On either side dwarf pilasters and massive twin trusses support an overhanging balcony with a beautiful central window, the whole being surmounted by a noble entablature and pediment enriched with cantilevers. The front is well balanced at either end by an elegant arrangement of columns inclosing three arched windows, and having a cornice and parapet finished with dormer windows and pavilion roofs. The same feature is repeated at the corners next Athenæum-street, contracted in width by the omission of one bay. The whole of the ground floor is of polished ashlar, with rustic joints, the 4ft. base being finished with rock-faced panels. The street fronts are enriched by pediment and medallion sculptures, carved panels, and floriated capitals to columns. The internal arrangement of the building has been carefully planned to meet the requirements of the different departments. Three of these are on the ground floor, namely, that of the borough accountant, to which is united the rate-collecting department, the borough engineer's department, and on the west, or railway-station side of the building, the health department. The first floor is occupied by the offices of the Town Clerk, two committee rooms, the Mayor's Parlour, and two council chambers, the larger one of which is also suited for an assembly and general meeting room. There are two main entrances. The Fawcett-street entrance passes under the tower, and the Athenæum-street entrance is near the railway-station. A back entrance is also provided, with access from an arched passage entering the building behind the public health office. It is connected with a staircase from the basement to all the floors, and is so planned that the public attending council meetings or going to schools of art, on the second floor, can be shut off from the rest of the building — a device which we believe, strongly recommended Mr. Binyon's plans to the favourable consideration of the corporation. From the main entrance we pass into a vestibule, the size of the tower, 20ft. square, and thence to a spacious hall and staircase, which, with its central flight rising straight in front of the visitor as he enters, produces a very pleasing effect. The balustrades of the staircase are modelled in faïence ware, and together with the tile dado, give a warm and rich effect of colour, which is further enhanced by contrast with the colour tints of the stonework. Stained-glass windows and a carved ceiling with decorated panels of enamelled iron, add to the richness of effect. On the left side of the entrance are the borough accountant's offices, and on the right the borough engineer's office. Immediately adjoining is the general office, 33ft. 6in. by 22ft. 6in., all facing Fawcett-street. In the rear of the latter is the engineer's department, the spaces being divided by wood and glass screens, and partitions arranged for the several officials, and adjoining the back street are the cloak-room and the sanitary arrangements. Immediately at the back of the grand hall and staircase is a private office for the medical officer. On his right is the laboratory, and on his left the inspector's office, the back staircase and entrance dividing the public office for the scavengers' superintendent, &c., from the above. Returning to the entrance-hall, we have the accountant's

department—first the private office on the left hand, then the clerks' office filling up the space to Athenæum-street. The large room between these and the entrance is 31ft. by 29ft., and is for the rate office, which is entirely lighted from Athenæum-street. On the first floor we are landed from flights of stairs on either side on to a spacious corridor, which is lighted from the open areas, and in the centre, under the towers, we find the deputy town clerk's office, on the left the town clerk's office, then a waiting-room and cloak-room. In the south-east angle is placed the mayor's chamber, 22ft. 6in. by 21ft., with two fronts, which is thus well lighted; then the ante-room, 19ft. by 21ft., and the council-chamber, 44ft. by 31ft., all lighted from Athenæum-street. Returning to the centre, we have, on the right, the town clerk's general office, 30ft. by 22ft. 6in., and at the end from back to front is the art gallery or reception-room, 77ft. by 33ft., having an area of 2,541sq.ft., and lighted by ceiling lights. Between it and the staircase in the rear are three committee-rooms, approached from a corridor round by the art gallery, in which also are placed the sanitary arrangements. On the second floor are the school of art premises, approached from the back staircase only. This department is at the end facing Athenæum-street, and the sanitary exhibition rooms embrace the tower and Fawcett-street front as far as the art-gallery roof. The back or private staircase also gives access to the caretaker's rooms, which are over the committee-room. In the rear of the main staircase, at the end of the art gallery, is a kitchen, with lift, &c., for public entertainments and banquets when held in the reception-room. The basement floor has a variety of spaces and rooms, which seem well lighted from the open areas, the main apartment, marked Ballot-room, being under the rate offices, and the large store-room required for the voting-by-ballot fixtures and boxes is under the engineer's offices. The workmen's pay-offices, coal-chamber, sample-room, store-room, and heating-chamber, &c., are well arranged at the rear, gaining light from the areas placed in the back street. The sculpture and stone carvings have been executed by Messrs. Sidney W. Elmes and Son.

COLSTON BASSETT, NOTTS.—PROPOSED MEMORIAL CHURCH.

Our illustration shows one of the designs sent in (in a limited competition) for the erection of the new Memorial Church, which is proposed to be erected at Colston Bassett, Notts. This was the accepted design, conditionally upon the work being carried out for the sum named in the competition. It is proposed to erect the church with rock-faced Coxbench stone on outside, with fine Hollington stone for all external dressings; the inside to have hammer-dressed Coxbench ashlar, with Ancaster or Bath dressings; the columns carrying nave arches to be in white Mansfield stone; and for all steps, paving, &c., blue Yorkshire to be used. The roof will be covered with best pressed Staffordshire tiles, and oak-block flooring to floors of nave and transepts. Mr. Arthur W. Brewill, of Nottingham, is the architect.

SOUTH DOORWAY, ST. HELEN'S CHURCH, BISHOPSGATE.

This sheet, drawn by Mr. F. Kingsley Oliphant, of Dover, represents a well-known doorway in the City of London, near to Crosby-place, which is reached under a low timber-corbelled gateway out of Bishopsgate-street. The Church of St. Helen has been described as a kind of Westminster Abbey for the City on account of the vast number of tombs and monuments located within its walls. The building consists of two aisles separated by Perpendicular arches, with chapels attached at the south-east. Only a very small part of the church is used for Divine service. An inscription over the west door states that "This is none other than the House of God;" but the usual entrance is by the Jacobean doorway which we illustrate to-day. The tombs of the interior are of the greatest interest, including several removed from the church of St. Martin Outwich, which was pulled down in 1874.

DETAILS OF DOORWAY AT AMBER PALACE, LAHORE.

(For description, see p. 875.)

BILLIARD-TABLE.

This, entitled the "Sportsman's Table," was concepted by Messrs. Orme, of Old Bond-street, and is now in course of construction at their works in Manchester, from drawings prepared for them by Mr. W. H. Jewitt. The sides bear sporting scenes as shown, the opposite end to the one given being a stag-hunt. The corners contain different objects of field sports—fox, hare, pheasant, black-cock, bittern, and wild duck. The cushion frieze or cornice is a foliated ornament, enriched with birds and vermin, magpie, rook, hedgehog, polecat, badger, &c., the centre of each side having a trophy of whips, brush, antlers, &c.

NEW TOMB OF ST. YVES AT TREGUIER.

This monument to St. Yves, a popular Breton saint, has been erected in what once was the Cathedral in the small seaside town of Tréguier, which, by the way, is the native place of M. Renan. It stands on the site of an older one, erected by John V. of Bretagne, in the 15th century, and which was totally destroyed in the days of the Revolution. The recumbent statue of the saint is in white marble. The whole of the other work, with the exception of the base and cornice of the tomb (which are granite) is of white stone. The figures carved on the tomb represent the parents, friends, and followers of the saint. In the niches of the piers stand the first nine Breton bishops and other local personages; while the pinnacles are crowned with figures of the Virgin, St. Michael, and angels with spread wings. Sculpture, representing animal life on land and in the sea, is also worked in, suggested by the maritime position of Tréguier. M. Devrez is the architect of this really fine monument.

COMPETITIONS.

Ceylon Planters' Association Tea Kiosk.—Government have granted the Planters' Association a splendid site for the Tea Kiosk, which is to be erected before long in the vacant space near the passenger jetty at Colombo. Designs were invited in limited competition, and the plan which has been chosen is by Messrs. Karslake and Mortimer, the senior partner of which firm is a close relative of a leading member of the planting community. The Kiosk is 60ft. long by 40ft. broad, which gives ample space for a wide verandah, a bar and counter with servants' room, pantry, and store room behind. There are also two ladies' rooms, and altogether the plan promises a building eminently suited for the purpose to which it is to be put.

Middlesbrough School Board.—At the last meeting of this board a communication was received from the Educational Department formally approving of the plans of a block of schools to be erected in Victoria-road. The plan and design of these was accorded the first place in a limited competition, Mr. E R. Robson, the architect to the Educational Department, acting as assessor. Nine architects in practice in Middlesbrough, Darlington, Hull, Leeds, York, Bradford, and Newcastle were invited to compete, and eight sets of plans were received by the Board. The design placed distinctly first by Mr. Robson bore the motto "Vi et Armis," and was found to be the work of Mr. J. Mitchell Bottomley, of Middlesbrough. The site at the Victoria-road schools is an elongated parallelogram, and the plan adopted for the buildings is somewhat unique, consisting of two separate school blocks, connected in the centre by the entrances, lavatories, and teachers' rooms.

Swansea.—The School Board for Swansea, after a long discussion on the desirability of instituting a fresh competition for plans for the Higher Grade School, have instructed their clerk to inform the following architects—Mr. T. Townend, jun., Rochdale; Mr. Locke Worthington, 23, Queen Anne's-gate, Westminster; Mr. Henry Sully, Nottingham; Mr. J. Buckley Wilson and Mr. Glendenning Moxham, Swansea; Messrs. Mercer, Allender, and Chidson, Liverpool; Mr. T. P. Martin, Swansea; Mr. Richard Watson, Kingsbridge—that the Board is disposed to offer a premium of 15 guineas for the best and 10 guineas for the second best set of plans and designs for the proposed Higher Grade Schools, confining it to the seven architects whose design most nearly met the requirements and approval of the Board on a former occasion, but upon the details enumerated in certain conditions, and to inquire whether, under the circumstances, they would be disposed to send in new designs.

MANCHESTER ARCHITECTURAL ASSOCIATION.

On Tuesday evening last, at the ordinary meeting of the association, Mr. T. Chadwick, A.R.I.B.A., President, in the chair, a lecture was given by Mr. Edward Hewitt, A.R.I.B.A., Vice-President, and member of the firm of Messrs. E. and F. Hewitt, architects, Manchester, in the lecture-hall, Athenæum, the subject being "A Tour in Normandy and Brittany, from an Architectural Point of View," illustrated by an oxyhydrogen lantern with 60 original views from drawings and photographs. After explaining the route taken—and which the lecturer strongly recommended to anyone contemplating a holiday, and being easily extended with but little additional cost—Mr. Hewitt went on to describe the various buildings of interest in the different towns and villages visited. After landing at Boulogne, where there was so little of interest architecturally, the next town taken was *Abbeville*, with its grand church of St. Wolfram. The façade is a rich example of the Flamboyant style, with its three portals surmounted by pediments and flanked by two massive towers. The front is covered with flowing tracery and panelling, and the niches are filled with statues, the central doorway being most elaborately carved. Only five bays of the nave are built in this grand style, and it is a most unusual thing for the west end of the church to be built first, leaving the choir to be erected afterwards. There are many other points of deep interest that may be found in the back streets. For instance, some old Spanish houses, and quaint overhanging dormer windows, and half-timber houses in the fish market. The next move was to *Amiens*. Conspicuous above all buildings is, of course, the cathedral, with its carved wood flèche towering above the roof at the intersection of the nave and transept. The west front is the richest portion of the exterior, with its deeply-recessed portals; the arches are apparently supported by a series of statues with canopies; the arches themselves, and the tympanum of the arches are completely covered with figures and statuettes. Above the arch heads is ranged a beautifully-proportioned arcading, and over this is a line of colossal statues in niches; over the central portion is a grand wheel window, and the whole is flanked by two towers of unequal heights. The whole elevation is, indeed, a masterpiece of beauty. *Rouen*, the next town visited, has still much left of antiquity; the "so-called" modern improvements are fast destroying the venerable character of the place, with its narrow winding streets and picturesque overhanging gables which throw their deep shadows in all sorts of shapes. Their strange histories will, it is feared, soon be forgotten by all but a few cranky antiquarians; for as there is a law in Rouen, as also in Manchester, that no timber shall be allowed to project above a few inches, we should feel thankful that law works but slowly and leaves us something to satiate our ardent appetites for the things of by-gone days. The church of St. Ouen has much that is extremely beautiful, though it has not by any means the same charms as the cathedral. The church of the deepest interest is St. Maclou, even supposing the author of the "Seven Lamps" had not dwelt on the merits of the sculpture contained in its magnificent gates. *Lisieux*.—Here I found a charming little market town, from the centre of which arises the great towers of its venerable church of Pierre, and under its shadow clustered together a number of wonderful timber houses, black and weather-stained with age. The interior is a beautiful composition in the most refined period of Early French, with a circular end to the choir and the aisle continuing round. Beyond the choir is a charming 14th century Lady-chapel. Perhaps the strongest point of interest in Lisieux is its ancient domestic architecture, which may be found in every street, more especially in the Grande Rue and Rue aux Favres. *Caen* is a place where, from an ecclesiastical point of view, one would like to stop long, as there is so much of interest to an Englishman as being connected so much with the life of the great Conqueror, and in the period of his greatest achievements. The Abbaye-aux-Dames was founded by Matilda, wife of William, shortly before he set out for England. The Abbaye-aux-Hommes is indeed worthy of its founder, bold in design, as William the Conqueror was in his life. Then, again, there is the church of St. Pierre, with its won-

derfully graceful flèche. *Bayeux.*—The cathedral being the chief point of beauty; and there is also the Bayeux tapestry. *Sainte Lo*, the next halting place, and although picturesque, has not the amount of interest displayed in it that you see in many of the Normandy towns. The Abbey Church is situated in a grand position on the brow of a hill. *Coutances.*—Here we find another magnificent cathedral. In the western steeples there is absolutely nothing wanting, the massiveness of the base and the long elegant shafts, crockets, and pinnacles are carried out in all their perfection. The strange effect in the interior is in the nave triforium, which is not open, but richly panelled. *Mont St. Michel, Brittany.*—This is, in point of fact, a rock standing out of the sea about three miles from the main land. On near approach we see it rising sheer out of the sand. Coming closer we see picturesque houses surrounded by a high fortification and circular towers at intervals, and surmounted by the ancient monastery with its numerous turrets and pinnacles, and above all this rises the Gothic church, 400ft. above sea-level. Special attention should be given to the richness of the carved spandrels and the variety of design in the cloisters. *Dinan.*—Here the streets are found full of interest with the grey old houses constructed in wood in many places, covering the footpath, as in the "Rows" at Chester. There are several hundred English residents in Dinan, and the voices in the streets have a familiar sound, neither Breton nor French. Especial interest is attached to the steep and dirty street leading to the quay, Rue le Jersuale; it is indeed a ladder of slippery cobble-stones and pebbles. *Dol and St. Malo.*—At the former we find more picturesque houses and pretty streets, and a fine cathedral, the choir being more like an English church, with its square east end, than any I have seen in France. A delightful day may be spent along the ancient ramparts and narrow streets of St. Malo; the sea around dotted here and there with islands covered with grass, and on the brows of others are ruins of picturesque fortifications. *Vitre* and *Leval.*—Vitre, the next place I went to, is notorious for its old castle and picturesque group of buildings. Notice also should be taken of the 15th-century outside pulpit and overhanging canopy. The Flamboyant Gothic cathedral at Leval is well worthy of study; also the castle, with its entrance flanked by the round towers. *Le Mans* and *Chartres.*—At the former place we find a grand cathedral, 390ft. long, surrounded by a double aisle and twelve chapels, and the windows are filled with lovely painted glass. All the world knows of the beauties of Chartres Cathedral, my next stopping place, with its rude hewn piers, as though built for eternity, with its grand south-west spire and its triple portals, flanked on either side of piers by statues of royal saints. *Paris* and *Havre.*—With these two places my holiday drew to a close. It would be useless to attempt to describe the cathedral of Notre Dame, or the Abbey Church of St. Dénis, or the great interest attached to the Sainté Chapelle, and the many other churches I saw.—At the conclusion of the lecture, the President proposed a vote of thanks to Mr. Hewitt, which was seconded by Mr. Hill and supported by Messrs. Stelfox, Barker, Mold, and others.

JEYPORE PORTFOLIOS OF ARCHITECTURAL DETAILS.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

SCHOOLS of art and students of applied ornament will do well to acquire access to these portfolios of Indian ornament, for the simple reason that they present an almost endless variety of suggestive detail adaptable for modern uses, particularly where strictly conventional forms are desired. Few of the specimens represented, probably, may be found suitable for those who are on the look out for a direct crib; indeed, the highly elaborate style of the ornamentation, so characteristic of Indian work, necessarily often precludes the use of such examples for direct copying, at least for articles of ordinary use, while, of course, the style unaltered is not the most suitable for everyday purposes in Europe. There is, however, a countless quantity of good decorative forms to be found in such details as those with which Colonel Jacob has enriched his six folios of 374 plates. This vast collection has been issued at the cost of His Highness the Maharaja Sawai Madhu Singh, G.C.S.I., of Jeypore, and a special interest attaches to the work from the fact that all the drawings have been produced by native artists trained by the head-master, Mr. Opendra N. Sen., at the Jeypore School of Industrial Arts—an institution which was founded by the Maharajah Sawai Ram Singh, the father of the promoter of this publication. The designs which are thus brought together in uniform scale are compiled chiefly from old buildings in Rajputana, one of the protected states of North-west India, and they are divided into sections, thus:—Part 1, Copings and Plinths; Part 2, Pillars, Caps, and Bases; Part 3, Carved Doors; Part 4, Brackets; Part 5, Arches; and Part 6, Balustrades. We may say at once that unqualified praise is due to the Maharajah for his zealous endeavour to bring the indigenous arts of his country before the world in this highly practical manner, and to thus secure a valuable as well as reliable record of their wonderful detail. He is certainly distinguished among the native rulers of India as the first head of a State who has caused to be produced a technical book on Indian architecture for the benefit of his own people, and of art students throughout this country and America. We have to-day reprinted, to a reduced size, by permission, one of the plates from Part No. 3, giving the details of a beautifully-wrought door from the Amber Palace at Jeypore. By this means we shall the better enable our readers to judge of the character of the plates to which these notes have reference. The drawing in the centre of the sheet, Fig. 1, represents one leaf of a door in outline, showing the arrangement of the panelling, which seems admirably proportioned. Each of the panels A, B, C, D, E, and F is most delicately carved, and Colonel Jacob's book likewise gives the designs of each panel to a good workable scale. Figs. 2 and 3 represent the overlap bar, and sections are also added below. "Amber Palace is situated in the Hills, about five miles north of the present capital, Jeypore; it was originally held by Bhatu, the chief of the Susâwat Minas, a local race in Rajputana, and is naturally a strong position. It was wrested from them by Maidal Rao, a Kachhwaha chief, about the middle of the 12th century. The Amber Palace was founded by Raja Mansingh, and was the chief residence, although at first it had no buildings of any pretension. In A.D. 1630 Mirza Jaysingh erected the Jaya Mandir and other beautiful buildings, which make it rank with Gwalior as one of the finest specimens of Rajput architecture. In A.D. 1728 Maharajah Sawai Jaysingh—one of the most illustrious princes of India, famous for his study of mathematics and astronomy, and as a ruler who did more to promote sound science than any other Hindu prince on record—founded the modern capital of Jeypore, and Amber was gradually deserted, and, with the exception of the palace buildings and a few temples, is now more or less in ruins." The palace buildings contain numerous courts and suites of apartments, some of them small, and reached thrcugh intricate passages; others extremely beautiful, and "enjoying from their windows, balconies, and terraces," says Heber, "one of the most striking prospects which can be conceived. For varied and picturesque effect, for richness of carving, for wild beauty of situation, for the number and romantic singularity of the apartments," he adds, "I am able to compare nothing with Amber!" The doors of the Palace of Amber, chiefly in the Zanana part, are some of them inlaid with ivory and ebony, and others are carved in blackwood. The workmanship, as regards framing, is very rough; but, as may be seen from the plate, they are remarkable for the variety and beauty of the designs of the carved portions. Unfortunately, from exposure and neglect, they are all more or less decayed, and in a few years will probably be entirely lost. The author adds: "It is with the hope of rescuing these designs from oblivion, and placing them on record, that these drawings are now produced." The doorways are of stone or marble. The doors are usually fitted by a pivot at top or bottom, on which they swing. They are of a great variety of shape, and the upper parts for the most part are made to fit the corbelled stone lintels of the doorway openings. To enumerate the several specimens which Colonel Jacob has arranged would take more space than we can here give to the subject, though we may name, in conclusion, a few of the buildings which he has chosen for illustration in detail—viz., the Motix Masjid in the Lal Kila, or Fort at Delhi. Mirza Jahangir's Tomb at Nizam-ud-din, near Delhi; the Jagatsarwan Mandir, at Amber; the Madhu-Bilas, Jeypore; the Cenopath of Maharajah Sawai Jaysingh, at Jeypore; Singhaji's Mandir, at Sangauer; the College of Itimad-ud-daulah, at Delhi; the Jama Masjid, at Agra; the Chaksu, Jeypore State; the Suraj Pol, at Udaypur; the Jodhbhai's quarters, at Fatehpur Sikri; the Cenotaph of Santoji, at Pushkar, near Ajmir; and many more well-known examples. Some of the plates are beautifully printed in colours by Mr. Griggs, and the sheets representing the inlay work are specially successful. These working drawings are shown on separate sheets, so that they may be placed before the student out of the portfolios, and for this reason the author has devoted a plate to almost every single detail. There can be no pecuniary profit attending such a publication, and its expense has been met almost entirely by the Maharajah. The cost of each plate in the finished folio, works out, we understand, at about fourpence per copy.

* Jeypore Portfolios of Architectural Details. Compiled by Colonel S. S. Jacob, C.I.E. London: Bernard Quaritch, Piccadilly, W.

CHIPS.

The tender of Mr. A. Groves, of Milton-under-Wychwood, has been accepted for new reading-room at Icomb.

On Saturday a company assembled at the Burcot pumping station of the East Worcestershire Waterworks Company, to witness the starting of a new engine for pumping the supply for the Lickey district. The engine, which was supplied by Messrs. Beck and Co., London, has a pumping capacity of 6,000 gals. per hour. Mr. W. T. Layton is the resident engineer and manager.

A meeting of the Liberal Association for South-West Warwickshire was held at Stratford-on-Avon on Saturday, when Mr. John Fell, contractor, of Leamington, and President of the Allotments and Small Holdings Association, was unanimously chosen as candidate for the division.

Mr. Alfred Groves, Milton-under-Wychwood, is just completing extensive additions and improvements to Oddington Rectory House, Gloucestershire, from plans and under the supervision of Messrs. Waller and Sons, architects, Gloucester.

A new organ, built by Mr. J. J. Binns, of Bramley, Leeds, at a cost of over £2,000, for Eccles parish church, was opened on Saturday afternoon by a special service.

The Wesleyan Chapel at Tuckingmill, near Camborne, a substantial building of granite, erected in 1843, has been reopened after undergoing extension and renovation. The chief work was the addition of a new orchestra and organ chamber, with four classrooms under. The chapel has been re-painted and decorated throughout, the rostrum set back, and the pews and benches on the ground floor removed to make way for open seats of pitch-pine. Mr. Sampson Hill, of Redruth, was the architect. The carpentry was done by Mr. W. H. Moyle, of Chacewater, the masonry by Mr. W. H. Gray, of Illogan, and the decorations by Messrs. J. and W. M. Hichens, of Redruth. The total cost has been over £650.

An extraordinary general meeting of the governors of the Ross Cottage Hospital was held on Wednesday, the 10th inst., Mr. H. C. Moffatt, J.P. (president), in the chair. It was decided to erect an additional wing, the cost of which the committee of the Kyrle Coffee House have generously offered to defray. The plans of Mr. Arthur Pole Small, architect, of Ross, were submitted and approved.

The Established Church at Inchture, about nine miles west of Dundee, was almost totally destroyed by fire on Sunday afternoon. The walls and spire are still standing, but have been greatly damaged. The church was built nearly 60 years ago.

Part of a new cemetery for Scotforth, Lancashire, was on Friday last consecrated by the Lord Bishop of Manchester. A small mortuary chapel has been erected near the entrance gates at a cost of about £500, the whole of the works being carried out from designs by, and under the superintendence of, Mr. E. Howard Dawson, A.R.I.B.A., of Lancaster.

The memorials to the late Rev. Henry White, the popular chaplain to the House of Commons, will take the forms of a stained-glass window and inscribed brass in the Savoy Chapel, and a mosaic in the chapel of King's College, London.

Considerable improvements have been made to the Home Farm House and buildings at Sherborne, Gloucestershire (according to drawings and specifications from the estate office), for the Right Hon. the Lord Sherborne. Mr. A. Groves, of Milton-under-Wychwood, was the builder.

Building Intelligence.

Barry.—On Thursday, the 11th inst., the new market at Barry, Glam., was formally opened. The buildings have frontages to Barry Dock-road, West-street, and High-street, and form part of a larger scheme which has for its object the erection of market buildings, 166ft. in length by 74ft. in width. The portion now completed comprises a market-hall, 74ft. in length by 40ft. in width. Shops, with a room above each, are arranged on both sides and at the front of the hall, the total number being seventeen. The internal portions of the walling to the hall are faced with red brick, and are divided into bays on one side, with pilasters and arches over, with windows in the centre of each bay lighting the rooms over the shops. The light to the markets is principally obtained from glass in the apex of the roof and clerestory windows. The height is 33ft. to the springing of the roof and 48ft. to the apex. The interior will be warmed with hot-water pipes by Mr. E. Hampton, of Abergavenny. As used for concerts, the central hall will accommodate 550 on the ground floor and 130 on the balcony. The style adopted has been Queen Anne, freely treated, with moulded cornices, stringcourses, &c., the walling being faced with red brick relieved with Bath stone. The work has been carried out by Messrs. C. Shepherd and Son, of Cardiff, at a cost of £3,672, from designs by and under the superintendence of Messrs. W. G. Habershon and Fawckner, of London, Newport, and Cardiff.

Bradford Abbas.—The 15th-century parish church, which was closed during last summer for alterations and repairs, was reopened by the Bishop of Salisbury on Thursday, Dec. 11th. The restoration has been effected from plans prepared by Mr. C. B. Benson, Mr. J. Andrews, of Thornford, being the contractor. The chantry was first taken in hand, and was reopened in May. The carving has been mainly done by Messrs. Grassby and Son, of Dorchester, and six of the angels by Mr. Harry Hems, of Exeter. The painting and decoration of the interior of the edifice have been carried out under the personal superintendence of Mr. W. Raymond (Raymond and Penny, Yeovil). The total outlay has been £1,700.

Ipswich.—The new bank erected on the Cornhill for Messrs. Bacon, Cobbold, Tollemache and Co. was opened on Monday. It occupies the centre of the north side of the main square of the town, facing the town hall, Corn Exchange, and post-office, and facing the approach from the railway station, and adjoins new business premises similar in style from the designs of the same architect, Mr. T. W. Cotman, M.S.A., of Ipswich. The style is an adaptation of French and Flemish Renaissance, carried out in rubbed and glazed brickwork, with Portland stone dressings. The building is four stories in height, the ogee-headed windows being divided vertically by fluted stone pilasters and horizontally by deep entablatures. Above the parapet are dormers and gables of elaborate scrollwork design, and the centre of the steep-pitched roof is broken by a flèche, the total height from the pavement being 70ft. to top of gable, and 93ft. to finial on flèche. The banking-room is 58ft. by 33ft. 6in., and 20ft. 6in. in height. Four columns, inclosed in fibrous plaster castings, support the cross walls of the floor above; the ceiling is deeply moulded, and divided into parallelograms by beams with bold cornices, and there are pilasters all round the room which connect a frieze adorned with arabesques. The dado is of Spanish and Tobasco mahogany, and the pedestals of the principal columns, which form the dividing line of the counters, are similarly inclosed. In the rear of the banking-room is the manager's apartment. It is shut off by a glass partition, and lighted from the roof. Mr. R. Girling was the chief contractor; Mr. Fred Bennett built the walls and vaults of the basement and strong rooms: the electric light has been installed by Messrs. Laurence, Scott, and Co.; Mr. E. Harvey provided the hot-water apparatus; and Messrs. C. Kite and Son the ventilators. Mr. Sidney Elms, of London, has done the stone carving, and Messrs. Jackson and Sons, also of London, executed the moulded fibrous plaster, largely used in the internal ornament.

Engineering Notes.

The Nicaraguan Canal.—Work has been going on rapidly during October on the various branches of construction, &c., connected with this canal. By the end of the month the railroad bridge across the San Juanilla river had been completed, and the road was being built beyond the river, where for some distance the work is comparatively easy. Two vessels had arrived with piles, &c., for the breakwater. The six dredges in use are eventually intended to cut the canal; but in the meantime are doing important work in connection with the opening of the bar. The City of Paris dredge is cutting a channel from the deep-water basin at present existing at Le Fé to a position selected outside the outer bar. She had progressed 900ft., having cut a channel 120ft. wide and 20ft. deep, and had thrown up an embankment of sand on either side of her. Several other dredges will follow her, and the channel, once cut through, can be kept open, and steamers of 17ft. and 18ft. draft enabled to enter the port. When this has been done the main difficulty—viz., that of transporting here the heavy machinery which will be necessary as Mr. Menocal's operations progress—will have been disposed of. The most important event, however, is the completion of the work of the commission appointed by the Nicaraguan Government to examine the work done and to certify that the expenditure stipulated for in the concession has been made. Nearly double the amount stipulated for by the Nicaraguan Government on granting the concession has been expended, and the commission has finally confirmed the concession, and the Nicaragua Canal Company have now a period of ten years in which to complete the work.

Penshaw Bridge, Sunderland.—This bridge over the river Wear at Penshaw Staiths, near Sunderland, consisting of iron bow girders 155ft. in length, supported by Marsden limestone ashlar abutments resting on concrete and pitch-pine piled foundations to a depth of 20ft. under the bed of the river, is now rapidly approaching completion, and is expected to be open for traffic about the end of the year. The whole of the works have been designed by, and carried out under the superintendence of, Mr. D. Balfour, M.Inst.C.E., F.G.S., St. Nicholas Buildings, Newcastle-on-Tyne. The contractors for the masonry, piling, and iron-work are Messrs. Head, Wrightson, and Co., Stockton-on-Tees; and for the approach roads, Mr. J. Carrick, Durham.

CHIPS.

At the last meeting of the Darlington town council, Councillor G. G. Hoskins, F.R.I.B.A., moved that a resolution adopting plans by the borough surveyor for the extension of the town hall and alterations to the public offices, be rescinded. He showed an alternative scheme of his own, and criticised the adopted plans in detail. The matter was referred back to the Markets Committee, to which Mr. Hoskins' name was added.

At the last meeting of the local board for Rugby it was decided to pay to the widow of the late surveyor 100 guineas as remuneration for the extra work entailed by the superintendence of street improvements done by her late husband.

A new police-station has been erected at Gillingham, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator.

Newland Congregational Chapel and Schools, Lincoln, were reopened last week after the erection in the chapel of an organ gallery, and a new organ and decorating the walls and ceiling. The adjoining schools and vestries have been remodelled and enlarged. Mr. P. Bellamy, of Lincoln, was the architect, Messrs. Salt and Nicholson, of the same city, were the contractors for the alterations to chapel, and Messrs. Wright and Sons for those in the schools.

Important additions have just been completed to the Grammar School buildings at Burford, Oxon, by Mr. Alfred Groves, builder, Milton-under-Wychwood. Messrs. Waller and Son, of Gloucester, were the architects.

Mr. S. Lees, the Mayor of West Bromwich for 1889-90 and the present year, died suddenly on Saturday last. He was associated with his brother, Mr. J. B. Lees, in business as timber merchants and iron manufacturers.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—At the last meeting of this association the President, Mr. T. Naden, delivered an address in which he referred at length to the growth and development of the city up to the earlier part of the 19th century. Beginning with the mention of Birmingham in Domesday Book, and of the weekly market held in the 12th century, Mr. Naden passed rapidly over the earlier periods of the growth of Birmingham till the stirring times of the 17th century, in which the old Ship Inn and Stratford House at Camp Hill were well-known houses on the outskirts of the town. In 1689 the first Dissenting chapel was built in Old Meeting-street, followed by a second in three years' time in Digbeth, and about the same time the Roman Catholics built a chapel and convent near the present St. Bartholomew's Church. Both these were almost immediately destroyed, and in their place a chapel was built at Edgbaston. From this time onwards the growth of Birmingham was rapid and steady, and before the close of the 17th century there were six churches or chapels in the town. St. Philip's Church was finished in 1719, and in 1731 that and St. Martin's and the newly-built Grammar School were the most prominent buildings in the town. Mr. Naden was able to show, by means of the surveys of Wesley and Bradford, and those of the present time, the growth in the next hundred years, and concluded his address by a tribute to the genius and labours of the manufacturers and inventors to whom Birmingham owed her greatness. Hearty thanks were, on the motion of Mr. H. R. Lloyd, accorded to Mr. Naden.

Edinburgh Architectural Association.—A meeting of this association was held on Thursday, the 11th inst., Mr. John Kinross presiding. Ten new members were admitted. Councillor Mackenzie read a paper on "Heating of Buildings by Hot Water and Steam," his opinion being that there was no advantage in using steam for ordinary buildings, while there were many disadvantages, and always considerable risk. The merits of various shapes of boilers were discussed, and the subject of mechanical ventilation, combined with heating, was touched upon. The paper was illustrated by diagrams. A discussion followed. The prizes gained by the successful students for last year were afterwards distributed.

Sheffield Society of Architects and Surveyors.—Mr. J. B. Mitchell-Withers, F.R.I.B.A., last night read a paper before the meeting of the above Society on "The Development of Ornament in English Mediæval Architecture." There was a good attendance of members and others, including Mr. F. Fowler, president, Mr. C. J. Innocent, vice-president, Messrs. E. M. Gibbs, Potts, Winder, jun., Smith, Hemsoll, H. Webster, Benton, McDougall, Wigfull, H. Tooley, A.R.I.B.A., Mr. J. T. Cook, and others. He introduced the subject by stating that a knowledge of the historical development of the various styles was absolutely necessary to the artist, and he proceeded to carry out that view by tracing the history of ornamental English architecture. He cited the principal characteristics of the English styles, adopting the simple nomenclature of Rickman, and divided the periods into Norman, Early English, Decorated, and Perpendicular. He instanced the principal English buildings in which these types are exemplified, and there were lantern-slide illustrations (prepared principally by Mr. Mitchell-Withers, jun.) showing specimens of ornament in detail, and groups of each period found in various notable buildings. An interesting discussion took place, in the course of which Mr. Tooley, remarking on the lecturer's criticisms of the flint panelling work seen in Norfolk and Suffolk, thought the lecturer judged it too harshly. He admitted that its appearance was much improved by the hand of time.

Prince Victor of Hohenlohe has almost ready for transference to marble the plaster statue of the Princess of Wales which is to be placed in the vestibule of the Royal College of Music. The Princess of Wales is represented arrayed in the robes of a Doctor of Music of the University of Dublin. The square of the college cap crowns the head, and the Princess, holding in her left hand a roll of music, catches with her right at the folds of her doctor's gown.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

CHRISTMAS DAY.

Next week, in consequence of the Christmas Holidays falling on Thursday and Friday, December 25 and 26, it will be necessary to publish the Building News on *Wednesday*, December 24. All advertisements and other communications for the next issue must therefore reach us by 3 p.m. on *Tuesday*, December 23.

Received.—Rev. F. G.—R. B.—C. H. S.—T. J. M. F.—S. and Co.

Correspondence.

PATENTED PLANS.

To the Editor of the Building News.

Sir,—We are of opinion that Messrs. Flockton and Gibbs' exhaustive letter, published last week, does not alter in any way the plain facts stated in yours of the week previous. The essential qualities of their "patent plans" have been previously embodied by other architects, and the examples we quoted are sufficient verification of this.—We are, &c.,

Leeming and Leeming.

Victoria House, 117, Victoria-street, Westminster, Dec. 15.

Sir,—In my letter to you of November 14, I referred to the Houses of Parliament, amongst other buildings, as an anticipation of Messrs. Flockton and Gibbs' patent application No. 19624 of 1889. If correct, this disposes of their case.

In their letter in your last issue, Messrs. Flockton and Gibbs deny the applicability of this reference, on the ground of the limitation contained in their provisional specification, which disclaims hospitals, workhouses, asylums, prisons, palaces, and mansions, where "the public have little or no business, and are generally admitted only by special permission." Nor is their invention applicable (they say) to museums or galleries where the public are admitted unreservedly, and wander unrestrictedly. But "it is applicable only to such buildings as have general or inquiry offices by or through which the public have entrance to the private offices."

It is clear, from the above, and from an examination of their specification, that those gentlemen have sought to patent not only a certain principle of arrangement in buildings (or combination of these principles, as they put it), but also the *use* to which a building so planned is put to afterwards. So that while they disclaim, let us say, Milbank Prison, yet, if the London County Council acquires it and converts it into municipal offices, they will then be entitled to their royalty! Again, let us suppose the Sheffield buildings erected upon Messrs. Flockton and Gibbs' three principles, and liable to their claims, and, further, that before their use for municipal purposes they are employed for a time as an art museum and picture-gallery (as the Leeds Infirmary was some years ago), their limitation would apply in that case to their loss; yet in neither of the instances given could they, either as architects or inventors, have any control over the use to which the buildings are put.

The title and claims cover "buildings applicable to *Government*, county, municipal, and other public offices and courts." Certainly, the Houses of Parliament would be considered a Government building, and therefore may be cited as anticipating their claims; yet, technically, it is also a royal palace, and as such is disclaimed by Messrs. Flockton and Gibbs. So this building is claimed and disclaimed in the same specification; but seeing that Sir Charles Barry here carried out the three principles claimed—(1) building in wings, (2) a central public hall, and (3) entrance to the wings through an inquiry office or lobby, it follows that there is no patentable novelty in applying the same arrangement to other classes of public buildings.

I hope that nothing I have said will be construed as a reflection upon Messrs. Flockton and Gibbs, who, indeed, have gone out of their way, and at some expense, to be perfectly fair to the profession. They have as much right as other inventors to protection under the Patent Law; and had it not been for their public challenge, and the peculiar interest I have on both sides of the question, I should not have engaged in the ungracious work of criticising their claims to a patent.—I am, &c., J. Sinclair Fairfax.

433, Strand, London, W.C., Dec. 15.

Sir,—A great deal has been said, written, and published anent the patenting of certain plans by Messrs. Flockton and Gibbs. May I ask if any of the objectors have been game enough to lodge the necessary *formal* opposition against the granting of the patent?—I am, &c.,

A Constant Reader.

COMPETITIVE DESIGNS FOR RENTON PARISH CHURCH.

Sir,—The above competition has just been decided. The church was only to cost £2,600, and the designs were to be submitted under mottoes only. As the committee, immediately on receiving the plans, disclosed the names of all the authors, and as the competition has been the subject of considerable talk in architectural and building circles, I think it right that the facts should be made known. This may be done in a sentence or two, and I shall not transgress on your space in order to impute motives, or to call the action of any one in question.

The committee sent the designs placed first, second, and third in order of merit to their measurer, to ascertain their cost. He reported that not one of them could be carried out for much less than £4,000, the cheapest being the third, at £3,900. They thus violated the condition as to cost. The authors of the design placed third, Messrs. H. and D. Barclay, of Glasgow, in submitting their design, said it could not be built for less than £3,000. They thus openly violated the condition as to cost. Messrs. Barclay are now appointed the architects; but they have to undertake the task of proving that the committee's professional adviser knew so little of his business that he made a mistake of £900. The committee now intend to spend £3,000, thus showing their own condition as to cost "cast overboard." Their measurer reported that my design would cost £2,570, or £30 less than the stipulated sum. It was thus the only design among the first four which complied with the conditions of this architectural contest.

I am quite content to lose the church in these circumstances, and I am grateful to the minority on the committee, whom I do not know, for their honourable support, and for their desire to secure my appointment.—I am, &c.,

P. MacGregor Chalmers.

176½, Hope-street, Glasgow, Dec. 16.

THE CISTERCIAN ABBEY OF ST. MARY AT QUARR.

Sir,—With the owner's permission, I have started excavating the site of the Cistercian Abbey of St. Mary at Quarr, in the Isle of Wight, on the lines laid down, after a careful consideration of the "lay of the ground," with so far complete success. The foundations brought to light are apparently those of the great church, the chapter house, cellarium, refectory, dorter, calefactorium, kitchen, and the infirmary. The cloister was of considerable size, 130ft. by 120ft., and we hope to uncover the walls of the Lady-chapel to the east of the great church. The inclosing walls of the monastery comprise within them an area of nearly 40 acres, and are in sufficient evidence to be easily traced, though the ground unfortunately has for many years been used for farming purposes. The abbey was an important one, its abbot sitting in the House of Peers, and was one of the earliest Cistercian foundations in England. On the Dissolution the site was bought by a merchant at Southampton, Geo. Mills, who pulled down the buildings and sold the materials. So thoroughly had he carried out his Vandalic work that 60 years after Sir John Oglander could find little or no trace of the Abbey buildings, *corn*, as he tells us in his "Memoirs," *growing on the site.*

Although the stones have, in many cases, been entirely removed, we have come upon the concrete bed on which they lay, 5·6 thick.

So far, the cost of excavating has been defrayed by myself; but our find has naturally impelled us to further researches, towards the cost of which I must appeal for outside help, or the work will have to be abandoned, being of too extensive a nature to be supported by my "private purse."

To carry out my object in a thorough manner a *large* sum will not, I am of opinion, be necessary, so that any contribution, however small, will be of assistance in defraying the cost.

Sincerely trusting that those who are interested in the history of the past will not allow so important an archæological undertaking to fall to the ground for want of support,—I am, &c.,

Percy G. Stone,

16, Great Marlborough-street, S.W.,
To whom all communications may be addressed.

P.S. — Careful drawings of everything of interest that may be met with, as well as a correct plan of the site and building, and an exhaustive history of the Abbey itself, will be published in my forthcoming book on the "Architectural Antiquities of the Isle of Wight."

THE LATE JOHN BENNETT, BUILDER.

Sir,—Referring to the paragraph in your last issue which records the death of Mr. John Bennett, builder, of Ipswich, I may be allowed to add—as a fellow pupil of his—that in early life he passed some time in an architect's office, having been articled to the late Harry Woolnough, architect, and at that time county surveyor of Suffolk, and contemporary with Fredk. Barnes and R. M. Phipson, architects, practising in Ipswich, all men of mark in their day.

Although not excelling greatly as a draughtsman, young Bennett was possessed of considerable constructional ability, and became both shrewd and clever as a man of business. He never followed the profession, as he preferred building to architecture. There was not sufficient money to be made at the latter to please him. In this respect his views were amply verified, as he was enabled to retire from the business some years before his death.—I am, &c., Robert Clamp, A.R.I.B.A.

Woking, Surrey.

At Tuesday's meeting of the London County Council it was reported that Mr. Blashill, the superintending architect, had made a report upon the structural condition of the Gaiety Theatre. Mr. Blashill had been instructed to communicate with Mr. C. J. Phipps, F.S.A., who represented the owner and the lessee of the theatre.

Additions have been made to St. Mary's Mills, Norwich, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Intercommunication.

QUESTIONS.

[10457.]—**Pointing during Frost.**—Is there not some preparation of mortar that will enable this to be done with as good effect as in ordinary temperature?—Frost.

[10458.]—**Torching Inside Old Roof.**—What is the best mortar for this purpose? Can asphalte and pitch, or kindred materials, be used with equal facility and better result. If so, how?—Frost.

[10459.]—**Quantities.**—Could any of your numerous readers tell me if, when architects supply quantities, the client can legally demand a copy of accepted contractor's figured quantities, to base any addition to, or deviation from, same? A reliable answer will greatly oblige.—One in Perplexity.

[10460.]—**Powers of Local Authorities.**—What are the powers of local authorities respecting building line according to recent Acts, and what is the best and briefest information I can get upon this? For instance, the buildings upon my right and left are 20ft. to 30ft. from road: can I build within three or four feet or right up, and can I bring out the front of my property? Acts of Parliament are uninteresting in their detail; perhaps you could tell me in a few lines, and oblige.—A. P. Jevon.

[10461.]—**Water Engineering.**—Will some engineering readers kindly give me their advice as to what books are the best treating on the works of water supply to large towns?—Student.

[10462.]—**Ranging Curves.**—Will any of your readers give a convenient and simple mode of setting-out curves for sewers, footpath kerbings, and similar town work? The formulæ for railways hardly apply to the above, the former being for long radii, while street kerbs and sewers frequently range from 40ft. to 150ft. The method should apply to cases in which the centre of the circle and the point of intersection of the straight lines of sewer or kerb are inaccessible.—Municipal.

REPLIES.

[10450.]—**Ventilation.**—I was very much amused with the answer Mr. Buchan gave to "Rustycuss" in your last issue. I would say, provided always a sufficient quantity of fresh, warmed air is poured into the building, there is not the slightest objection to extracting the vitiated air at the floor level through vertical gratings. This system I have many times carried out, and may add it has always proved successful. In winter it is better to extract at the floor level, as you get a better diffusion of the air, and as the air costs so much in warming, it is wise to extract as much of the heat from the air as possible before it escapes from the building and is lost. In summer this is slightly different, as the incoming air has not to be warmed, and it is usual to get it away as soon as possible; but this is the most troublesome part of ventilation, as by far the most part of automatic ventilators cease to act in summer time. I can give "Rustycuss" many instances of bottom extraction, and which have proved most efficient, and in some cases far exceeded my expectations. If proper precaution is taken with the arrangement of the building while it is on paper, there ought to be no difficulty in designing a heating and ventilating apparatus to suit its requirements, however peculiar the design and requirements of the building may be. Further, it can be made so that the occupants need not fear "the exhalations from the lungs and gas-lights," especially when the inside air is "so largely diluted," which, I presume, Mr. Buchan means with fresh, external air. An eminent English authority says:—"The example shows that extraction shafts should be placed as to cause a circulation of air such as is effected by a fireplace, which acts to cause a circulation and to extract the air." In another part the same well-known author says:—"In cold weather the extraction should generally take place from the lower part of the room, so as to draw off the cold air from near the floor, and cause the warm air above to circulate." My experience has led me to believe that there is too much of this so-called roof or top ventilation. If "Rustycuss," and others like him, will only spend a little time in becoming thoroughly acquainted with the principles of heating and ventilation, they will soon understand what systems to adopt and what systems to discard.—David M. Nesbit.

[10451.]—**Gas-Stove.**—"Caloric's" stumble is due to the condensation of the products of combustion. The flue-pipe is evidently in a cold room, which causes the gases inside the pipe to condense. The only plan to prevent the water running out at the joints is to wrap the pipe well with some good non-conducting material. I should prefer thin sheet asbestos, and secondly, hard felt. Even then you may have a little trouble with the water.—D. M. Nesbit.

[10454.]—**Hot-water Pipes.**—A low-pressure hot-water apparatus is usually known by the term "not hermetrically sealed," and in contra-distinction to the Perkin high-pressure system. The water is not 212° F. in any part of your apparatus, consequently no steam is being formed; and what extra pressure there is is being continually relieved by your escape-pipe at top. The case you cite is a *low-pressure system, pure and simple.*—David M. Nesbit.

[10454.]—**Hot-water Pipes.**—Supposing the hot-water supply circulation is for a large dwelling-house or a hotel, and the building being more than 40ft. high, so that the cold-water supply cistern to the boiler is 40ft. higher, than the boiler; yet if the expansion-pipe rises upward in every part of its course, so that any steam generated in the boiler can rise up freely and easily without any check through the expansion-pipe, and so get free and ready exit at its top—then I consider that this is merely low pressure, although the height of the cistern above the boiler be 40ft. This height of the cistern above the boiler is quite common in hundreds of four-story self-contained dwelling-houses in Glasgow. To keep the hot-water pipes 3in. from the wood would be pure bunkum, in my opinion; but it would be a good thing to wrap the hot pipes in strips of strong flannel felt, to conserve the heat and protect from frost, and they may lie on wood.—W. P. Buchan.

[10454.]—**Hot-water Pipes.**—Your district surveyor is wrong. The apparatus is a low-pressure one. The "ample expansion" pipe is not necessary. Your open-top cistern is the expansion pipe, and if your circulating pipes are right, you may fire as much as you can and boil the water in the "open top cistern"; but your pipes will nowhere exceed 212°. 40ft. head of water will give a good pressure in the boiler, but it cannot be called a high-pressure system.—A. P. Jevon.

[10454.]—**Hot-water Pipes.**—Your correspondent's query as to whether the head of water affects the temperature at the lowest point in a system of circulation, is one that must first have been suggested by those only acquainted with the operations of steam. It is known by all intelligent hot-water engineers that, with an open cistern and a properly arranged system of circulation, it is not possible to heat the water beyond 212°, even although the head of water should be 100ft.—i.e., assuming that the boiler is not too large for the work required. The difference in the temperature between the lowest point (the boiler) and the highest in the flow-pipe will be the amount lost by radiation in travelling the greater distance.—Robert Crane, 6, Binfield-road, Clapham, S.W.

[10455.]—**Legal.**—See *Transactions* Surveyors' Institution, Vol. XXI. Parts 4 and 5, to be obtained of the Secretary, 12, Great George-street, Westminster, S.W.—R. Watson.

WATER SUPPLY AND SANITARY MATTERS.

Dwellings of the Poor in Shoreditch.—The inquiry ordered by the Home Secretary, at the instance of the Mansion House Council on the Dwellings of the Poor, into the sanitary condition and requirments of the parish of St. Leonard, Shoreditch, was resumed on Monday at the Shoreditch Town Hall, Old-street, the commissioners being Mr. Cubitt Nichols, M.S.A., and Dr. Edward Seaton, with whom, as assessors, were Messrs. Ebenezer Moffatt and Brabner, the latter being appointed by the Shoreditch Vestry. The first sitting was held early in November, and the case for the Mansion House Council having been opened, the commissioners adjourned in order to make a thorough inspection of the parish, especially those parts which had formed the subject of the Mansion House Council's complaints. On the resumption of the inquiry on Monday, Dr. Louis Parkes stated that many of the defects complained of by the Mansion House Council had been remedied, but the sanitary staff of the parish was even now insufficient to cover all its requirements, one of which was that there ought to be a sanitary inspection of the parish, say twice a year. The reduction of the death-rate—from 20·8 per 1,000 in 1885 to 19·22 in 1890—did not show that things were getting worse. The Rev. F. E. Spencer, vicar of All Saints', Haggerston, thought that an improvement could be effected in the working of the sanitary laws, especially by enforcing a house-to-house inspection, which should certainly take place not less frequently than once every year. He did not consider that the sanitary staff of Shoreditch was sufficient. Mr. Lewis Thomas addressed the commissioners on behalf of the Shoreditch Vestry, and submitted that the sanitary administration of the parish, both past and present, was good. He recounted the steps taken for sanitary purposes by the authorities during the last ten years. Dr. Sutton, medical officer of health, detailed the sanitary work carried out in the parish of Shoreditch during the 25 years he had filled that position. The inquiry was adjourned.

Erdington Sewerage.—These works have just been completed at a total cost of £4,093 11s. 7d. The sewage is conveyed by pipe-sewers into the Birmingham system, and puified on the Birmingham Sewage Farm. This arrangement necessitated some sewers from 30 to 40ft. deep, and special precautions had to be taken. The engineer to the works was Mr. W. H. Radford, C.E., of Nottingham, and the contractor was Mr. G. Law, of Kidderminster.

The *World* announces that Mr. Calder Marshall, R.A., has placed his resignation in the hands of the President, and will forthwith join the ranks of the "retired." He is the Nestor of the Royal Academy, having been elected Associate in 1844, and full Academician in 1852, eighteen years before Mr. Hook, who now becomes the senior member of the Academy.

A three-light Decorated window in St. John's Church, Cardiff, has been filled with stained glass, in memory of the late Col. W. H. Martin. The subject is our Lord receiving the alabaster box of ointment, and the artist was Mr. J. W. Dixon, of University-street, N.W. The dedication took place on Sunday last.

By an overwhelming majority of more than ten to one, the ratepayers of All Saints', Poplar, have resolved to adopt the provisions of the Free Libraries Act.

The death occurred on Monday, in Paris, of M. Eugène Charpentier, the well-known historical painter, aged 80 years.

LEGAL INTELLIGENCE.

Re George Wall.—(London Court of Bankruptcy, Dec. 16, before Mr. Registrar Linklater.)—The bankrupt was a builder and contractor at Kentish Town, trading as Wall Brothers. He filed his petition in September last, and now applied for his order of discharge. His liabilities are returned at £13,088, and the assets are estimated as likely to realise £3,861. The bankrupt commenced business as a builder in 1866, and it appeared from the Official Receiver's report that he was a very illiterate man, being able only to read slowly and scarcely able to write his own name. He attributed his failure to losses on contracts incurred since 1882, such losses amounting, in respect of seven contracts, to no less than £12,627 18s. 6d. He did not attribute the losses to miscalculations in the estimates on the part of those he employed, but to the condition of the country, the state of trade, and of the labour market, and—as to the largest of the losses—to the delay in procuring terracotta from Wales. In addition to the above losses the bankrupt stated that he had lost £2,350 in respect of a house built by him for his own occupation. The house was elaborately embellished, and was estimated to have cost £4,300. The Official Receiver submitted, having regard to the magnitude of the bankrupt's transactions, that he had been guilty of improper conduct, amounting to culpable negligence, in not having taken steps to acquaint himself with his position from time to time. It appears that the bankrupt had entered into various contracts with the London School Board, and proceedings were recently taken by the Board against the bankrupt in respect of the alleged deviations by him from the terms of the contracts, defective workmanship, and the use of inferior materials—damages to the amount of £13,000 being claimed upon one contract alone. Mr. Houghton, for the trustee, said there were matters of serious gravity into which he desired further to inquire, and he asked for an adjournment. Mr. E. C. Willis, Q.C., on behalf of the London School Board, supported the application. Mr. F. C. Willis, who appeared for the bankrupt, submitted that no sufficient reason had been given for delay. The bankrupt naturally desired to be in a position to go into business again as soon as possible. His Honour adjourned the application to the 21st of January.

Unapproved Plans and Bad Bricks.—At Lawford's Gate Petty Sessions, on the 1st inst., John B. Maclaine, builder, was charged by the local board of St. George's, near Bristol, with commencing the erection of a building in Washington-avenue, Easton, without giving notice or delivering plans and sections, and also with not using proper materials. Mr. T. L. Lewis, surveyor to the local board, proved the case, stating that some of the bricks used crumbled away in his hand; they were "the most inferior" bricks he ever saw used for building. Defendant's foreman asserted that the bricks produced were very good for plastering, and was corroborated by Wm. Lesseymore, surveyor of Clifton; Frederick Rumball, dealer in building materials, and W. Graham, bricklayer. It was also contended, as to the first charge, that there was nothing in the by-laws to prevent a building being commenced before the plans were approved. The Bench thought otherwise, and fined defendant, for the breach of by-laws, 20s. and costs, and adjourned the second case until the 15th inst., when, after an inspection of the premises, they inflicted a further fine of 20s., with three guineas costs.

Re W. L. Kellaway.—The bankrupt, a builder and contractor, carrying on business at Pentonville, filed his petition in September last, and applied on Dec. 12 for an order of discharge. The unsecured debts amounted to £3,148, and debts fully secured £29,532, and the assets were estimated to realise £676, after providing for preferential payments. The bankrupt commenced business in 1881 with £500 capital, and traded successfully until the beginning of 1888, when he estimates he had a surplus of about £2,750. In February, 1888, he entered into a contract with a committee representing the costermongers of Islington for the erection of a block of costermongers' dwellings. The outlay incurred by the bankrupt on the dwellings was about £10,000, but he failed to obtain repayments, and the mortgagee was in possession. Various charges were made, but Mr. Registrar Brough held that the only one which had been substantiated was that of the insufficiency of the books, and upon that ground he suspended the bankrupt's discharge for twelve months.

Ventilating Shafts on Houses.—At Kensington Petty Sessions last week a case of interest to householders was heard. Messrs. Simpson are carrying out certain drainage works at a house in the Holywood-road, South Kensington, and have done everything to satisfy the demands of the local authorities with the exception of providing a ventilating shaft in front of the house. For non-compliance with this requirement by the vestry's surveyor, a summons was granted by the Bench, and partially heard a month previously, when the case was

adjourned for the attendance of expert evidence and counsel. Mr. William Weaver, surveyor to the Kensington Vestry, and Mr. Bruce Scott, surveyor to the St. Pancras Vestry, having given evidence in support of the summons, Mr. Bodkin argued that the section of the Act of Parliament had been strained by the vestry, who were endeavouring to get his client, a private individual, to ventilate a sewer, whereas that work was cast upon the local authorities. If this pipe were constructed it would be an intolerable nuisance to his client, who would have to ventilate the whole sewer. Mr. Peter Dollar, architect, was called, and said a pipe of this kind would be a death-trap. He had done work in Kensington, Hammersmith, St. Pancras, and, in fact, over all London, and had never known such pipes demanded. He would go farther and say that he had carried out work in Kensington, and had never been required to provide a pipe of this character. He believed the intercepting trap in existence to be perfect. In answer to Com.-Gen. Downes, Mr. Bodkin said his chief argument was that this pipe, if erected, would not affect the existing drain, as there was an intercepting trap and a siphon already in existence. Mr. Austin relied on the strict words of the Act, which included "the safe and proper working of the drain," and asked the Bench not to tie the vestry's hands. The Chairman said the magistrates were of opinion that the pipe was intended for the sewer, and not for the drain, and that section 73 was not wide enough to compel an owner to take such a pipe into a private house.

CHIPS.

The memorial stone of the new wing of the Lady Vernon Schools, Gateshead, was laid on Friday by the Bishop of Durham. The enlargement is the third the school has received in five years, and will accommodate 400 boys. Beneath the floor is a large covered playground. The architect is Mr. Stephen Piper, M.S.A., Eldon Chambers, Newcastle-on-Tyne.

Preliminary stages are being taken to establish an antiquarian museum for Aberdeen. It will probably be formed in connection with the Art Galleries in that city.

A mural tablet of alabaster with an inlaid brass, executed by Mr. Harry Hems, of Exeter, has been placed in the Baptist Chapel at Tiverton as a memorial.

The School Board for Cadoxton-juxta-Barry, Glamorgan, have accepted the tender of Messrs. Symonds and Co., of Cardiff, amounting to £12,344, for new schools to be built in Holton-road. Mr. G. Thomas is the architect.

A new cemetery is about to be formed at Hetton-le Hole, Co. Durham, for the rural sanitary authority of Houghton-le-Spring. Mr. R. Hudson, jun., of Sunderland, has taken the contract for drainage, laying out, and boundaries at £3,690.

The committee appointed to carry out the work of placing a stained-glass window in the chancel of St. James's Church, Horseley Fields, Wolverhampton, as a memorial of the late Alderman W. Edwards, churchwarden of the church for thirty years, have decided to place the undertaking in the hands of Messrs. Heaton, Butler, and Bayne, of London.

Chalford Church, near Stroud, has been repaired by Messrs. Drew, of Chalford, from plans by Mr. B. Edmund Ferrey, F.S.A. The galleries have been removed, the church has been reroofed, reseated, and refloored, a new heating apparatus has been inserted, and the organ has been rebuilt and improved. The works have cost £1,200.

The Dublin Corporation have this week accepted tenders for the erection of the new vegetable and fish market from plans prepared by the city surveyor, Mr. S. Harty, Pres.M.I.C.E.I. For the buildings themselves, the tender of Messrs. W. Connolly and Son has been accepted at £14,700, and for the new roof and fittings that of Mr. J. Lysaght at £4,360.

The new Technical School at Ossett, Yorks, was opened on Friday by Mr. Swire Smith. A loan exhibition of oil paintings, engravings, and etchings is being held in the building, supplemented by art objects from South Kensington.

At a meeting of the Droitwich town council, held on Wednesday, Mr. Bernard Godfrey was unanimously appointed borough surveyor. Mr. Godfrey is assistant to Mr. Robt. Godfrey, A.M.I.C.E., engineer and surveyor to the King's Norton rural sanitary authority, and also assistant surveyor to the Northfield highway board, and hon. sec. of the Association of Birmingham Students of the Institution of Civil Engineers.

An improvement has been effected at All Saints' Church, Southampton, by the introduction of a new oaken Communion-table, manufactured by Mr. A. Jones, of Kingsfield, from designs by Mr. J. P. St. Aubyn.

Our Office Table.

THE sudden death of Sir Edgar Boehm removes from our midst a Court favourite rather than an "eminent sculptor," as he is styled by the *Times*. In an issue of May 9 of the present year we published an excellent portrait and biography of Sir Edgar Boehm, and need only add that his elevation to the Associateship R.A. in 1878 followed immediately on his production of the model for the admirable statue of Carlyle, now on the Chelsea Embankment. In 1881 he was appointed Sculptor in Ordinary to the Queen, and two years later was advanced to the full rank of Academician. The Jubilee coinage may be accounted the greatest of his failures. His statue of the late Emperor Frederick in St. George's Chapel, Windsor, was unveiled in the presence of the Queen yesterday (Thursday), and he had in hand among other commissions a memorial effigy of Bishop Lightfoot for Durham Cathedral, the clay model of which he had almost completed. Sir Edgar, who was but 56 years of age, will, by command of Her Majesty, be interred in the crypt of St. Paul's Cathedral in a grave beside that of Sir Edwin Landseer to-morrow (Saturday) at noon.

AT the meeting of the R.I.B.A., on Monday evening, a letter from Sir Arthur W. Blomfield was read, stating that the modern nave of St. Saviour's, Southwark, has now been demolished, with the exception of a few fragments which remained of the original nave and aisles. These remains present some puzzling features, and prior to the rebuilding of the church (from Sir A. Blomfield's designs) Mr. Simpson, the clerk of works, will be happy to show them to any architect presenting his card. A visit of the members of the Institute will be arranged at the church one Saturday early in the new year, when it is hoped Sir A. Blomfield and Mr. F. T. Dollman, the author of the well-known monograph on the subject, will meet them and discuss the problem raised by the fragments of the 13th-century church of St. Mary Overie.

AFTER a long inquiry, Mr. G. Pemberton Leach, one of the Assistant-Commissioners of the Board of Agriculture, has concluded the consideration of the scheme for the protection of Mitcham Common and other open spaces in the neighbourhood, known as Upper-green, Lower-green, Figg's Marsh, and Beddington-corner. Under the scheme it is proposed to place the common and the other lands mentioned in the hands of a board of twelve conservators representing Mitcham, Croydon, Beddington, and Wallington. The extent of these open lands covers an area of about 600 acres. The scheme has been strongly opposed by the lords of three manors, who claim the freehold of the soil, and value their rights at £30,000. In the event of the Board sanctioning the scheme, it will be subject to the approval of Parliament before it can become operative.

THE death of Mr. Philip Horsman, of Tettenhall-road, Wolverhampton, took place, after a short illness, on Sunday. The deceased for many years carried on a successful business as a builder and contractor in Darlington-street, Wolverhampton, and during his later years was widely known for his unstinted philanthropy, Wolverhampton having benefited in a marked degree by his generous gifts. His principal benefaction was the Art Gallery in Lichfield-street, which was erected at his sole cost. He also contributed largely to the erection of the Eye Hospital in Compton-road, and gave with open hand to many other charities. The deceased, who was in his 66th year, leaves a widow, but no children.

A HIGHLY-SUCCESSFUL International Exhibition is being held just now by the Edinburgh Photographic Society in the Royal Scottish Academy National Galleries, Edinburgh. The President of the Executive Council is Mr. Hippolyte J. Blanc, architect, who himself is a distinguished exhibitor. The collection is a large one, and the illustrated catalogue is quite the best of its kind that we have seen, giving reproductions of photographs by the various processes now in use. One showing Temple Bar as re-erected at Sir Henry Meux's Park at Theobalds, Cheshunt, is specially interesting, and shows how well Mr. Ponting, F.S.A., of Marlborough, has done the work of "restoration." Mr. Richard Keene, of Derby, shows some of his beautiful photographs of Derbyshire churches, and Mr. Lyd Sawyer some charming studies of river and boating scenes, an odd corner of Newcastle, &c. Mr. Maurice B. Adams exhibits a pen-and-ink drawing of the Quadrangle, Hotel Dieu, Beaune, with a photo-lithographic reproduction of the same. Some Aristotype views from Ludford are shown by Mr. W. R. Spiers, and Mr. Henry W. Reeves contributes some excellent architectural interiors from Harrow and Morden Green of houses. Melrose Abbey, by Mr. R. S. Webster, is a fine print, and Mr. Fred Hollyer sends his delightful impressions of paintings by Mr. Burne Jones, A.R.A. Mr. Ralph W. Robinson shows his Academicians' portraits, and the Autotype Company are large exhibitors. Lectures are being given during the evening. The next, on Tuesday, Dec. 23rd, will be by the President, on "The Architecture of Normandy and Brittany," with slides by the author.

THE Fine Art Exhibition in connection with the Glasgow Institute opens this year two months earlier than usual, the chief object being to set free such pictures as the artists may desire to show in the London spring and summer Exhibitions. The work of members of the Institute forms the staple of the display, a feature being the painting of works by members of the R.S.A. There are 767 oil pictures and water colours, in addition to about sixty architectural drawings and pieces of sculpture. The more prominent exhibitors include A. K. Brown, William Rattray, Morris Henderson, Austen Brown, and James Guthrie. The loan collection, although small, is select.

MEETINGS FOR THE ENSUING WEEK.

FRIDAY (To-night). — Architectural Association. Adjourned Special Business Meeting for consideration of proposed new rules. 7 p.m.

MONDAY.—Society of Arts. "Gaseous Illuminants," Cantor Lecture No. 5, by Professor Vivian B. Lewes. 8 p.m.

TUESDAY.—Royal Scottish Academy Galleries, Edinburgh. "The Architecture of Normandy and Brittany," by Hippolyte J. Blanc, architect. 8 p.m.

CHIPS.

A life-sized oil portrait of Sir Rowland Hill has been presented to the National Portrait Gallery by his son, Mr. Pearson Hill, and accepted by the trustees. It is a half-length by J. A. Vinter.

It is stated that the directors of the Barry Dock Company have, without prejudice, offered Mr. Walker's executors £50,000 in settlement of the executors' claims of £204,000, and that the offer has been declined. The arbitration before Mr. J. Wolfe-Barry, which was to have commenced on the 1st inst., was adjourned until the 16th inst., in the hope that negotiations between the parties would have resulted in an amicable settlement. This has, however, unfortunately, not been the case.

On Saturday the Bishop of Colchester consecrated the new church of St. Margaret's, Partridge-green, West Grinstead.

The Denbighshire coroner held an inquest at Wrexham, on Friday, as to the death of Mr. Fred Davy, who came to that town from Chesterfield early in October last to take the mastership of the Science and Art Schools. He was on Tuesday morning found dead in bed. The jury returned a verdict of "Found dead."

At a meeting of the City side of the Gresham Committee, held on Monday, Mr. Karl Pearson was elected Gresham Lecturer in Geometry, in succession to the Dean of Exeter. Mr. Pearson gained an open scholarship at King's College, Cambridge, in 1875, and was Third Wrangler in 1879. He was subsequently elected Fellow of King's College. He is now Professor of Mechanics and Applied Mathematics in University College, London, and for the past six years has been actively employed in teaching engineering students, principally at that institution. There were twenty candidates for the position.

The Press view of the Guelph (Hanover) Exhibition at the New Gallery will take place on Monday week, the 29th inst., and the private view on the following day.

Mr. Gilbert Thomson, M.A., C.E., who lectures on sanitation in the Technical College, Glasgow, has been appointed to the lectureship on civil engineering in the same college, vacant through the acceptance by Mr. Arthur Thomson of a similar appointment at Poona.

Mr. Arnold Mitchell, A.R.I.B.A., gave a lecture at the London Institution on Monday on "English Architecture of the Middle Ages."

Trade News.

WAGES MOVEMENTS.

THE NORTH WALES SLATE TRADE.—In connection with the North Wales Quarrymen's Union, a special conference was held at Carnarvon on Saturday for the discussion of the hours of working, the rate of wage, and other details appertaining to the industry. The president of the union (Mr. D. G. Williams, Festiniog), in an introductory address, remarked that the quarrymen had allowed themselves to subside into a very low and unsatisfactory condition, but there were now indications of a reaction. Mr. W. H. Williams (Bethesda) read a paper on "The Condition of the Quarrymen and the means for uniting them." Mr. W. J. Williams (the secretary of the union) introduced a discussion upon the operations of the slate trade, declaring that the workmen were entitled to an advance in wages of at least 10 per cent. After a discussion, it was resolved to call the attention of the quarry proprietors to the large discounts allowed off the price-lists, which caused great loss, not only to the proprietors themselves, but also seriously affected the wages of the workmen, and to invite a conference at an early date.—Mr. D. Williams (Festiniog), in a paper on "The Rate of Wages," contended that the quarryman was entitled to a daily remuneration of 5s. A long discussion resulted in the passing of a resolution urging that the wages for skilled quarrymen should be at least upon the scale recommended in the paper. Resolutions were also passed in favour of the appointment of boards of arbitration, and of shorter hours of labour.

Col. Luard, one of the Inspectors of the Local Government Board, held an inquiry at the Town Hall, Stockton, on Friday, with reference to the application of the Corporation to borrow £6,500 for the purpose of reconstructing the baths and washhouses, and £1,000 for the purchase of property for improving the means of ingress and egress from the Borough Hall. The borough engineer submitted plans showing the alterations, and explained the same to the inspector.

Holloway's Pills.—The balsamic nature of Holloway's Pills commends them to the favour of debilitated and nervous constitutions, which they soon resuscitate. They dislodge all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young females and delicate persons.

A HUMANE TELEPHONE.

People who suffer from deafness and noises in the head will be glad to hear that an eminent Aural Specialist of London has hit upon a cure which is said to be absolutely efficacious, and may be applied at the patient's home. It is a miniature telephone, which fits inside the ear. It is not only a producer of sound, but also a cure for the distressing noises in the head. Being comfortable to wear, it will no doubt be a boon to mankind. A pamphlet describing its construction is printed, and may be had from the Publisher, 21, Bedford-square, London, W.C. Price 3d.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W

DOULTING FREESTONE.

THE CHELYNCH STONE—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY.
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

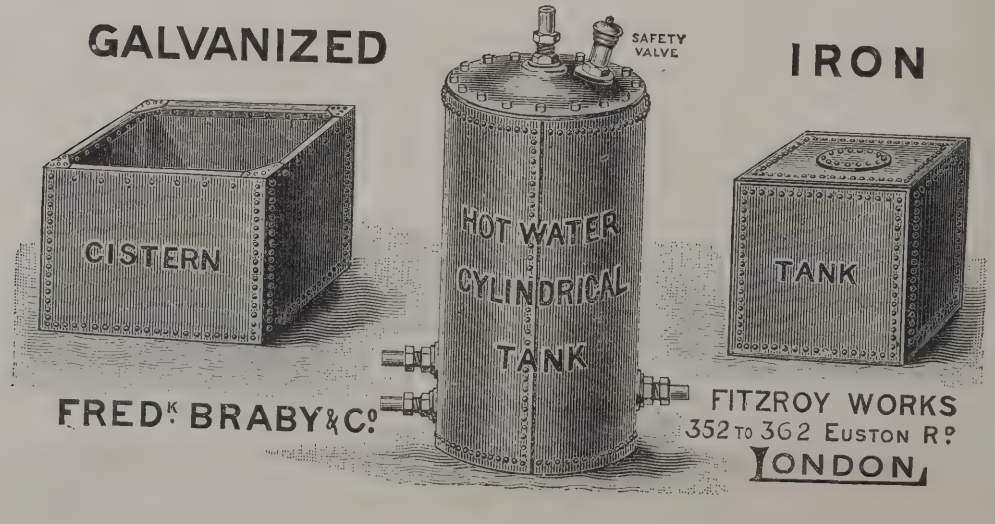
*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

AYLESBURY, BUCKS.—For the erection of a residence on Pickford's Hill, for Mr. T. Field. Mr. H. J. Capell, 7, Abbeville-road North, Clapham Common, S.W., architect:
Ball and Mayne, Aylesbury (accepted) ... £870
(Exclusive of certain works).

CREDITON.—For alterations and additions to the Plymouth Inn, Crediton, for Messrs. Harding, Richards, and Thomas. Mr. C. Cole, Queen-street Chambers, Exeter, architect:—
Brooks, J. T. (accepted).
(Seven tenders received).

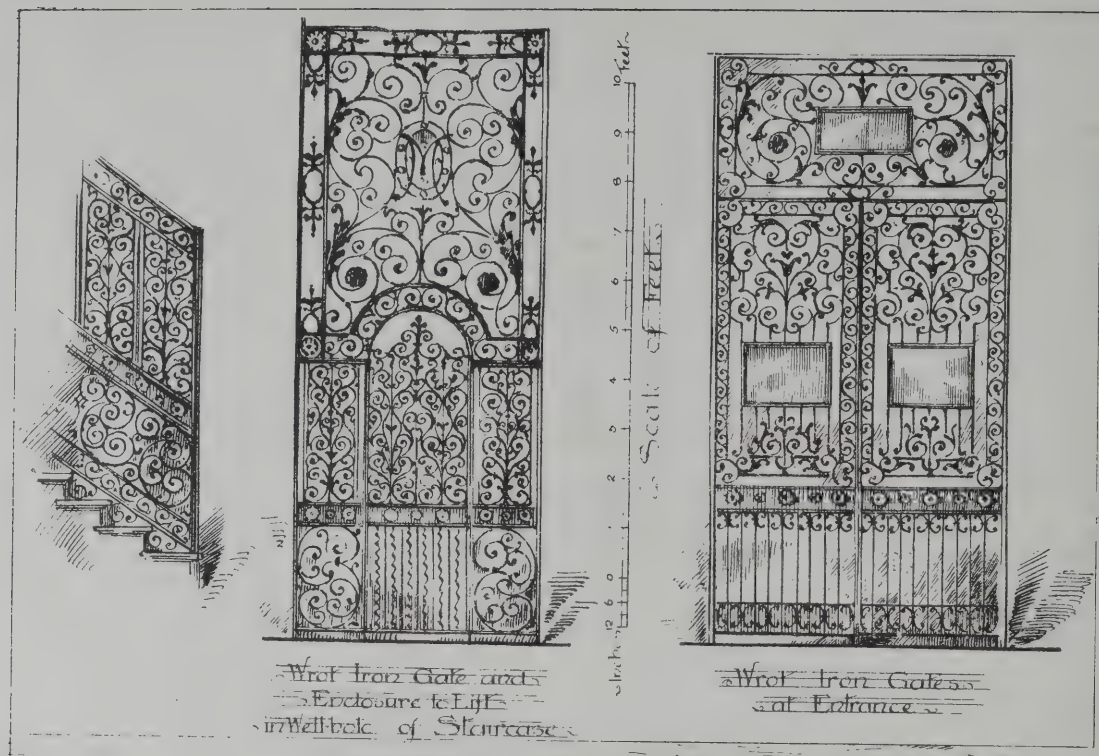
EXETER.—For sanitary alterations to the Sawyer's Arms p.h., for Messrs. Ross and Pidsley. Mr. C. Cole, Queen-street Chambers, architect:—
Ham and Pasmore (accepted).

EXETER.—For erection of villa residence in the Polsloe-road. Mr. C. Cole, Queen-street Chambers, architect:—
Reynolds, H. (accepted).
(No competition.)



LEEDS.—For two terrace houses, Potternewton. Messrs. Swale and Mitchell, Leeds, architects:—
Brickwork, &c.:—Kirby, R.
Joiner:—Benton, J.
Plumbers:—Stead and Noble.
Plasterer:—Branton, R.
Slater:—Season, J.
Painter:—Butler, J.
All of Leeds.

JENNINGS' PATENT
WASTE-PREVENTING CISTERN,
WITH AFTER-FLUSH.
Approved by all the principal Water Companies. Applicable to Valve-Closets of all kinds.



An absolute Waste-Preventer, dividing the regulation quantity into two portions. The first cleanses the Basin when the handle is raised; the second provides an abundant and equally rapid after-flush, re-charging the Basin, a most essential feature in connectionwith Valve-Closets.

GEORGE JENNINGS,
SANITARY ENGINEER, STANGATE, LONDON.
ILLUSTRATED PRICE LISTS ON APPLICATION.
AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

ADAPTATIONS OF DESIGN AND STRUCTURE.

SPECIALISM in plan, structure, and fittings is a development of the nineenth century. Less than half a century go buildings were designed upon models or istoric types; we had churches and chapels uilt with very little reference to the reuirements of worship or of congregations; omestic buildings were designed in Italian r Gothic style without comfort internally; ommercial and other buildings were seldom udied with regard to their adaptation, but nerely as displaying some style or predilecon of the architect or owner. Happily this ra of purposeless building and "architecturalism" has passed away, and we ave entered upon what Comte would ave designated the "positive" phase f architectural development. As with eligion, science, and sociology, architecture has gone through two stages since he Renaissance, one in which commonense vernacular architecture entirely disppeared under the mania of Classicism, the ther in which it became abjectly imitative. The first was the Reactive, the second the rchæological stage. We have now entered pon the last, or specialised stage, when rchitecture is beginning to assume a definite haracter as a science. Buildings are no onger erected to represent old types or istoric periods of art; they are the determinate solutions of problems presented to the lesigner. We cannot say that all modern vorks are of this description, but we can onfidently point to such examples as the Manchester Town Hall, the Birmingham Assize Courts, the Leeds, Glasgow, and Greenock Municipal Buildings, the Natural History Museum, the Imperial Institute, the new Admiralty Offices, and other recent buildings to illustrate our proposition. Recent hospitals and unions, our leading Board schools and technical schools equally show a study of plan and design to meet definite requirements. Their authors have made a special study of the best types of arrangement, they have mastered the evidence of Blue-books and Government regulations, and have formulated schemes based on experiments and scientific data. Even church-building has been taken out of the sphere of puritanical narrowness and ignorant churchwardenship; archæological restorationists have not the influence they had a few years ago in trying to make every church conform strictly to a particular period or style; on the contrary, the absolute requirements of ritual, or of liturgical meaning, have evolved a plan adapted to our views of Anglican worship, quite independent of Mediæval tradition on one side, and of post-Reformation meagreness on the other. The same regard for specialisation has influenced the design of churches outside the Establishment. They are no longer bare conventicles of four walls, but are designed with particular reference to the requirements of congregational worship, many of them displaying considerable skill in construction and architectural treatment of the interior. In this class of church we find details of Mediæval and Classical design adapted to a distinctly new type of plan, admitting of new roof construction, domical and other features. We may trace in a similar manner architecture applied to concert halls, theatres, buildings of public assembly, winter gardens, horticultural structures, museums, art galleries and libraries, baths and wash-houses, and a host of buildings erected for commercial and industrial purposes. For each of these kinds of buildings the architect, some years ago, would have been content to grope his way as best he could, by making haphazard guesses, and consulting the tastes of his employers; but now he has more reliable data to work from. He can consult the latest results; types of plan are within his reach for many of these kinds of building. The elementary school is no longer a matter of consulting masters, as dimensions of school and class rooms, modes of grouping, the arrangement of desks, lighting and conveniences have all become matters of regulation, and there is little room for guesswork. So it is with infirmary wards and hospitals, the floor area for each patient, the determining unit of each ward plan, the mode of arranging ward kitchens, nurses' rooms, and conveniences, the method of disposing the administrative offices are no longer subjects of conjecture and doubt, as the medical profession and the requirements of nursing staff have settled the question, so far, at least, as scientific research and observation of experts have gone. The whole plan and design of such a building have, so to speak, become crystallised round a type. Precision, the result of special knowledge in every department, is one of the aims of the architect. We now find the profession striving more than it has ever done to master certain problems, and we cannot point more convincingly to this fact than in the attempt made to "patent" certain arrangements of buildings or combination of principles. The very fact of a claim being made for a system of building on wings having a central public hall, with entrance to each wing through an inquiry office, shows the increased attention given to principles and germs of arrangement. As more determinate plans are evolved for buildings of different sorts, so we can imagine certain principles of combination will assert themselves. The progress of every scientific study is to eliminate error or useless features, and to lead to a few well-defined types—in other words, to "a survival of the fittest."

Specialism is not alone confined to plan. As a certain form or determinate type is given to a structure, so its ornamental features must tend to crystallise round the form, and be suggested by it. The plan develops the feature. Thus an angle spiral stair suggests the turret, and the form the turret takes can be varied by the artistic mind in many ways, but it is possible to exhaust them. Every eminent architect has his own style by which he is known, a proposition that is only another assertion of specialism in design. To extend this argument would be useless, as our readers are aware that the churches of one architect, the municipal buildings of another, or the workhouses and infirmaries of a third—we need not mention names—have a certain style or individuality, and these peculiarities have been derived not altogether from mere imaginary whim, but are incidental to, or derivative of, special study and knowledge. The specialisation of structure opens a much greater field for attention than we can bestow upon it, for it may be said to include every mode of structure and material. We will here mention two of the more important examples, the structure of floors and of roofs. Less than fifty years ago, before the introduction of cast or wrought iron, there were only two sorts of floor—those of timber and stone. We possess now a variety of special modes of construction suitable for every purpose. The requirements against fire have created a large number of ingenious methods or patents in which rolled iron girders and joists have been introduced with brick-arching, concrete, fireclay, overlaid with wood, tiles, or cement. In the proper exercise of his professional skill, the architect is called upon to select that method which affords the greatest efficiency for strength, and resistance against fire. Four or five varieties may be named here. First, those in which wrought-iron joists and wooden flooring are combined with concrete or plaster beneath the iron joists, adapted for ordinary dwellings. Messrs. Barrett and Fox's and Allen's systems are of this class. Second, the girder and arch systems, such as that introduced by Sir W. Fairbairn, in which girders resting on iron columns at intervals support arches of brick resting on lower flanges, the girders being tied together by tension-rods, the wood flooring being laid upon spandrels filled up level with cement concrete, adapted for mills, factories, and warehouses. The Lancashire Mills show this method, in which cast-iron main girders, carrying cross girders of wrought iron, are combined, the latter carrying half-brick arches with spandrels of concrete. Third, iron girders encased by fireclay blocks, or skewbacks supporting arches, or hollow tubes of refractory clay, like the floors introduced by the late Mr. Whichcord at the National Safe Deposit Company's premises, Mr. W. Hornblower at the Liverpool Corn Exchange, and the Doulton-Peto floor. Fourth, the Dennett System, composed of iron girders supporting a specially-prepared concrete arching, which has no tendency to spread, and can be finished with an arched ceiling of considerable fire-resisting power and strength, suitable for warehouse floors. Fifth, other systems of encasement, one in which iron is embedded in concrete in such a manner as to utilise resistance to compression and tension to the utmost, like that of Hyatt; also Moreland's system of immersing braced girders in a concrete slab. Now there is a special value in each of these methods. Where great strength, fire resistanee, and economy of space is required, those plans appear to be the best which encase the lower flanges of the girders, and call into play resistance to compression in the intermediate material between the girders. For architectural purposes and decorative treatments, that method may be desirable which exhibits the lower portions of the girders or allows them to appear below the level of the ceiling. The improved manufacture of iron and steel joists, compound girders, as those of Measures Bros. and Co., Dunkerley and Co., has greatly facilitated the design of floors and ceilings for architectural effect, as great strength and lightness can be combined with a limited depth. Flooring has become quite a special department of building, and it would be impossible to enumerate here all the kinds. But of the more durable materials we have tiles, concrete, patent artificial stones, like the "Granolithic," and internal floors varying from the substantial wood block, like Lowe's, to the ornamental kinds of parquetry, made by several well-known firms of repute. The methods of fixing the blocks or the parquetry are ingenious. We have the blocks secured by metal keys, by "disc keys," by a system of dowelling, tongueing, and grooving, the respective merits of which, as regards durability and cleanliness, the architect has to consider before writing his specification. Then as to ceilings, the necessities of modern architecture has brought in existence a whole host of substitutes for ordinary plastering. The specialisation has been the result of certain wants, such as lightness, economy of labour, fire-resisting, and sanitary purposes. Plain or elaborate and curved work called for distinct materials and treatment. The non-inflammable and light fibrous plaster slabs, like Jackson and Son's, have rendered internal decorations independent of old methods of construction, and made rapid execution possible; asbestos in various forms is coming into use, and the "anaglypta" relief is one of the many new special kinds of decoration.

The many requirements of roofing have developed a few special methods. To cover

large areas with light roofs and vaults that shall exert no thrust on the walls has developed concrete and tubular pottery as a filling in between ribs of iron. Some fire-proof material, like concrete or terracotta, was an essential condition. The last material can now be manipulated like stone, and is brought to a degree of accuracy in the new Doulton manufactures. Asphalte is being largely used for roof coverings, gutterings, and weatherings, in lieu of lead or slate, and a method of applying it in a heated liquid state or as plates has become a special trade. Horticultural glazing has also assumed quite a distinct art. Steel for roof construction is coming into requisition, and it will not be long before light roofs of metal and porous concrete, put together in sections, will be substituted for the more tedious operation of hoisting every rib into place and constructing centring for the vault or dome.

Not less remarkable are the improved and special fittings which every illustrated catalogue affords. Specialisation has been carried to a great extent in matters of furniture, art metalwork, and fittings. Chimneypieces and over-mantels, of designs to "suit all tastes," with grates to match, have naturally provoked artistic minds, though it is the general result of the same tendency. The details of ironmongery, such as door and window openers, and door furniture, illustrate in a remarkable manner the development of ingenuity in the attainment of particular objects. We have fittings specially suited to every kind of window and door, modes of adjustment and regulation for casements under different conditions of fixing, fastenings for every kind of door and window, grates and stoves for various situations. Electric lighting has developed a large and important branch in connection with building, in which special adaptations and fittings are very noticeable, and the same specialising is evinced in the fittings of the sanitary and ventilating engineer. In all these trades of building we see the adaptation of means to ends has been carried to an extent hardly considered possible some years ago, and that both in design and structure there are some definite ideals within our grasp.

PLASTER DECORATION.

ONE or two useful suggestions were made the other day at the Institute by those who contributed papers on the subject of Decorative Plaster-work, reported in our last issue. Of these the principal was the absolute importance of "doing the work of design in the place instead of for the place," a point very properly insisted upon by Mr. Stephen Webb. Practically this advice would leave to the modeller the design of the decorative work of ceilings and friezes, for very few architects have the experience of designing *in situ*, and not many have a very keen sense of scale. Now, this is a principle of architectural design to which we have called attention more than once. Paper-design, as we have called it, has tended to separate the architect from the art craftsman, and has introduced a species of fictitious design into every branch. In no other trade is this more marked than in those of the modeller, the carver, and the decorator. These arts require for their effective production a knowledge of the media or materials worked in, and also an appreciation of scale or proportion. How often do we find admirable detailed designs for cornices and friezes quite spoiled or out of scale with the building when the work has been executed!—stone carvings in panels or bands that are finical in appearance and exceedingly flat—defects attributable mainly to the designs having been made in the drawing office, perhaps a long way from the actual building, or having been copied from designs utterly unsuited both in scale and in motive. Well did Mr. E. S. Prior say that, "Learning to design was not learning to draw designs; paper-work designing was ineffectual; the medium of execution was the only one for conscientious design." Plaster ornamentation as we see it on many recently erected buildings—both municipal and domestic—is a sorry thing. The plasterer is present, and the material is there, but certainly not the artist. Enter any important council chamber or music room in some of the fashionable buildings designed by well-known architects—notice the coarse plaster-work in coves, the heavy swags and trusses and brackets, the proportions of moulded ribs. Projecting members look either too coarse or meagre; these are prevalent features of coved ceilings and vaults. Of materials there are enough, but of design scarcely an indication. Who is to blame? We think the architect is, in giving designs made in his drawing office, partially copied examples of old work without any relation to the situation. He has probably neglected the study of modelling, thinking it the least important of the architect's studies, or he makes the common mistake of treating stucco design as surface ornament that can be applied anywhere. English Domestic architecture of the 16th and 17th centuries affords the student examples of stucco duro or modelling of much beauty and variety, yet very few of the details are accessible or published, and many of the old houses either no longer exist, or are mutilated. Italian, French, and Flemish stucco work have each in turn been exemplified during the period referred to. The delicately manipulated art practised by Raphael and Giovanni, referred to by Mr. G. T. Robinson, is only accessible to those who have visited Italy. The revived art of stucco modelling in this country is less delicate, often bold, and later the French and Flemish styles were introduced in which the ornamentation was sometimes exuberant and heavy. The 18th-century houses of the nobility display many excellent examples of stucco work: these are mainly the work of Italian modellers, who have kept the secret of their craft to themselves. Architectural students would do well to follow the steps of a few of the leading architects of this period, and become modellers, for the art is one of the greatest importance to anyone who desires to become a master of stucco work or any kind of external ornamentation. We know, in fact, that plaster-work in the 18th century was a recognised and remunerative vocation, and many artists, craftsmen, and architects followed the calling of stuccoist. Thus the father of the late Mr. John B. Papworth, architect, was a famous plasterer and stuccoist, employing some hundreds of hands, and was apprenticed to Rose, a leading craftsman in London, in the middle of the last century. Rose was a pupil of two celebrated fret-workers, who erected the plaster-work of St. Martin's-in-the-Fields early in the century, and other notable buildings. As the plasterer to H.M. Board of Works, Papworth had excellent opportunities, and brought the art of stucco embellishment to a high degree of perfection. The influence of Sir William Chambers aided the artist in stucco. When the 18th century Italian stuccoists appeared, there was a mixed style in vogue, often vigorous, as we see in many of the houses of the Jacobean period. The heavy panelled work and stucco ornament on ceilings of the Stuart period are known to every student of the period. It was left to the Italian workers to introduce a lighter and more elegant style in which foliage and other ornament were worked by hand, and with particular reference to distance and situation, light and shadow. But at the commencement of the present century casting in plaster was introduced, and the modelling of stucco by hand was superseded. In every case mechanical methods of reproduction have crushed o individual hand skill. The cast work l naturally to heavy, coarse decoration, a as a matter of course, to excessive repr duction and repeats of ornament.

It is for architects once more to encoura modelling. All that is required is for t office to assume more of the character of t studio. Modelling, we know, is taught connection with the Art classes of t Department; but it is confined to the pr duction of isolated studies of panels, relie and designed ornament, without relation actual buildings. There is little that practical in the course given to studer in the schools of art. The profession m do something by promoting a special cl of modelling in the department by bringi their designs into the school, and by instru ing modellers as to the requirements buildings, and as to the effect of orname in relief *in situ*. The great obstacle to t development of the art of the stucco work is the isolation of those who have to do t work—the architect and the modeller. T one is content to design something in his offi without the slightest idea of the proportio and degree of relief necessary for a ceili panel or a cove; the other is only an expe in the material, but has no interest in stud ing the effect of his work in its place. Wh architect and plaster-workers are broug together, and the one devotes his time a lit to modelling and the other to architectur design, we shall see an improvement in t art of modelling in plasterwork—we sha see fewer sprawling ornaments in ceiling less of that distasteful repetition of moul ings or repeats. Modelling can only done in the workshop or on the scaffol It is ridiculous to imagine that a desi on the flat, however clever as a work mere surface ornament, can give t result or decorative value which a schem worked out by hand in clay or plaster c do. The quantity and distribution of stuc ornament in a frieze or a ceiling panel ca not be arrived at by a pencil-line drawi on paper, simply because the lines do n express the forms, and when seen in particular light the plaster-work, as com pleted in compliance with the drawing, loo overcrowded or exceedingly coarse. To a successful design, the material must itself manipulated; next to this, we shou say all plaster or stucco ornament ought be drawn full size *in situ* as cartoons, a brush-work as drawing from the roun certainly not line work—is the only mode which the effect of the design can be obtain approximately.

TWO LARGE RAILWAY BRIDGES I INDIA.

AT the last two meetings of the Institution Civil Engineers papers on the new Lan downe and Chittravati Bridges have been re and discussed. The Lansdowne Bridge over t Indus at Sukkur, was described by Mr. F. Robertson, M.Inst.C.E. At Sukkur, where t North Western State Railway had been carri across the Indus, the river passed through isolated ridge of nummulitic limestone, and w divided into two channels. The Sukkur Pass w bridged by three spans of 278ft., 238ft., a 94½ft. respectively, while the Rori Channel w crossed in a single span of 820ft. The ste superstructure of the last-named span w designed by Sir A. M. Rendel, K.C.I.E., a consisted of a pair of cantilevers, each having projection of 310ft., carrying between them central girder 20ft. in length. Each cantilev had a vertical height of 170ft. above the abu ment, and at this point the principal membe consisted of a vertical pillar and an inclin strut or jib, united at the top by a horizont tie, and tied back by an inclined land-tie backstay anchored into the rock. When t anchorage had been bedded, the inclined guy a the vertical pillar were erected by means of tem porary staging, and were permanently connect at the top. The inclined strut, which was 230 in length, was then built up from the abutmen

ng laid in its inclined position on staging at lower end, and further supported, as it pro-ssed, by temporary wire ropes from the tical pillar. For the erection of the permanent rizontal tie between the tops of the pillar and strut, a temporary wire-rope suspension dge was thrown across the space of 123ft. ween their summits. This bridge carried a ntry, on which ran the travellers employed in cting the steel-work of the horizontal tie. The ntilevers on each side of the river having thus en pushed forward with an over-reach of 123ft., system of running overhead rope-gear was ted up, spanning the intervening gap and rving for the erection of the remaining mem-rs of each cantilever piece by piece. The ropes re worked from the summit of each cantilever winches, which were driven by a steam-gine on land by means of a running rope. hen the cantilevers had thus been carried out their full length, the central girder was erected on a temporary inverted bowstring, which was ung across the opening by the overhead gear.

The New Chittravati Bridge, on the Madras ailway, was the subject of a paper by Mr. d. W. Stoney, M.Inst.C.E. The main line of e Madras Railway was originally carried across e Chittravati River upon a plate-girder bridge, nsisting of 40 spans of 70ft. each. This bridge as opened for traffic in 1868, and was partially stroyed by a great flood in October, 1874, when ne of the piers were undermined and over-rown. It was afterwards repaired, and the maged piers having been replaced by screw-les, the structure had served for some years to rry the traffic, but was now replaced by the idge which formed the subject of this paper. he new bridge had a total length of 2,680ft., nsisting of 19 spans of 140ft. from centre to ntre of the piers. It crossed the river along-de the old bridge, but more nearly at right ngles to the stream, the approaches being formed y a railway diversion 1¾ miles in length. The urce of the river was 80 miles above the bridge, id in that distance it drained an area of 2,400 quare miles. In the flood of 1874 its velocity was calculated to have been 8½ft. per second, and the discharge 114,625 cubic feet per second. As a rule, the bed of the river was practically dry for nine months in the year, and taking advantage of this fact, the dry bed of the stream was made use of for the transport of materials, for the erection of the iron-work, and for the operations connected with the sinking of the pier cylinders and the well-foundations of the abutments. The foundations were carried down to the solid rock at a depth varying from 18ft. to 80ft. below the present bed, the overlying strata consisting of sand, gravel, and clay, and in some places of a deep bed of large trap boulders. The cylinders were sunk by various processes, according to the nature of the ground, the greater part of the work being done by dredging, while some cylinders were partly excavated in the dry with the aid of pulsometer pumps, and in others the work was carried on by divers or by pneumatic apparatus. The superstructure was designed for a single line, the girders being of the Murphy-Whipple type. The iron-work of each span was erected, during the dry season, upon camber-blocks laid upon the dry bed of the river, and was lifted into place by 60-ton hydraulic jacks applied under the end pillars of each girder. The weight of each span was 146 tons 12 cwt.

HOREHAM CHURCH, SUSSEX.

THIS small church, with accommodation for 100 worshippers, has recently been erected on the Horeham Hurst Estate. The walls are constructed with red bricks, the roofs covered with dark tiles, and the bell-cot with oak shingles, the timber-work to gable-end, porch and doors being of oak. Internally the walls are finished to a height of 4ft. 6in. in cement, and rendered in plaster above. The roof is ceiled with deal match-boarding, stained and varnished. The sashes are glazed with light tints of cathedral glass, the east window being stained glass. The flooring is formed with Duffy's solid wood blocks, and the building heated by means of Grundy's patent hot-air system. The works, which include the seating, oak pulpit, and reading desk, have been carried out by Mr. Daniel Ashdown, builder, Horeham-road, Sussex, under the superintendence of the architect, Mr. H. Percy Monckton, F.R.I.B.A., of 32, Walbrook, E.C.

THE ARCHITECTURAL ASSOCIATION.

THE REVISION OF RULES.

AN adjourned business meeting of the Association was held on Friday evening to further consider the report of the special committee on the revision of the rules. Mr. Leonard Stokes, the president, occupied the chair. Our subjoined detailed report of the discussion and that of last week show that, as we anticipated in our article of the 5th inst., p. 778, the report as presented by the committee, has so far been confirmed in the main, the numerous alterations being emendations of an explanatory or verbal character, and not changes in principle. A feature of the meeting was the small minorities by which amendments which seemed to be out of harmony with the spirit of the meeting were supported by vote. Eight, seven, and even four and three hands only were raised for propositions to which larger numbers had spoken in the discussion. At times the President had no little difficulty in maintaining the rules of debate, three or four members, each propounding a distinct amendment, endeavouring to speak at the same time. Turning now to our notes of the proceedings, we may remind our readers that at the previous meeting held on the 12th inst. (see p. 847 in our issue of last week), the whole of the first class of rules, to be known as the Constitution, were adopted, with the exception of No. 3, the consideration of which was postponed until the arrangements with allied societies had been considered in detail under the By-laws. In opening the adjourned proceedings on Friday, Mr. Hugh Stannus, chairman of the Rules Revision Committee, moved that a new rule be added to the Constitution, fixing the

subscription of existing members at half a guinea, in order to render it less easy in future years, when "old members" will be in a minority, for younger men to snatch a division, levelling up subscriptions to the guinea. The feeling of the meeting seemed, however, to be against the proposal, and on the suggestion of Messrs. Owen Fleming and W. H. J. Leverton, its consideration was adjourned.

Passing on then to the proposed code of By-Laws, 39 in number, Mr. Stannus moved the adoption of No. 1, defining the objects and methods of working of the Association. Mr. W. H. Atkin Berry demurred to the introduction in the draft of a "studio," as one of these, believing that the establishment of such a form of organisation by the Association was not only unnecessary, but inexpedient. The very best studio a youth could enter was, he held, an architect's office. The President and Mr. T. E. Pryce pointed out that the Association would not be bound forthwith to provide a studio if the rule was adopted as it stood, while Mr. Cole A. Adams supported the rule on the opposite standpoint, that the members having already adopted a report of the education committee, recommending, among other changes, the establishment of a studio, the Rules Committee were bound in loyalty to consider it as an instruction for their guidance. Mr. F. R. Farrow supported the rule as it stood, and after further remarks by Messrs. W. Burrell and C. H. Brodie (who was informed by the President that the *A. A. Notes* was "an" organ of the Association), the rule was adopted unaltered, *nem. con.* By-law 2, placing the arrangements for all methods of working under the control of the committee, gave rise to considerable discussion, led off by Mr. Leverton, who moved an amendment delegating certain independent powers to each class-committee. This was seconded by Mr. C. M. Hudson and supported by Mr. Brodie, while the rule was spoken to by Messrs. Stannus, F. L. J. Barrow, Burrell, and others. Eventually, on the suggestion of Mr. Cole Adams, Mr. Leverton's motion was amended to the insertion of the word "sub-committees," as among the bodies to be appointed by the committee, and in that form it was carried. By-law 3, relating to Class-reports, was the subject of much criticism, and after a discussion in which Messrs. Cresswell, Brodie, Arthur E. Earle, F. T. W. Goldsmith, C. A. Adams, Pryce, Farrow, and others took part, Mr. Stannus withdrew the proposed rule, and recast it as follows:—"Each class shall present a monthly report and an annual report and balance-sheet at the end of June in each year to the committee." This was seconded by Mr. Earle, and carried without a dissentient. By-law 4, stipulating the mode of election of members, was adopted, with verbal alterations suggested by Messrs. Adams, Atkin Berry, and F. T. Baggallay, and spoken to by Messrs. E. S. Gale, H. Sirr, and others. The next four rules, relating to allied societies, were adopted *nem. con.*, and then the consideration of No. 3 in the Constitution was resumed, and the rule passed without alteration. The fight of the evening took place on by-law 9, which raised the question of the entrance fee and subscriptions, and read as follows: "The entrance fee of each member shall be two guineas, and his annual subscription one guinea; but members elected prior to the first day of January, 1891, shall pay an annual subscription of half a guinea." This was proposed by Mr. Stannus and seconded by Mr. C. A. Adams. Mr. Fleming thought the increased charges would press heavily on country members, and proposed, as an amendment, that all members residing beyond a radius of twenty-five miles from Charing Cross should pay an entrance-fee of one guinea, and a subscription of half-a-guinea, both as at present. The by-law, when regarded in the light of the history of the movement, was, he said, an extraordinary one. The education committee, after inquiry, came to the conclusion that the best step would be to raise the subscription uniformly to one guinea; but on account of the opposition with which this was met, the rules committee now proposed that the increased charge be only enforced on all future members. He believed its working would have an extremely injurious effect in checking the entrance of new members and the establishment of two rates of subscriptions. It was also unfair, as throwing the whole additional burden of the increased expenditure on the youngest students, and injudicious, inasmuch as it would deprive the Association of any *locus standi* in appealing to the R.I.B.A. for pecuniary help in working out their scheme. The plea that had been urged, that the seniors would leave *en masse* if the subscriptions were raised, was very selfish, and one that everyone should be as ashamed to use with regard to a body from which he had in the past derived benefit in his studies as he would be with regard to any religious or philanthropic body. He believed it would be practicable to raise the extra sum required out of students' fees perhaps, supplemented from without; but he would deal with the question of provincial members, and move his amendment. Mr. Walter Millard seconded the amendment, characterising the committee's proposal as shabby in the extreme, and a "newspaper shuffle," expressions which were greeted with cries of "Withdraw," and appeals to the chair. Mr. C. A. Adams, in defending the rule, said since he was defeated a few years ago by a narrow majority on a proposal to raise the subscriptions of existing members, he had learned to regard that proposal as a mistake, as it would undoubtedly lead to a large secession of senior members. The Association would in the future offer advantages and privileges which the present members had not enjoyed, and as these could not be obtained without expenditure, it was necessary, unless the improvements were to be abandoned, to make increased charges. As to the entrance-fee and first subscription or two, they were paid not by the pupil, but by his parents or guardians. It was undesirable to make entrance to the profession too cheap. He urged the members to support the by-law heartily and unanimously, as it afforded the best solution of the difficulty. Some confusion ensued, as Mr. Earle was permitted to move another amendment retaining the half-guinea subscription while raising the entrance-fee; and Mr. Bernard Dicksee a third, under which the subscription was to be 25s. including a copy of the A.A. Sketchbook. An urgent appeal on the point of order to the President by Messrs. Goldsmith, Adams, and others, resulted, however, in a ruling that the amendments must be taken and disposed of seriatim. Mr. Fleming's amendment was spoken to by Messrs. Brodie, Hudson, and Atkin Berry, the last-named speaker arguing that it would be unfair and selfish of existing members, who had derived great educational benefits from the Association, to shelve all the cost of the new scheme upon those who had not yet joined. On being put to the vote, Mr. Fleming's amendment was lost by a very large majority, only eleven holding up their hands in its favour. The result was received by the meeting with loud applause. Mr. Earle then moved a further amendment that the subscription of members residing not less than thirty miles from Charing Cross be half a guinea, leaving the two guineas entrance-fee as at present. This was seconded by Mr. A. H. Clark, and supported by Mr. Cresswell. Messrs. Hampden W. Pratt and E. W. Mountford opposed, on the grounds of the difficulty that would arise in defining whether a man was a town or country member, and after observations by Messrs. Goldsmith, Hudson, C. A. Adams, and others, the amendment was defeated, only three voting in its favour. Mr. Dicksee then moved a further amendment that the subscription of all members be 25s., including a copy of the "A.A. Sketchbook." He expressed his regret that the Sketchbook was not more widely supported, and argued that, assuming they had 1,150 members, the change would bring in an additional £266 10s. annually, allowing for the cost of the extra copies. Mr. Earle seconded the amendment. The President deprecated its adoption, pointing out that to charge members for a book they did not voluntarily subscribe for would be to cheapen the publication without commensurate benefit to the Association's funds. The amendment was lost, as was a fourth one moved by Mr. Arnold S. Taylor and seconded by Mr. Burrell, under which it was proposed to retain an entrance fee of one guinea, and after an hour and twenty minutes' discussion, the rule as proposed was carried as a substantive motion amid loud applause. The President announced that the committee would, subject to the approval of the meeting, treat as "old members" liable to the present subcription those candidates already nominated on the 12th inst., whose elections would come on at the first meeting next year, and this was unanimously agreed to. Rule 12 dealing with members whose subscriptions are in arrears, was, at the suggestion of Mr. Cresswell, amended by the insertion of a clause providing that a tender of resignation "shall not absolve a member from paying arrears then due." No. 13, as amended at the suggestion of Messrs. Baggallay, Brodie, and Goldsmith, provides that a list of members whose subscriptions are "one session" in arrears shall be posted. To by-law 15, giving the constitution of the committee, Mr. Leverton proposed to add the clause: "No member of the committee shall hold any paid office," and this was seconded by Mr. Hudson. Mr. Stannus said that frequently lectureships went a-begging, and this would preclude any member of the committee who volunteered to fill a vacancy from accepting an honorarium for expenses. He himself only received for his course of lectures three guineas, which did not cover the cost of the diagrams. Mr. Cole Adams and the President supported Mr. Stannus, and the amendment was rejected by a very large majority, the rule being agreed to with a verbal alteration. By-laws 16 to 20 having been agreed to, the adjournment of the meeting was moved at a quarter past ten by Messrs. Baggallay and Stannus, and agreed to, the President promising that as soon as a date could be fixed for the next meeting, it should be announced to all members. Nineteen by-laws remain for consideration: but the only business about which a strong difference of opinion may be anticipated is No. 36, dealing with votes, in which it will probably be sought to substitute papers sent by post for a show of hands in open meeting, a change made indeed by the new rule No. 12, added a fortnight since to the Constitution.

"BUILDING NEWS" DESIGNING CLUB.

A SMALL SCHOOL OF ART.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE new session of our Designing Club has commenced with a very large number of members, and it is evident from the great many designs sent in for the first subject that the work of the club is quite as popular as ever. To insure success we depend upon the industry of our contributors, and without their co-operation it is evident that the high standard of excellence obtained by previous members of the Designing Club cannot be maintained. Looking round among architects now in good practice, we can number a few who in years gone by were constant contributors to the competitions which we conducted, and it has from time to time been a satisfaction to receive letters from some of them saying how much practical knowledge they obtained while working out the subjects which were set for solution in this way. Such success is the best inducement to further efforts, and we begin our task once more with a renewed determination to render our enterprise of mutual advance as far as possible worthy of the record which has distinguished the work of our Designing Club in the past. These were the particulars supplied to competitors for subject A:—

"*A Small School of Art for a Village*, comprising at least four class-rooms or studios, one to be suited for life studies, and to have a small dressing-room for model attached. A master's room to be provided, and a small office. Studios 15ft. high. Site in a village street on frontage line to measure 75ft. in width and 30ft. deep; no entrance from rear. Front of site faces north. Style left to competitor. Scale, 8ft. to the inch. Sufficient elevations and plans to illustrate design, with small perspective sketch."

We have carefully examined all the plans sent in, and award the first place to "Spider," the second place to "G in a Horseshoe," and the third place to "Multum in Parvo." This choice has not been easily made, however, and we are quite aware of the merits of some of the other designs, as well as the faults of the selected ones. That the result will please everyone is not expected, and it is certain that all the designs leave much room for improvement.

"Spider" acknowledges the need of large windows in a school of art, and makes his façade design accordingly. The entrance is wanting in dignity, and the iron gates are too trivial in detail, and not high enough to prevent boys climbing over, which they would be sure to do in a village street. The turret in the centre is too squat, and not very attractive. Taking the area occupied by the hall, entrance lobby, and porch, it will be noted that the area devoted to the hall is cramped, and wanting in dignity. This is a

fault, and we do not like the way in which the staircase is reached round the corner. It is well lighted, however, and the office commands the entry fairly well; the master's room, too, is handy for receiving visitors. The conveniences are located well one over the other, though the ladies' accommodation could be improved by shifting the w.c.'s, and placing the washbasins in the cloak-room. The model's throne is too much of a stage. An octagonal revolving dais is the best arrangement, made to run on wheels; it can then be readily shifted and adapted to the size of the class, and light available for any given study or pose. The model's room is good, and the modelling room, with an adjoining place for the sinks and clay, is a thoughtful provision very necessary in a school of art. We illustrate the design to-day from the sheet as sent in by "Spider."

"G in Horseshoe," the second design, is also herewith reproduced among our lithographic plates. It is hardly so successful architecturally, and the plan does not occupy the whole of the site. Half-timber work, perched up as it is here under a somewhat "pimping" roof, looks very much out of place, and has the effect of being stuck on as here used. In old work there would have been more repose, and more sailing over for shadows' sake, and to accord with timber construction. The entrance-archway is hardly a success, while its flat top is positively ugly as here managed. The hall is more commodious than in "Spider's" plan, and the staircase is better, giving a roomy landing. The conveniences right and left are good, but rather too small, giving no room for cloaks and hats.

"Multum in Parvo" is to be commended for his endeavour to be simple, though he has hardly marked his building as a school of art. It might be an ordinary elementary school, or possibly a set of stables, looked at from the street. The smaller studios are too small, and the ladies' retiring-rooms are in too public a position, and the men's would be better more out of the way. All the accommodation is obtained on one floor.

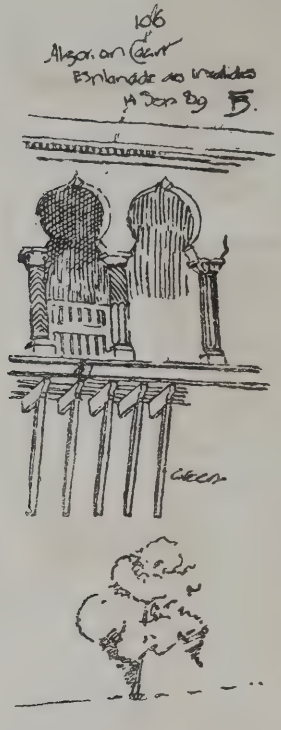
To exactly classify the following designs is hardly possible if we are to give precise prominence to their relative points of merit, seeing that they so closely compete with each other. "M.P." has nearly done a good thing, and we like his elevation generally speaking, though the pent along at the first floor level is meaningless, and the entrance-arched treatment is excessively poor. The three oriels above are pretty, and the frieze is suggestive. The brick mullions to the ground-floor windows in so exposed a position and so low down would be cut about soon enough, and are not to be recommended. The hall is needlessly large; the staircase is very good, but the long landing is ugly. The model room should be reached without coming into the life-class studio. "Walmer" shows a care for detail which deserves praise, though his perspective is poorly drawn. Let him note that tall, vertical, narrow windows ranging along by the side of a low squat portal are features which do not harmonise with each other, and the contrast is too marked to be effective. "Walmer's" upstair windows agree with neither, and the steep central gable does not set off the sprawling ones on either side. The plan is better and the studios are well considered. "Red Lion" makes his class-rooms a little too square, and at a depth of 25ft. the light would be hardly enough to draw by, with windows on one side of the rooms only. The administrative part of the building, though very compressed, is cleverly contrived, giving, at same time, a spacious hall and a nice room for the model. "Red Lion" has no knowledge of decorative forms, and till he has acquired some better appreciation of good foliage, it would be best for him to avoid showing any details of this kind. His frieze sketches spoil a practical-looking section. He need not draw with a rotten corkscrew line when delineating perspectives. Such tricks are not really artistic. "Black Prince" ought to do better than his maiden attempt would seem to indicate. Why a tower and spire should be introduced into a school of art is a riddle for Christmas. The conservatory-like lean-to's are ugly, though we admit their introduction has been due to the intention of being practical. The great objection is the studios are the wrong way on, and are lighted from the end, all of them, instead of from the side. Too much room is wasted in the hall, and a "picture-gallery" has to account for the wasteful landing. The master's room in the tower without a fire-place is not good, even for a "Black Prince." "McGinty" sends in a very pretty design; but it looks too much like a roadside parsonage. No one would take the building for a school of art. The skylight on the elevation is the only indication, and this is too much for "McGinty," as he leaves it out in his perspective, for fear of spoiling the effect. This is wrong; but the details of the top light are worse when you come to look at them—nearly all hips and valleys, besides being run on beyond the vertical line of the wall which divides the studio from the rest of the building. Windows on both sides of a studio give cross-shadows, and are a mistake. The hall, staircase, and landing are well planned. "Syphax" adopts half-timber work, and like the second design, does not occupy all the site. He has many merits in his treatment, and the entrance is better than "G in Horseshoe," but his lavatory and w.c. accommodation are exceedingly bad. "Etudiant" has some good taste, but is a little old-fashioned. His entrance doorway is very pretty, the entrance hall is very wasteful, the studios are lighted from both ends, and the life-room from the south side. This is a bad plan. "Merlin" studies American modern work, and designs accordingly. He thus obtains a freshness, but unless he had written "School of Art" along his front, we should not in the least have recognised the purpose of the building. By far too much room is occupied in the plan with hall and staircase, and as a consequence the studios or class-rooms are very small. The arcade above the parapet is meaningless, and, without being pretty, is expensive. We shall expect better things of "Merlin" than this. "Rustic" sends an amply lighted practical-looking building, but his plan is not perfect by any means. His perspective is excessively poor. The upper studios are furnished with skylights. The staircase is very wasteful, but the façade would have looked well if it had not been over-fenestrated. "F. E. B." makes his class-rooms too square, and his cloak-rooms, &c., too small. His elevation has some good windows in it of suitable character; but the doorway is absolutely poor and ill-proportioned. There is no perspective sketch. "Spectre" adopts a Classic dress and draws an elevation in perspective very nicely though scrappily. His plan with all four studios on the ground-floor is crowded and out of the question. Another time we shall expect better work than this from "Spectre." "Philomath," too, is one of our most promising members with an eye for ingenuity of plan and taste in design. He must be practical and realise how his buildings would work out in execution. Take one of his points. Facing the entrance-door are three openings close up together. In the central one rises the staircase, to the left the ladies' lavatory, and to the right the gentlemen's, both in the most public position possible. The office is too wasteful, but the hall is good and the studios are roomy, with a special scheme for lighting those on the ground-floor. "Try," another able contributor, has hit off a characteristic design which well befits a school of art, so far as the exterior is concerned, and with better detail would have given us rather a good thing. The figure panels, the medallions, and the frieze suggest a building devoted to art culture. There is much ingenuity, too, in the plan, but the author has tried to do too much on one floor, and the lighting of the bigger studios at one end is an objection already remarked upon. The cloak-rooms are too prominently placed and are much too small. "Cathetus" sends a design made too much like a house, but having good architectural detail marked by taste and study. The plan is wasteful. "Granite City," contrived on one floor, is too restricted, the studios, with the exception of one, becoming merely small rooms about 16ft. by 14ft. The T-shaped passage is ugly enough, and the elevation would do better for a parish schoolhouse. Everything nearly in "Brook's" design is sacrificed for an octagonal hall in the centre, carried up like a tower, without any practical gain, while the studios are reduced in a needless way till they are too small for real work. The elementary room, for example, if we devoted to it the largest studio, would be only 21ft. by 12ft., and the walls nearly all windows, door, or fireplace. The author has evidently done his best, but must try again, and aim at being less original. "Albyn" draws in a restless way, and designs with an endeavour of being picturesque, breaking up his elevation into a variety of parts to the loss of all breadth and harmony. He is not a bad planner; but this specimen shows want of attention to minor points—thus we find the ladies' and gentlemen's conveniences very much in evidence. Do not black in the windows so heavily, "Albyn," another time. "Horseshoe" draws two sheets, one in brown, the other in black. We see no advantage in this. By not occupying the whole length of the site, this contributor obtains light at both ends; but he lessens thereby the size of his classrooms. Though the building is wanting in "go," it has some fair points, which bear evidence of a love for good work. The elevation is better than the perspective. "Hope" has a plan in general idea somewhat like "Try's," already named, with a corridor the whole length of the site at the rear, with the males' closets at one end of it, and the women's conveniences at the other—the doors facing—a shocking arrangement. "Flint" comes next, with a crude plan and over-windowed façade. "Marmion" draws very carefully; but his design only provides very small studios. "Lotus" gives a conical-capped embattled tower to his façade, and wastes his ground floor on the administrative department. "Stanley" ought to rise in the work of the club. His elevation is much better than his crudely-disposed plan. "Renaissance," if he is the old member who adopted this motto, has improved greatly. His present design is too much like a dwelling, and the plan is occupied too much with small parts below and too cramped above. "Black Diamond" a trifle commonplace, but neat. See corridor remarked upon in "Try's" plan, and ditto to you. "Flute" has some clever parts in his plan, as in the staircase, but the corresponding faults outweigh them. "Tauder" sends a pretty elevation, which is quite spoiled by the sketch view. The plan is on the right lines, if not all that we could wish. Go on, "Tauder," and we shall hope to see you doing better. "St. Gothard" is Dutch-like in style, wanting in dignity. Nothing was gained by not occupying the whole of the site. "Smilash" has endeavoured to strike out a new line for himself, and in a way is original with success. He only gives three good class-rooms, and the lavatories are very bad. "Zummerzet" plans with refinement and care, but his rooms are too small. The elevation is pleasing. "The Bogie Man" sends a design more like a school for the School Board, for which the façade would be well adapted. "Office Jacket" has delineated with the utmost care a by no means unworthy design, but the plan is not equal to the occasion. We like the elevation, apart from its immediate purpose, exceedingly. "Ariel's" design would do for a residence; "Dono's" looks like a club; "Spes" has a good elevation and poor plan; "Dutchman," the last of the second class, sends a design looking suitable for a church institute. The other designs are by "Macbeth," "Art Rambler," "Grafton," "Jope," "Oak," "Minerva," "Snowball," "Sine Nomine," "Ancient Lights," "Venice," "Até," "Sol," "Spider and Fly," "I. C. Y.," "Juno," "No Cards," "Aires," "Æneas," "Jos," "Bootles," "Sam Veller," "Waverley," "Forward," "Beulah," "Koko," "Exonia," "Palæozoic," "Night Light," "Cyclist," "17 Winters," "Camera," "Organist," "Higs," "Nelson," "Castle in a shield," "Over all a bend vert," "Y. H. S.," "North," "Avancez," "Tally-ho," "Cleopatra," "Orm," "Bladud," "Obbiks," "Light," "Practical," "Quoin," "Herbert," "Gerwy," "Devil's Chimney," "St. Edmund," "Old Michael," "Hopeful," "Regina," and "B."

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XXII.

By Banister Fletcher, Jun., A.R.I.B.A.

THE ESPLANADE DES INVALIDES.

FROM a constructional point of view the esplanade is not so interesting to the architect as the Champ de Mars.

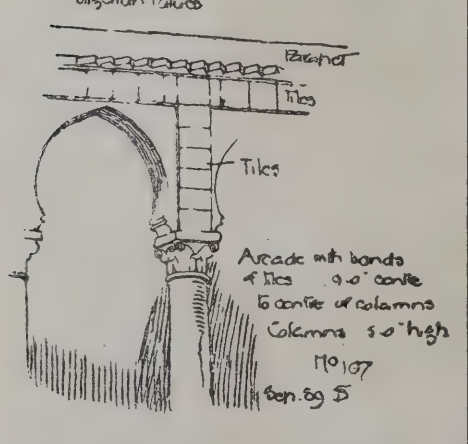


The buildings generally, with some few exceptions, are devoted to French Colonies, and are representative of the architecture indigenous to these colonies; in that respect they are successfully interesting, giving one a faithful imitation of the architecture of the countries, which in the great majority of cases are only seen on paper by architects.

The Algerian Palace, Tunisian Palace, Colonial Palace, Annam and Tonkin Pavilion, and Indo-

China Pavilion are the principal buildings on the east side, and are of this description.

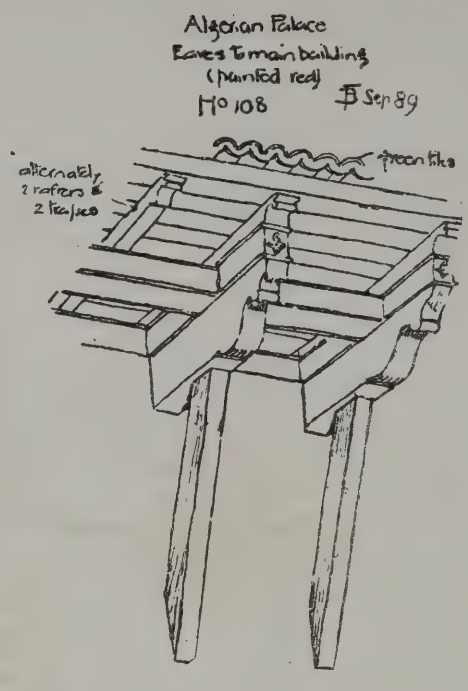
They are constructed in pan-de-bois, and their walls are, as a rule, about 25 centimètres, or 10in. thick.



On the west side of the esplanade is the Health

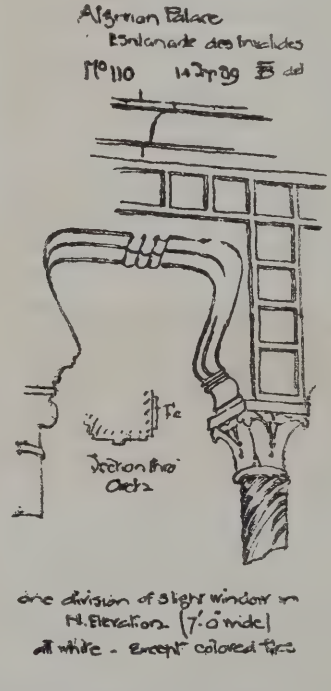
Exhibition in its relation to houses, &c. The Social Economy Exhibition, the Pavilion of the Ministry of War, the "Postes et Telegraphes," are the more important. The construction of the latter is in some respects novel, and will be explained, especially the roof to the "Postes et Telegraphes" pavilion, by M. Boussard.

THE ALGERIAN PAVILION (NO. 105),



Of which M. Albert Baller is the architect, is situated at the northern end of the esplanade, and reproduces "bits" from Algerian architecture. The principal façade facing the Quai d'Orsay for example, is a reproduction of the "Kouba of

Sidi-abder-Rhaman" as far as its entrance, vestibule, and overhanging roof are concerned (see drawing). The large horseshoe-arched entrance at side, ornamented with faïence, reproduces the Mihrab de la Mosquée de la Pêcherie.

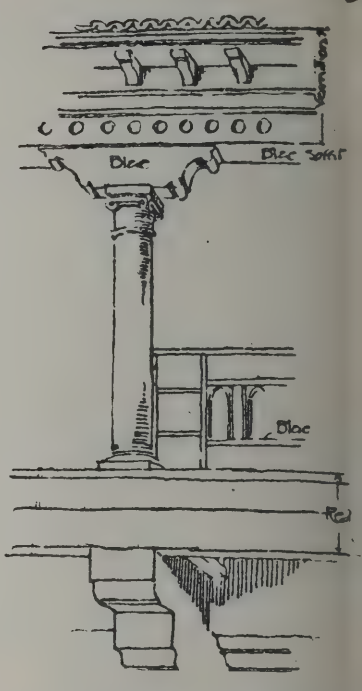


The plan consists of a large central building, divided into three, for the exhibits of the three principal towns of Algeria, separated by columns, and with top light, a gallery running all round this. The horseshoe-arched entrance leads into a square hall with dome over, in stalactite vaulting. On the side nearest the esplanade is an arcaded one-story building, used as a bazaar (shown to the right of the drawing), which is separated from the main buiding by an open arcade.

On the east side of the entrance is a tower containing a staircase. Above the ground story

it consists of three arcades, one above the other, with three openings on each face, and each story being separated by tile bands. The doors to the entrance are noticeable, the panels being entirely formed in octagons. The horseshoe arch is everywhere abundant.

In contradistinction to the exterior, which



relies for its colour on the wooden balconies and supports, and tile band, to the tower, &c., the interior is extremely rich in colour. The angle dome of the N.E. corner is an example: it is circular, and lighted from the top at the springing of the dome (see drawing) by four semi-circular windows. The dome is carried on four arches, and a corbel starts from each corner of the inclosure space to form pendentives; over the warm brown, as a groundwork, are placed geometrical patterns in gold and dark red.

The palace externally is painted a stone colour.

The balconies to the first floor are supported as in the sketch by wooden props—a feature of Algerian architecture.

At the right-hand corner of the perspective will be seen an effective little circular dome in green glazed tiles, with the crescent over in gold.

A rough "note" of the type of colonnading

employed to join the bazaar to the main building, and showing the method of introducing colour by aid of tiles, is given (No. 107).

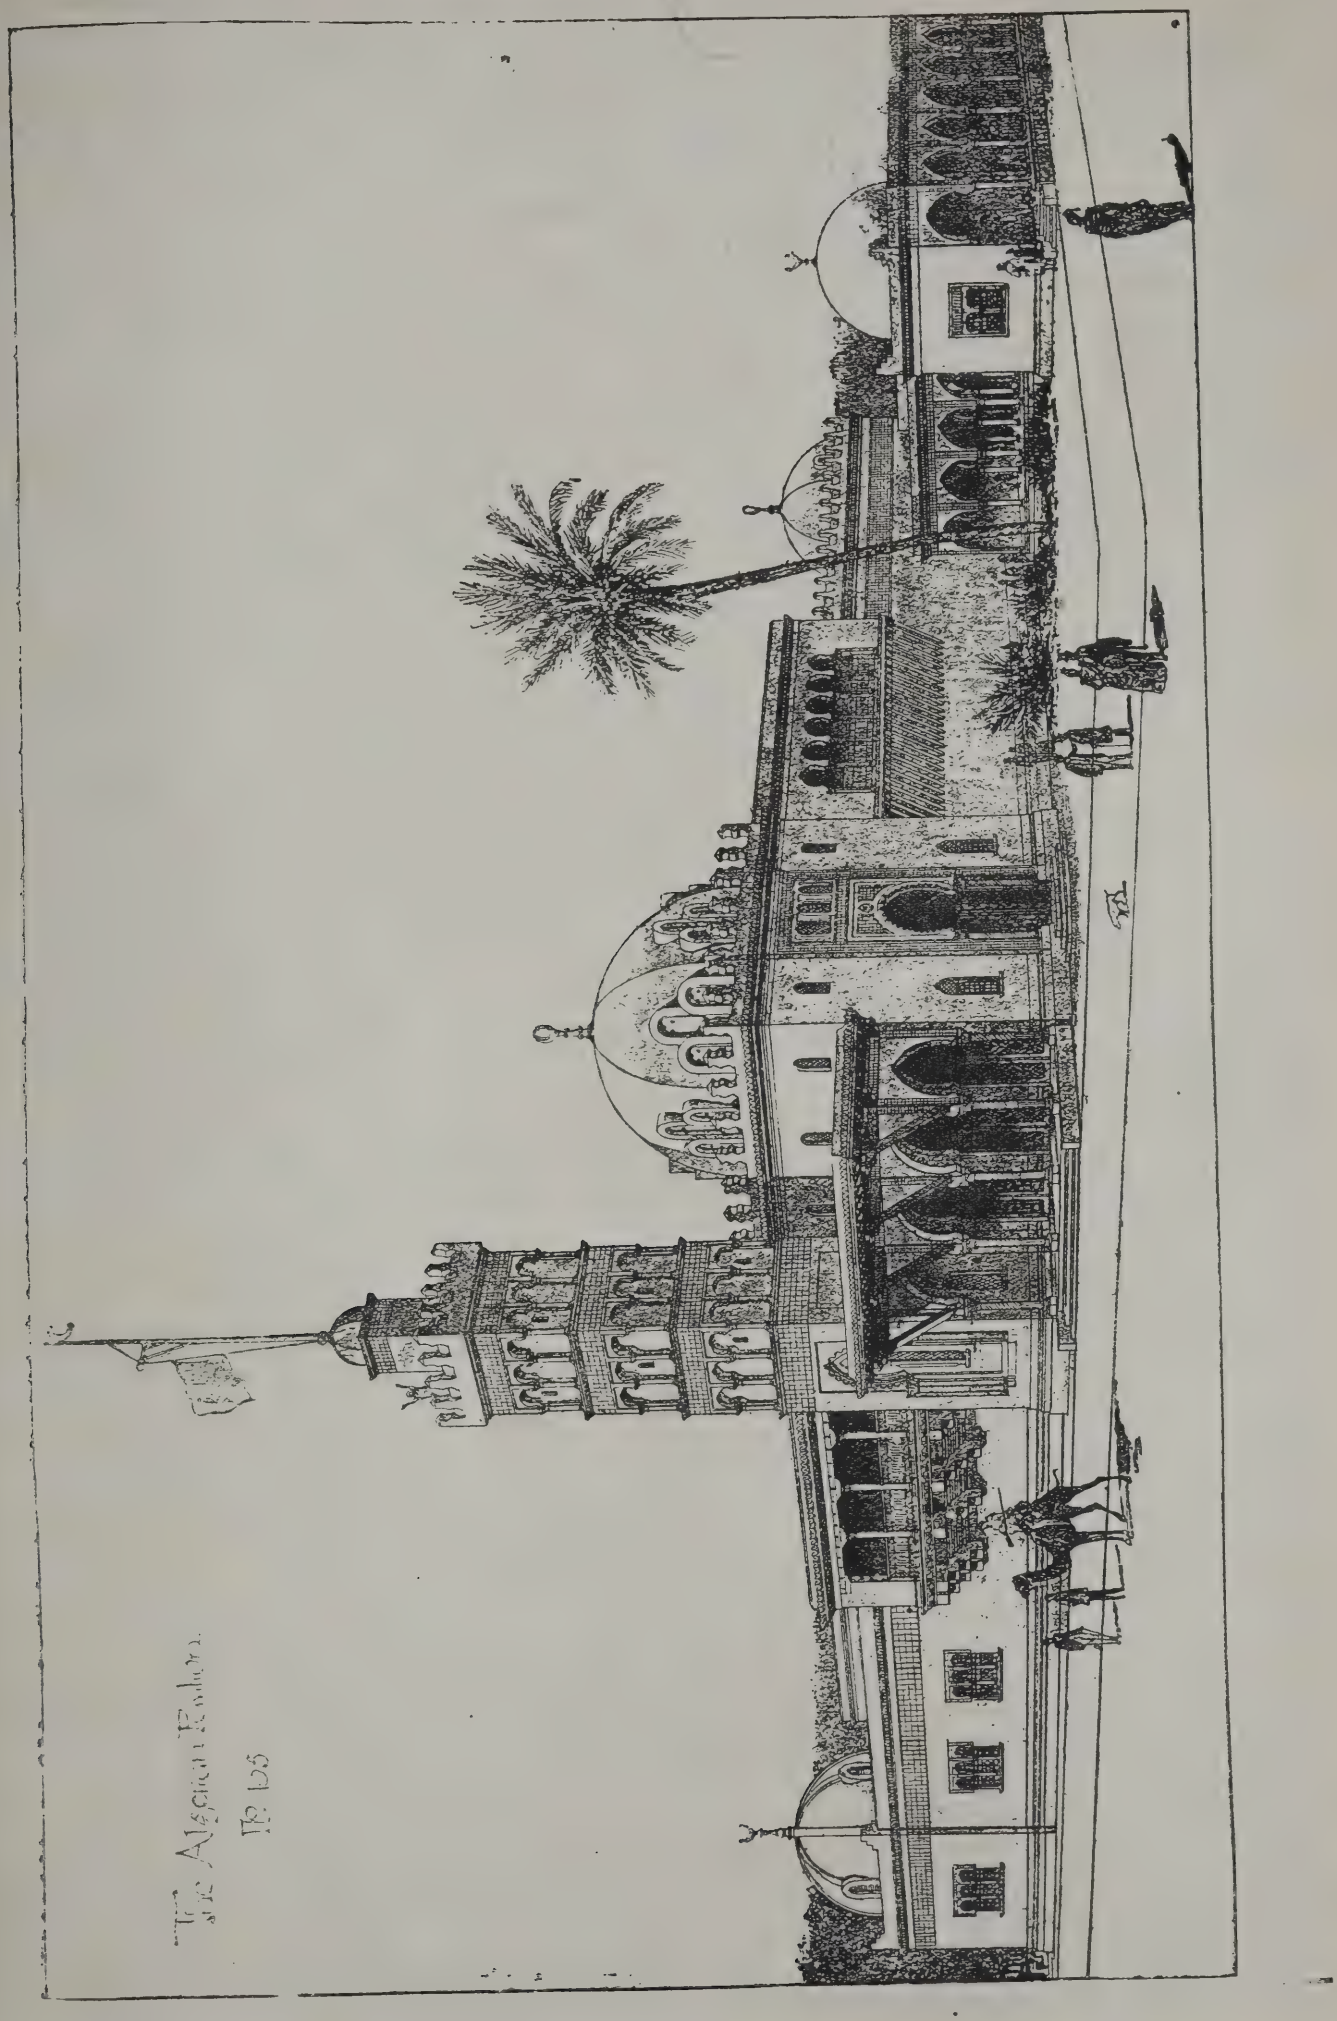
The overhanging eaves are all richly moulded and painted vermilion red, which contrasts strongly with the stone-coloured plaster of the building itself.

Blue-coloured tiles are made use of in the various parts of the building for decorative effect, and also faïence and sculptured work by M. Marquette, an Algerian architect.

The overhanging balcony in the front façade, a detail of which is given above (No. 107), practically in wood, coloured, is also thoroughly wooden in construction, and is coloured as indicated. The rough note of the groups of window lights, one of which is given below, is also characteristic (No. 110).

CHIPS.

A tea-party and concert, under the auspices of the General Union of Carpenters and Joiners, Liverpool district, took place on Friday evening in the Oddfellows' Hall, St. Anne-street, Liverpool. After tea, there was presented to Mr. William Matkin, the secretary, an enlarged photographic portrait of himself, coloured in oil, and mounted in a gilt frame, together with an illuminated address.



The Hove school board have instructed Mr. Simpson, of Brighton, to prepare plans and designs for new schools in Holland-road to accommodate 750 children.

At a parish meeting held at Sleaford last week to receive the report of the organ committee, it was decided to place a new organ in the chancel, and plans prepared by Messrs. Forster and Andrews for an instrument to cost about £270 were adopted.

M. Louis Eugène Lami, the distinguished painter in oils and water-colours, died on Friday, at the advanced age of 91. M. Lami, who made his *début* as an exhibitor at the Salon of 1824, painted a portrait of Oliver Cromwell, and also numerous historical pictures, notably "Mary Queen of Scots Finding the Body of Douglas" and "Charles I. Receiving a Rose while going to Prison."

About 4,500 Roman copper coins of the later Imperial period have been found a few feet under the surface of a ploughed field at Hahnheim, near Oppenheim, between Mayence and Worms.

The time for depositing in the Private Bill Office of the House of Commons, copies of all private Bills that will be proceeded with during the present Session expired on Saturday. The total number that has been deposited is 197, which is only four more than the number lodged in 1887, when fewer Bills were deposited than had been known for many years. Compared with last session the decrease is 47. Of the total number deposited 159 relate to England and Wales, 33 to Scotland, and five to Ireland.

Our Illustrations.

CHURCH OF THE ENGLISH MARTYRS, PRESTON.

This church was designed by the late Edward Welby Pugin in 1866. It is in the Early Decorated style, and accommodated 800 people. In 1887 the present rector, Dean Pyke, found it necessary to increase the accommodation, and Messrs. Pugin were consulted on the subject, and gave it as their opinion that they could enlarge the church without affecting the proportions of the old building, as the original church was very lofty. The additions to the church consist of two bays to the nave and aisles, transept and transept chapels, chancel and side chapels, two large sacristies, committee-room, and corridor, which runs round the apse and down the whole north side of the church, communicating with the presbytery. These additions give increased accommodation for 500 persons. The church is now 150ft. long and 102ft. across the transept. The chancel arch, from which is suspended a massive rood, is 50ft. high, and the height from floor to ridge of roof is 70ft. The roof is ceiled inside at the height of 60ft. The walls are built of brick, faced with Longridge stone; all the internal masonry is also of Longridge stone. The magnificent high altar is a very striking feature in the church. Everything is completed as shown in the illustration, with the exception of the tower, the first stage of which will form the baptistery, and attached to this will be the baptistery chapel, divided from the church by arches filled in with a stone screen. The contract for the additions was carried out by Messrs. W. Hothersall, of Preston, from the designs of Messrs. Pugin and Pugin, of Westminster.

ALL SAINTS' MEMORIAL CONVALESCENT HOSPITAL FOR CHILDREN, EASTBOURNE.

The above building, which is now being erected to the memory of the late Mother and Foundress of the All Saints' Sisters, and the foundation-stone of which was laid by her Royal Highness the Duchess of Albany on July 19th last year, is of red brick with blue bands, and red roof tiling, with some stonework to give relief. It will afford accommodation for about 130 beds. The passages and rooms will be warmed at the same temperature, and every convenience to facilitate labour and save expense has been adopted throughout the building. The vitiated air will be extracted by a foul-air trunk running right through the roofs, with flues into same from every room, and terminating in the kitchen flue, which, being in daily use, practically makes the extracting power automatic. Very ample and cheery day-rooms with low windows, that the patients may enjoy the lovely view, are provided on two floors. There are covered playgrounds for wet weather, lifts for patients and goods, bedrooms adjoining day-rooms for cripples, and conveniences of all kinds to render the working of the hospital as efficient as possible. The cost of the whole will be about £10,500. The works are being carried out by Messrs. Longley and Co., of Crawley, Sussex, under the supervision of Mr. A. Mardon Mowbray, F.R.I.B.A., architect, Oxford.

"BUILDING NEWS" DESIGNING CLUB: A SMALL SCHOOL OF ART.

(See description on page 884.)

FALKLAND PARK, SOUTH NORWOOD.

This mansion is now in course of erection on a fine site overlooking the Surrey Hills and an extensive range of country. In an old house on the estate lived the late Admiral Lord Falkland, whose descendant, the twelfth Lord Falkland, sold it to the present owner, Mr. Thomas McMeekin, for whom the new house is being built. The materials used in the elevations are Portland stone and white bricks. The marble mosaic paving is by Messrs. Mainzer and Kempthorne. Messrs. George Jackson and Son, of Rathbone-place, have supplied the carton pierre ornaments. The building will be wired throughout with the electric light. The architect is Mr. H. A. Rawlins, A.R.I.B.A., F.S.I., of 46, Queen Victoria-street, E.C.; Messrs. Patman and Fotheringham, of Theobald's-road, are the contractors; and Mr. Cook has been employed throughout as clerk of works.

"CHESFIELD," HAMPTON WICK.

This house was built at Hampton Wick, near Kingston-on-Thames, for Mr. H. E. Tatham. The walls are of Fareham bricks, and the roofs of red Broseley tiles. Mr. T. Boyce, of Hart-street, Bloomsbury, was the builder, and Mr. J. G. Finch Noyes, F.R.I.B.A., of No. 42, Half-Moon-street, W., the architect.

HOUSES AT TUNBRIDGE WELLS.

These houses have, we believe, been recently erected; but no particulars have reached us in reply to our usual application for information.

CURIO CABINET.

The illustration bearing this title, and the design of which is by M. Barbedienne, was exhibited at the Paris Exhibition of 1889. The drawing is made from a photo.-tint which recently appeared in *La Construction Moderne*.

CHEMIN DE FER METROPOLITAIN, PARIS.—METHODS OF SUBWAY CONSTRUCTION.

These four diagram sections are particularly interesting, showing the means proposed to be employed for constructing the subways near the road-surface in Paris without interfering with the vehicular traffic of the streets. It will be seen that movable platforms on wheels are located above the cuttings, and run on rails, for the purpose of shifting as the work proceeds. This will be done in sections. Fig. 1 shows the first stage, Fig. 2 the second, Fig. 3 the completed arch, and Fig. 4 the finished subway, with the method of removal of the earth and reconstruction of the invert. The proposed scheme of an underground railway for Paris is the combined undertaking of the Société Eiffel and of the Compagnie du Chemin de Fer du Nord. It will encircle the heart of the city, and the system will commence at the Place de la République, round by the Opera House and the Madeleine, and then skirting the north bank of the Seine past the Concorde, Palais Royal, and so on, right away to St. Bercy and Gare de Lyon. There will be branches connecting this inner circle with the various main railways. Some of the sections are so near the surface as to have iron girders supporting the roads. A long detailed account is given of the project in the December number of the *Nouvelles Annales de la Construction*, to which journal we are indebted for the illustrations given to-day. The four cuts will almost entirely explain themselves.

The report of Messrs. Bruton and Williams, architects, of Cardiff, has been adopted for the restoration of Lisworney Church, near Cowbridge.

LONDON DORMERS.

A short experience of the duties of a district surveyor, writes Mr. Edward J. Tarver, F.S.A., the recently appointed district surveyor for South St. Pancras, is sufficient to show that a little consideration given to the preparation of designs in conformity with the Building Act may exert great influence upon the appearance of our streets. Perhaps others may be induced to contribute hints on the subject. Meanwhile, I venture to begin at the top, and to point out how dormers may be planned either to make or mar the architectural effect of London streets. Dormers may be placed so near to the line of the face of an external wall as to sacrifice their right to wooden window frames, the moulded beauties of which may therefore have to be abandoned. This seems a pity, because, when we can get a good view of a well-designed dormer—where streets are not too straight or narrow, nor houses too high—it is an architectural feature not to be despised. There is, however, a far more important fate depending upon the position of dormers with respect to party-walls. If placed within 4ft. thereof, and so repeated in several houses, a street may have the appearance of being penned in between houses more lofty and dismal than is really the case, for up must go the party-walls 12in. higher and wider than such dormers, in order to prevent the fire demon from striding from one to the other along the line of contiguous houses. It seems to be such a very simple bit of planning to group the dormers nearer the centre of each house, that it is strange that some architects would rather build up the party-walls vertically than let them follow the slope of the roof, and yet the cost of these increased gaunt party-walls would pay for picturesque cornices seen in playful perspective around the dormer heads, if they were only kept at a respectful distance from both external and party-walls.

Luckily we live under a County Council professionally advised by an architect who appreciates the picturesque in our streets.

During the last four months numerous consents have been given by the County Council to projecting architectural features in this district. This may help to repress the dismal views of those hopeless critics who are for ever bewailing the impossibility of the art of architecture being a thing of the present, and who only cherish its memory as that of a relic of the past.

CHIPS.

On Saturday morning a serious fire occurred on the premises of Messrs. Lauder and Co., West Hartlepool. The seat of the fire was the store-yard for creosote timber, which is divided from the extensive sawmills by Mainsford-terrace. Here about 25,000 creosoted sleepers and a large number of telegraph poles were stored all ready for delivery. The property destroyed was worth £4,000.

A public inquiry was held at Drighlington in the West Riding last week by Colonel J. C. Hasted, R.E., one of the inspectors of the Local Government Board, with reference to an application by the Drighlington local board for sanction to borrow £1,150 for providing public offices.

A public inquiry was held on Tuesday week at Newcastle-under-Lyme by Mr. T. Codrington, C.E., and Mr. Bird, inspectors for the Local Government Board, the corporation having applied for sanction to borrow a sum not exceeding £20,000 for gasworks extension purposes, for paying off loans, &c.

A new pastoral staff, the gift of an anonymous donor, was presented to Bishop Lloyd, of Bangor, and was used for the first time on Friday at his enthronement.

Hurts Hall, Saxmundham, the seat of Mr. W. B. Long, which was burnt down a year ago, will shortly be rebuilt in accordance with the plans of Mr. T. W. Cotman, of Ipswich. The contract has been taken by Messrs. Grimwood, of Sudbury, whose tender was only £1 under Mr. Runnacles', of Halstead.

A special meeting of the Rugby local board was held on Wednesday week, for the purpose of appointing a surveyor in the place of Mr. W. Stewart, deceased. There were 140 applications for the post, and of these six had been asked to attend the board. They were Mr. Frank Bagshaw, of Harrogate; Mr. John H. Brierley, of Reading; Mr. Thomas W. Franks, West Bromwich; Mr. George Green, Nottingham; Mr. Geo. W. Hawley, Beeston; and Mr. Hugh Nettleton, Leeds. Mr. Brierley was elected. He was for some time in the borough surveyor's office at Halifax, and has been assistant surveyor of Reading for the last five years.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Architectural Society of Glasgow.—At a meeting of the Architectural Section of the Philosophical Society of Glasgow, held on Monday week, Mr. James Thomson, president, in the chair, the secretary of the society, Mr. A. Lindsay Miller, read a paper on "Architecture." His purpose, he said, was to present illustrations of the architecture of different countries, without attempting to make any particular analysis of the qualities, good or bad, of any particular period, but having in view the object of attempting to trace the changes that had occurred in architecture since the earliest days, and noticing the causes of some of these changes. By means of the lime-light he presented illustrations of the buildings of Greece, Egypt, and Rome, pointing out the changes which had occurred in architecture, resulting largely from the nature and differences in climate and other influences; and also noticing the changes that had resulted from the adoption of Christianity in Rome under Constantine, and the architecture of Byzantium, Spain, the introduction of Romanesque, its development into Gothic, and illustrating by views the changes of Continental Gothic, and particularly the changes in Gothic in England and Scotland from the Norman to the Tudor.—At the monthly meeting, held on Thursday, the 18th inst., the President, Mr. J. Honeyman, F.R.I.B.A., occupied the chair, and read a paper on "Recent Alterations in the Choir of Glasgow Cathedral, and Note on post-Reformation Chancel Arrangements." The operations were commenced about seven months ago with a view to improving the arrangements for the congregation, and no record having been kept of operations which were carried out about forty years ago, it was thought desirable on the present occasion to have a record kept. In the course of the operations at the west-end of the choir, he remarked, a brick sarcophagus was discovered, which had evidently been put there during the former alterations to hold the bones of the bishops whose remains had been ruthlessly taken out of their places, and as this 19th-century "kist" was a foot shorter than the lid, Mr. Honeyman remarked that this indicated the carelessness exhibited in looking after the workmen at that time, and that the workmen must have been left to double up the skeletons of the bishops if they thought proper, and to hide them out of sight in the box, believing evidently that they would never be seen again. Indicating the improvements, he said they had now covered an area of about 6,000 superficial feet with marble flooring, and the pulpit had been placed on the north side at the west end of the stalls.

ARCHÆOLOGICAL.

Beverley Minster.—A few weeks since, when workmen were excavating for a new rain-water drain from the corner of the north-west transept of Beverley Minster, they came upon the plinth of one of the walls of the Octagonal Early English Chapter-house. Further investigations have revealed the foundations and part of the walling of the other sides, as well as the circular base of the central column of the structure. It is evident that the building was of two stories, having been erected like those of Old St. Paul's, Wells, Westminster Abbey, and others, on a vaulted crypt or undercroft. This discovery is of great interest, as explaining the object of the well-known beautiful double arcaded staircase in the wall of the north aisle of the choir. The twin doors at the top of this staircase must have led by a short passage into the Chapter-house itself, the low round-headed doorway in the wall below the stairs giving access to the undercroft. When and why this beautiful building was destroyed is quite unrecorded.

Chester.—Mr. F. Haverfield writes that during some recent repairs to the North Wall of Chester, carried out by Mr. I. M. Jones, the city surveyor, 10 inscriptions, some fairly perfect, some mere fragments, several sepulchral sculptures, and many worked stones have been found. The inscriptions are all sepulchral, like 31 out of the 32 found in 1887, and were erected either to soldiers of the Chester garrison or to women. Thus one inscription records one C. Iulius Severus, a horseman of the 20th legion, who died at the age of 40; another is to the memory of two little girls, Restita and Martia, aged respectively seven and three. Both had sculptures above the inscriptions—the former a horseman, the latter a banquet scene of a kind common on ancient tombstones; but unfortunately both these are broken. There are, however, several complete sculptures of much interest. One represents a horseman riding over a fallen enemy; on another we have a rider carrying a banner. Altogether Chester may claim to have considerably increased our knowledge of Roman sepulchral sculpture.

Ethie Castle, Arbroath.—An ancient grave has just been discovered under the floor of a vaulted cellar in Ethie Castle, the Forfarshire seat of the Earl of Northesk. The Castle has been undergoing considerable alterations and repairs, and this discovery was made in the course of the work. The grave, like many which have from time to time been found in the Arbroath district, was roughly built with slabs set on edge, and it was covered with boulders. A quantity of bones were found in the grave, and by order of Lord Northesk the bones were reinterred, the grave filled up, and the cellar floor cemented.

New Discoveries at the Roman Wall.—For many years it has been supposed that everything of real importance connected with the Wall of Antoninus stretching between the Forth and the Clyde had been fully made known. Up till now the remains of the Wall, roughly speaking, were supposed to consist of the *fossa*, the *agger* or earthwork, and the traces of the road by which supplies were conveyed to the encampments. This road has been defined by Roy. It pursued a winding course, sometimes near and sometimes at a very considerable distance from the Wall. The Carron Company having made a line from their newly-opened pit at Nether Croy to the North British Railway between Dullatur and Croy Stations, it was expected that a section of the military road would thereby be exposed. This section was found, but at so great and apparently so unnecessary a distance from the Wall as to awaken a suspicion as to its genuineness. Mr. Alexander Park, factor on the Gartshore estate, therefore made a careful inspection of the ground. About 20ft. from the south side of the ditch, and 3ft. below the surface, he came upon two lines of freestone kerb, running exactly parallel with the ditch, and in a fresh state of preservation. The two lines of kerb are 14ft. apart, and their outer edges are in a straight line and laid with great care. On this lower layer there are evidences of having been strewn another layer of smaller stones, which appear to have been bound together by cement. Following up this find, he caused other trenches to be dug on Croyhill and on Castlehill, and in every case the parallel lines of freestone kerbing have been found, and also illustrations of the layers of which the structure has been formed. Altogether, the close kerbing has been already traced for nearly five miles. It is evident that the road, following, as it does, the line of the great ditch at a distance of about 30ft. from its southern lip, must have been placed at the very bottom of the earthwork which occupied the 30ft. between it and the ditch. The fortification consequently, instead of consisting, as has hitherto been supposed, merely of the *fossa* and *vallum*, had also on the south side of the latter, and running parallel with it along its entire length, this excellent military road. Mr. Whitelaw, the proprietor, will lay bare at his own cost a considerable part of the structure on several parts of the estate.

The organising committee of the Imperial Institute were informed at their meeting on Wednesday that good progress is being made with the main building at South Kensington (Mr. T. E. Collcutt being, it will be remembered, the architect), and that the administrative offices will be ready for occupation in the spring of next year. Active preparations are being made for the immediate commencement of the erection, also from Mr. T. E. Collcutt's designs, to the north of the main building of the Imperial Institute, of a permanent exhibition gallery of two floors, connecting those portions of the east and west arcades which are leased to the Institute.

The death is announced of Mr. George Robson, A.R.I.B.A., of Crowndale-road, Fulham. He received his early instruction in architecture at the Science and Art Department, South Kensington, and was afterwards engaged in the offices of Mr. H. Saxon-Snell and Mr. James Knowles. For some years he was resident architect to a large building estate in London, and was the author of a work entitled "Domestic Building Construction," published in 1876. For some time past Mr. Robson had retired from active practice.

COMPETITIONS.

Bath.—At a meeting of the School Board, held on Friday, a report was received from the assessor, Mr. E. R. Robson, F.S.A., on the four sets of plans submitted in competition for the new school to be erected in Wells-road. Mr. Robson's recommendation of the plan under motto "Experience" was adopted. It proved to be by Mr. William J. Wilcox, of Belmont, Bath.

Coventry.—Thirty-nine sets of plans have been sent in in the competition for the new Corporation baths proposed to be erected in the Pool Meadow. They have been hung on the walls of the School of Art for the inspection of the Baths Committee, who at a meeting on Friday decided to appoint a professional assessor to adjudicate the premiums.

Leicester and County Proposed New Conservative Club.—The directors of this company in September last invited competitive designs for new club premises, limiting the competition to the Conservative architects of the town. The designs, eleven in number, have been on exhibition for the last six weeks, and the services of Mr. William Jackson, President of the Leicester Society of Architects, were called into requisition to adjudge the three best plans, for which premiums were offered of £30, £20, and £10 respectively. The cost of the building was limited to £4,500, and it will stand on a most eligible site, having three street frontages, in the centre of the town. The selected design is by Mr. Frank Seale, of 3½, Belvoir-street, Leicester, to whom the first premium of £30 has been awarded. In this instance the premium is in addition to the usual 5 per cent. commission, when the work is carried out.

CHIPS.

On Wednesday week the ex-mayor of Leamington, Councillor John Fell, contractor, was, for the second time within his brief municipal career of six years, entertained by his fellow burgesses to a complimentary banquet, as an expression of their gratitude to him for the eminent services which he ungrudgingly rendered to them during his year of mayoralty, and also in celebration of the extension of the borough successfully brought to a completion.

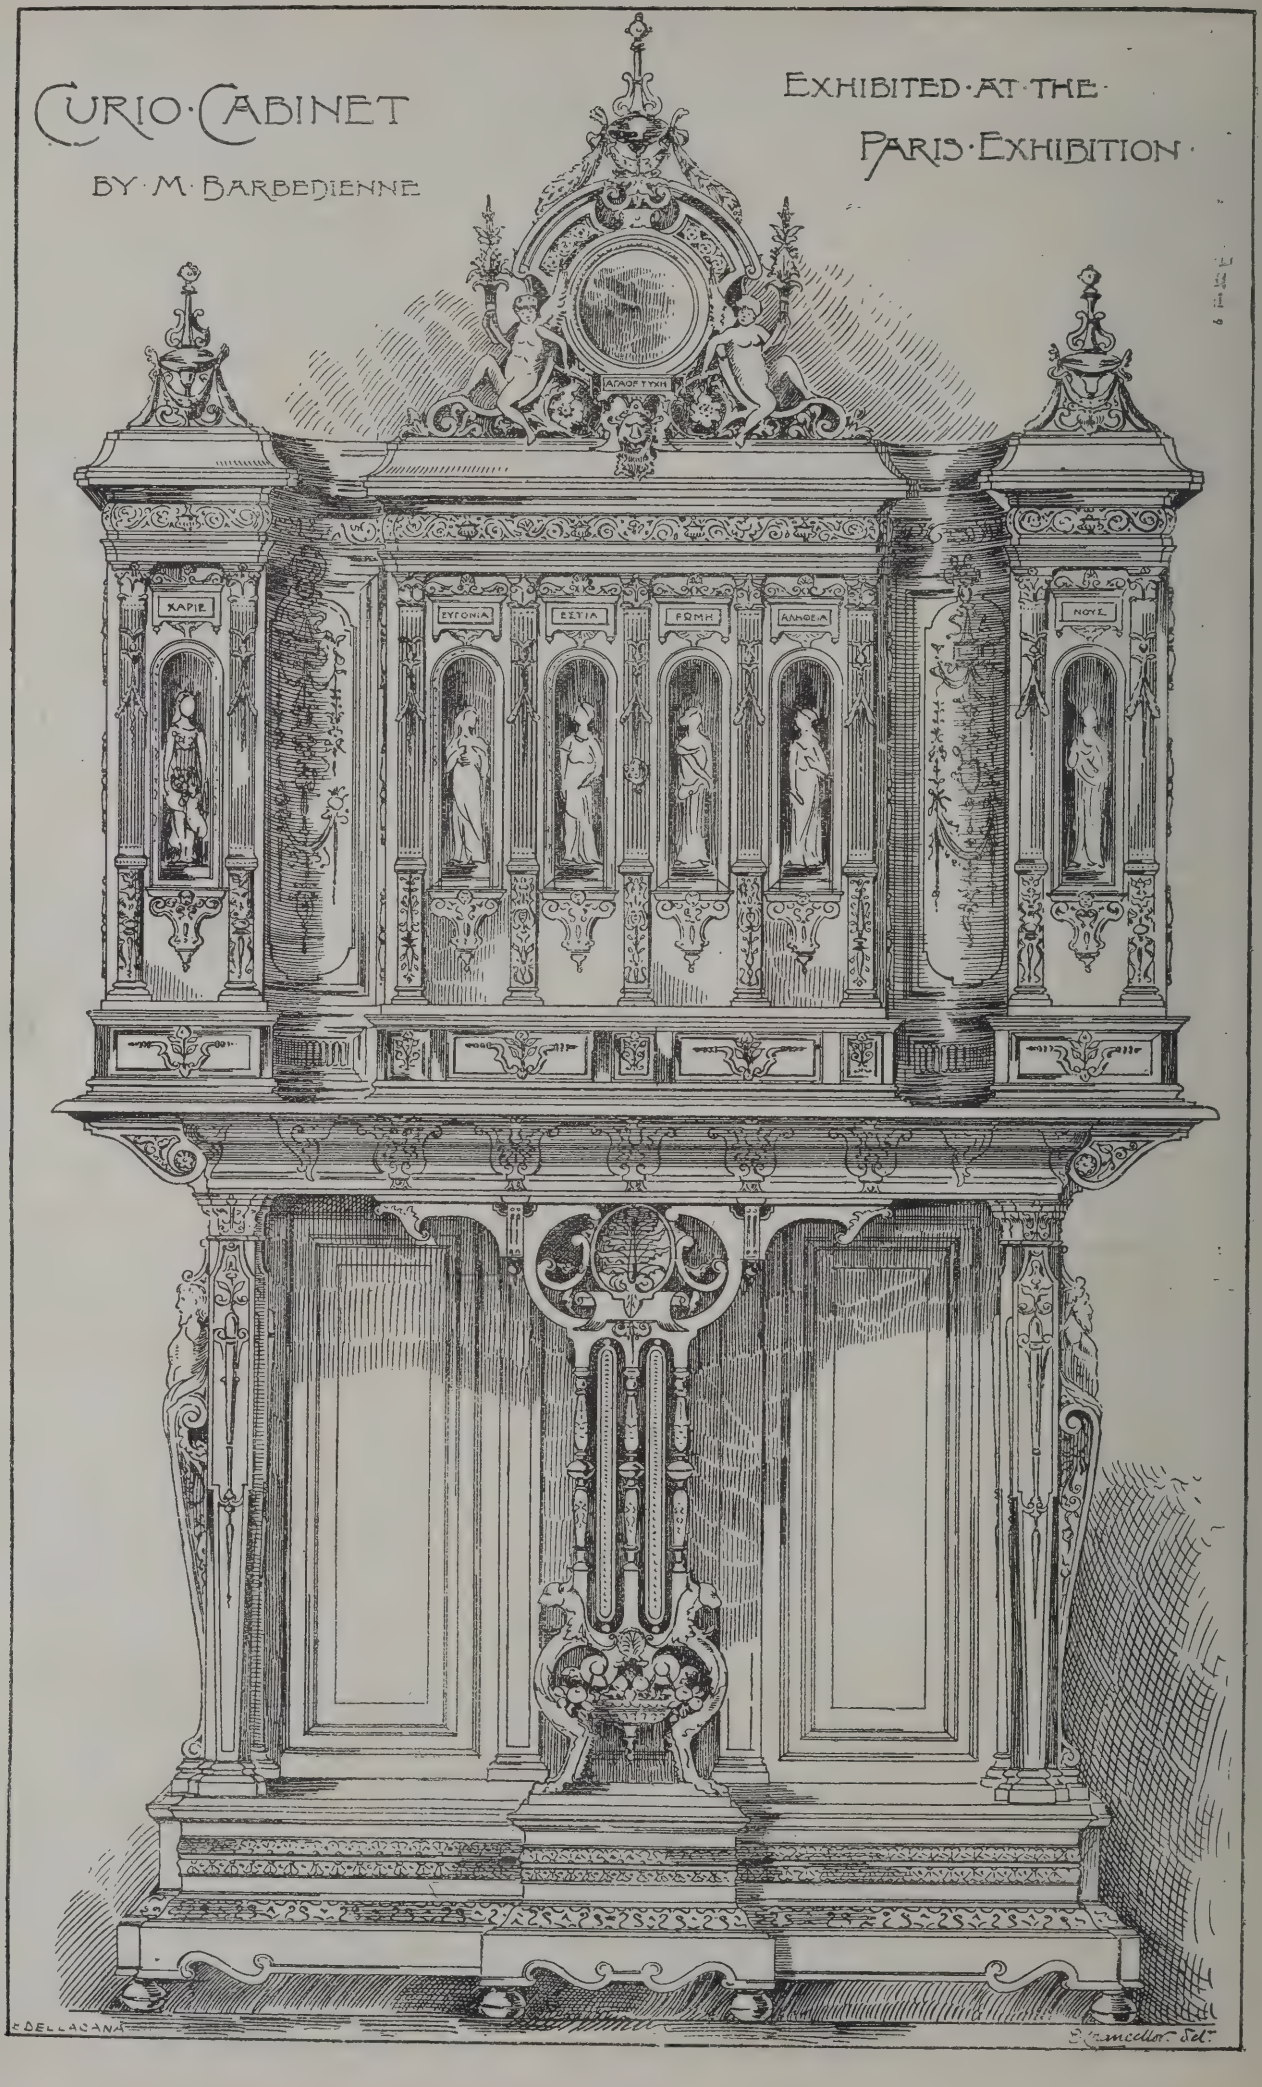
A new Art Gallery and Public Library, at Mere Hall, Bolton, the gift of Mr. J. P. Thomasson, formerly member for the borough, was opened on Saturday. Mr. Thomasson wrote from Rome that he had secured for the exhibition a statue by Rosetti—a Vestal Tempted by Cupid. The exhibition will remain open till March.

The Leeds County Council abandoned on Wednesday a Bill which it was proposed to promote in Parliament for the consolidation of the various local Acts of Parliament, for the granting of further powers in reference to improvements and other matters. The cost of preparing the Bill has been nearly £7,000.

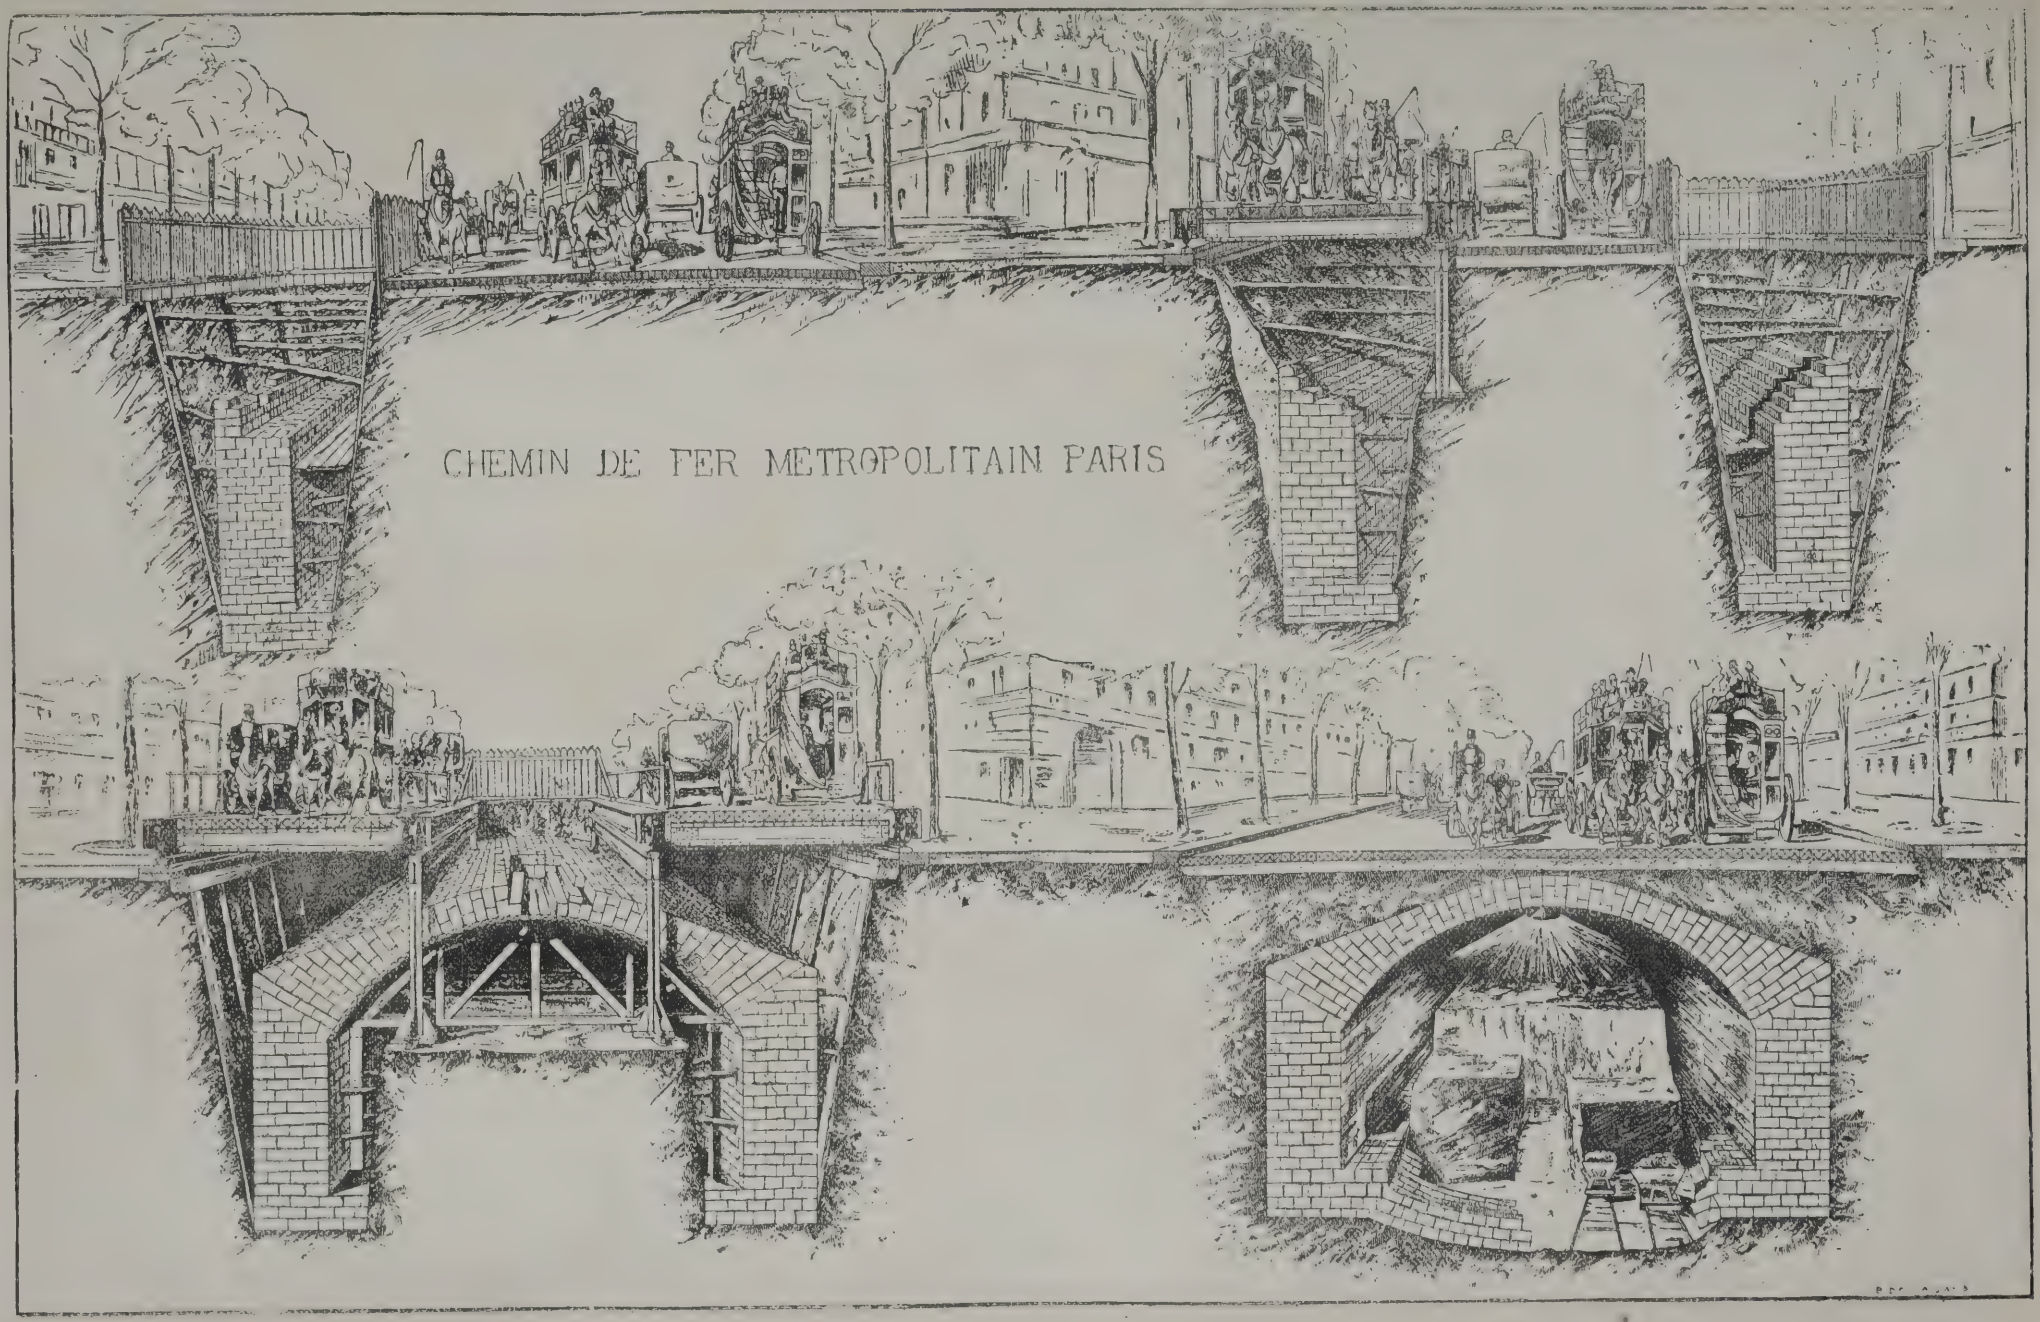
Mr. John Anderson, borough surveyor of Montrose, has been elected sanitary inspector to the County Council of Dumbartonshire from among several candidates.

The late Mrs. Harriet Bolckow, the second wife of the late Mr. H. W. F. Bolckow, M.P., has bequeathed to the trustees of the South Kensington Museum certain gold and silver ornaments and lace. Amongst the lace, some of which had been already lent by Mrs. Bolckow for exhibition at South Kensington, are a Brussels deep pillow lace flounce, given by Madame de Maintenon to Archbishop Fénélon, a set of Cardinal's vestments, and some remarkable old rose lace.

Mr. Alfred Groves, builder, of Milton-under-Wychwood, Oxon, has received instructions from the Rev. A. Majendie, rector, to take down the modern chancel at Bladen Church, near Woodstock, and build a new one according to designs, and under the care of, Sir A. W. Blomfield and Sons, architects.



The opening meeting of the session of the Civil and Mechanical Engineers' Society took place at the Westminster Palace Hotel on Wednesday evening, when Mr. R. Nelson Boyd, M.I.C.E., the president-elect, took the chair, in succession to Professor Henry Adams, M.I.C.E. Mr. Boyd then read his opening address, the subject being "Petroleum—Past, Present, and Future."



Operations have been commenced by the promoters for the construction of the Marine Drive round Douglas Head to Port Soderick, Isle of Man. A quantity of plant has arrived, and already a considerable number of men have been employed. The work is to be pushed on during the winter, and the drive is expected to be completed by next summer.

CURIO-CABINET

EXHIBITED AT THE PARIS EXHIBITION

BY M. BARBEDIENNE

CHEMIN DE FER METROPOLITAIN PARIS

Building Intelligence.

Blackpool.—At the last meeting of the Blackpool Town Council the General Purposes Committee's recommendations with respect to new Municipal Buildings were confirmed. The proposal is to purchase the plot of land in Victoria-street adjoining the town's yard, extending to Bank Hey-street. About a dozen large houses and several shops and two licensed houses will have to be pulled down, and it is intended to make a large square, in which will be included a town hall, with all the corporation offices together, as well as a free library, market, and art gallery. The intended site of the town hall has a frontage of 72ft., and extends 70ft. backwards, altogether covering an area of 5,040ft.

Bradford School Board and Mr. E. R. Robson.—At a meeting of this board, held on the 17th inst., Mr. S. P. Myers, chairman of the Sites and Buildings Committee, said in two instances recently he thought the action of the Department's architect at London was such as to entitle the board to object to his suggestions. Although the London architect knew nothing of the nature of the sites or the requirements of the district, yet the board were continually badgered by the London architect's objections, which were of an impracticable nature. In the case of extensions at Drummond-road School, the architect had objected to the length of the class-rooms, although there were already rooms of the same length. Then, at Horton Bank Top School, where the board proposed to add two class-rooms, the formation of the land being difficult, plans were sent to the Department; and thereupon there was sent by the Department a suggestion which, he felt sure, if it had emanated in the first instance from the School Board would have met with objection on the part of the Department; the suggestion was that the class-rooms should be built quite away from the main building—a plan which would not only prove inconvenient, but additionally expensive. Then the London architect objected to sky-lights, although the Department had repeatedly sanctioned such lights, and from experience the members of the board knew that a sky-light was a most desirable way of lighting large rooms. The chairman concurred in the remarks of Mr. Myers, and remarked that the Departmental architect had a salary of £750 a-year.

Bristol.—A new Medical wing will be added in the spring to University College, Bristol, from plans by Mr. F. Bligh Bond, Corn-street, in that city. It is not contemplated to add more at present to an unfinished block of the college standing back from the road, which was designed to form the back and one side of a future internal quadrangle; but the present building will represent the first section of the future grand front of the completed design, and will occupy a site next the road, and in the angle immediately above the museum buildings—a spot now used as a botanical garden. The building, which is to be constructed of local stone, with freestone dressings, will internally consist of a basement, ground, and first floor. The basement will consist merely of caretaker's rooms, vaults, and other minor offices, whilst on the ground floor will be a large medical museum 50 by 30ft., a meeting room for the faculty, a private room for the medical tutor, a students' room, with lavatories, &c.; and on the first floor will be a large library 50 by 30ft., a laboratory averaging 29 by 24ft., a physiological theatre, 28 by 24ft., and a professor's room. The estimated cost of the present portion of the undertaking is £7,000.

Leamington.—The new Turkish baths, in Priory-street, erected by Mr. F. James, of Wolverhampton, have just been completed. The exterior of the building is modest in appearance, with a frontage of 22ft., and a depth of 70ft. from the street. Inside the front door is a lobby. Those taking a first-class bath pass to the cooling-room, around which there are seventeen dressing compartments fitted with couches, and couches and tables are set in the centre of the room. The second-class bathers go from the lobby upstairs into a gallery, cut off by a heavy curtain from the lower cooling-room. Here there is accommodation for twenty. From both apartments the hot rooms are reached. The first of these has an average temperature of from 130 to 140deg., the second 160 to 180deg., and the third 200 to 240deg. The boiler and heating apparatus are in the basement, where there is also a large cellarage used for laundry purposes. The external rooms of the hot rooms are hollow to preserve the temperature. Vapour and electric baths are also provided, the latter being fitted with a battery of one hundred cells. The basement of the building is fireproof, and in the roof are water-tanks holding 600 gallons for use in case the town water should be turned off.

Lincoln.—The foundation-stones of a new Liberal club have been laid in St. Swithin's-square, Lincoln, recently. In the basement are a cellar 76ft. by 28ft., kitchen, baths, and the heating apparatus. The chief façade is of red brick and stone. The main entrance is nearly in the centre of the building, a vestibule opening into a central hall 18ft. wide. On the right of the vestibule will be a conversation-room 12ft. by 12ft., and an office 16ft. by 10ft.; and further to the right a lecture-hall 60ft. by 30ft., capable of seating 500 persons. There will be a separate front entrance to this hall, at the south end of which will be two cloak-rooms and offices. On the left of the central hall will be a reading-room 26ft. by 22ft.; the bar, with manager's room adjoining, and a smoke-room 32ft. by 22ft. A staircase will lead to the billiard-room, 62ft. by 26ft., which will occupy the entire front of the building on the first floor. Two French windows in the billiard-room will give access to a verandah 22ft. long, over the main entrance. Above the smoke-room will be a room 24ft. by 22ft. available for cards and other games. The library, 14ft. by 10ft., and the directors' room, 16ft. by 14ft., are also on the first floor; and at the back will stand the caretaker's apartments, consisting of sitting-room and three bedrooms. All the rooms throughout the building will be 15ft. in height. The architects are Messrs. Sington and Brameld, of Manchester. Irrespective of the land, the club will cost £3,000. Messrs. Lansdown and Son, of Lincoln, are the contractors, and Mr. Simpson is clerk of the works.

Ludlow.—The Lady Chapel of the parish church is now being restored under a scheme prepared by the Charity Commissioners for the management of a legacy of £2,000 by Maria Alicia Johanna Nightingale. The stained-glass Jesse window is being restored by Messrs. Hardman, of Birmingham, at an estimated cost of £630. The stone tracery of the whole of the windows, together with the ashlar work of the exterior, is also being replaced by Mr. John Thompson, Peterborough, at an estimated cost of £580. During the progress of the work a discovery has been made of an old priest's door and a considerable amount of carved Early English tracery. The old tile pavement in the doorway of the 14th century has been exposed. The probable existence of these remains was alluded to by Mr. Irvine at the restoration of the interior thirty years ago, and the details now discovered correspond exactly with Mr. Irvine's theory as to the Early English building, which the present Late Perpendicular one had superseded. A large portion of the legacy has been appropriated for the purpose of improving the organ. Messrs. Gray and Davison have been intrusted with the work, which is now being carried out at a cost of £450.

Manchester.—The governing body of Owens College have adopted plans prepared by their architect, Mr. A. Waterhouse, R.A., for a further block of buildings to cover the whole of a site, measuring 170ft. by 99ft., immediately adjoining the western side of the present Medical Schools, and occupying the space between Coupland-street, Lloyd-street, and Walter-street. The principal entrance to the new block is in Coupland-street, at the north-east corner of the site. The porch leads by a vestibule to the Dean's room, 23ft. by 14ft., and the public waiting-room, 16½ft. by 14ft., attached to it. The Dean's room also communicates directly with the professors' common-room, 20½ft. by 14ft., and with the central corridor of the building. From the entrance porch and vestibule a corridor 12ft. wide runs along the whole of the eastern end of the building, terminating in the principal staircase at the south-east angle of the site, and opening near the centre on the one hand into a bridge communication with the heart of the old building, which is repeated on the upper floors, and on the other into the main 15ft. corridor, which forms the axis of the new schools. This central artery has a secondary staircase at its further end, and is lighted by an extension of its width for a length of 61ft. under a central area. Flanking this main corridor are professors' retiring-rooms, students' locker room, and lavatory, and the two large lecture theatres, 60ft. by 38ft. and 50ft. by 38ft. respectively, with a preparation-room, 38ft. by 19½ft., for the smaller lecture theatre. Other rooms are one for students, 42ft. by 23ft.; one for experimental research, 30ft. by 23ft.; one for galvanometer, 16ft. by 11ft.; an experimental room, 40ft. by 30ft.; and a workroom, 23ft. by 13½ft.; diagram-room, 23ft. by 12ft.; and preparation-room, 30ft. by 13½ft. On the first floor are a number of rooms for the pathology and physiology sections, and on the floor above are other classrooms and a lavatory, 94ft. by 30ft., for histology. This large room has a gallery at the level of the floor above (the third floor) extending all round the room, and is lighted by windows. Other rooms are provided on the third and top floor. With the exception of the centrifugalising apparatus chamber (which, however, is shared by the gas-engine and dynamo for electric-lighting purposes) and one or two possible spare rooms, the whole of the basement is given over to storage purposes, to the heating apparatus, coals, and engineer's workshop, while in the end next Lloyd-street and a part adjoining the present is proposed to use low-pressure hot water for heating, and the ventilation will be effected as regards inlet of fresh air by vertical inlets in connection with the hot-water coils, and in respect of extract of foul air by shafts below the corridor floors communicating directly with a ventilating shaft. In the elevations generally everything has been subordinated to the one dominant idea of getting an absolute maximum of window area. Welsh buff brick and stone sparingly introduced are employed in maintaining harmony with the existing schools. The floors are fireproof only in the corridors, staircases, and such rooms as require cutting off from the noise and heat of the basement service departments, and where the floors are not double the concrete is covered with a wood-block floor.

Thelwall.—Alterations and additions are being made to the parish church of Thelwall, near Warrington. A new north aisle, almost equalling the size of the nave, is being added, as well also as a very large organ-chamber, and a choir and clergy vestry. The benches, which were of pitch-pine, have been removed from the church, and will be replaced with oak benches throughout, whilst the floor under will be of pitch-pine blocks. The new aisle will have an open-timbered, heavy pitch-pine roof. The walls will be of Rainhill and Helsby stone. The work is Early English in character, with bold mouldings to the windows, which will be in treble and single lights. The church will be ready for reopening in February next. The work is being carried out by Mr. Beckett, of Hartford, from the designs of Mr. W. Owen, of Warrington.

Whalton.—The chancel of this parish church has been restored and fitted up with marble pavement and steps, richly carved oak rood-screen, choir seats, and altar-rails. The east window has been raised 2ft. higher in the wall, thus giving space for a dossal with side hangings. A part of the old plaster has been removed from the south wall, laying bare the traces of an ancient low side window, close to the east wall, and sedilia which had been destroyed and walled up apparently in the 15th century, a piscina and credence table combined taking the place of the sedilia, with an almery. In raising the modern east window, it was found that the inside arch was made of a large grave-slab, with a floriated cross and sword incised upon it. This had been cut away to give it an arched form, and the incised cross covered with plaster. It was accidentally broken in two while it was being taken down, and before it was discovered to be an ancient grave-slab. Its remains will be preserved with other memorials. The rood screen has delicate traceries and cresting and carved inscriptions on both sides. The marble pavement, of Frosterley, Sicilian, and Sienna marbles, was supplied and laid by Messrs. Emley and Sons, of Newcastle-on-Tyne. The oak-work was made by Mr. Ralph Hedley, of Newcastle; the contractors for the alterations of floors and east window were Messrs. Carse and Sons, of Amble; and the whole of the work was carried out from the designs of Messrs. Hicks and Charlewood, architects, of Newcastle.

The sum of £80,000 is to be expended at Sydney, N.S.W., in building an art gallery for that city.

THE VICE-REGAL PALACE AT SANTA FE, NEW MEXICO.

THE sound of the hammer, the saw, and the trowel, the Santa Fé *New Mexican* says, makes a merry echo-song in and about this historic adobe palace to-day. The (U.S.) National Government has supplied the funds, and Secretary Thomas has let the contract for 3,000dol. worth of improvements or, more properly speaking, repairs, on this ancient official edifice, so full of interest to all tourists and sight-seers who visit Santa Fé. The workmen have taken possession of the building, and in 60 days will have completed their task.

The Governor's palace is in much the same condition as last year, except that the additional lapse of time has made the need of repairs more pressing. The secretary of the territory, who is its custodian, has obtained an appropriation of 3,000dol. from Congress for this purpose, and while this sum is considerably less than that which he estimated to be necessary, yet it will do much to preserve this interesting historic edifice in fair condition.

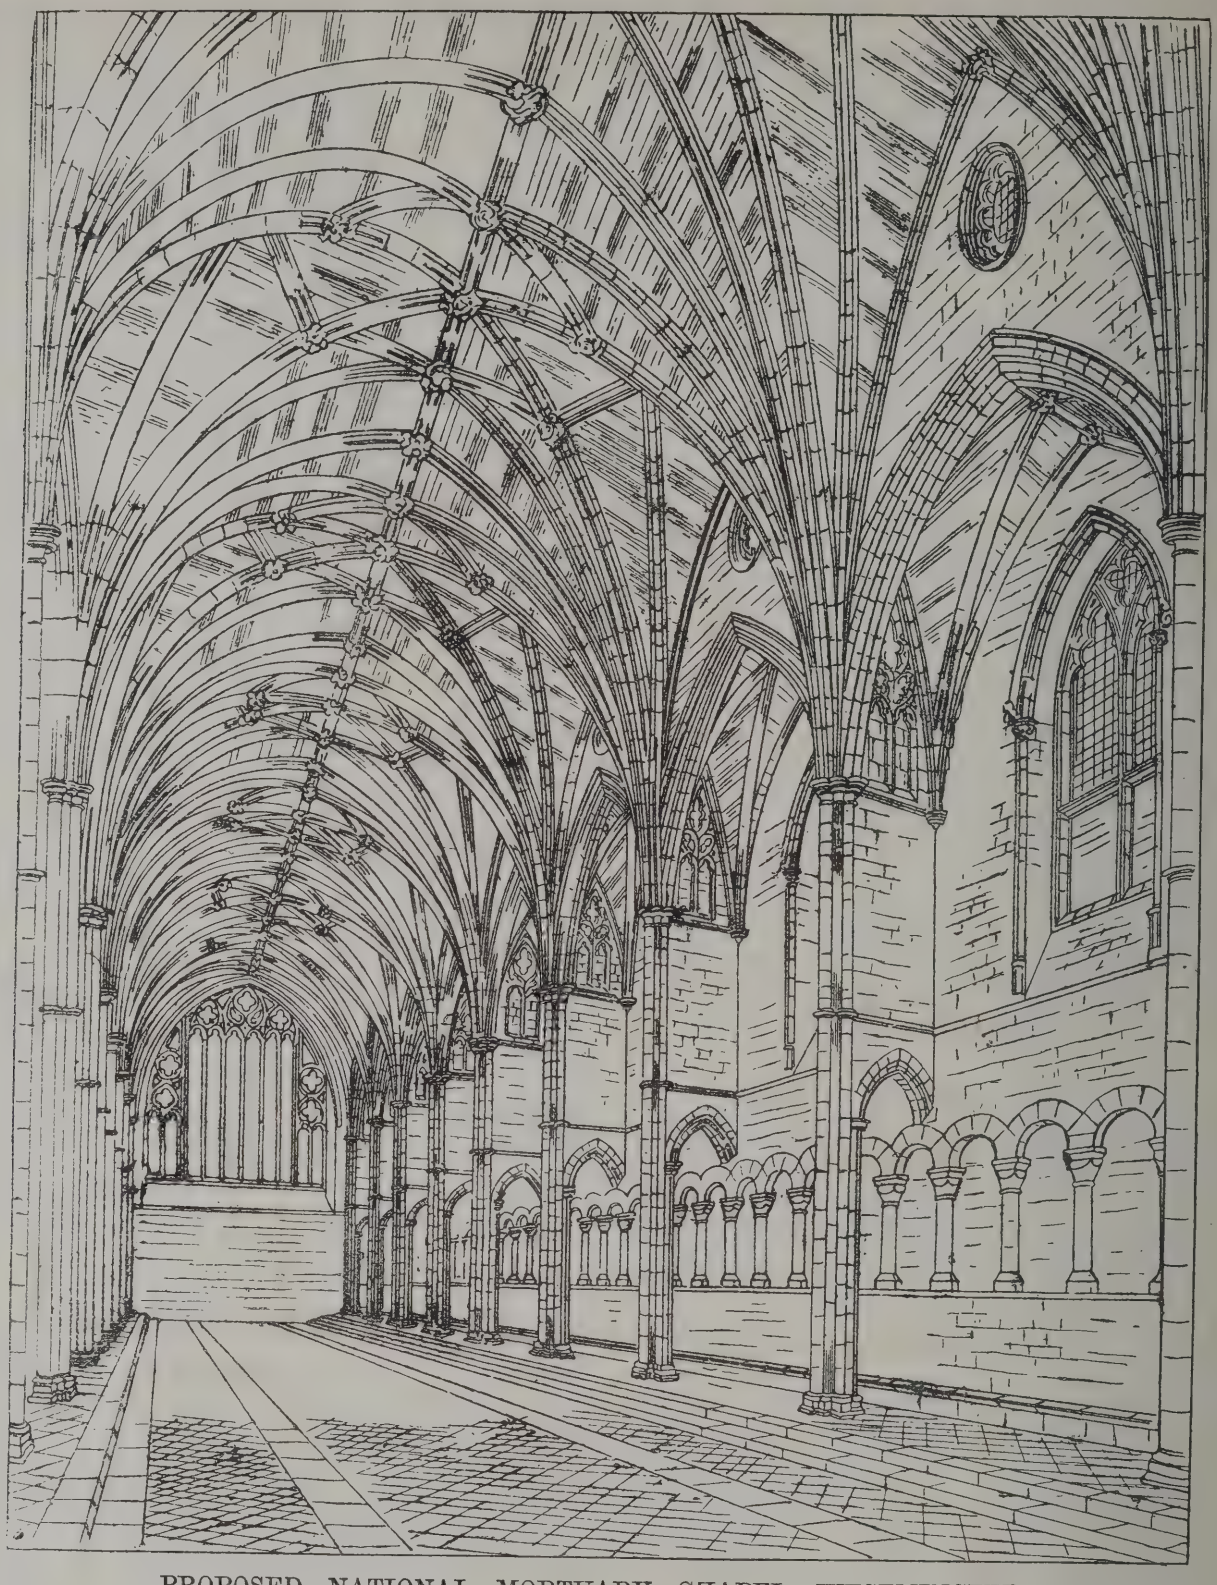
This ancient palace surpasses in historic interest and value any other place or object in the United States. It antedates the settlement of Jamestown by nine years, and that of Plymouth by 22 years, and has stood during the 292 years since its erection, not as a cold rock or monument with no claim upon the interest of humanity except the bare fact of its continued existence, but as the living centre of everything of historical importance in the southwest. Through all that long period, whether under Spanish, Pueblo, Mexican, or American control, it has been the seat of power and authority. Whether the ruler was called viceroy, captain-general, political chief, department commander, or governor, and whether he presided over a kingdom, a province, a department, or a territory, this has been his official residence. In his recent annual report to the secretary of the Interior, Governor Prince takes occasion to present some highly interesting data relative to this structure, tracing its history from the departure thence of Onate in 1599 on his adventurous expedition to the Eastern plains, to the formal taking possession of the new territory by General Kearney on behalf of the United States Government in August 1848.

THE ARCHITECTURAL ORDERS.

MR. PHENE SPIERS, F.S.A., has compiled from Normand's Parallels, Chambers, Gwilt, Nicholson, and other authorities, a set of useful outline plates of the Greek, Roman, and Italian orders.* To these he has added three new plates, making a series of twenty small folio sheets. The need of such an authorised collection of drawings to good scale, shown in a practical manner and issued at a moderate price, has long been felt by those engaged in preparing students for the compulsory examination in architecture, for pupils in offices, and members of the elementary classes of the Architectural Association. Mr. Spiers, as head master of the Architectural School at the Royal Academy has had special opportunities of learning the wants of students, and he has gone to the best authors, such as Mauch, for his delineations of the Orders. Although the system of calculating the proportions of an Order and its parts in relation to the lower diameter of the column has become customary, it has been thought better here to retain, in Normand's plates, the module or half-diameter, with its various subdivisions as engraved on the original plates, giving in most cases, however, the diameters as alternatives for the chief parts, and the terms, of course, in English, instead of French. The examples are represented by the Temple of Theseus, Athens; Theatre of Marcellus, Rome; the Doric and Ionic Orders of Vignola; Temple at Eleusis; the Choragic Monument of Lysicrates, Athens; Temple of Jupiter Stator, Rome; the Pantheon, Rome; Temple of Augustus and Faustina, Rome; Temple of Vesta, Tivoli; Basilica of Antoninus, Rome; Composite Order of Palladio; the Erechtheum, Athens; and four sheets of Classic ornament, with another on the drawing and setting-out of the Ionic volute. Some of Mr. Horsley's outlines of foliage are rather clumsy, and indicate a dislike for the necessity of exactitude, so dominant in pure Classic art—a restriction not by any means insisted upon in the Free Classic or Queen Anne school. The book is handy and well bound in a simple cloth cover, admirably adapted to the use of the studio, classroom, and office. For schools of art the folio cannot fail to be useful.

* The Orders of Architecture: Greek, Roman, and Italian. By R. Phene Spiers, F.R.I.B.A., F.S.A. London: B. T. Batsford.

AMERICAN ENGINEERING.



THE *Transactions* of the American Society of Engineers for September contains two papers of interest. One describes "The Cheapest Railroad in the World," by Arthur Pew. This railroad was from Wrightsville to Dublin, two Georgia villages 19 miles apart; the country is rather rough. The grading commenced with convict labour; the greater part of the line was through pine forests, and the clearing was done for the width of the road, which was 14ft. wide in cuttings and 10ft. wide on "fills," the gradings averaging about 4,000 cubic yards per mile. The convicts were employed under skilled foremen in hewing timbers and building trestles, and these structures were built entirely of trees that had grown within 200ft. of the structure. The track was laid with 45lb. iron rails, fastened with fish-plates, bolted and full-spiked. The ties were of Georgia pine, hewn on two sides, and were laid at the rate of 2,640 to the mile. The total cost was 1164·49 dollars per mile, exclusive of rails. All the conditions were favourable.

The paper by Lewis M. Haupt on "Littoral Movements of the New Jersey Coasts, with Remarks on Beach Protection and Jetty Reaction," is particularly instructive. Professor Haupt shows there is a determinate direction to the movement of littoral drift, and that it forms the most important element in obstructing the navigable channel of inlets, and that little aid can be obtained from the use of parallel or convergent jetting for removing bars by the scour from concentrated ebb currents. The author discusses the predominating forces causing movement, and points out the defects of the wind-wave theory in explaining the resultant direction of drift. Professor Haupt's theory is the development of a flood component, which causes the littoral movement along the shores, and the formation of inlets. He draws conclusions as to the best method of improving harbours on alluvial coasts, and proposes a plan for creating and maintaining deep-water channels over the bars of harbours. Several interesting photographic illustrations accompany the paper, besides maps of inlets, coast chart of Boston Bay, charts of soundings, reaction breakwater at Aransas Bay. The principle advocated of a curved jetty instead of a straight one, in assisting to deepen channels, is an important point in Professor Haupt's paper.

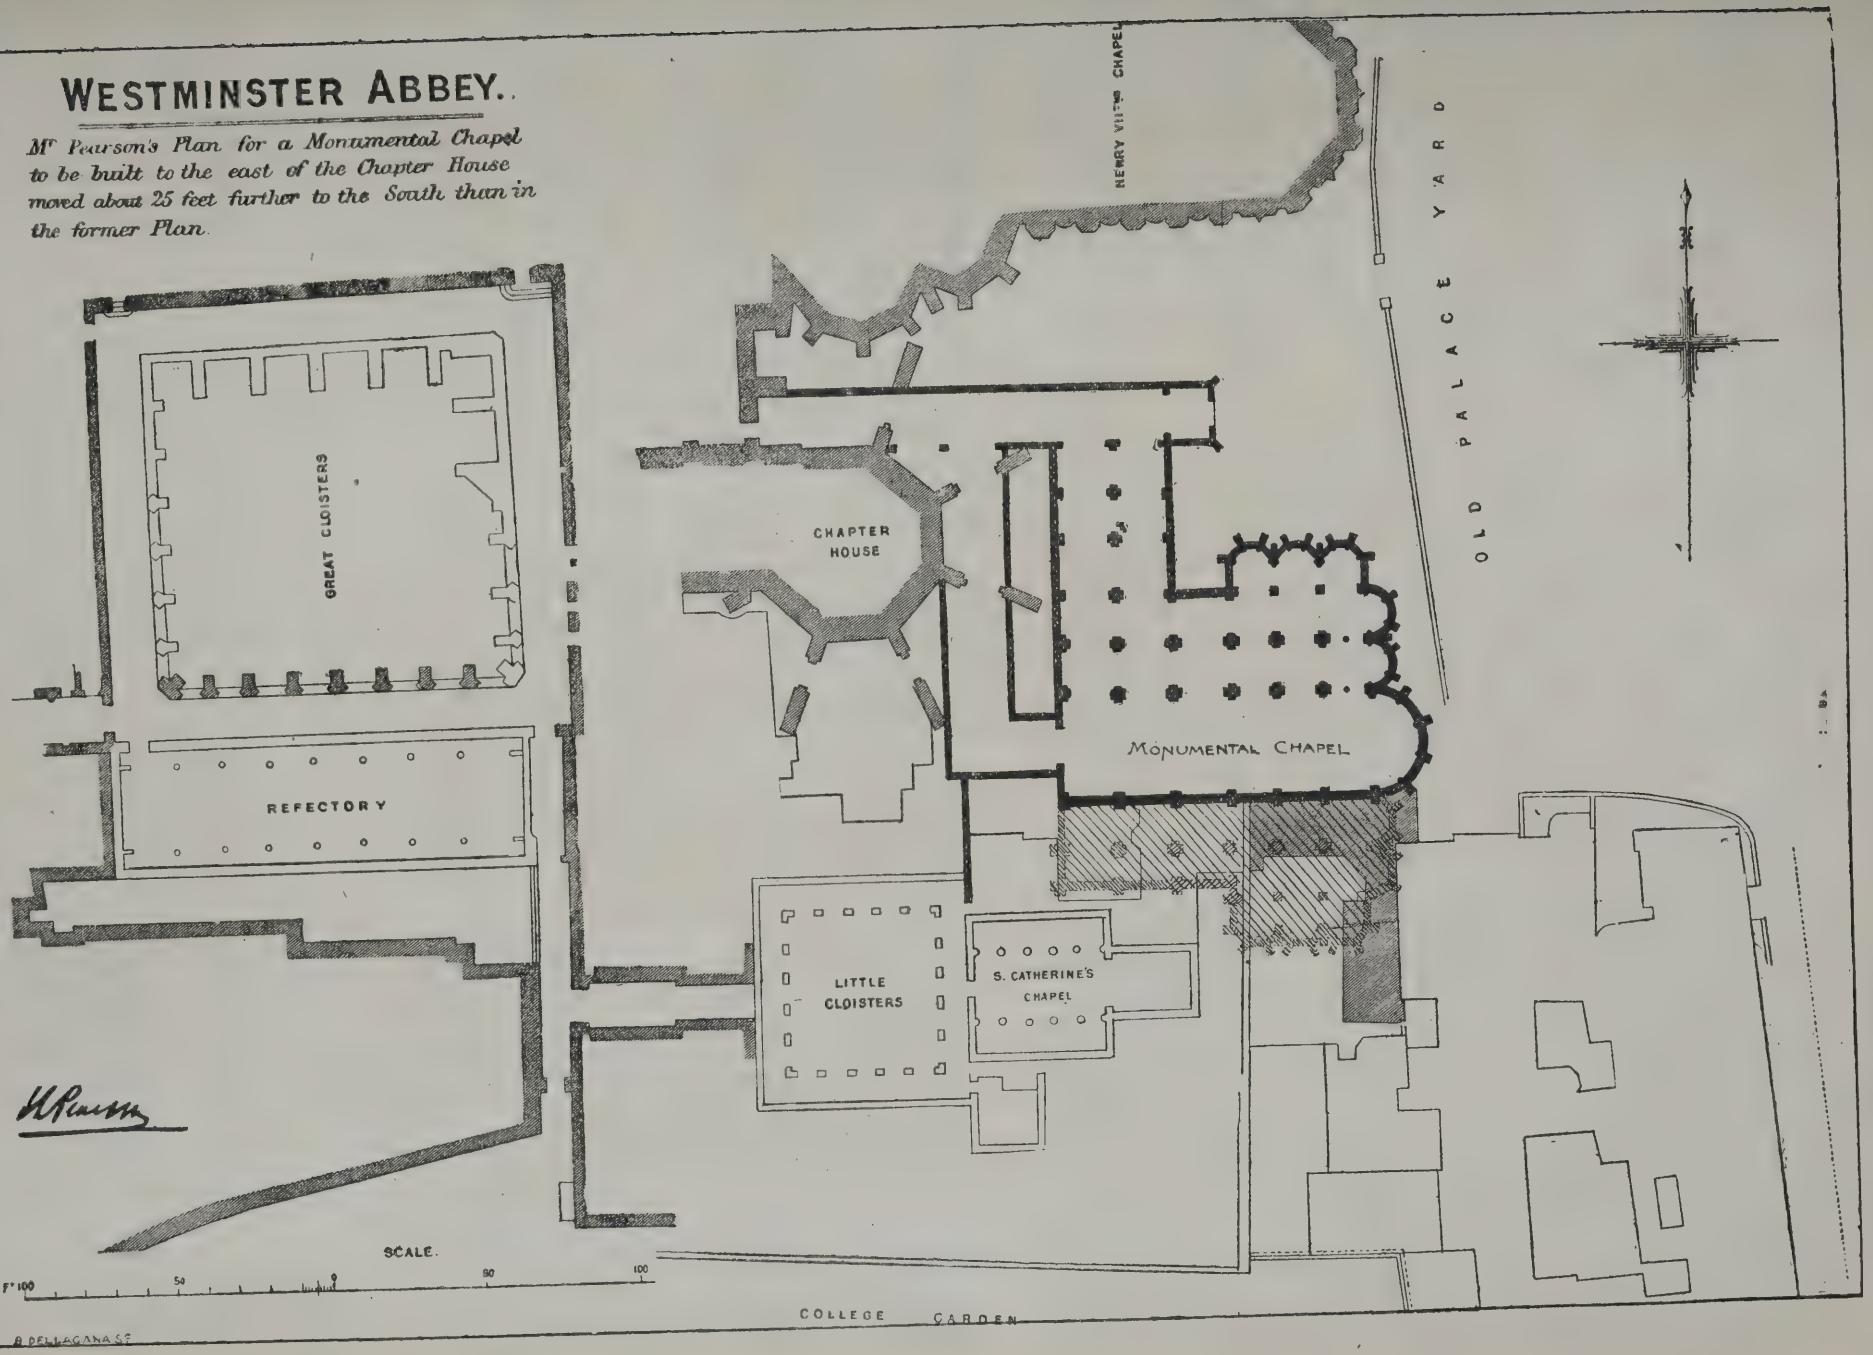
PROPOSED NATIONAL MORTUARY CHAPEL, WESTMINSTER.

[WITH ILLUSTRATIONS.]

THE Royal Commission appointed to inquire into the present want of room for burials and monuments in Westminster Abbey has just published its first report, and the evidence is extremely interesting, particularly the historical record printed by Dean Bradley, who seems to have taken great pains to bring together much useful information connected with the interments which have at various periods occurred within the church and its precincts. Mr. Wright, the clerk of the works, furnished particulars of recent date, estimating that room sufficient for about 50 more bodies could still be found in the Abbey; but the concrete of the foundations has already, it seems, been encroached upon for graves in some parts of the building, principally in Poet's Corner. Mr. John L. Pearson, R.A., the architect to the Abbey since 1879, questioned the clerk of works' estimate as to the room remaining for further interments, but saw no objection to excavating the concreted parts for the purpose of finding places for burials. The chairman, the Right Honourable D. R. Plunket, First Commissioner of H.M. Works, read at length our description of Sir Gilbert Scott's design for the National Campo Santo at Westminster, published when we illustrated (Feb. 29, 1884), that plan, which was 460ft. long by about 40ft. wide. These proportions Mr. Pearson thought objectionable, and he also very rightly condemned the late Mr. Fergusson's plan, made public subsequently. We publish to-day the plan showing the scheme prepared for the intended building by Mr. Pearson, by which it will be seen that the original extent of the structure has been very considerably reduced, and instead of the vast cloister extending along Abingdon-street in a southerly direction to Great College-street, is made to take the form of a nave with double aisles, on a site in Old Palace-yard. All four aisles, as well as the nave, are to have apsidal ends. At present only the nave and north aisles are proposed to be built, leaving those on the south for future extension. The chapel is so designed as to throw open the view of the Chapter House and Henry VII.'s chapel, from Old Palace-yard, and by keeping the aisles low in elevation, the second aisle much lower than the first, this end is certainly gained. Besides the five apsidal east ends, Mr. Pearson shows three northern chapels, each with canted ends, the only rectilinear part of his composition being the very low cloister leading from Poet's Corner in the south transept to the new memorial chapel. We think the effect would be most unfortunate if this were executed in immediate conjunction with the ornate apse of Henry VII.'s chapel, with all its minor rounded parts, and close to the great octagon of the Chapter House. It should also be borne in mind that the radiating chapels of the abbey choir will be seen, and again at this point the grouping is dominated by the vast apse of the main building. Whatever faults of proportion may be noticed in Sir Gilbert Scott's plan, he, at least, realised the stern necessity of keeping his work well in contrast with the existing lines of the Abbey church, and besides, the need of making his cloister sufficiently subsidiary to it. The breadth, too, of the Early style which Sir Gilbert suggested, assisted this idea. Mr. Pearson, with a degree of reserve which may be termed astuteness, supplies no architectural treatment for the elevation of his plan, but he says that he would "make it of a Late style to show that the building was an addition." As, however, we have in Henry VII.'s chapel almost the Latest possible phase of Gothic architecture, we cannot quite see the force of this argument. In point of fact, whatever style Mr. Pearson, or any other modern architect, works in, there can be no mistake about the chapel thus erected being recognised as an addition, and unless the dreary "Late and Flat" be embraced, it is not easy to see what choice of style remains for adoption in that case. Of course, Elizabethan or Renaissance would be "Late"; but such styles undoubtedly are out of the question. We do not suppose but what Mr. Pearson would make a suitable choice of style in accord with the Abbey and Houses of Parliament, as he assures us. Indeed, we will go further, and say that if his plans are determined upon, the wisest thing to do would be to leave the design architecturally entirely to him, unfettered in every way. We only wish to point out the questionableness of the above specious argument of his as to style. We protest, however, against the shape of the building proposed in his plan. The site indicated is the best, no doubt, and there is little force in the plea that the structure ought to be made more an intrinsic part of the Abbey proper. It is said that the distinction of being buried in the Abbey is the great idea associated with a national funeral at Westminster; but whether the bodies are actually interred within the church proper, or in the so-called Campo Santo, will soon cease to be of any moment. Another proposal made by Mr. Pearson is to erect on the site of the Refectory a monumental chapel, incorporating with it some parts of the ruined structure, so far as they will serve. It would be 130ft. long by 37ft. 5in. wide, and 28ft. between the piers. We give Mr. Pearson's sketch of the interior, and he says he thinks it would form a very charming building. The cost is reckoned by him at £30,000, and he estimates the alternative chapel, already described, for the Old Palace Yard site at £60,000, exclusive of the cost of removing existing houses, &c. Perpendicular architecture of a Late type would be used for this larger scheme, so that it might "look like an addition." For the refectory scheme the style of the windows to be preserved would settle the character of the design—viz., 15th-century work. The Archbishop's objection to this latter plan, that the idea of sanctity and dignity attaching to burial in the Abbey would not be transferred to a sort of restored dining-hall, is, we agree, fatal. So, too, is the objection raised by his Grace against the new north aisle, or third scheme, brought forward by the architect to the

PROPOSED NATIONAL MORTUARY CHAPEL, WESTMINSTER.

Abbey, by which a chapel would be erected on the disused graveyard, and extending along the nave from the north transept to Wren's western towers. This erection would hide the only clear view now obtainable of the abbey church, and, besides, would make a very ungainly arrangement. Among the other plans illustrated in the Commissioner's report is one by Mr. Somers Clarke, F.S.A., who wisely adopts square forms, and, like most of the other architects who suggest schemes, selects the old Palace Yard site. He encroaches, however, too much on the view of the abbey from this point of sight, and his chapel would hide the greater part of the chapter-house and adjacent buildings. Besides this, the buttresses of the chapter-house would very much interfere with the carrying out of his idea. Mr. J. P. Seddon, in conjunction with Mr. Lawrence Harvey, contributes a plan providing a building further south, connected by a cloister skirting the site of St. Catherine's chapel, and extending to the corner of Abingdon-street, with an octagonal treatment at the end, entered by a triangular porch over the pavement. Between the chapter-house buttresses small chapels are proposed. This latter part of Mr. Seddon's scheme is adopted also by Mr. E. J. Tarver, F.S.A., who thus proposes to accommodate 350 monuments under skylights. The idea is ingenious, but quite out of accord with the secular use of the chapter-house, and it found little favour with the Commissioners, among whom were Sir Fredk. Leighton, P.R.A., and Mr. Alfred Waterhouse, R.A., P.R.I.B.A. The report ends with a useful list of burials in Westminster Abbey.



Mr. Stewart, burgh surveyor of Brechin, has been appointed to a similar office under the town council of Arbroath.

A new Fisher-lads' Home has been erected at Grimsby, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The Sanitary Institute carried out in Leeds, on Friday and Saturday last, an examination for inspectors of nuisances. The examiners were Mr. H. Percy Boulnois, M.Inst.C.E., of Liverpool; Dr. Louis Parkes, London; Mr. Ernest Turner, F.R.I.B.A., London; and Dr. B. A. Whitelegge, Medical Officer of Health, West Riding of Yorkshire. The registrar (Mr. G. J. Symons, F.R.S.) and the secretary of the institute (Mr. E. White Wallis) superintended the arrangements. Leeds is to be the Institute's examination centre for the Midlands, and at this, the first examination, there were thirty candidates, most of them from Yorkshire and Lancashire, but others from as far south as Northampton, and as far north as Aberdeen and Inverness.

WESTMINSTER ABBEY.

Mr Pearson's Plan for a Monumental Chapel to be built to the east of the Chapter House moved about 25 feet further to the South than in the former Plan.

Engineering Notes.

ANOTHER GREAT BRIDGE FOR NEW YORK.—The preliminary steps have been taken, the *American Architect* says, in the matter of the construction of a bridge across the Hudson River from Jersey City to New York, and work on the bridge itself will be commenced in the spring. The plan is to cross the river at or near the foot of Forty-second-street. The bridge will be 150ft. above tide-level, but the railroad on the New Jersey side, which at that point slopes rapidly to the water, can reach it directly with a very moderate grade, and on the New York side it is intended to carry the connecting roads by viaducts to the entrance of the bridge. The whole affair is intended almost exclusively for railroad use. There will be a footpath across, but no carriageway. Instead of this, there are to be either six or eight tracks, so as to admit an almost unlimited amount of railway traffic, a part of the scheme consisting in the erection of an immense station at the New York end of the bridge. As the plans of the bridge have been approved by the War Department, little remains but to carry them out. It is said to be intended to issue fifteen million dollars in stock, and thirty-five millions in bonds.

CRYSTAL PALACE SCHOOL OF ENGINEERING.—Major F. A. Marindin, inspector of railways to the Board of Trade, on Saturday distributed certificates to the students of this school in the south tower of the Crystal Palace. Mr. Shenton having read the reports of the examiners for the winter session, the close of the eighteenth year of the school upon which the certificates were awarded, Major Marindin congratulated the students and their instructors on the gratifying report of the work of the term. He had, he said, been struck by the quality of the models exhibited, and the excellent drawings in the civil engineering section.

THE FORTH DEFENCES.—The alterations which have been going on for fully six months in connection with the fortifications on the Island of Inchkeith are only the beginning of an extensive scheme which the War Department is carrying out for the improvement of the Forth defences. Messrs. Meikle, of Ayr, have the contract for the work on Inchkeith, which includes the removal of No. 1 and 2 batteries, and the construction of others in their stead. Already both the 18-ton guns have been dismounted, and the immense blocks of granite, weighing about six tons each, required in the construction of the gun-seats, have been bodily removed, and set aside for use at Kinghornness. These were firmly bedded in concrete, and the work of removal was carried out with much difficulty. The new batteries are to be built of cement, instead of granite. No. 1 is finished, and No. 2 is being rapidly pushed forward. The War Department contemplate the construction of a harbour on the island sufficient to admit steamers with passengers or provisions at all states of the tide. This, however, is dependent on a satisfactory issue of the negotiations going on between the Department and the Duke of Buccleuch with the view of acquiring the island. At Kinghornness a staff of engineers have just completed a survey of the additional ground required.

Inquiry was held at Horbury by Colonel J. Orde Hasted, R.E., an inspector from the Local Government Board, on the 18th inst., touching the application of the Horbury Local Board for sanction to borrow the sum of £4,200 for street improvements in the township. Mr. T. Barker, clerk and solicitor to the Local Board, explained that the principal improvement sought to be carried out was the widening of Westfield-road, between Horbury and the borough of Ossett.

The new branch line from the Harrow Station of the London and North Western Railway system to Stanmore, was formally opened by Mr. George Findlay on Thursday of last week. The line, which is two miles in length, has been constructed from plans by Mr. Beswick Myers, M.Inst.C.E., by a company, the cost having been about £36,000. Mr. Charles Braddock, of Wigan, was the contractor.

The death is announced, in his 80th year, of Auguste L. M. Ottin, formerly a well-known Parisian sculptor. Perhaps his best work is the group of Acis and Galatea surprised by Polyphemus, an adjunct to the Medici Fountain in the Luxemburg Garden.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. W. and R.—B. Co.—T. T.

J. P. LOVELL. (Yes, we shall give more architects' portraits with some others; but the continued fogs have hindered our reproductions of the photographs already in hand.)

"BUILDING NEWS" DESIGNING CLUB.

THIRD LIST OF SUBJECTS.

C.—A small stone-built Mountain Church to seat 300 persons, including choir of six men and eight boys. Church to have central tower for bells, with small lead-covered spire, but no transepts or aisles. The font, pulpit, and seating benches to be shown on the plan. The vestry is to accommodate choir as well as priest, and the organ-chamber is to open into chancel by a roomy arch, and be large enough to take a good-sized organ suitable for such a building. A south porch to be included, and a heating-chamber under vestry. The site is supposed to fall rapidly from the N.W., not less than one in ten. Style, 14th century. Scale, 8ft. to the inch. Sufficient drawings to illustrate design, including perspective sketch.

DRAWINGS RECEIVED.—"Black Prince," "Higs," "St. Edmond," "Philomath."

Correspondence.

BOMBAY MUNICIPAL BUILDINGS.

To the Editor of the BUILDING NEWS.

SIR,—With reference to the illustrations of the above-mentioned buildings, published in your issue of the 7th inst., may I solicit the favour of a corner in your valuable paper for the two following letters?—

Baroda, 16th March, 1889.

To His Excellency, The Right Hon. Lord Reay, LL.D., G.C.I.E., &c., &c.

MY LORD,—I see by the public papers that you have inspected the plans prepared for the new municipal offices, showing that this subject interests you beyond your official position as the Governor in Council of this Presidency.

I have the honour respectfully to bring to your lordship's notice the following facts in connection with this matter:

First, that I fairly gained the first prize for these buildings in open competition.

Secondly, that for three years I have danced to municipal piping without any remuneration.

Thirdly, that during this period I was regarded generally as the accredited architect of the proposed buildings, and that I did nothing to forfeit the good opinion of the municipality as a body.

Fourthly, that at the very moment when a successor was appointed in due form, I was actually preparing, under the orders of the municipality, and with the sanction and approval of your lordship's government—a plan for the oval site.

I would respectfully point out that the plans now accepted are identical with my own, as regards the position on the site, the widths and heights of the several apartments and verandahs, and that while bulk for bulk the buildings are practically the same, my successor has been allowed nearly twice the sum of money.

I feel certain that your lordship altogether desires to see fair play, and to secure for this presidency a building worthy of its renown, and confidently relying on your lordship's keen sense of justice, I pray that when these municipal proceedings are placed before your lordship in council for confirmation, that you will bear the above facts in mind.

In conclusion, I would respectfully suggest an equitable way of dealing with the matter. As the *plans* and *style* have been approved, permit me to submit elevations and a perspective view from the same point of sight, and in the same style, and let the respective merits of the two designs be adjudicated by Messrs. Ewan Christian, Waterhouse, and Pearson. These proceedings would cost nothing beyond the judges' fees. No delay would be occasioned, as the buildings up to ground level would be identical, the public would be satisfied that the best building of its style had been secured, and I myself, when vanquished, satisfied that I had been fairly and honourably beaten.

I have the honour to be
Your lordship's most obedient servant,
R. F. CHISHOLM.

Mahableshwar, 16th April, 1889.

DEAR SIR,—I am desired to acknowledge receipt of your letter of March 16th, and to say that the remarks therein will receive every consideration should the papers referred to come before Government for orders.

Yours faithfully,
G. W. EDGELLEY, Private Secretary.

I may mention that it has taken me many months to discover either that the Government of Bombay have changed the official method of procedure, or that the buildings in question are being carried on by the Municipality without the sanction of the Bombay Government.—I am, &c.,
R. F. CHISHOLM.

Intercommunication.

QUESTIONS.

[10463.]—**Penstock Chamber.**—Will some reader kindly tell me how to construct a double penstock chamber to receive sewage and surface water, to contain two penstocks, and be arranged so that the surface water can be used for flushing purposes if required?—F. R.

[10464.]—**Hoggin.**—Will someone please tell me the meaning of this term?—M.

[10465.]—**Gas-Stove (Calorigen).**—Can anyone tell me why this gas-stove has ordinary light-giving burners instead of a Bunsen burner? The light is shut off by an iron door, so it cannot be on the score of cheerfulness.—M.

REPLIES.

[10451.]—**Gas-Stove.**—Water would be condensed by the gas independently of pipe being in cold room. Cannot the pipe be made to have a slight fall towards the room in which the stove is placed, and a small hole made in the bottom elbow of the pipe, with a tray placed under same to catch the condensation.—C. F. M.

[10454.]—**Hot-water Pipes.**—The surveyor is no doubt right in insisting on the pipes being kept 3in. away from woodwork.—G. H. G.

[10454.]—**Hot-water Pipes.**—I was not aware that "not hermetically sealed" was a common definition of a low-pressure hot-water supply system. Is "hermetically sealed" not a new expression introduced by Mr. Nesbit? Amongst the other mistakes he makes on page 878 is the assertion that the heat in a low-pressure water-supply system never exceeds 212° F. I think it often does so where there are large fires and the plumber has not given the expansion or blow-off pipe a rise in every part of its course. I have seen a strong lead pipe swelled out with the heat and pressure like an egg, just as if it had been frozen. When the water in the boiler boils, and the steam cannot get freely away, and the supply cistern is 40ft. above the boiler, why should not the heat get up to above 212° F.? Mr. A. P. Jevon is wrong in saying "W.'s" expansion-pipe is not necessary, as "W." appears to state that his water-supply cistern is a cold one, not a hot one. Mr. Crane's reply seems to refer to a system of hot-water heating; but "W.," on page 842, asks about a "hot-water supply."—W. P. BUCHAN.

[10455.]—**Legal.**—It is the most desirable course to inform the client that a bill of quantities should be taken out, though when a client orders plans, specifications, and desires tenders to be obtained, his architect has an implied right to have them taken out.—G. H. G.

[10457.]—**Pointing during Frost.**—Bricklaying is carried on in Sweden and Norway during frosty weather by using unslaked lime, gauged in small quantities as required, and thoroughly dry bricks. But this, I believe, is only applicable when the joints are "struck as the work proceeds," and not to "raking out and pointing." There have been several substances recommended for rendering mortar impregnable to frost (see BUILDING NEWS, p. 813 *ante*); but it is very doubtful whether they would be of use for merely pointing, even if the brickwork was dry; and if the walls had been previously wet, and

therefore "frozen" when the pointing is done, I feel sure it would be ineffectual. There is also a limit to the number of degrees of frost which the hot-lime mortar will stand; I fancy about 15° Fahr. There is no getting away from the fact that to obtain thoroughly good work, bricklaying should be entirely suspended during frosty weather, unless in such a position that the work is, or can be, protected from the frost. If "Frost" values good work, and does not wish to have the pointing, in all probability, to do over again, I should advise him to wait until the frosty weather is over.—Neville Davis.

[10458.]—**Torching Inside Old Roof.** — Good lime-and-hair mortar, well pressed in, and not just smeared over the outsides of joints. Would asphalte, which in this case would have to be applied in a plastic state, withstand the heat of the sun in summer?—Neville Davis.

[10458.]—**Torching Inside Old Roof.**—Lime-and-hair mortar. The answer to second part of question is "No."—C. F. M.

[10459.]—**Quantities.**—I should say not. If you give a tailor an order for a coat, you cannot demand a paper pattern he may have had to cut, and a copy of the dimensions he took.—R. Watson.

[10460.]—**Powers of Local Authorities.**—Outside the Metropolis the local authorities are urban and rural sanitary authorities. If your authority is a rural authority, you may build up to the road, so long as you do not encroach upon it. If urban, it will depend upon their by-laws. Your best plan is to see the authority's surveyor.—N. D.

[10461.]—**Water Engineering.**—By far the most elaborate work on the subject is Humber's "Water Supply of Cities and Towns" (Crosby Lockwood). There is also Bateman's "Water Supply: History and Description of the Manchester Waterworks" (Spon). A very useful little book for a student is Hughes's "Treatise on Waterworks" (Weale's Series); and the article on waterworks in Spon's "Dictionary of Engineering" is well worth reading, and can be obtained in a separate number.—Neville Davis.

LEGAL INTELLIGENCE.

The Building of St. Cuthbert's Church, Edinburgh.—In the Scottish Court of Session held at Edinburgh, the action was partly heard on Thursday, Friday, and Saturday last, in which James Steel, builder, of Edinburgh, sought to prevent the kirk session of St. Cuthbert, Edinburgh, from interfering with the churchyard in connection with the projected re-erection of the church. One of the witnesses for the kirk session was Dr. Hunter Stewart, who stated that he had been pursuing a scientific examination of the air in public buildings in Edinburgh for the last three years. He had been requested by the Town Council to examine the air in some of the schools, and he extended it for his own information and theirs to churches and theatres and the like. In pursuance of that course, he went to St. Cuthbert's on Sunday, 4th November, 1888. His visits had nothing whatever to do with the questions that have since arisen. Witness sat in Dr. MacGregor's pew in the forenoon, an assistant sat in the lower gallery, and another in the upper gallery. Each took a sample of the air. Analyses showed that the air of the top gallery contained 48·7 parts carbonic acid in 10,000 parts of air, the middle gallery 54·3 parts carbonic acid in 10,000 parts. On the evening of the same Sunday samples were again taken, and on analysis they showed that the air in the upper gallery contained 62·25 parts carbonic acid in 10,000 parts, the lower 63·5 parts carbonic acid in 10,000 parts, and the area 48·7 parts carbonic acid in 10,000 parts. The air in the lobby contained 62 parts carbonic acid in 10,000 parts of air. The external air in St. Cuthbert's graveyard contained 4·3 parts carbonic acid per 10,000 parts. He stated that in one of the largest churches in Edinburgh, examined at the close of a forenoon service, the sample of the air at the front seat of the gallery showed 43 parts per 10,000, and in that church there were complaints both by clergymen and congregation as to headaches after service. He gave other cases of analysis varying from 30 parts per 10,000 in the church to 16 parts in the schoolroom, nine parts in theatre, to show how very much more defective the ventilation in St. Cuthbert's was than even the worst of the instances given. There were few recorded cases of air as bad as it was. The cubic space per sitter was only 113ft. per head. Cross-examined: To improve the ventilation in the present church would not be an improvement at all, because by no system of ventilation could the present church be made sanitary if the present number of sitters were retained. Professor Crum Brown gave corroborative evidence. John Cooper, burgh engineer, Edinburgh, in examination, said he had expressed approval of the plans regarding the proposed alterations. James Walker, partner of Brown and Walker, surveyors, Edinburgh, gave evidence relative to the measurement of Mr. Hippolyte J. Blanc's plans for the proposed alterations.—Lord Stormouth-Darling, the presiding judge, has taken the case to avizandum.

The trustees of the Nicholson Institute at Leek have resolved to open the art galleries, museum, and reading-rooms on Sunday afternoons and evenings. This decision has given great satisfaction to a large majority of the inhabitants of the town.

WATER SUPPLY AND SANITARY MATTERS.

Chester-le-Street. — The Chester-le-Street Union Rural Sanitary Authority have approved of four schemes of main sewerage and sewage disposal for (1) Birtley, (2) Witton Gilbert, (3) Sacriston and Daisy Hill, and (4) Edmondsley in the county of Durham, with a total estimated population of 10,000, per plans prepared by Mr. D. Balfour, M.Inst.C.E., F.G.S., 3, St. Nicholas Buildings, Newcastle-on-Tyne. The main sewerage embraces about 12 miles of pipe sewers, and the sewage will be purified by the process of intermittent land filtration, the total cost being estimated at £14,000. The necessary steps for the compulsory purchase of the land are now being taken.

Glasgow.—The refuse-despatch works which have just been erected at Kelvinhaugh by the Corporation of Glasgow were formally inaugurated on Wednesday week. The works are situated on the site of the old Mansion-house, and are connected with a mineral siding at Yorkhill Station. The main floor of the machinery-house is on the highest level, and the refuse falls from the carts through a short shoot into a revolving screen, from which all the finer material passes into a mixer, where other manurial refuse is introduced, and forms a compost, which is thrown into the railway waggons and despatched for agricultural purposes. By a catching arrangement the cinders are extracted, and they are sufficient to raise steam for the whole of the works. The rougher rubbish falls on to a travelling carrier—an endless revolving web of iron plates and chains. Meat-tins, old iron, and anything which can be profitably utilised can be picked off as they pass along the carrier. There is stable accommodation, and four tenements of suitable dwelling-houses have been erected on the ground for the workmen who require to be at hand. The chimney stalk in connection with the works is 300ft. high. The ground cost £11,950, and the buildings and works, £16,000. These works were designed by the Cleansing Committee, with the assistance of Mr. Clark as architect, and of Mr. John Young, the superintendent of cleansing to the corporation.

Knaresborough.—At a special meeting of the Knaresborough and Tentergate Improvement Commissioners and Local Board of Health, held on Monday in the Town Hall, Knaresborough, Mr. B. T. Wood, J.P. (chairman), presiding, Mr. D. Balfour, Newcastle-on-Tyne, presented complete plans and estimates for a scheme of main sewerage and sewage disposal for the town of Knaresborough, which the board unanimously agreed to adopt. The scheme shows two main outfall sewers, one for the east part of the town, by Chain-lane, and the other for the west part, along the side of the River Nidd, joining together at Grimbald Bridge, thence on to the land for sewage disposal at the Haugh's Farm, lower down the river, where the sewage will be purified by the process of intermittent land filtration, without the use of any chemicals whatever, sufficient and suitable land being available there. The scheme is being carried out to avoid the impending injunction of Lady Hawley's trustees for polluting the Frogmire Dike, which passes through the Haya Park Estate before reaching the River Nidd.

Open Ventilators for Sewers.—A special meeting of the town council of Newark-on-Trent has been held to consider a report prepared by the borough surveyor, Mr. George Shepperd, on the subject of the open ventilators of sewers. The investigation was a result of complaints having been made that offensive smells proceeded from these ventilators. The report states that the total length of sewers now ventilated was 4¼ miles, which included only two of the seven sections into which the town had been divided, leaving five sections unventilated. From recent examination all the manholes and flushing-tanks had been found to be free from deposit, and in several localities ventilating shafts had been erected to relieve the grates. Reference was made to between 70 and 80 towns which have adopted the open grid system of ventilation. In these places very few shafts were in use. The borough surveyor in his report strongly recommended the continuance and completion of the system throughout the town, together with constant flushing, the use of disinfectants, and ventilation of private drains. In his opinion he was backed up by the opinions of several sanitary engineers. He quoted the opinion of Dr. Angus Smith, who stated "a rather wild clamour has taken place about sewers, and bad as their gases are, the danger arising from them has been much exaggerated." He also appended the following letter from Mr. E. B. Ellice Clark:—"Dear Sir,—You have asked me to solve a very difficult problem in a few answers. Will you allow me to suggest that the subject of sewage ventilation is far too complex for any decision to be come to by answers to your queries. I have been investigating the subject for fifteen years, and have made many thousands of observations—but I am by no means satisfied that I know the best means of effecting sewer ventilation. The evidence as yet goes to prove—(*a*) that open ventilators at the street level are most effective; (*b*) That on no account should they be closed; (*c*) That the nuisance arising from them may be greatly mitigated by having shafts of large diameter (at least 24 square inches) carried up the sides of houses between the open street ventilators; (*d*) That flushing with cold water has a marked effect for good upon sewer air; (*e*) That no one system is applicable to every system of sewers.—Yours faithfully, E. R. Ellice Clark, M.Inst.C.E." The Mayor read a recommendation from the sanitary committee to close certain "dead ends" of sewers and moved its adoption, and Mr. Millthorp seconded the proposition. An amendment that the sewer ventilators be closed was proposed. A long discussion followed, and the amendment being put to the vote, was lost, three only voting for it, and the original proposition was carried.

The Pollution of the Rivers Irwell and Mersey.—Colonel Ducat, R.E., and Mr. T. W. Thompson, inspectors of the Local Government Board, have held at the Assize Courts, Manchester, an inquiry into an application which has been made by the County Councils of Chester and Lancaster, under sub-section 3 of section 14 of the Local Government Act, 1888, to the Local Government Board, for power by provisional order "to constitute a joint-committee representing the administrative counties of Chester, Derby, and Lancaster, and certain county boroughs, the said counties and county boroughs being those through or by which the river Irwell or any tributary thereof passes, or through or by which so much of the river Mersey as is above the intersection by the said river of the southern boundary of the borough of Warrington, and to confer on such committee the powers of a sanitary authority under the Rivers Pollution Prevention Act, 1876. The chief witnesses were Mr. Hulton, clerk, and Mr. Hibbert, chairman of the Lancashire County Council, Dr. E. Sargeant, their medical officer of health; and opposition was manifested by representatives of Ashton-under-Lyne, Eales, and other boroughs which feel themselves slighted by the proposals.

CHIPS.

A life-sized portrait of the donor of the art gallery to Liverpool, painted by Mr. W. Q. Orchardson, R.A., was presented on Tuesday, the 23rd inst., to Sir A. B. Walker, in the gallery which bears his name. The canvas, which is oblong in shape, represents Sir Andrew in morning costume, seated in an armchair before a writing-table covered with correspondence.

A scheme for providing a public park for Wakefield is maturing successfully. £6,000 towards the £6,500 required has been promised, and the committee which has the matter in hand has instructed Mr. Arthur Fawcett, surveyor, of that city, to prepare an outline plan, prior to advertising for designs from landscape gardeners for laying out the grounds.

A large organ erected in Eccles parish church by Mr. James J. Binns, of Bramley, at a cost of over £2,000, was dedicated on Saturday last. The organ is constructed throughout with tubular pneumatic action, and is placed on the north and south sides of the chancel screens, 15ft. above the floor. The great feature is the position of the console, which is placed on the south side of chancel at the end of the choir seats, the tubes being carried under the chancel floor, those on the north side being 90ft. from the console. The inside metal pipes are spotted metal, the outside pipes of electro-plated zinc.

The parochial committee of Leighton Buzzard have recommended to the rural sanitary authority the adoption of a drainage and water supply scheme prepared under the motto "Forward" by Mr. Nicholls.

At the monthly meeting of the Masonic Lodge, No. 261, Unanimity and Sincerity, held at the Masonic Hall, Taunton, on Wednesday last, Mr. George C. Strawbridge, M.S.A., the senior warden, was unanimously elected master for the ensuing year. The ceremony of installation will be performed in January.

At the conclusion of the service in Dunblane Cathedral on Sunday, the Rev. Mr. Ritchie intimated that that was the last service which would be held in the cathedral as it now stands. The masons having finished the restoration of the nave, a start is now to be made with the restoration of the choir, which has been used as the parish church since the Reformation.

A memorial to the late General Sir Howard Elphinstone is being erected in the garrison chapel at Devonport, and will be unveiled in January, probably by the Duke of Edinburgh. The memorial is a suitably-inscribed marble tablet.

The town council of Stoke-on-Trent have voted their borough surveyor, Mr. J. Pattison, an increase of £50 a-year to his salary.

Our Office Table.

A memorial as to the present condition of the monuments of Ancient Egypt, signed by over 650 persons interested in the question, including architects, painters, and sculptors, students of history and archæology, lovers of art, and others, has just been presented to Lord Salisbury. The memorialists call attention to the priceless value of the wall sculptures and decoration of the Egyptian temples, which themselves are fitting shrines for their wealth of artistic design. They point out that "the destruction which has been in progress during centuries has of late years been carried on with increased intensity. The growing prosperity of the country has naturally created a demand for building materials, and the ancient monuments are now, as formerly, resorted to as convenient quarries. Miracles of the sculptor's art, and vast wall spaces on which are inscribed the documents relating to the earliest civilisation, are broken up for rubble or cast into the limekiln. But the worst cases of destruction have arisen from other causes, as in the recent notorious mutilations of Beni-Hassan, where the paintings and sculptures have been cut away for sale." They ask Lord Salisbury to direct the British Agent at Cairo to move the Egyptian Government to appoint a qualified official inspector instructed to submit, with a view to their publication, yearly reports of his proceedings.

The London School Board, at their last meeting, considered what terms should be made with the quantity surveyors employed by them for taking the quantities for schools proposed to be built from duplicated plans. At present a commission of 1 per cent. on the amount of contract is paid to the quantity surveyors, and the professional men employed (Messrs. Arding, Bond, and Buzzard, Mr. Frederick Downing, Mr. Charles G. Dunning, Mr. F. H. A. Hardcastle, and Mr. Henry Lovegrove) intimated that they would be willing to accept, as now, 1 per cent. in each case on the first school of a kind, and in the case of buildings duplicated above the ground floor, a uniform reduced rate of ¾ per cent. for the work comprised under the head of "main" building, and including latrines, urinals, and drains. This arrangement has been accepted by the Board as reasonable under the circumstances.

At the same meeting of the School Board, a special report was received from Mr. T. J. Bailey, their architect, with reference to the proposed enlargement of the Board offices. Mr. Bailey said that the work, being of a special nature, could only be done at periods when he was not preoccupied. At the sacrifice of his private time and annual holidays, he had prepared the general scheme, which had been approved in principle by the Education Department; but, having regard to the pressure of work in his office, he did not see a possibility of further taking up the work for a time, and suggested that it might be desirable to intrust the completion of the plans and the execution of the work to an outside architect. The Board accepted the suggestion, and instructed the works committee to ask a number of architects to state the terms on which they would be willing to carry out the enlargement, and to make a selection.

The project conceived a twelvemonth since by some members of the Birmingham Photographic Society, of making a complete survey of Warwickshire by camera, is making good progress, and it is expected that next autumn will see the work so far completed that an exhibition of the members' work can be held. It will be recollected that some 200 photographers, professional and amateur, residing within this county have agreed to take part in the work, and a committee of antiquarians and others have charge of the arrangements. The plan decided on is that each member is to take each a small portion of the county—say, a square mile—as marked out on the Ordnance map, and to photograph the churches, the other historical buildings, and the remarkable geographical, geological, biographical, ethnological, and botanical specimens or scenes contained within that area. A preliminary exhibition of work already done is being shown at the Temperance Hall, Temple-street, Birmingham, by Mr. J. B. Stone, the president of the society. The photographs include Duddeston Hall, the house of Galton the banker, the two pages of the perishable burial register of Aston Church, pages which are supposed, from their date, to contain the names of soldiers who fell in the Civil War, two views of the old chancel of Aston Church, now destroyed; many photos of Edgbaston old church prior to its restoration, Castle Bromwich Hall before it was injured by fire, the font at Coleshill Church, etc. Messrs. E. C. Middleton and C. J. Fowler have made a trip down the romantic and beautiful valley of the Severn, from its source on bleak Plynlimmon to its mouth in the Bristol Channel, and brought back no fewer than 240 scenes, now hung with Mr. Stone's views.

Few towns are more rapidly increasing in population and commercial prosperity than is Cardiff, and this growth, due to the development of the coal and shipping interests, is manifesting itself alike in the number of new buildings erected, and in the reconstruction to more imposing scale of business premises in the main thoroughfares. According to a tabulated report presented to the Cardiff Corporation by the borough surveyor, there have been approved during the present year by the Public Works Committee 13 plans for new streets, 722 for houses, 44 for shops, two for places of worship, four for schools, and 153 for other buildings. During the preceding five years building operations were going on at a similar rate, for in 1885 the number of plans passed were for houses and shops 1,345, and for all other buildings 258, while in the following year the numbers were 1,201 and 227 respectively; in 1887, 1,226 and 194; and in 1888, 1,062 and 189. Last year there was, and for the first time, a marked falling off, the numbers being 603 and 163; but there has been a perceptible rise again during the twelvemonth now being completed.

The Birmingham Museum and Art Gallery has this week been enriched by the gift from Mr. S. Jevons of a collection of illuminated manuscripts, printed books, and carved ivories, which fill two large cases in the Italian Gallery and Industrial Hall. The first case contains books dating from the 14th to the 18th century, and illustrates the gradual development of the art. Among the more important exhibits are a copy of the Koran, written and illuminated on a roll of thin paper; an illuminated Flemish Book of Hours in manuscript on vellum, dating from the end of the 14th century; a French Book of Hours, dated Paris, 1497; the Codex of Saxo-Ferrato, one of the earliest printed books with a date; an illuminated choral book and scored church missal, both Italian, 15th century; a large church choir book in the original binding with the arms of the Medici family; "The Jewish Prophets," by Martin Luther, with illustrations by Lucas Cranach, Wittemberg, 1543; and a book of etchings, "The Horrors of War," by J. Callot, printed in Amsterdam, 1633. The second case contains a collection of carvings in ivory, the work of Flemish, Scandinavian, German, Russian, Italian, and Japanese carvers being illuminated.

Mr. J. A. Cossins, architect, of Birmingham, who is in consultation with the Estates Committee upon the structural inconveniences of the Birmingham Town Hall, has lately discovered the original competitive design for the building, which was sent in to the Town Commissioners by Messrs. Hansom and Welch, the architects. It is not merely an architectural drawing of perfect fidelity, but a clever picture, in which the hall is surrounded by a busy throng of inhabitants, whose quaint costumes are in singular contrast with the dress of the present day. It has been preserved with the care which its merits as well as its extrinsic interest ought to have procured for it. The draughtsman was the late Mr. Harris, father of Mr. H. H. Harris, and an inscription on the back of the drawing records that it was presented by the architects "to the late Charles Fiddian."

The lecture arrangements for the ensuing session of the Royal Institution, include an address by Dr. E. Emanuel Klein, on Friday, Feb. 20th, on "Infectious Diseases: their Nature, Cause, and Mode of Spread"; and one by Professor W. E. Ayton, F.R.S., on Friday, March 20th, entitled "Electric Meters, Motors, and Money Matters." Short courses, each of three lectures, will be given by Mr. W. Martin Conway, F.S.A., on Saturdays Jan. 24 and 31, and Feb. 7, on "Pre-Greek Schools of Art"; and by Professor C. Meymott Tidy, on Thursdays, March 5, 12, and 19, on "Modern Chemistry in relation to Sanitation."

The Press view of the Fine Art section of the Glasgow East End Industrial Exhibition was on Saturday. A very interesting collection of loan pictures in oil and water-colour, and of old line engravings, has been got together in a building which, till recently, was the workshop of a reformatory. The exhibition affords an excellent representation of works by artists bred in Scotland, some of the more worthy being by Sam Bough, Paul Chambers, Erskine Nichols, J. Milne Donald, and Alexander Fraser. There is also a small collection of works by English painters, including specimens from the brushes of Godfrey Kneller, Hogarth, Constable, Bonnington, Herring, Clarkson Stansfield, Creswick, Cotman, De Wint, and of the more modern works some by Cecil Lawson, John Linnell, and Sidney Cooper. Sir John Millais is represented by "Lady Carew Getting Violets," Burne Jones by three pencil sketches, and Sir John Gilbert by some powerful drawings. The Arts and Crafts section is made up of exhibits by the pupils of Mr. Newbury, head master of the Glasgow School of Art.

CHIPS.

M. Gustave Revilliod, the well-known Geneva bibliophile and author, who died on Sunday at Cairo, aged 74, has left a legacy to Geneva of several million francs, and has also bequeathed to it a splendid museum, called the "Ariana," situated near Geneva, which is frequently visited by tourists.

The new Wesleyan chapel, Brook-road, Walton, Liverpool, has just been opened. The chapel has cost £3,700. Messrs. Briggs and Wolstenholme (Liverpool and Blackburn) are the architects, and Mr. M'Dermott (Bootle) the builder. Accommodation is provided for over 600 worshippers.

A new organ in Redgrave Church, Suffolk, built by Messrs. Casson and Co., of London, at a cost of £300, was dedicated on Wednesday week.

The marble memorial pulpit for St. Michael's Parish Church, Crieff, presented by ex-Provost M'Rosty, one of the elders, was formally inaugurated on Sunday by the Right Rev. Dr. Boyd, of St. Andrew's, Moderator of the General Assembly. The pulpit is the work of Mr. D. Beveridge, sculpor, Perth. The body is of Sicilian marble, is Gothic in character, and octagonal in form. It is supported by eight columns of coloured marble, the dark tints of which set off the clear white of the upper structure, while the lower base is formed of polished Peterhead granite. The front panel bears a figure in relief representing the Saviour delivering the Sermon on the Mount, and is from the chisel of Mr. Stevenson, Edinburgh, while the other panels are filled in with verses from the Beatitudes.

Holloway's Ointment.—Glandular swellings in the throat, neuralgia, tic douloureux, rheumatism, gout, lumbago, and other diseases affecting the glands, muscles, and nerves of sensation are permanently eradicated by this healing anti-febrile and soothing preparation. It is also a perfect remedy for all skin diseases, and every kind of superficial inflammation.

A HUMANE TELEPHONE.

People who suffer from deafness and noises in the head will be glad to hear that an eminent Aural Specialist of London has hit upon a cure which is said to be absolutely efficacious, and may be applied at the patient's home. It is a miniature telephone, which fits inside the ear. It is not only a producer of sound, but also a cure for the distressing noises in the head. Being comfortable to wear, it will no doubt be a boon to mankind. A pamphlet describing its construction is printed, and may be had from the Publisher, 21, Bedford-square London, W.C. Price 3d.

DOULTING FREESTONE.

THE CHELYNCH STONE—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

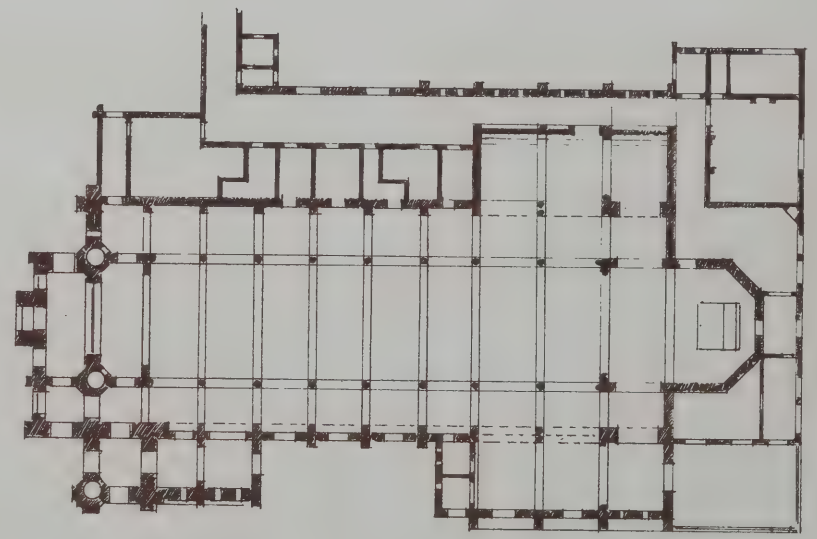
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.

Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

THE HAM HILL STONE COMPANY

NORTON, STOKE-UNDER-HAM, SOMERSET.



London Agent:—

Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.
